 good store of crystals, whose figur-  
 ing enough, though prettily shaped,  
 had at once affected variety in their  
 and yet confined herself to *geometri-*

## DEFINITIONS of the SCIENCE.

**METRY** is defined by Dr Johnson as follows:

**GEOMETRY**. *n. f.* [*γωμετρία*; *geometrie*, Fr.] signifies the art of measuring the earth, distances or dimensions on or within it: now used for the science of quantity, extent or magnitude, abstractedly considered, in regard to matter.—*Geometry* is usual-ly divided into speculative and practical; the former contemplates and treats of the properties of continued quantity abstractedly; and the latter applies these speculations and theories to use and practice. *Harris*.—In the music there seems to be more *geometry* than in the artificial engines in the world. *Ray*.—I think also for my censor I disdain, I think all science, as all virtue, vain; I count *geometry* and numbers toys, I with his foot the sacred dust destroys.

*Dryden's Persif.*  
The word **GEOMETRY** literally signifies *measuring the earth*, as it was the necessity of measuring land that first gave occasion to study the rules and rules of this science, which has since extended to numberless other speculations. It is the science of inquiring, inventing, constructing, all the affections of magnitude: it files it the knowledge of magnitudes and their limitations; as also of their ratios, positions and motions of every kind. The word, *geometry*, together with arithmetic forms the chief foundation of all the mathematics.

## HISTORY of GEOMETRY.

The invention of geometry is generally ascribed to the EGYPTIANS. Herodotus, Diodorus, Strabo, Proclus, all agree that the annual inundation of the Nile gave rise to it, by carrying away the sand marks and boundaries of estates and covering the surface of the ground, which effaced every trace of their former. Hence the Egyptians were obliged to distinguish and lay out their lands in consideration of their figure and quantity, and every person might have his own property: by repeated experience and practice, in measuring of lands, the Greeks at length discovered the science of *Geometry*. By farther consideration on the draughts of figures, their wonderful properties were more and more discovered, and continually gained ground and improved, till the discoveries of succeeding mathematicians appear to be the most probable origin of it; though Josephus seems to ascribe the invention to the Hebrews; while others of the ancients ascribe it to Mercury the inventor. *Polyd. Virg. de re. l. i. c. 18.*

It is said to have introduced this science into Greece; where it was greatly improved and improved by himself, as well as by THALES, ANAXAGORAS of Clazomene, HIPPOCRATES of Chios, and PLATO; who testified

his conviction of the necessity and importance of *Geometry* to the successful study of Philosophy, by inscribing over the door of his Academy, *Let no one ignorant of GEOMETRY enter here*. Plato thought the word *Geometry* too mean a name for this science; and substituted instead of it the more extensive name of MENSURATION; and after him others gave it the title of PANTOMETRY. But even these are now become too confined in their import, fully to comprehend its extent; for it not only inquires into, and demonstrates the quantities of magnitudes, but also their qualities, as the species, figures, ratios, positions, transformations, descriptions, divisions, the finding of their centres, diameters, tangents, asymptotes, curvatures, &c.

About 50 years after PLATO, EUCLID collected together all those theorems, which had been invented by his predecessors in Egypt and Greece, and digested them into 13 books, entitled *The Elements of Geometry*: demonstrating and arranging the whole in a very accurate and perfect manner.

The next to Euclid, of those ancient authors whose works are extant, is APOLLONIUS PERGÆUS, who flourished in the reign of Ptolemy Euergetes, about A. A. C. 230, and 100 years after Euclid. He was author of the first and principal work on Conic Sections; on account of which, and his other accurate and ingenious geometrical works, he acquired from his patron the emphatical appellation of the *Great Geometrician*.

Contemporary with Apollonius, or perhaps a few years before him, flourished ARCHIMEDES, celebrated for his extraordinary mechanical inventions during the siege of Syracuse, and no less so for his many ingenious geometrical compositions.

EUDOXUS of Cnidus, Archytas of Tarentum, Philolaus, Bratosthenes, Aristarchus of Samos, Dinostratus, the inventor of the quadratrix, Menechmus his brother, and the disciple of Plato, the two Aristarchuses, Conon, Thracidius, Nicoteles, Leon, Theudius, Hermetimus, Hero, and Nicomedes, the inventor of the conchoid; besides many other ancient geometricians, have contributed to the improvement of geometry.

The Greeks continued their attention to it, even after they were subdued by the Romans; whereas the Romans themselves were so little acquainted with it, even in the most flourishing time of their republic, that Tacitus informs us they gave the name of mathematicians to those who pursued the chimeras of divination and judicial astrology. Nor does it appear they were disposed to cultivate geometry during the decline, and after the fall of the Roman empire. But the case was different with the Greeks; among whom are found many excellent geometricians since the commencement of the Christian era, and after the translation of the Roman empire. Ptolemy lived under Marcus Aurelius; and we have still extant the works of Pappus of Alexandria, who lived in the time of Theodosius; the commentary of Eutocius, the Ascalonite, who lived about A. D. 540, on Archimedes's mensuration of the circle; and the commentary on Euclid, by Proclus, who lived under the empire of Anastasius.

The consequent inundation of ignorance and barbarism was unfavourable to geometry, as well

as to the other sciences; and the few who applied themselves to this science, were calumniated as magicians. However, in those times of European darkness, the Arabians were distinguished as the guardians and promoters of science; and from the 9th to the 14th century, they produced many astronomers, geometricians, geographers, &c.; from whom the mathematical sciences were again received into Spain, Italy, and the rest of Europe, somewhat before the year 1400.

Some of the earliest writers after this period, are Leonardus Pisanus, Lucas Pacciolus or De Burgo, and others between 1400 and 1500. And after this appeared many editions of Euclid, or commentaries upon him: thus, Orontius Finæus, in 1520, published a commentary on the first 6 books; as did James Peletarius, in 1556; and about the same time Nicholas Tartaglia published a commentary on the whole 13 books. There have been also the editions, or commentaries, of Commandine, Clavius, Billingsly, Scheubelius, Herlinus, Dasydopodius, Ramus, Herigon, Stevinus, Saville, Barrow, Tacquet, Dechales, Fournier, Scarborough, Keill, Stone, and many others; but the completest edition of all the works of Euclid, is that of Dr Gregory, printed at Oxford in 1703, in Greek and Latin. The edition of Euclid, by Dr Robert Simson of Glasgow, containing the first 6 books, with the 11th and 12th, is much esteemed for its correctness.

The principal other elementary writers, besides the editors of Euclid, are Pardies, Marchetti, Wolfius, Simpson, &c. And among those who have gone beyond Euclid in the nature of the elementary parts of geometry, may be chiefly reckoned, Apollonius, in his Conics, his Loci Plani, De Sectione Determinata, his Tangencies, Inclinations, Section of a Ratio, Section of a Space, &c.; Archimedes, in his treatises of the Sphere and Cylinder, the Dimension of the circle, of Conoids and Spheroids, or Spirals, and the quadrature of the Parabola: Theodosius, in his Spherics, Serenius, in his Sections of the Cone and Cylinder; Kepler's Nova Stereometria; Cavalierius's Geometria Indivisibilium; Torricelli's Opera Geometrica; Viviani in his Divinationes Geometricæ, Exercitatio Mathematica, De Locis Solidis, De Maximis & Minimis, &c.; Vieta, in his Effectio Geometrica, Supplement. Geometricæ, Sectiones Angulares, Responsum ad Problemata, Apollonius Gallus, &c.; Gregory St Vincent's Quadratura Circuli; Fermat's Varia Opera Mathematica; Dr Barrow's Lectiones Geometricæ; Buihald de Lineis Spirabilibus; Cavalierius; Schooten and Gregory's Exercitationes Geometricæ, and Gregory's Pars Universalis, &c.; De Billy's treatise De Proportione Harmonica; La Lovera's Geometria veterum promota; Stadius's Mefolabium, Problemata Solida, &c.; Wallis in his treatises De Cycloide, Cissoide, &c.; De Proportionibus, De Sectionibus Conicis, Arithmetica Infinitorum, De Centro Gravitatis, De Sectionibus Angularibus, De Angulo Contactus, Cono Cuneus, &c. &c.; Hugo De Omericis, in his Analysis Geometrica; Pascal on the Cycloid; Stepl. Angeli's Problemata Geometrica; Alex. Anderson's Suppl. Relati 1, Vartorum Problemata Practice, &c.; Baronius's Geomet. Prob. &c.; Gheudo Grandini Geometr. Demonstr. &c.; Ghe-

taldi Apollonius Redivivus, &c.; Lu Colen or a Ceulen, de Circulo et Adici Snell's Apollonius Batavus, Cyclometriae Herbertstein's Diotomo Circularum; Palcit. in Geometriam; Guldini Centro-Ba several others equally eminent, of modern date, as Dr Rob. Simson, Dr Mat. St Tho. Simpson, &c.

Since the introduction of the new geometry of curve lines; as exponential equations, in this part of geometry following names, among many others especially to be respected, viz. D Schooten, Newton, Maclaurin, Br Cramer, Cotes, Waring, &c. &c.

As to the subject of practical geometry chief writers are Beyer, Kepler, Ram Mallet, Tacquet, Ozanam, Wolfius, with innumerable others.

On the whole, the history of geometry divided into 4 grand æras: viz. 1. Prior to its introduction into Greece by 2. From that period to its meridian; EUCLID: 3. From EUCLID and ARCH DESCARTES, who, by applying algebraic elements of geometry, gave a new turn to it: and, 4. From Descartes to its present state, by Sir ISAAC NEWTON and M. LEIBNIZ: who introduced still greater improvements by the application of FLUXIONS.

This science is generally divided into two parts, viz. I. THEORETICAL GEOMETRY, the general principles of the science; II. PRACTICAL GEOMETRY, or the application of these principles to the mensuration of solids, &c.

## PART I.

### THEORETICAL GEOMETRY

OR, GENERAL PRINCIPLES OF THE  
SECT. I. Of STRAIGHT LINES and FIGURES. See Plates CLXV, CLXVI

#### DEFINITIONS.

1. A POINT is that which has position without magnitude.

2. A LINE is length without breadth; the extremities of a line are therefore points.

3. A RIGHT LINE, or STRAIGHT LINE, is that which lies evenly between its extremities. Fig. 1. Plate CLXV.

4. A SUPERFICIES is that which has length and breadth; the extremities of a superficies therefore lines, and the intersections of a superficies with one another are also lines.

5. A PLANE SUPERFICIES is that in which two points being taken, the straight line which connects them lies wholly in that superficies.

6. A PLANE RECTILINEAL ANGLE is the inclination of two straight lines to one another, meeting together, but are not in the same line. Fig. 2.

Note. When several angles are formed at the same point, as at B, Fig. 3. Each angle is described by three letters, whereof one lies within the angular point, and the other two

GEOMETRY.

form the angle, thus, CBD or DBC denoting the angle contained by the line CB and DB. A straight line standing on another so makes the adjacent angles equal to each other, each of the angles is called a RIGHT ANGLE, and the straight line which stands on the other is called a PERPENDICULAR. *Fig. 4.*

AN OBTUSE ANGLE is that which is greater than a right angle. *Fig. 5.*

AN ACUTE ANGLE is that which is less than a right angle. *Fig. 6.*

PARALLEL STRAIGHT LINES are such as lie in the same plane, and which being produced both ways do not meet. *Fig. 7.*

A FIGURE is that which is enclosed by one or more boundaries.

RECTILINEAL FIGURES are those which are bounded by straight lines.

Every plane figure bounded by three straight lines is called a TRIANGLE, of which the three sides are called the sides, that side upon which the triangle is conceived to stand is called the base, and the opposite angular point the vertex.

AN EQUILATERAL TRIANGLE is that which has three equal sides. *Fig. 8.*

AN ISOSCELES TRIANGLE is that which has two equal sides. *Fig. 9.*

AN OBTUSE ANGLED TRIANGLE is that which has one obtuse angle. *Fig. 10.*

AN ACUTE ANGLED TRIANGLE is that which has three acute angles. *Fig. 11.*

Every plane figure bounded by four straight lines is called a QUADRILATERAL, and the right line which divides the opposite angles is called a diagonal.

A PARALLELOGRAM is a quadrilateral of which the opposite sides are parallel. *Fig. 12.*

A RECTANGLE is a parallelogram which has four right angles. *Fig. 13.*

A SQUARE is a parallelogram which has four equal sides and all its angles right. *Fig. 14.*

A RHOMBUS is a parallelogram which has four equal sides. *Fig. 15.*

A TRAPEZIUM is a quadrilateral which has two opposite sides parallel. *Fig. 16.*

A TRAPEZOID is a quadrilateral which has two opposite sides parallel. *Fig. 17.*

Every figure bounded by more than four sides is called a POLYGON. *Fig. 18.*

A PENTAGON is a polygon of five sides, a HEXAGON hath six sides; a HEPTAGON seven; an OCTAGON eight; a NONAGON nine; a DECAGON ten; an UNDÉCAGON eleven; and a DODECAGON twelve sides.

AN EQUILATERAL POLYGON hath all its sides equal; if they are not equal, it is called an IRREGULAR POLYGON.

A CIRCLE is a plane figure bounded by one line, the circumference, which is such that all the lines drawn to it from a certain point called the centre are equal; and these lines are called the radii of the circle. The circumference itself is also often called a circle. *Fig. 19.*

31. The DIAMETER of a circle is a straight line passing through the centre, and terminated both ways by the circumference.

32. An ARC of a circle is any part of its circumference. *Fig. 20.*

33. A CHORD is a straight line joining the extremities of an arc. *Fig. 21.*

34. A SEGMENT is any part of a circle bounded by an arc and its chord. *Fig. 22.*

35. A SEMICIRCLE is half the circle, or a segment cut off by a diameter. The half circumference is also sometimes called a semicircle. *Fig. 23.*

36. A SECTOR is any part of a circle which is bounded by an arc, and two radii drawn to its circumference. *Fig. 24.*

37. A QUADRANT, or quarter of a circle, is a sector having a quarter of a circle for its arc, and its two radii are perpendicular to each other. A quarter of the circumference is also called a quadrant. *Fig. 25.*

38. The HEIGHT or ALTITUDE of a figure is a perpendicular let fall from an angle or its vertex to the opposite side or base. *Fig. 26.*

39. In a right angled triangle the side opposite the right angle is called the HYPOTHENUSE, and the other two sides are called the LEGS, or sometimes the base and perpendicular. *Fig. 27.*

40. The circumference of every circle is supposed to be divided into 360 equal parts called DEGREES, and each degree into 60 MINUTES, each minute into 60 SECONDS, and so on. Hence a semicircle contains 180 degrees, and a quadrant 90 degrees.

41. The MEASURE of a RECTILINEAL ANGLE is an arc of any circle contained between the two lines which form that angle, the angular point being the centre, and it is estimated by the number of degrees in that arc. *Fig. 28.*

42. IDENTICAL FIGURES are such as have all the sides and all the angles of the one, respectively equal to all the sides and all the angles of the other, each to each, so that if the one figure were applied to, or laid upon the other, all the sides of the one would exactly fall upon and cover all the sides of the other, the two becoming as it were but one and the same figure.

43. The DISTANCE of a POINT from a LINE is the straight line drawn from that point perpendicular to, and terminating in that line.

44. An ANGLE in a SEGMENT of a CIRCLE is that which is contained by two lines drawn from any point in the arc of the segment to the extremities of that arc. *Fig. 29.*

45. An ANGLE on a SEGMENT, or an ARC, is that which is contained by two lines drawn from any point in the opposite, or supplemental part of the circumference, to the extremities of the arc, and containing the arc between them. *Fig. 30.*

46. An ANGLE at the CIRCUMFERENCE is that whose angular point is any where in the circumference, and an angle at the centre is that whose angular point is at the centre. *Fig. 31.*

47. A TANGENT to a CIRCLE is a straight line that meets the circle at one point, and every where else falls without it. *Fig. 32.*

48. A SECANT is a straight line that cuts the circle lying partly within and partly without it. *Fig. 33.*

49. A RIGHT LINED FIGURE is inscribed in a circle, or the circle circumscribes it when all the angular points of the figure are in the circumference of the circle. *Fig. 28.*

50. A RIGHT LINED FIGURE circumscribes a circle, or the circle is inscribed in it when all the sides of the figure touch the circumference of the circle. *Fig. 28.*

51. ONE RIGHT LINE FIGURE is inscribed in another, or the latter circumscribes the former when all the angular points of the former are placed in the sides of the latter. *Fig. 28.*

52. SIMILAR FIGURES are those that have all the angles of the one equal to all the angles of the other, each to each, and the sides about these angles proportional.

53. The PERIMETER of a FIGURE is the sum of all its sides taken together.

Note. When the word *line* occurs, without the addition of either *straight* or *curved*, a straight line is always meant; also the contractions (Def.) (Ax.) (Th.) are references to the definitions, axioms and theorems that have been before mentioned.

#### AXIOMS.

1. Things which are equal to the same thing are equal to one another.

2. When equals are added to equals, the wholes are equal.

3. When equals are taken from equals, the remainders are equal.

4. When equals are added to unequals, the wholes are unequal.

5. When equals are taken from unequals, the remainders are unequal.

6. Things which are doubles of the same thing are equal to one another.

7. Things which are halves of the same thing are equal.

8. The whole is equal to all its parts taken together.

9. Things which coincide, or fill the same space, are identical, or mutually equal in all their parts.

10. All right angles are equal to one another.

11. Angles that have equal measures, or arcs, are equal.

12. More than one straight line cannot be drawn from any given point to another given point. *Fig. 1.*

13. If two points D, F in a right line MN are situated at unequal distances DC, FE from another right line AB in the same plane; those two lines being indefinitely produced on the side of the least distance will meet one another. *Fig. 29.*

REMARKS. A PROPOSITION is something proposed to be done, and is either a Problem or Theorem.

A PROBLEM is something proposed to be done.

A THEOREM is something proposed to be demonstrated.

A LEMMA is something premised or demonstrated, in order to make what follows the more easy.

A COROLLARY is a consequent truth gained immediately from some preceding truth or demonstration.

A SCHOLIUM is a remark or observation made upon something going before.

THEOREM I. *fig. 30.* If two triangles have two

sides and the included angle of the two sides and the included angle of the triangles will be identical, or equal.

In the two triangles ABC, DEF, if the side AB of the one be equal to the side DE of the other, and the side AC equal to DF, also the angle A equal to the angle D, the triangles will be identical, or equal in all respects. For the triangle ABC, to be applied to, or superposed on the triangle DEF, so that the point A coincide with D, and the side AB with DE, then since the angles A and D are equal, the side AC shall also coincide with DF, and the angle C equal to E, and AC is equal to DF; consequently the side BC will coincide with the side EF; (Ax. 12.) therefore the triangles are identical (Ax. 9.) and have their corresponding parts equal.

THEOR. II. *fig. 30.* Triangles whose two sides and the side which lies between them are identical, or have their other sides equal.

Let the two triangles ABC, DEF, have the angle B equal to the angle E, the side BC equal to the side EF, and the side AB equal to DE, then these triangles will be identical.

For conceive the triangle ABC to be applied to, or superposed on the triangle DEF, so that BC may fall exactly upon EF, since the angle B is equal to the angle E, the side BA will fall upon DE, and in like manner the angles C and F, are equal, the side AC will fall upon FD, thus the triangles will coincide and therefore (Ax. 9.) are identical.

THEOR. III. *fig. 31.* In an isosceles triangle the angles at the base are equal.

If the triangle ABC be isosceles, with the side AB equal to a side AC; then will the angle B be equal to the angle at C. For the angle at A to be bisected, or divided into two equal parts by the line AD. The triangles BAD, CAD having two sides an angle of the one equal to two sides and the contained angle of the other, namely AB equal to AC, and AD common to both, BAD equal to the angle CAD, are identical (Th. 1.) therefore the angle B is equal to the angle C.

COROLLARY I. An equilateral triangle is equiangular.

COR. 2. A line that bisects the vertex of an isosceles triangle bisects also the base and is perpendicular to it.

THEOR. IV. *fig. 31.* If a triangle has its angles equal, the sides which subtend opposite to these angles are also equal.

Let ABC be a triangle, of which the angles B and C are equal, the side AB will be equal to the side AC. Suppose BC to be bisected, and AD joined, dividing the triangle into the two triangles BAD, CAD; and the angle ABD to be turned over, so that it may fall upon DC, then the point B will fall upon DC, and since the angles B and C are equal, the sides AB and AC will fall upon CA, and the extremity C will coincide with the extremity C because DC is common to both; consequently the side AC is equal to the side BC.

hence every equiangular triangle is also

V. *fig. 32.* Triangles which have sides mutually equal, are identical, or their three angles equal each to each.

Triangles ABC, ADC have their 3 sides equal, viz. AC equal to AC, AB equal to BC equal to DC, the angles opposite shall be equal, namely BAC to DAC, CA, and ABC to ADC. Suppose the lines AB, DC are not parallel, draw the line BD. Then the angle ABD is equal to ADB, and the angle CBD to the angle CDB (Th. 3.) the whole angle ABC is equal to the whole angle ADC (Ax. 2.) and since AB is equal to BC to DC, the triangles ABC, ADC are equal. (Th. 1.)

VI. *fig. 33.* The angles which one line makes with another upon one side of it are equal to two right angles.

Let the line AB make with CD upon one side angles ABD, ABC, these are together equal to two right angles. If AB be perpendicular to CD, draw BE perpendicular to CD, dividing the greater angle ABC into the angles EBC, EBA, then the former EBC is equal to the angle ABD, and the remaining part EBA is equal to the whole lesser angle ABC equal to two right angles, the whole of both the angles must necessarily be equal to two right angles. (Ax. 2.)

Hence also, conversely, if the two angles ABD, ABC on both sides of line AB make equal to two right angles then CB and BD form one straight line.

All the angles that can be made round a point are equal to two right angles.

VII. *fig. 34.* If two lines intersect each other, the opposite angles are equal. Let the lines AB, CD intersect each other in E, the angle AEB is equal to BED, and AED to BEC; the angles AEC, AED are together equal to two right angles (Th. 6.) and in like manner BED, BEC are together equal to two right angles; therefore the angles AED are together equal to BED, BEC, and taking away the common angle AED, there remains AEC equal to BEC.

VIII. *fig. 35.* Two straight lines perpendicular to one and the same straight line are parallel to each other.

Let CD be perpendicular to EF, the lines AB, CD be parallel. For if they be not parallel, draw the line GH, meeting EF at G, and join FH. The triangles EHF, GHF have the angles FEH, FEH equal to EG and EF common to both, and also the angles FEH, FEH equal in all respects, (Th. 1.) and so the angles EHF, GHF being both right angles, the lines AB, CD must be one straight line; (Th. 6. Cor. 1.), which is impossible, therefore AB and CD are parallel.

IX. *fig. 36.* If two straight lines be perpendicular to the one terminated

by the other, are equal, and are also perpendicular to both the parallels.

Let AB and CD be parallel straight lines, and let EF, GH, perpendiculars to CD one of them at E and C, meet the other at F and H; the lines EF and GH are equal between themselves, and also perpendicular to CD. It is evident that EF and GH are equal, for if they were not equal, AB would not be parallel to CD. (Ax. 13.) The line EF must also be perpendicular to CD, for if it be not, then draw FM perpendicular to FE, meeting GH in M; so shall FM be parallel to AB (Th. 8.) and therefore GM equal to EF, or to GH, which is impossible; therefore EF is perpendicular to CD, and by the same argument GH is perpendicular to CD.

THEOR. X. *fig. 37.* If a line intersect two parallel lines, it makes the alternate angles equal.

Let the line EF intersect the parallel lines AB, CD at G and H, the alternate angles AGH, GHD are equal. Let HK, GL be perpendicular to the parallel lines AB, CD, then the lines HK, GL are also parallel, (Th. 8.) now the triangles HKG, HGL having the side HK equal to GL and KG equal to HL (Th. 9.) also the angles at K and L equal, they being right angles, will have the angles KGH, LHG equal. (Th. 1.)

COR. If a line intersect two parallel lines it makes the exterior angle equal to the interior and opposite on the same side, and also the two interior angles on the same side equal to two right angles. For the interior angle GHD is equal to AGH, that is, (Th. 7.) to the exterior angle EGB, to each of these add BGH, and the two interior angles BGH, GHD are together equal to BGH, EGB, that is to two right angles. (Th. 6.)

THEOR. XI. *fig. 38.* If a line intersecting two other lines makes the alternate angles equal, these lines are parallel.

Let EF intersect the lines AB, CD at G and H, and make the alternate angles AGH, GHD equal, the lines AB, CD are parallel. For if AB or AG be not parallel to CD, suppose KG parallel to CD, then the angle KGH will be equal to GHD, (Th. 10.) that is by hypothesis to AGH which is impossible, (Ax. 8) therefore no other line than AB can be parallel to CD.

COR. If a line intersecting two other lines makes the exterior angle equal to the interior angle on the same side, or the two interior angles on the same side equal to two right angles, these lines are parallel.

THEOR. XII. *fig. 39.* If one side of a triangle be produced, the exterior angle is equal to both the interior and opposite angles, and the three interior angles are equal to two right angles.

Let BC a side of the triangle ABC be produced to D, the exterior angle ACD is equal to the two interior and opposite angles BAC, ABC, and the three interior angles ABC, BAC, BCA are equal to two right angles. Let CE be parallel to AB, then the angle ACE is equal CAB (Th. 10.) and the angle ABC to ECD, (Th. 10. Cor.) therefore the angle ACD is equal to the two angles CAB, ECD, to each of these equals add ACB, thus the angles ACB, ACD are equal to the three angles ABC, CBA, BAC, but ACB, ACD are equal to two

two right angles (Th. 6.) therefore the three angles of the triangle are equal to two right angles.

COR. 1. The exterior angle of a triangle is greater than either of the interior opposite angles.

COR. 2. Any two angles of a triangle are together less than two right angles.

COR. 3. If two triangles have two angles of the one equal to two angles of the other, the remaining angle of the one is equal to the remaining angle of the other.

COR. 4. The two acute angles of a right angled triangle are together equal to a right angle.

THEOR. XIII. *fig. 40.* The greatest side of every triangle subtends the greatest angle.

Let ABC be a triangle of which the side AB is greater than AC, the angle ACB is greater than ABC. Take AD equal to AC and join DC, then the angle ACD is equal to ADC (Th. 3.), but ADC is greater than ABC (Th. 12. Cor. 1.) therefore ACD is greater than ABC, much more then is ACB greater than ABC.

COR. The greatest angle of every triangle is subtended by the greatest side.

THEOR. XIV. *fig. 41.* The opposite sides and opposite angles of a parallelogram are equal, and the diagonal divides the parallelogram into two equal parts.

Let ABC be a parallelogram, AB is equal to CD, and AC to BD, also the angle CAB is equal to CDB, and ACD to ADB, and the triangle ACD is equal to ABD. For since AB is parallel to CD (def. 21.) the angles BAD, CDA are equal (Th. 10.) and since AC is parallel to BD, for the same reason, the angles CAD, BDA are equal, now AD is common to the triangles ABD, ACD therefore these triangles are identical, (Th. 2.) hence AB is equal to CD, AC to BD, the angle ACD to ABD, the angle CAD to ADB, and BAD to ADC, and consequently the whole angle CAB to the whole angle CDB.

THEOR. XV. *fig. 41.* The lines which join the extremities of equal and parallel lines towards the same parts are themselves equal and parallel.

Let AB be equal and parallel to CD, then AC and BD which join their extremities towards the same parts are also equal and parallel. Join AD, then the angles BAD, CDA are equal, (Th. 10.) and since AB is equal to CD and AD common to the triangles ABD, ACD, these triangles are equal in all respects (Th. 1.), therefore AC is equal to BD, and the angle CAD to ADB, hence AC is also parallel to BD. (Th. 11.)

THEOR. XVI. *fig. 42.* Parallelograms standing upon the same base and between the same parallels are equal.

Let ABCD, EBCF be parallelograms standing on the same base BC, and between the same parallels BC, AF, they are equal to one another. For since AD is equal to BC, that is to EF, (Th. 14.) therefore AE is equal to DF, now AB is equal to DC (Th. 14.) and the angle BAE to CDF, (Th. 10. Cor.) therefore the triangles BAE and CDF are equal. (Th. 1.) Now if from the whole figure BAFC there be taken away the angle CDF, there remains the parallelogram ABCD, and if from the same figure there be taken away the equal triangle BAE, there re-

mains the parallelogram EBCF, therefore the parallelograms are equal to one another.

COR. 1. Hence triangles standing on the same base and between the same parallels are equal to one another.

For let BAC, BEC be two triangles on the same base BC and between the same parallels BC, AF, it is evident that they are the parallelograms BADC, BEFC, and equal.

COR. 2. Hence if a triangle and a parallelogram stand on the same base, the triangle is equal to one half of the parallelogram.

COR. 3. Therefore all parallelograms on the same base and between the same parallels are equal among themselves.

THEOR. XVII. *fig. 43.* The complement of a parallelogram are equal.

Let BD the diagonal of a parallelogram be drawn, and let HK, EG parallels be drawn, intersecting each other at F a point in the diagonal, the whole parallelogram is thus divided into four parallelograms; two of these, viz. EK and FK are called the complements, and are proved equal. The whole triangle BDC is equal to the whole triangle DAB, (Th. 12.) for the same reason the parts DEF, FGD are respectively equal to the parts DKF, FGB, therefore the remaining parts HE, CK, are equal.

THEOR. XVIII. *fig. 44.* In a right angled triangle the square of the hypotenuse is equal to the sum of the squares upon the other two sides.

Let AD be a square upon the hypotenuse of a right angled triangle ABC and BG, a square upon its side AB, AD is equal to the sum of the squares BI, BH. Let MBH be parallel to AE produced in H, and let EA, produce in N. If from the equal angles CAB, MBH, common to both, be taken, there remains NAG, equal to BAC, and the side AN is equal to AB, and the side AG is equal to AC, and the angle NAG is equal to BAC, and the side AN is equal to AB, and therefore the parallelograms AM, AN are equal (Th. 16. Cor. 3.) but AH is equal to BG (Th. 16.) therefore AM is equal to BG, in the same way it will appear that the square BI is equal to the square BH, therefore the whole AD is equal to the sum of the squares BI, BH.

THEOR. XIX. *fig. 45.* A perpendicular from the centre of a circle to a chord bisects the chord.

Let CD be drawn from the centre C perpendicular to AB a chord in the circle, AD, DB. Join CA, CB. Because AC is equal to BC (def. 3.) the angles CAB, CBA are equal, now ADC, BDC are equal, being in the same straight line, therefore the angles ACD, BCD are equal, (Th. 12. Cor. 3.) therefore the triangles ADC, BDC are in all respects equal, (Th. 1.) and consequently AD equal to DB.

COR. A perpendicular bisecting at right angles passes through the centre of a circle.

THEOR. XX. *fig. 46.* A straight line drawn through any point in the circum-

right angles to the radius terminating in it, is a tangent to the circle.  
 If a line be perpendicular to the radius AC, the line is a tangent to the circle at the point A.  
 If any line from the centre cutting the circle, and the line AB at E. Because CAE is a right angle, CEA is less than a right angle, therefore CE is greater than CA, or, (Th. 13.) therefore the point E is without the circle, and the same may be shewn of every other point in AB, except A, therefore AB is a tangent to the circle. (def. 47.)  
 If a line be perpendicular to a tangent at the point of contact, that line passes through the

XXI. fig. 47. An angle at the centre is double the angle at the circumference subtends upon the same arch.  
 Let B be the angle at the centre of a circle and angle at the circumference, the angle subtended is double ADB. Join DC which produces to angle ACE is equal to both the angles CAD, (Th. 12.) that is, since CD and AD are equal to twice CAD; (Th. 4.) in like manner will appear that BCE is equal to twice the angle at the circumference therefore the whole angle ACB is double

All angles in the same segment of a circle are equal to each other.

In the same circle, or in circles of equal radii, if two angles at the circumference subtend equal arches, they are equal to one another and conversely.

XXII. fig. 48. An angle in a semicircle is a right angle.

Let B be an angle in a semicircle, draw the diameter CDE. The angle ACE at the circumference is half of ADE at the centre, and in like manner CE is half of BDE; (Th. 21.) therefore angle ACB is half the sum of the angles ADE, EDB, or is equal to a right angle.

XXIII. fig. 49. The sum of any two opposite angles of a quadrilateral inscribed in a circle is equal to two right angles.

Let ABCD be a quadrilateral inscribed in a circle, the angles A and C, also the sum of ADC, ABC, are equal to two right angles. Join AC, BD. The angle BAC is equal to BDC, also the angle DAC is equal to DBC (Th. 21. cor. 1.), therefore angle DAB is equal to the two angles BDC and DBC; and the sum of DAB and DCB is equal to three angles BDC, DBC and DCB, that is, equal to two right angles. (Th. 12.)

XXIV. fig. 50. The angle formed by a tangent and a chord drawn to the point of contact, is equal to the angle in the alternate segment of the circle.

Let AB be a tangent, and AC a chord, the angle BAC is equal to any angle CEA in the alternate segment. Draw AF perpendicular to AB, and join EF; thus AF is a diameter of the circle (Th. 20 Cor.) and angle AEF is a right angle (Th. 21.), and therefore angle FAC, but FEC, FAC, parts of these angles are equal, therefore the remainders CEA, AEF are equal.

PART I.

SECT. II. Of RATIOS and PROPORTIONS.

In treating of proportion, the Algebraic notation is here adopted for the sake of brevity; it will therefore be proper to observe,

1. That the letters A, B, &c. are used to denote quantities of any kind, and the letters m, p, q, &c. to denote numbers only.

2. The sign + (plus) written between the symbols of two quantities or numbers, signifies the sum of those quantities or numbers. Thus A + B means the sum of the quantities denoted by A and B, &c.

3. The sign - (minus) written between the symbols of two quantities, signifies the difference of these quantities. Thus A - B means the difference between A and B.

4. When a letter denoting a number is written close to a letter denoting any quantity, it signifies that the quantity is multiplied by the number, thus mA means m times A, also qmB means that B is multiplied by the product of the numbers q and m.

5. The quotient arising from the division of any quantity A by another quantity B is written thus  $\frac{A}{B}$ .

6. The sign = signifies the equality of quantities denoted by the letters that stand on the opposite sides of it. Thus  $\frac{mA}{mB} = \frac{A}{B}$  denotes that the quotient arising from the division of m times A by m times B is the same as the quotient arising from the division of A by B.

7. It is likewise supposed that the following principle in the arithmetic of fractional quantities is already known, namely, that if both the numerator and denominator of a given fraction be divided by the same number, the resulting quotients are the numerator and denominator of a fraction of the same value as the given one. It is upon this principle that the fractional quantity  $\frac{mA}{mB}$  is concluded to

be equal to  $\frac{A}{B}$ , viz. by dividing both numerator and denominator by m, and so of other quantities.

DEFINITIONS.

54. When one quantity contains another a certain number of times exactly, the former is said to be a MULTIPLE of the latter, and the latter a PART of the former; thus 20 is a multiple of 5, and 5 a part of 20; and in general, m being any number, and A any quantity, mA is a multiple of A, and A a part of mA.

55. When several quantities are multiples of as many others, and each contains its part the same number of times, the former are said to be EQUI-MULTIPLES of the latter, and the latter LIKE PARTS of the former; thus 20 and 30 are equimultiples of 2 and 3, and in general mA and mB are equi-multiples of A and B; also, A and B are like parts of mA and mB.

56. RATIO is the proportion which one magnitude bears to another.

Y y

tude

tude bears to another magnitude of the same kind, with respect to quantity.

NOTE. The measure, or quantity of a ratio, is conceived by considering what part or parts the leading quantity called the antecedent is of the other called the consequent. So the ratio of a quantity expressed by the number 2 to a like quantity expressed by the number 6 is denoted by 6 divided by 2, or  $\frac{6}{2}$  or 3; the number 2 being 3 times contained in 6, or the third of it, and in general the measure of the ratio of A to B is expressed by the quotient of B divided by A, or the fraction  $\frac{B}{A}$ .

57. PROPORTION is an equality of ratios, and three quantities are said to be PROPORTIONAL when the ratio of the first to the second is equal to the ratio of the second to the third. As of the three quantities A (2), B (4), C (8); where  $\frac{4}{2} = \frac{8}{4} = 2$ , the same ratio.

58. Four quantities are said to be PROPORTIONAL when the ratio of the first to the second is the same as the ratio of the third to the fourth. As of the four quantities A (2), B (4), C (5), D (10); where  $\frac{4}{2} = \frac{10}{5} = 2$ , the common ratio.

NOTE. To denote that four quantities A, B, C, D, are proportional, they are usually placed thus A : B :: C : D, and read thus, As A is to B, so is C to D; but when three quantities are proportional, the middle one is repeated, and they are written thus, A : B :: B : C.

59. Of three proportional quantities, the middle one is said to be a MEAN PROPORTIONAL between the other two, and the last a THIRD PROPORTIONAL to the first and second.

60. Of four proportional quantities, the last is said to be a FOURTH PROPORTIONAL to the other three taken in order.

61. Quantities are said to be CONTINUALLY proportional, or in CONTINUED proportion, when the ratio is the same between every two adjoining terms, thus, 1, 2, 4, 8, 16, &c. are in continued proportion.

62. In a series of quantities continually proportional, the ratio of the first and third is said to be DUPLICATE to that of the first and second; and the ratio of the first and fourth is said to be TRIPPLICATE to that of the first and second, and so on.

63. INVERSE ratio is, when the antecedent is made the consequent, and the consequent the antecedent; thus, if 1 : 2 :: 3 : 6; then, inversely 2 : 1 :: 6 : 3.

64. ALTERNATE proportion is, when antecedent is compared with antecedent, and consequent with consequent, as if 1 : 2 :: 3 : 6; then by alternation or permutation 1 : 3 :: 2 : 6.

65. COMPOUNDED ratio is, when the sum of the antecedent and consequent is compared, either with the antecedent or consequent, thus, if 1 : 2 :: 3 : 6; then by composition 1 + 2 : 1 :: 3 + 6 : 3, and 1 + 2 : 2 :: 3 + 6 : 6.

66. DIVIDED ratio is, when the difference of the antecedent and consequent is compared either with the antecedent or consequent, thus, if 1 : 2 :: 3 : 6; then by division 2 - 1 : 1 :: 6 - 3 : 3; 1 : 2 :: 6 - 3 : 6.

THEOR. XXV. Equimultiples of any two quantities have the same ratio as the quantities them-

selves. Let A and B be any two quantities, mA, mB any equimultiples of them, number whatever; then will mA have the same ratio as A and B, or A : B :

For  $\frac{mB}{mA} = \frac{B}{A}$ , the same ratio.

COR. Hence, like parts of quantities have the same ratio as the wholes, because the equimultiples of the like parts, or like parts of mA and mB.

THEOR. XXVI. If four quantities of the same kind are proportional, they will be also by alternation or permutation, and the antecedents will have the same ratio as the consequents.

Let A : B :: mA : mB, then will A :

For  $\frac{mA}{A} = m$  and  $\frac{mB}{B} = m$ , both the same ratio.

THEOR. XXVII. If four quantities of the same kind are proportional, they will be proportional also or inversely.

Let A : B :: mA : mB, then will B :

For  $\frac{mA}{mB} = \frac{A}{B}$ , both the same ratio.

THEOR. XXVIII. If four quantities of the same kind are proportional, they will also be proportional, and by division.

Let A : B :: mA : mB.

Then will B + A : A :: mB + mA :

or, B + A : B :: mB + mA :

For  $\frac{mA}{mB + mA} = \frac{A}{B + A}$  &  $\frac{mB}{mB + mA}$

In like manner it will appear, that

B - A : A :: mB - mA : mA,

or, B - A : B :: mB - mA : mB.

For  $\frac{mA}{mB - mA} = \frac{A}{B - A}$  &  $\frac{mB}{mB - mA}$

THEOR. XXIX. If, of four quantities there be taken any equimultiples of the two antecedents, and any whatever of the two consequents, the resulting will still be proportional.

Let A : B :: mA : mB, also let pA

any equimultiples, of the two antecedents, then will pA : qB :: pmA : qmB.

For  $\frac{qmB}{pmA} = \frac{qB}{pA}$ , the same ratio.

THEOR. XXX. If there be four quantities, and the two consequents be multiplied or diminished, by quantities having the same ratio as the respective antecedents and the antecedents will still be proportional.

Let A : B :: mA : mB, and nA :

two quantities having the same ratio as the antecedents; then will

A : B + nA :: mA :: mB + nA

Also A : B - nA :: mA :: mB - nA

For  $\frac{mB + nA}{mA} = \frac{B + nA}{A}$ , the same ratio.

THEOR. XXXI. If any number of quantities be proportional, either of the antecedents or consequents, as the sum of all the antecedents will have the same ratio as the sum of all the consequents.

# G E O M E T R Y.

...ponding angles equal. Take DH equal to AC and DG equal to AB. Then  $DG : DH :: DE : DF$ , therefore GH is parallel to EF (Th. 36, Cor. 2); hence the triangles DGH, DEF are equiangular (Th. 10.); wherefore  $DG : GH :: DE : EF$  (Th. 38.);  $AB : BC$  (by hyp.); since therefore  $DG : GH :: AB : BC$ , and that DG is equal to AB, therefore GH is equal to BC. Thus the triangles DGH, ABC, having the three sides of the one respectively equal to the three sides of the other, are equiangular (Th. 5.) therefore also the triangles ABC, DEF are equiangular.

**THEOR. XL. fig. 55.** Triangles which have one angle in the one equal to one angle in the other, and the sides about these angles proportional, are equiangular.

Let ABC, DEF be two triangles having the angles A and D equal, and  $AB : AC :: DE : DF$ ; these triangles shall be equiangular. Make DG equal to AB, and DH to AC, and join GH: thus the triangles ABC, DGH are identical and equiangular (Th. 1.); therefore  $HD : DG :: CA : AB :: FD : DE$  (by hyp.); therefore HG is parallel to FE, (Th. 36. Cor. 2.) and the triangles HDG, FDE, also CAB, FDE are equiangular.

**THEOR. XLI. fig. 56.** If four lines are proportional, the rectangle of the extremes will be equal to the rectangle of the means; and if the rectangle of the extremes be equal to the rectangle of the means, the four lines are proportional.

Let the four lines A, B, C, D be proportional, or  $A : B :: C : D$ , then will the rectangle of A and D be equal to the rectangle of B and C. Let the four lines be placed with their extremities meeting at a common point, and forming four right angles; and draw lines parallel to them to complete the rectangles P, Q, R; where P is the rectangle of A, and D, Q the rectangle of B and C, and R the rectangle of B and D. Then the rectangles P and R will be to each other as A and B (Th. 35.) and in like manner the rectangles Q and R will be to each other as C and D; but the ratio of A to B is the same as the ratio of C to D; therefore the ratio of P to R is the same as the ratio of Q to R, and consequently P and Q are equal.

Again, if the rectangle of A and D be equal to the rectangle of B and C,  $A : B :: C : D$ . For the rectangles being placed as before, it is evident that P and Q have each the same ratio to R; but P is to R as A to B, and Q to R as C to D, therefore  $A : B :: C : D$ .

**COR.** If three lines are proportional, the rectangle of the extremes is equal to the square of the mean: and if the rectangle of the extremes be equal to the square of the mean, the three lines are proportional.

**THEOR. XLII. fig. 57 and 58.** If two lines meeting a circle cut each other, either within it, or without, the rectangle of the parts of the one will be equal to the rectangle of the parts of the other; the parts of each being measured from the point of meeting to the two intersections with the circumference.

Let the two chords, AB, CD, meet each other in E, the rectangle of AE, EB is equal to the rectangle of CE, ED. Join AD, and CB. The angles AED, CEB are equiangular, for the angles at D and B are equal (Th. 21. Cor. 1.), and

the angles AED, CEB are opposite (fig. therefore equal (Th. 7.); or the angle common to both triangles (fig. 58.), in both triangles are equiangular; therefore  $DE : EB :: EC : ED$  (Th. 38.); hence the rectangle EC is equal to the rectangle of AE, EB.

**COR.** If the line BAE, (fig. 58.) be by revolving to come into the position tangent AE (fig. 59), the distances BE, AE have become equal. Hence we have the **LEM.** If from a point without a circle be drawn, one touching it, and the other it, the rectangle of the distances of it from the intersections of the cutting tangent, is equal to the square of the tangent.

**THEOR. XLIII. fig. 60.** In a right angle, a perpendicular from the right angle is a mean proportional between the segments of the hypotenuse; and each of the sides about the angle is a mean proportional between the segment, and the hypotenuse.

Let ABC be a right angled triangle, perpendicular upon the hypotenuse;  $AD : DC :: DC : DB$ , and  $AB : AC :: AD$ , and  $AB : BC :: BC : BD$ .

For the triangles ACB, ADC having angles at C and D equal, and the angle common, have their third angles equal, and equiangular; and in like manner it will be the triangles ACB, CDB are equiangular; these three triangles ACB, ADC, CDB equiangular, will have the sides about angles proportional; thus we get  $AD : DC :: DC : DB$ , and  $AB : AC :: AC : AD$ ,  $BC : : BC : BD$ . (Th. 38.)

**THEOR. XLIV. fig. 61.** Equiangular triangles are to each other as the squares of their like sides.

Let ABC, DEF, be two equiangular triangles AB and DE being their homologous or AL DN squares on these sides. The triangle ABC is to the triangle DEF as the square AL to the square DN. Draw GG and FH parallel to AB and DE, and join BK and FL; triangles ACG, DFH are equiangular (Cor. 3.); therefore  $AC : DF :: CG : FH$  but the triangles ABC, DEF being equiangular we have  $AC : DF :: AB : DE$ ; therefore by equality of ratios, we have  $CG : FH :: AB : DE$ , and by alternation,  $CG : AB :: FH : DE$ . Now  $CG : AB ::$  triangle ABC : triangle DEF (Th. 35, Cor.); and in like manner  $FH : DE ::$  triangle DEF : triangle DME, therefore triangle ABC : triangle DEF :: triangle DEF : triangle DME, therefore triangle ABC : triangle DEF :: triangle ABC : triangle DME, and by alternation triangle ABC : triangle DEF :: triangle ABC : triangle DME. Therefore the triangle ABC is to the triangle DEF as the square AL to the square DN.

**THEOR. XLV, fig. 62.** Similar rectilinear figures are to each other as the squares of their like sides.

Let ABCDE, FGHIK be two similar figures the like sides being AB and FG, BC and HI, &c.; the figure ABCDE will be to the figure FGHIK as the square of AB to the square of FG. Join BE, BD, GK, GI. Because the angles at E and F are equal, and BA : AE :: GF : FG, triangles BAE, GFK are equiangular

# G E O M

EB : FK : KG, but AE : ED :: FK  
 (p.), therefore BE : ED :: GK : KI.  
 Angles AED, FKI are equal, and the an-  
 gles FKG have been proved equal; there-  
 fore BED, GKI are equal; thus the  
 ED, GKI are also equiangular, and in  
 ay it may be shown that the triangles  
 are equiangular. The triangle ABE  
 as the square of BE to the square of  
 s, as the triangle EBD to the triangle  
 14.), and in like manner it will appear,  
 s to KGI as DBC to IGH: Therefore  
 figure ABCDE is to the figure FGHK,  
 gle ABE to the triangle FGK (Th. 37.);  
 the square of AB to the square of FG

From this proposition it may be  
 ed, that circles are to one another as  
 of their diameters. And in general,  
 ilar plane figures whatever, are to one  
 the squares of their like parts.  
 BCDEF, GHKLMN, (fig. 63.) be any  
 polygons, of the same number of sides,  
 circles whose diameters are AD, GL.  
 FO to the centre of the one polygon,  
 NP to the centre of the other. The  
 F, GPN, standing each upon the same  
 whole circumference, are evidently e-  
 consequently the isosceles triangles, AOF,  
 imilar: Thus it appears that each of the  
 made up of the same number of simi-  
 s; therefore the polygon, ABCDEF, is  
 gon, GHKLMN, as the triangle AOF  
 gle GPN; that is, as the square of AO  
 re of GP, or as the square of the dia-  
 to the square of the diameter GL. Now  
 e the number of the sides of the polygon,  
 s, that their proportion to each other will  
 ; namely, that of the squares of the dia-  
 their circumscribing circles. By suppo-  
 mber of the sides of the polygons con-  
 creased, it is evident that their areas will  
 more and more to the areas of their cir-  
 circles, which may be considered as  
 ; for it may be demonstrated, that a  
 ay have its sides so numerous as to dif-  
 re area of its circumscribing circle by  
 y assignable quantity. Hence we may  
 that the area of the circles themselves  
 h other the same proportion as their in-  
 polygons; namely that of the squares of  
 ra.

## . III. Of PLANES and SOLIDS.

### DEFINITIONS.

**COMMON SECTION** of two planes, is  
 which they meet, or cut each other.  
**PERPENDICULAR** to a  
 straight line is **PERPENDICULAR** to a  
 n it is perpendicular to every line which  
 that plane.  
**PERPENDICULAR** to another,  
 right line in the one, which is perpen-  
 their line of common section, is perpen-  
 the other.  
**INCLINATION** of one plane to another,  
 le they form between them, is the angle  
 by two right lines, drawn from any

# E T R Y.

357.

point in the common section, and at right angles  
 to the same, one of these lines in each plane.

71. **PARALLEL PLANES** are such as being pro-  
 duced ever so far both ways, will never meet; or  
 which are every where at an equal perpendicular  
 distance.

72. A **SOLID** is that which has length, breadth,  
 and thickness.

73. A **PRISM** is a solid whose ends are parallel,  
 equal, and like plane figures; and its sides con-  
 necting those ends, are parallelograms. Fig. 64.

74. A **PARALLELOPIPED**, or **PARALLELOPIPE-  
 DON**, is a solid bound by six parallelograms, every  
 opposite two of which are equal, alike, and paral-  
 lel. If the bounding planes are rectangles, it is a  
**RECTANGULAR PARALLELOPIPEDON**. Fig. 65.

75. A **CUBE** is a rectangular parallelopipe-  
 don, whose six bounding sides are squares. Fig. 66.

76. A **CYLINDER** is a solid, conceived to be ge-  
 nerated by the revolution of a rectangle about one  
 of its sides, supposed to be at rest. The fixed line,  
 about which it revolves, is called its **AXIS**. Fig. 67.

77. A **PYRAMID** is a solid, whose base is any  
 right-lined figure, and its sides triangles, having  
 all their vertices meeting at a point above the base,  
 called the **VERTEX** of the pyramid. Fig. 68.

77. A **CONE** is a solid, conceived to be genera-  
 ted by the revolution of a right angled triangle a-  
 bout its perpendicular, which fixed line is called  
 the **AXIS** of the cone. Fig. 69.

78. A **SPHERE** is a solid described by the revo-  
 lution of a semicircle about its diameter; the fixed  
 line, about which it revolves, is called the **AXIS**  
 of the sphere. Fig. 114.

**THEOR. XLVI, fig. 70.** A **PERPENDICULAR** is  
 the shortest line that can be drawn from any point  
 to a plane.

Let AB be perpendicular to the plane DE, then  
 any other line, as AC, drawn from the same point  
 A to the plane, will be longer than AB. Join BC;  
 then ABC is a right angle, hence BAC is less than  
 a right angle, and consequently BA less than BC.  
 (Th. 13.)

**COR.** A perpendicular measures the distance of  
 any point from a plane.

**THEOR. XLVII, fig. 71.** The common section  
 of two planes is a straight line.

Let ACBDA, AEBFA, be two planes cutting  
 each other, and A, B two points in which the two  
 planes meet; the straight line joining these points  
 will be the common intersection of the planes.  
 For, because the straight line AB touches both  
 planes at the points A, B, it touches them in all  
 other points (Def. 5.); this line is therefore com-  
 mon to both planes, that is, their common inter-  
 section is a straight line.

**THEOR. XLVIII, fig. 72.** If a straight line be  
 perpendicular to two other straight lines, at their  
 common intersection, it will be perpendicular to  
 the plane of those straight lines.

Let the line AB make right angles with the lines  
 AC, AD, it will be perpendicular to the plane  
 CDE, which passes through these lines. For, if  
 the line AB were not perpendicular to the plane  
 CDE, another plane might pass through the  
 point A, to which AB would be perpendicular;  
 but this is impossible, for since the angles BAC,  
 BAD,

BAD,

$\angle B A D$ , are right angles, this other plane must pass through the points  $C, D$ . Hence this plane passing through the points  $A, C$  of the line  $AC$ , and also through the points  $A, D$  of the line  $AD$ , it will pass through both these lines, and therefore be the same plane with the former.

**COR.** If a straight line stand at right angles to each of three straight lines at the same point, these three lines are in one plane.

**THEOR. XLIX. fig. 73.** If two straight lines be perpendicular to the same plane, they will be parallel to each other.

Let  $AB$  and  $CD$  be both perpendicular to the plane  $EF$ ; these lines are parallel. Join the points  $B$  and  $D$ , and draw  $DG$  perpendicular to  $BD$ , in the plane  $EF$ ; make  $DG$  equal to  $BA$ , and join  $AD, AG$ . The triangles  $B D G, D B A$ , have the sides  $DG, BA$ , equal, and  $BD$  common to both; the angles  $B D G, D B A$  are also equal, being right angles; therefore these triangles are identical, (Th. 1.) hence  $BG$  is equal to  $AD$ , and the triangles  $ABG, GDA$  have two sides  $AB, BG$  of the one, equal to two sides  $GD, DA$  of the other, each to each, and the side  $AG$  common to both; therefore these also are identical (Th. 5.) hence the angle  $ADG$  is equal to  $BDG$ , that is to a right angle. Hence it appears that  $DG$  is perpendicular to the lines  $BD, AD$ ; and it is also perpendicular to  $DC$ ; (Def. 68.) Therefore the lines  $BD, DA, DC$  are in the same plane. (Th. 48, Cor.) Since it thus appears that  $AB, CD$ , lines in the same plane, are both perpendicular to a third line  $BD$ , the lines  $AB, CD$  are parallel. (Th. 8.)

**COR.** If two lines be parallel, and one of them perpendicular to any plane, the other will also be perpendicular to the same plane.

**THEOR. L. fig. 74.** If two planes cut each other at right angles, and a straight line be drawn in one of the planes, perpendicular to their common intersection, it will be perpendicular to the other plane.

Let the planes  $ACBD, AEBF$ , cut each other at right angles, and the line  $CG$  be perpendicular to their common section  $AB$ ; then will  $CG$  be perpendicular to the plane  $AEBF$ . For, let  $EG$  be perpendicular to  $AB$ , thus the angle  $CGE$  is the angle of inclination of the planes (Def. 79.), and is therefore a right angle; since therefore the line  $CG$  is perpendicular to the two lines  $AG, GE$ , it is perpendicular to the plane  $AEBF$ , in which these lines are drawn. (Th. 48.)

**THEOR. LI. fig. 75.** Planes, which are perpendicular to the same straight line, are parallel to one another.

Let the planes  $EF, GH$ , be perpendicular to the same line  $AB$ ; these planes are parallel. For, draw any straight line  $CD$  parallel to  $AB$ , meeting the planes in  $C$  and  $D$ , join  $AC, BD$ . Then  $CD$  as well as  $AB$  is perpendicular to both planes (Th. 49. Cor.); thus  $ABCD$  will be a rectangle, and consequently  $AB$  equal to  $CD$ , and in the same way it may be shewn, that all other perpendiculars terminated by both planes are equal; therefore the planes are parallel. (Def. 71.)

**COR.** Hence straight lines perpendicular to one of two parallel planes are also perpendicular to the other plane.

**THEOR. LII. fig. 76.** If two straight lines be parallel to each other, and a third line be drawn parallel to a third line, though not in the same plane with it, they will be parallel to each other.

Let  $AB, CD$ , be each parallel to the line  $EF$ , though not in the same plane with it; shall be parallel to  $CD$ . For, let  $GH$  be perpendicular to  $EF$ , in the planes  $AF, CE$ , the parallels; then shall  $GF$  be perpendicular to the plane passing by  $HGI$  (Th. 48.); and will also be perpendicular to the same plane (Th. 49. Cor.), and therefore parallel. (Th. 49.)

**THEOR. LIII. fig. 77.** If two lines that are parallel to two other lines, and each other, tho' not in the same plane, the angles contained by these lines will be equal.

Let the lines  $AB, AC$ , be parallel to the lines  $DE, DF$ , then will the angles  $BAC, EDF$  be equal. For, take  $AB, AC, DE, DF$ , equal, and join  $EB, FC, BC, EF$ . Then the triangles  $DE, EF$ , being equal and parallel, the line  $DE$  will also be equal and parallel, (Th. 15.) the same reason  $AD, CF$ , are equal and parallel, therefore  $CF$  is parallel to  $BE$ , (Th. 51.) equal to it; hence  $BC$  is equal to  $EF$ . The triangles  $ABC, DEF$ , are in all respects equal; and therefore the angles  $B, E$  are equal.

**THEOR. LIV. fig. 78.** The sections of a plane cutting two parallel planes are parallel to each other.

Let the parallel planes  $AB, CD$ , be cut by the plane  $EPHG$ , in the lines  $EF, GH$ . These lines are parallel. For, suppose  $EG, FH$ , to be parallel to each other in the plane  $EF$ ; let  $EI, FK$ , be perpendicular to the line  $EG$ , and let  $IG, KH$ , be joined: Then  $EG, KH$ , are parallel, and  $EI, FK$ , being both perpendicular to the plane  $CD$ , are also parallel to each other. (Th. 49.) therefore the angle  $IFK$  is equal to the angle  $GEI$  (Th. 53.); but the angles  $I, E$  are equal, being right angles; therefore the triangles  $FKH, EIG$ , are equiangular, (Th. 1.) and the sides  $FK, EI$ , being equal, it follows, that the sides  $FH, EG$ , are equal (Th. 2.); but these two lines are parallel as well as equal; therefore also  $EF$  and  $GH$  join their extremities are parallel. (Th. 16.)

We have now given the most material demonstrations, with their demonstrations, of the most important parts of geometry, as far as relates to PLANE and to the positions and intersections of planes. As to what relates to SOLID geometry, such as the proportion of similar Solids, the proportion of Pyramids to Prisms, the Cone to the Cylinder, and of the Sphere to the Cylinder, &c.; it can hardly be expected that we can find room for the work as ours, we can find room for the parts of geometry in so diffuse and rigid as they are treated of in books professing upon the subject. We shall therefore proceed to such as wish to acquire the true geometrical reasoning, as are contained in the works of Euclid and Archimedes; particularly on his sphere and cylinder, and on spheroids. In the 11th and 12th books and in Archimedes's works, we may find that very refined mode of geometrical

*Method of Exhaustions*, applied to describe relations which solids bear to each other bounded by plane or curve surfaces. *Remarks* however, relating to the mensuration of bodies, may be more concisely, and rigidly investigated by the methods of *analysis*. See *FLUXIONS*. What has already demonstrated in this treatise will be found for connecting GEOMETRY with ALGEBRA, SECTION, PERSPECTIVE, NAVIGATION, TRIGONOMETRY, PLANE and SPHERICAL, the different branches of mixed MATHEMATICS, such as OPTICS, &c. all which are treatises of sciences, in their order, in this *Ve* shall, therefore, in the second part, PRACTICAL GEOMETRY, concisely state the rules by which geometry is to be applied to a few easy but useful geometrical problems to the mensuration of all the figures, superficial or solid, that commonly occur in ordinary affairs of life.

PART II.

PRACTICAL GEOMETRY,

APPLICATION OF THE PRINCIPLES.

BOOK I. GEOMETRICAL PROBLEMS.

LEM I. *fig. 79.* To divide a given line AB into equal parts.—1. From the points A and B, with any distance greater than half the line, describe arcs cutting each other in *m* and *n*. 2. Through these points draw the line *mn*, and it will cut AB, where it cuts AB, will be the middle point required.

II. *fig. 80.* To divide a given angle ABC into equal parts.—1. From the point B, with any radius, describe the arc AC. 2. And from the same, or any other radius, describe arcs cutting each other in *n*. 3. Through the point *n*, draw *nB*, and it will bisect the angle ABC, as required.

III. *fig. 81, 82.* From a given point C, to draw a straight line AB, to erect a perpendicular. I. When the point is near the middle of the line. *Fig. 81.*—1. On each side of the point C, take two equal distances *Cn*, *Cm*. 2. From the points *n* and *m*, with any radius greater than *Cn* or *Cm*, describe arcs cutting each other in *s*. 3. Through the point *s*, draw the line *sC*, and it will be the perpendicular required.

II. When the point is at or near the end of the line. *Fig. 82.*—1. Take any point *o*, and from it, with any radius or distance *oC*, describe the arc cutting the line AB in *n*. 2. From the point *n*, draw the line *nC*, and it will be the perpendicular required.

III. *fig. 83, 84.* From a given point C, to draw a straight line AB, to let fall a perpendicular. I. When the point is nearly opposite to the end of the line. *Fig. 83.*—1. From the point C, with any radius, describe the arc *mn*, cutting the line AB in *n* and *m*. 2. From the points *n* and *m*, with the same or any other radius, describe two arcs cutting each other in *s*. 3. Through the point *s*, draw the line *sC*, and *CG* will be the perpendicular required.

CASE II. When the point is nearly opposite to the end of the line. *Fig. 84.*—1. To any point *m* in the line AB draw the line *Cm*. 2. Bisect the line *Cm*, or divide it into two equal parts, in the point *n*. 3. From *n*, with the radius *nm*, or *nG*, describe the arc *CG*, cutting AB in *G*. 4. Through the point C, draw the line *CG*, and it will be the perpendicular required.

PROB. V. *fig. 85.* At a given point D, to make an angle equal to a given angle, ABC.—1. From the point B with any radius describe the arc *nm*, cutting the legs BA, BC, in the points *m*, *n*. 2. Draw the line *DE*, and from the point D, with the same radius as before, describe the arc *rs*. 3. Take the distance *mn* on the former arc, and apply it to the arc *rs*, from *r* to *s*. 4. Through the points *Ds* draw the line *DF*, and the angle EDF will be equal to the angle ABC, as was required.

PROB. VI. To draw a line parallel to a given line AB. *Fig. 86, 87.*

CASE I. When the parallel line is to pass through a given point C. *Fig. 86.*—1. To AB from the point C, draw any straight line *Cm*. 2. From the point *m*, with the radius *mC*, describe the arc *Cn*, cutting AB in *n*. 3. And with the same radius, from the point C, describe the arc *mr*. 4. Take the distance *Cn*, and apply it to the arc *mr* from *m* to *r*. 5. Through the points *Cr*, draw the line *CG*, and it will be parallel to AB, as required.

CASE II. When the parallel line is to be at a given distance from AB. *Fig. 87.*—1. From any two points *r*, *s*, in the line AB, with a radius equal to the given distance, describe the arcs *n*, *m*. 2. Draw the line *DG*, to touch those arcs without cutting them, and it will be parallel to AB, as was required. *N.B.* The former case of this problem, as well as several other operations of practical geometry, may be more easily effected by a mathematical instrument known by the name of a *parallel ruler*.

PROB. VII. *fig. 88.* To divide a given line AB, into any proposed number of equal parts.—1. From one end of the line A, draw *Am*, making any angle with AB; and from B the other end, draw *Bn*, making an equal angle *ABn*. 2. In each of the lines *Am*, *Bn*, beginning at A and B, set off as many equal parts, of any length, as AB is to be divided into. 3. Join the parts *A5*, *14*, *23*, &c. and AB will be divided as required. *Note.* *Bn* may be drawn parallel to *Am* by means of a parallel ruler.

PROB. VIII. *fig. 89.* To find the centre of a given circle, or one already described.—1. Draw any chord AB, and bisect it with the perpendicular *CD*. 2. Bisect *CD* in like manner with the chord *EF*, and their intersection O will be the centre required. *Note.* The centre of a given circle, or any arch of it, may be found as in the next problem by taking three points in the circumference.

PROB. IX. *fig. 90.* To describe the circumference of a circle thro' three given points A, B, C.—1. From the middle point draw the lines or chords, BA and BC. 2. Bisect these chords perpendicularly with lines meeting each other in O. 3. From the point of intersection O, with the distance

distance

# G E O M E T R Y.

OA, OB, or OC describe the circle ABC, and it will be that required.

PROB. X. *fig. 91, 92.* To draw a tangent to a given circle that shall pass thro' a given point A.

CASE I. When the point A is in the circumference of the circle. *Fig. 91.*—1. From the given point A, to the centre of the circle, draw the radius OA. 2. Through the point A draw CD perpendicular to OA, and it will be the tangent required.

CASE II. When the point A is without the circle. *Fig. 92.*—1. To the point A from the centre O draw the line OA and bisect it in *n*. 2. From the point *n* with the radius *nA* or *nO* describe the semicircle ABO, cutting the given circle in B. 3. Through the points A, B, draw the line BA, and it will be the tangent required.

PROB. XI. *fig. 93.* To find a third proportional to two given lines A, B.—1. From the point C, draw two right lines, making any angle FCG. 2. In these lines take CE equal to the first term A, and CG, CD, each equal to the second term B. 3. Join ED, and draw GF parallel to it, and CF will be the third proportional required: That is, CE (A) : CG (B) : : CD (B) : CF.

PROB. XII. *fig. 94.* To find a fourth proportional to three given right lines A, B, C.—1. From the point D, draw two right lines, making any angle GDH. 2. In these lines, take DF, equal to the first term A, DE, equal to the second term B, and DH, equal to the third term C. 3. Join FE, and draw HG parallel to it, and DG will be the fourth proportional required: That is, DF (A) : DE (B) : : DH (C) : DG.

PROB. XIII. *fig. 95.* To find a mean proportional between two given right lines A, B.—1. Draw any right line in which take CE equal to A, and ED equal to B. 2. Bisect CD in O, and with OD, or OC, as radius, describe the semicircle CFD. 3. From the given point E, draw EF perpendicular to CD, and it will be the mean proportional required. That is, CE (A) : EF : : EF : ED (B).

PROB. XIV. *fig. 96.* To divide a given line AB, in the same proportion with which another given line C is divided.—1. From the point A draw AD equal to the given line C, and making any angle with AB. 2. To AD apply the several divisions of C, and join DB. 3. Draw the several lines 1, 2, 3, &c. each parallel to DB, and the line AB will be divided as required:—That is, the parts A 1, 12, 23, 34, 4 B, on the line AB, will be proportional to the parts 01, 12, 23, 34, 45 on the line C.

PROB. XV. *fig. 97.* To make a triangle whose three sides shall be respectively equal to three given lines A, B, C.—1. Draw a line DE equal to one of the given lines C. 2. On the point D, with a radius equal to B, describe an arc. 3. And on the point E, with a radius equal to A, describe another arc, cutting the former in F. 4. Draw the lines DF, EF, and DFE will be the triangle required.

COR. Hence it is evident in what way an equilateral triangle may be described upon a given straight line.

Note. The three given lines must be of such a

length that any two of them must be greater than the third.

PROB. XVI. *fig. 98.* Upon a given line describe a square.—1. From the point B perpendicular, and equal to AB, and C, with the radius AB, describe two arcs cutting each other in D. 3. Draw the line CD and the figure ABCD will be the square required.

PROB. XVII. *fig. 99.* To describe a rectangle whose length and breadth shall be equal to two given lines AB and C.—1. At the point B, in the line AB, erect the perpendicular BD equal to C. 2. From the points B, D, with the radii AB and C, describe two arcs cutting each other in E. 3. Join EA and ED, and the figure ABCE will be the rectangle required.

PROB. XVIII. *fig. 100.* In a given triangle to inscribe a circle.—1. Bisect the angles A and B by the straight lines AO and BO. 2. Let O be the point of intersection O; let fall the perpendicular ON, and it will be the radius of the circle required.

PROB. XIX. *fig. 101.* About a given triangle ABC, to circumscribe a circle.—1. Bisect the sides AB, BC, by the perpendiculars OD, OE. 2. From the point of intersection O, with the distance OA, OB, or OC, describe the circle, and it will be that required.

PROB. XX. *fig. 102.* To make a figure similar to a given figure ABCDE.—1. Take A as the side of the figure required, and from A draw the diagonals AC, AD. 2. On the points b, c, d, draw bc, cd, de, parallel to CD, DE, and A b c d e will be similar to ABCDE. The same thing may also be done by the angles b, c, d, e, respectively equal to the angles D, E.

PROB. XXI. *fig. 103.* To construct a square on any given radius, AB.—1. Draw a perpendicular to AB, and on A as a centre, with the given radius AB, describe the arc BC, which shall be a quadrant. 2. On B, as a centre, with the given radius AB describe an arc cutting the first quadrant arc at D, then BD will be an arc of 30 degrees. 3. Take an arc DE equal to the quadrant BC will be divided into 3 parts, each containing 30°. 4. Let each of the parts ED, DC, be divided into 30 equal parts, must be done by trials, for it cannot be done by any direct geometrical method, and the quadrant will be divided into 90°. 5. On B, as a centre, with the distance between B and each of the divisions as radii be described to meet BC, as in the figure the distance, between B and any one of the divisions of the scale BC, will be equal to the corresponding arc of the quadrant.

PROB. XXII. *fig. 104.* To make a circle of any proposed number of degrees.—1. First 60 degrees from the scale of chords, take the point A, with this radius describe the arc Am. 2. Take the chord of the proposed number of degrees from the same scale, as from *n* to *m*. 3. From the point A draw a line An and Am, and they will form the angle required. 4. If the given angle be greater than 60 degrees it may be taken at twice.

XXIII. *fig. 104.* An angle, BAC, being given find the number of degrees it contains — by the angular point A with the chord of arcs describe the arc *nm* cutting the legs in parts *n* and *m*. 2. Take the distance *nm* by *R* to the scale of chords, and it will be degrees required. 3. When the distance is greater than 90°, it must be taken at *N 2*. Both this and the last problem are performed by means of a protractor, and graduated arc designed for the purpose. *fig. 105.*

XXIV. *fig. 106.* In a given circle, to describe a polygon of any proposed number of sides — Divide 360° by the number of sides, and make the angle AOB, at the centre, whose measure is equal to the degrees in the quotient. 2. Take two points A, B, and apply the chord AB, to the circumference the given number of times, and draw the polygon required.

XXV. *fig. 106.* On a given line AB to describe a regular polygon of any proposed number — 1. Divide 360° by the number of sides, subtract the quotient from 180 degrees. 2. The angles ABO and BAO each equal to the difference last found. 3. From the point B, describe a circle. 4. Apply a chord, AD, to the circumference the proposed number of times, and draw the polygon required. *Nota.* By this the circumference of a circle may be divided into any number of equal parts.

**I. Of the MENSURATION of LINES and ANGLES, as applied to the DETERMINATION of HEIGHTS and DISTANCES.**

Every magnitude is measured by a magnitude of the kind, called the *measuring unit*. Thus, a line is measured by a line, an angle by an angle, &c. by a surface, and a solid by a solid. Magnitudes being given, that is, their measures being determined by an actual application of the measuring unit, it is the business of mensuration to show how the measures of others, which depend on these, may be obtained. The art of mensuration that treats of lines and angles being chiefly concerned about measuring the sides and angles of a plane triangle, is called PLANE TRIGONOMETRY, which is treated of, as a distinct science, in a

part of our work, to which our present engagement necessarily refers it, is yet to be considered as forming a part of the general science of geometry. By the mensuration and protraction of lines and angles, the lengths, heights, depths, &c. of objects are determined. ACCESSIBLE LINES are measured by applying to them, a certain measure a number of times, as an inch, or yard; but INACCESSIBLE LINES must be measured by a measurement of angles and distances, by means of proper instruments, and the application of methods to be derived from the principles of geometry.

INSTRUMENTS commonly used for measuring heights and distances are, a *Chain*, a *Quadrant*, and a *Theodolite*.

The *Chain* is used for measuring those distances, which are to be given sides of triangles.

**C. PART II.**

The English chain is in length 4 poles or 66 feet. It consists of 100 equal links, made of iron, each link, therefore, should be 792 inches long. Every ten links, from one end to the middle of the chain, is distinguished by a mark made of brass.

A *Quadrant* is used for determining vertical angles; it is made of brass or wood, the radius being of any convenient length; the circumference is divided into 90 equal parts, and these parts subdivided as far as the dimensions of the quadrant will admit. A silver plummet is suspended by a thread from the centre, and two sights fixed on one of the radii. See *fig. 107.*

A *Square* is used for finding the proportion of the sides of a right angled triangle. It is made of the same materials. Two of its sides are divided each into 100 equal parts. This instrument is commonly called a *Geometrical Square*. See *fig. 109.*

A *Theodolite* is used for measuring horizontal, as well as vertical angles. It is a circle of brass divided into degrees, &c. having an index moveable above its centre, and is furnished with sights. The manner of applying these instruments will be explained in the following Problems.

PROBLEM I. To find the height of an accessible object standing upon level ground. *Fig. 110, 111.*

I. By THE QUADRANT, *fig. 110.* Let any convenient distance, BA, be measured by the chain, in a direct line from the foot of the perpendicular, BC, that falls from the top of the object. Then standing at the point A, let the quadrant be held as represented in the figure, so that the eye at D may see the top of the object C, along the side of the quadrant, DE. Now if the plummet hang freely, the line, FP, will be perpendicular to the horizon, and therefore parallel to BC; hence the angles DPP, DCI, are equal, and their complements GEP, CDE, also equal. Thus GN, the arch of the quadrant that is remote from the eye, will shew the number of degrees in the angle of elevation CDE. Whence, in the right angled triangle CED, the side DE (=AB), and the angle CDE being given, we may find CE by this proportion; as radius to the tangent of CDE so is DE to EC to which DA, the height of the eye above the ground, being added, we get the whole height of the object. If the angle of elevation be 45°, then DE = EC; that is, the distance measured is equal to the height of the object above the eye.

II. By the SQUARE *fig. 111.* Having measured AB as before, hold the square to the eye at D, as in the figure. Then, the plummet hanging freely, the line FP cuts off from the square a small triangle similar to CDE. Therefore we shall have the proportion of DE to EC; and the former being given, the latter may be found by the rule of proportion. Let *n* represent the number of equal parts which the plummet cuts off from the side DH or HG, towards the end D or G. Then,

1. When the plummet cuts the side GH remote from the eye, it is as 100 : *n* :: DE : EC. Hence, if in this case, DE = 100, then EC = *n*.

2. When it passes through the opposite angle H, we have a ratio of equality, DE = EC.

3. When it cuts the side DH contiguous to the eye, it is as *n* : 100 :: D'E : EC.

PROB.

PROB. II. To find the height of an inaccessible object. *Fig. 112.*

I. By the QUADRANT. From any convenient station B, measure the distance BA in a direct line with the foot of the object, and at both stations A, B, take the angles of elevation DAC, DBC. The difference of these angles will give the angle ADE. Then in the triangle ABD, from the principles of trigonometry we have this proportion; as sine of ADB to sine of DAB so is AB to DB; Next, in the triangle BDC, as radius to sine of B so is BD to DC; the height of the object as required

II. By the SQUARE. At the station A, find by the square the proportion of AC to CD, and at the station B find the ratio of CD to CB; hence the ratio of AC to CB will be given, and consequently that of AB to BC, from which BC, and consequently CD may be found. Let  $AB=d$ , and  $AC : CD :: m : n$  and  $BC : CD :: p : q$ , then

$CD = \frac{n q d}{m q - n p}$ . If at both stations the plummet cut the side of the square remote from the eye,

$CD = \frac{n q}{q-n} \times \frac{d}{100}$ . If the side contiguous to the eye,  $CD = \frac{100 d}{m-p}$ . If the plummet cut the opposite angles of the square at the first station B,

then  $CD = \frac{n d}{100-n}$ .

PROB. III. To find the distance of a given place from an inaccessible object. *Fig. 113.*

Let A be the inaccessible object, it is required to find its distance from the given station B. Measure any convenient distance BC, as the base of a triangle, whose vertex is at A. Then, the theodolite being placed at B, let the diameter be directed towards the station C, and the movable index towards the object A, and the intercepted arch shows the number of degrees in the angle ABC. In like manner let the angle BCA be measured, and the angle at A will be known by subtracting their sum from  $180^\circ$ . Then in the triangle CAB, BA may be found by the following proportion. As sine of A to sine of C, so is BC to BA.

PROB. IV. To find the distance between two inaccessible objects. *Fig. 114.*

Let a proper distance, CD, be measured as the base of two triangles whose vertices are at the objects A, B. Then the angles at C and D being measured by the theodolite, we find as in the last problem the sides AD, DB; and as the included angle ADB is given, the other angles of the triangle DBA may be found by the following proportion. As the sum of AD and BD, to their distance, so is the tangent of half the sum of the angles DBA, DAB, to the tangent of half their difference. Then  $\frac{1}{2}$  the difference of their angles added to  $\frac{1}{2}$  the sum gives the greater; and  $\frac{1}{2}$  the difference subtracted from half the sum leaves the lesser. In the triangle CDA we now know all the angles; also two of the sides; hence we may find AB by either of these proportions. As sine of DAB to sine of ADB so is DB to BA; or, as sine of ABD to sine of ADE so is DA to AB.

The methods here pointed out for measuring heights and distances are generally applicable. But it will not be difficult for a person acquainted with the principles of geometry, who may be provided with instruments, to fall upon other methods of determining the angles, or the relation of known lines to such as are to be found. Thus if the height of an object be required, the length of its shadow can be found, it is easy to see that by measuring at the foot of the shadow of an object whose height is known, we shall get the height required by the rule of proportion. For, from the two similar triangles, as the length of the shadow of either object to its height so is the length of the shadow of the other object to its height.

### SECT. III. Of the MENSURATION of FIGURES.

THE AREA of any plane figure is the measure of the space contained within its extremes, or without any regard to thickness. This content of the plane figure, is estimate by the number of little squares that may be contained; the side of those little measuring squares an inch, a foot, a yard, or any other fixity. And hence the area is said to be square inches, square feet, or square yards. Thus if the figure to be measured be the rectangle ABCD, *Fig. 115*, and the little square side is one inch, be the measuring unit  $p$  then, as often as the said little square is contained in the rectangle, so many square inches the rectangle is said to contain, which in the *Fig. 115* is 12. The least superficial measure is other measures being derived from it: as the table given in ARITHMETIC, p. 62.

PROB. I. To find the area of any parallelogram whether it be a square, a rectangle, a rhombus, or a rhomboid. *Fig. 13, 14, 15, 17.*

RULE I. Multiply the length by the perpendicular breadth, or height, and the product is the area.

If two sides and an included angle of a parallelogram are given to find the area, then measure the following rule.

PROB. II. As radius to the side of the parallelogram, so is the product of the two sides to the area.

PROB. III. To find the area of a triangle

RULE I. When the base and perpendicular height are given, Multiply the base by the perpendicular height, and half the product is the area.

RULE II. When two sides and the included angle are given. Multiply the two sides, and take half their product: Then multiply by the sine of the given angle, so is that product to the area.

RULE III. When the three sides are given together the three sides, and take half the sum. Next subtract each side severally from half the sum, thus obtaining three remainders, multiply the half sum and those three remainders together, and extract the square root of the product for the area of the triangle.

PROB. III. To find the area of a parallelogram. *Fig. 19.* Add together the two parallel

multiply their half sum by the perpendicular  
th or distance between them, and half the  
uct will be the area.

os. IV. To find the area of any trapezium,  
3. Divide the trapezium into two triangles  
lagonal; then find the areas of these triangles  
d them together.

esse let two perpendiculars be drawn to the  
nal, from the opposite angles, the sum of  
eing multiplied by the diagonal; half the  
ct shall be the area required.

os. V. To find the area of any irregular po-  
Fig. 116.

ew diagonals dividing the proposed polygon  
rapeziums and triangles. Then find the areas  
these separately, and add them together for  
ment of the whole polygon.

os. VI. To find the area of any regular po-  
Fig. 116.

LE 1. Multiply the perimeter of the polygon,  
m of its sides, by the perpendicular drawn  
its centre on one of its sides, and take half  
roduct for the area.

LE 11. Square the side of the polygon; then  
ply that square by the area, or multiplier, set  
h its name in the following table, and the  
ct will be the area.

of sides.	Names.	Areas, or Multipliers.
3	Trigon or Triangle,	0.433013
4	Tetragon or Square,	1.000000
5	Pentagon,	1.720477
6	Hexagon,	2.598076
7	Heptagon,	3.639912
8	Octagon,	4.828427
9	Nonagon,	6.181824
10	Decagon,	7.694209
11	Undecagon,	9.365640
12	Dodecagon,	11.196152

. The numbers in the above table express  
as of the regular polygons, when the linear  
unity.

os. VII. To find the diameter and circumfe-  
re of a circle, the one for the other. Fig. 20.  
to 22, so is the diameter to the circumfe-

Or, 25 1 to 3.1416 so is the diameter to  
circumference.

os. VIII. To find the length of any arc of a

e. Multiply the degrees in the given arc by  
ius of the circle, and the product again by  
imal .01745 for the length of the arc.

os. IX. To find the area of a circle.

LE 1. Multiply half the circumference by  
diameter. Or multiply the whole circumfe-  
re by the whole diameter and take  $\frac{1}{4}$  of the  
t for the area.

LE 11. Square the diameter and multiply that  
by the decimal .7854, for the area.

os. X. To find the area of a circular ring.

LE 1. Take the difference between the areas  
circles, as found by the last problem. Or,  
the same thing, subtract the square of the  
meter from the square of the greater, and  
r their difference by .7854.

PROB. XI. To find the area of the sector of a  
circle. Fig. 22.

RULE 1. Multiply the radius, or half diameter,  
by half the arc of the sector, for the area. Or,  
multiply the whole diameter by the whole arc of  
the sector, and take  $\frac{1}{4}$  of the product.

RULE 11. As 360 is to the degrees in the arc of  
the sector, so is the area of the whole circle to  
the area of the sector. This is evident, because the  
sector is proportional to the length of the arc, or  
to the degrees contained in it.

PROB. XII. To find the area of a segment of a  
circle. Fig. 21.

RULE. Find the area of the sector, having the  
same arc with the segment, by the last problem.

Find also the area of the triangle, formed by  
the chord of the segment and the two radii of the  
sector.

Then take the sum of these two for the answer,  
when the segment is greater than a semicircle: or  
take their difference for the answer, when it is less  
than a semicircle: As is evident by inspection.

PROB. XIII. To find the area of an ellipse.

RULE. Multiply the product of the transverse  
and conjugate axes by the decimal .7854, the re-  
sult will be the area.

PROB. XIV. To find the area of a parabola, its  
base and height being given.

RULE. Multiply the base by the height, and  $\frac{2}{3}$  of  
the product is the area.

#### SECT. IV. Of LAND-SURVEYING.

THE most useful instruments for surveying are  
the CHAIN, and PLANE TABLE. A statute acre  
of land being 160 square poles, the chain is made  
4 poles, or 66 feet in length, that 10 square chains,  
or 100,000 square links, may make a square acre.  
A chain of that length is commonly called Gunter's  
chain, but in Scotland land is measured with a  
chain 24 Scots ells, or 74 feet in length. Hence  
it follows that the Scots acre is to the English in  
the proportion of 1369 to 1089, or nearly as 5 to 4.  
The plane table is used for drawing a plan of the  
field, and taking such angles as are necessary to  
calculate its area. It is of a rectangular form, and  
surrounded with a moveable frame, by means of  
which, a sheet of paper may be fixed to its sur-  
face. It is furnished with an index, by which a  
line may be drawn upon the paper in the direction  
of any object in the field; and with scales of equal  
parts; by which such lines may be made propor-  
tional to the distances of the objects from the  
plane table, when measured by the chain; and its  
frame is divided into degrees for observing angles.

PROB. 1. To measure a field with the chain.

Let  $A^mBCD^q$  (fig. 117.) represent the field to  
be measured. Let it be resolved into the triangles  
 $A^mB$ ,  $ABD$ ,  $BCD$ ,  $A^qD$ . Let all the sides of the  
large triangles  $ABD$ ,  $BCD$ , and the perpendicu-  
lars of the small ones,  $A^mB$ ,  $A^qD$ , from their ver-  
tices  $m$ ,  $q$ , be measured by the chain, and the areas  
calculated: their amount is the area of the whole.

But if, on account of the curvature of its  
sides, the field cannot be wholly resolved into tri-  
angles, then either a straight line may be drawn  
over the curve side, so that the parts cut off from  
the field, and those added to it may be nearly equal;

qual; or, without going beyond the bounds of the field, the curvilinear spaces may be taken so small, that they may be considered as a number of trapezoids and measured accordingly.

PROB. II. To measure a field with the plane table.

Let ABCDE (*fig. 118.*) be the field, and let the plane table be fixed about the middle of it, as at F, and its distances FA, FB, FC, &c. from the several corners of the field be measured with the chain. Let the index be directed from any point assumed on the paper, to the points A, B, C, &c. successively; and the lines Fa, Fb, Fc, &c. drawn in these directions. Let the angles which these lines contain be observed, and the lines themselves be made proportional to the distances measured, by means of a scale of equal parts, such as that represented by *fig. 107.* Then their extremities being joined, there will be formed a figure *abcde*, similar to that of the field; and the area of the field may be found, by calculating the areas of the several triangles of which it consists.

PROB. III. To plan a field from a given base line. *Fig. 119.*

Let two stations A, B, be taken within the field, but not in the same straight line with any of its corners, and let their distance be measured. Then the plane table being fixed at A, and the point *a* assumed on its surface directly above A; let its index be directed to B, and the straight line *ab* drawn along the side of it, to represent AB; also let the index be directed from *a* to an object at the corner C, and an indefinite line drawn in that direction; and so of every other corner successively.

Next let the plane table be set at B, so that *b* may be directly over B; and *ba* in the same direction with BA; and let a straight line be drawn from *b*, in the direction BC; then *c* the intersection of that line with the former, it is evident, will determine the position of the point C, and the triangle *abc*, on the paper, will be similar to ABC in the field. In this manner are all the other angular points to be determined; and these being joined, there will be formed a representation of the field.

If the angles at both stations were observed, as the distance between them is given, the area of the field might be calculated from these data; but the operation is too tedious for practice. It is usual, therefore, to measure such lines in the figure that has been constructed, as will render the calculation easy.

#### SECT. V. Of the MENSURATION of SOLIDS.

By the mensuration of solids are determined the spaces included by contiguous surfaces, and the sum of the measures of these including surfaces, is the whole surface or superficies of the body.

The measure of a solid, is called its solidity, capacity, or contents.

Solids are measured by cubes, whose sides are inches, or feet, or yards, &c.; and hence the solidity of a body is said to be so many cubic inches, feet, yards, &c. as will fill its capacity, or space, or another of equal magnitude. The least solid measure is the cubic inch, other cubes being taken from it, according to the proportion in the following TABLE.

1728	cubic inches,	make 1 cubic f
27	cubic feet,	1 cubic y
166 $\frac{2}{3}$	cubic yards,	1 cubic p
64000	cubic poles,	1 cubic f
512	cubic furlongs,	1 cubic r

PROB. I. To find the superficies of a solid.

RULE. Multiply the perimeter of  $\sigma$  the length or height of the solid, and it will be the surface of all the sides. To also the areas of the two ends when required.

NOTE. The cube and parallelepiped to be understood as coming under the denomination of a prism, agreeably to De

PROB. II. To find the surface of a pyramid or cone. *Fig. 62, 69.*

RULE. Multiply the perimeter of  $\sigma$  the base height, or length of the side, an product will be the surface of the side sum of the areas of all the triangles within it. To which add the area of the end, required.

PROB. III. To find the surface of  $\sigma$  of a pyramid or cone, being the lower part the top is cut off by a plane parallel to

RULE. Add together the perimeters of the ends, and multiply their sum by the side taking half the product for the answer.

PROB. IV. To find the solid content of a prism or cylinder. *Fig. 64, 65, 66, 67.*

RULE. Find the area of the base whatever the figure may be; and multiply the length of the prism or cylinder, for content.

NOTE. The cube and parallelepiped may be considered as prisms, as in Prob. I.

PROB. V. To find the content of a sphere or cone. *Fig. 68, 69.*

RULE. Find the area of the base, and multiply that area by the perpendicular height, and take  $\frac{2}{3}$  of the product for the content.

PROB. VI. To find the solidity of  $\sigma$  of a cone or pyramid.

RULE. Add into one sum, the areas of the two ends, and the mean proportional between them, that is the square root of their sum, and  $\frac{2}{3}$  of their sum will be a mean area being multiplied by the perpendicular height of the frustum, will give its content.

PROB. VII. To find the surface of a spherical segment of it. *Fig. 120.*

RULE I. Multiply the circumference of the sphere by its diameter, and the product will be the whole surface of it.

RULE II. Multiply the square of the diameter by 3.1416, and the product will be the surface of a segment or frustum required.

Multiply the whole circumference by the height of the part required.

PROB. VIII. To find the solidity of a spherical segment or globe. *Fig. 120.*

RULE I. Multiply the surface by the diameter, and take  $\frac{2}{3}$  of the product for the content.

RULE II. Multiply the cube of the diameter by .5235 for the content.

PROB. IX. To find the solid content of a spherical segment. *Fig. 120.*

- From three times the diameter of . take double the height of the segment; multiply the remainder by the square of the diameter the product by the number 5236 for t.
- To three times the square of the radius segment's base, add the square of its height multiply the sum by the height, and it by 5236 for the content.
- To find the solid content of a spheroid

of measuring the capacities of all kinds of vessels, and determining the quantities of fluids, or other matters contained in them. These are principally pipes, tuns, barrels, &c. also hacks, coolers, vats, &c. The solid contents of vessels of the most common figures may be found from the preceding rules in feet, or inches, &c. and thence their contents in liquid measure may be found, by considering that 231 cubic inches make a wine gallon, and 252 inches an ale gallon.

A spheroid is a solid formed by the revolution of a semiellipse about either of its axes.

In ascertaining the contents of vessels it may also be useful to know that the Winchester bushel contains 2150 cubic inches; the barley firloot contains 31 Scots pints, and the wheat firloot 21 pints and 1 mutchkin. Concerning the capacity of the Scots pint, however there is some uncertainty, for although the standard jug which is kept by the borough of Stirling, was supposed to contain 105 cubic inches, yet, after several careful trials, it was found to contain only about 103½ inches. The pint *stoups* however, are still regulated to contain 105 inches, and the customary ale measures are about ⅞ above that standard.

- Multiply the square of the revolving fixed axis, and the product again by the result is the solidity required.
- XL. To find the solid content of the sum of a spheroid, the ends being supular, or parallel to the revolving axis.

It has been usual to divide casks into four varieties of forms, denominated as follows from the supposed resemblance they bear to the frustums of solids of the same names: viz.

To twice the square of the middle diameter the square of the diameter of either end this sum multiplied by the length of the cask, and the product again by 2618 will give the solidity; where note, that 2618 is ⅓ of 7854.

1. The middle frustum of a spheroid.
2. The middle frustum of a parabolic spindle.
3. The two equal frustums of a paraboloid.
4. The two equal frustums of a cone.

III. To find the solid content of a paraboloid, or paraboloid. *Fig. 122.*  
A parabolic conoid is a solid formed by the revolution of a semiparabola about the axis, and diameter.

The contents of casks of these different forms, may be found from the rules already given, for the mensuration of the figures which the casks are supposed to resemble the most; and thence their content in gallons, or pints, by dividing the content in cubic inches by the number of cubic inches contained in the respective measures.

Multiply the area of the base by half the length, and the product will be the content.

III. To find the solid content of the frustum of a paraboloid, when its ends are perpendicular to the axis of the solid. *Fig. 122.*  
Multiply the sum of the squares of the diameters of the two ends, by the height of the frustum, and the product again by 3927, and it will give the solidity; where it may be observed is ⅓ of 11778.

The form that may be assigned to a cask, it is evident, is altogether hypothetical; and therefore it seldom happens, that the content, as found by experiment, agrees exactly with that found by calculation.

IV. To find the solid content of a parabolic spindle. *Fig. 123.*  
A parabolic spindle is a solid generated by the revolution of a parabola about its base or axis.

The calculations are also very troublesome and inconvenient, and for this reason excise officers generally determine the contents of casks by means of scales constructed for the purpose.

Multiply the area of the middle section by the length and ⅓ of the product is the solidity required.

Dr Hutton, in his mensuration, gives the following general rule, which he says applies to all casks commonly to be met with; and at the same time is quite easy and very accurate, as having been often verified and proved by filling the casks with a true gallon measure.

V. To find the solid content of the frustum of a parabolic spindle. *Fig. 123.*  
Add into one sum 8 times the square of the diameter of the smaller end, 3 times the square of the diameter of the larger end, and 4 times the product of the diameters; multiply the sum by the length, and by the number 5236, and the result will be the solidity required.

RULE. Add into one sum, 39 times the square of the bung diameter, 24 times the square of the head diameter, and 26 times the product of these diameters; multiply the sum by the length of the cask, and the product by 102034, and this last product divided by 9 will give the content of the cask in wine gallons, and by 11 will give the content in ale gallons.

SECT. VI. Of GAUGING.  
GAUGING is commonly understood the art

G E O

ORI. See EUPATRIDÆ.  
ONICAL. *adj.* [*γῆ* and *πῶς*; *gēpō-*

G E O

*nique*, French.] Relating to agriculture; relating to the cultivation of the ground.—Such expressions are

are frequent in authors *geoponical*, or such as have treated *de re rustica*. *Brown's Vulg. Err.*

\* **GEOPONICKS.** *n. f.* [*γῆ* and *πονός*.] The science of cultivating the ground; the doctrine of agriculture.

(1.) **GEORGE I.** king of Great Britain, the son of Ernest Augustus, D. of Brunswick Lunenburgh, and elector of Hanover, by Sophia, daughter of Frederick Elector Palatine, and grand daughter of K. James I. He succeeded to the British throne, in 1714, in virtue of an act of parliament, passed in the reign of K. William III. limiting the succession, after the demise of that monarch, and Q. Anne, without issue, to the princess Sophia and her heirs, being Protestants. He was born in 1660, created D. of Cambridge, in 1706, and died June 11th. 1727, aged 67. See ENGLAND § 76—78.

(2.) **GEORGE II.** the only son of K. George I. succeeded him in 1727, and enjoyed a long and glorious reign; dying amidst the most rapid and extensive conquests, in the 77th year of his age. See ENGLAND, § 79—82. He was succeeded by his grandson George III. our present sovereign, on the 25th Oct. 1760; leaving the character of a brave warrior, and an impartial lover of justice. It is recorded to his honour, that he never once pardoned murder, during the whole course of his long reign, though strongly importuned in some cases; particularly in that of Earl Ferrers, who was hanged for murdering his servant, and though a peer, could obtain no other mitigation of his sentence, than that of being hanged in a silken rope.

(3.) **GEORGE**, despot of Servia. See SERVIA.

(4.) **GEORGE**, David, the founder of the sect of the DAVIDISTS. See DAVIDICI.

(5.) \* **GEORGE.** *n. f.* [*Georgius*, Latin.] 1. A figure of St George on horseback, worn by the knights of the garter.—

Look on my *george*, I am a gentleman;  
Rate me at what thou wilt. *Shak. Henry VI.*  
2. A brown loaf. Of this sense I know not the original.—

Cubb'd in a cabbin, on a mattress laid,  
On a brown *george*, with lowly twobbers, fed.  
*Diad. Pers.*

(6.) **GEORGE**, FORT, a strong and regular fortress of Scotland, in Inverness-shire. It has several handsome streets of barracks, and is seated on the point of Ardrier, a peninsula running into the firth of Murray. It completely commands the entrance into the harbour of Inverness, and lies opposite to Fortrose, 15 miles N.W. of Inverness.

(7.) **GEORGE**, FORT, a fort on New York, at the S. end of Lake George, (N<sup>o</sup> 10.) 42 miles N. of Albany.

(8.) **GEORGE**, FORT ST, a town and fort of Asia, in the peninsula of India, belonging to Britain; called also *Madrass* and *Calicutam*. See MADRAS.

(9.) **GEORGE**, LAKE, a lake of E. Florida, called also GREAT LAKE, about 15 miles by a channel 20 feet deep. It is a dilatation of the great St Johns, which runs through it.

(10.) **GEORGE**, LAKE, a lake of New York, SW. of Lake Champlain, 25 miles long from N.E. to SW. and from a point to another. Its waters are 100 feet higher than those of lake Champlain, into

which they run by a channel 1½ mile is said to contain 365 isles.

(11.) **GEORGE**, ST, or **GEORGE** DOGIA, a saint or hero, after whom the both military and religious, he denoted is famous throughout all the East; by the Greeks *Μεγαλομαχης*, i. e. the great. On some medals of the emperors Jo-nuel Comneni, we have the figure of a man armed, holding a sword or javelin in one hand, and in the other a buckler, with this

an O, and therein a little A, and ΓΕ-

king O ΑΓΙΟΣ ΓΕΩΡΓΙΟΣ, *O holy George* is usually represented on horseback, as he is to have frequently engaged in combat. He is highly venerated throughout the East, and all the countries here to the Greek rite; from the Greek ship has long ago been received into the church; England and Portugal have him for their patron saint. Great disputes have been raised about this saint or hero, and his existence has been called in question. Some who wrote first and most about him, considered him only a symbolical device; and Dr I. turned him into a mere Basilidian story. Mr Pegg, in a paper in the (Vol. I. I.) has attempted to restore him finally, Mr Gibbon, has sunk him in his history, under Constantius and Julian.

(12.) **GEORGE**, ST, or **GEORGE** DOGIAN, was so surnamed, according to some, from his parents or education; and at Epiphania, in Cilicia, in a fuller's shop, of this obscure and servile origin, he rose by the talents of a parasite; and the more he assiduously flattered, procured the more he depended, a lucrative employment was meant; he rendered himself rich by the fraud and corruption; but his malice so notorious, that George was constrained to flee from the pursuits of justice. A grace, in which he appears to have shined, was the expense of his honour, he with real or affected zeal, the protestantism. From the love, or the contempt of religion, he collected a valuable library of books, philosophy, and theology; and of the prevailing faction promoted George's patron to the throne of Athanasius. In this faction is represented by a man as polluted by cruelty and avarice, a character as a just punishment for it of his life, among which Mr Gibbon has lately said *his vanity to the Greeks*; no modern or philosopher can justify a man of the absurdities and harshness of his mythology and superstition. Of his death, however, as narrated by several writers, will not add anything to it. There was in Alexandria, a place consecrated to offer human sacrifices. Constantine gave to the church of St

bishop ordered it to be cleared, to  
 isian church on it. In doing this,  
 ed an immense subterraneous cavern,  
 heathen mysteries had been perform-  
 t were many human skulls. These,  
 ings which they found in the place,  
 s brought out and exposed to public  
 he heathens, provoked at this exhibi-  
 tions and rushing upon the Christians,  
 of them. On this the Christians pro-  
 rther in clearing the temple; but the  
 using their advantage, seized the  
 e church, and put him in prison.  
 y they dispatched him; and then fast-  
 ed to a camel, dragged it about the  
 ay, and in the evening they burnt it  
 d together. This tale, Sozomen says,  
 wed in part to his haughtiness while  
 our with Constantius; and some say  
 of Athanasius were concerned in this  
 ut he ascribes it chiefly to the invete-  
 heathens, whose superstitions he had  
 ve in abolishing. His George, the A-  
 of Alexandria, was a man of letters and  
 valuable library, which Julian ordered  
 for his own use; and in his orders  
 t, he says that many of the books were  
 chical and rhetorical subjects, though  
 m related to the doctrine of the im-  
 ans; (as he always affected to call the  
 ' These books (says he) I could with-  
 rly destroyed; but least books of va-  
 e destroyed along with them, let these  
 fully sought for.' But Mr Gibbon  
 erent turn to the adair of George's  
 well as relates it with different circum-  
 ; and the rich temples of Alexandria  
 pillaged or insulted by the haughty  
 exclaimed, in a loud and threatening  
 long will these sepulchres be permit-  
 ?' Under the reign of Constantius, he  
 l by the fury, or rather by the justice  
 e; and it was not without a violent  
 at the civil and military powers of the  
 restore his authority, and gratify his  
 he messenger who proclaimed at A-  
 the accession of Julian, announced the  
 the archbishop. George, with two of  
 ous ministers, count Dioclorus, and  
 master of the mint, was ignominiously  
 chains to the public prison. At the  
 ays, the prison was forced open by  
 a superstitious multitude, impatient of  
 forms of judicial proceedings. The  
 sds and men expired under their cruel  
 lifeless bodies of the archbishop and  
 s were carried in triumph through the  
 ie back of a camel: and the inactivity  
 rian party was esteemed a shining ex-  
 vangelical patience. The remains of  
 wretches were thrown into the sea; and  
 leaders of the tumult declared their re-  
 ject the devotion of the Christians,  
 ept the future honours of these martyrs  
 een punished, like their predecessors,  
 ies of their religion. The fears of the  
 : just, and their precautions ineffectu-

al. The meritorious death of the archbishop ob-  
 literated the memory of his life. The rival of  
 Athanasius was dear and sacred to the Arians, and  
 the seeming conversion of these sectaries introdu-  
 ced his worship into the bosom of the Catholic  
 church. The odious franger, disguising every  
 circumstance of time and place, assumed the mask  
 of a martyr, a saint, and a Christian hero; and the  
 infamous George of Cappadocia has been trans-  
 formed into the renowned St George of England,  
 the patron of arms, of chivalry, and of the garter."  
*Hist. Vol. II. p. 404.*

(13.) GEORGE ISLAND, ST, in geography, one of the  
 AZORES. It has about 5000 inhabitants, who cul-  
 tivate wheat in great quantities. Lon. 28. 0. W.  
 Lat. 38. 39. N.

(14.) GEORGE, ST, an island of the United  
 States, in the Strait of St Mary, which runs be-  
 tween lake Superior and Lake Huron.

(15.) GEORGE, ST, in Italy. See *GIORGIO, ST.*

(16.) GEORGE, ST, CROSS OF, a red cross in a  
 field argent, which makes part of the British standard.

(17.) GEORGE, ST, DEL MINA, a fort on the  
 Gold Coast of Guinea, the principal settlement  
 of the Dutch in those parts, who took it from the  
 Portuguese in 1630. The fort is the best on the  
 coast. Under it is the town called by the natives  
 ODDENA, which is very long, and pretty broad.  
 The houses are built of stone, though in all the  
 neighbouring places they are composed only of  
 clay and wood. It was once very populous, but  
 the inhabitants were greatly reduced by the small  
 pox. It is about 12 miles W. of Cape Coast Castle.  
 Lon. 0. 21. W. Lat. 5. 0. N.

(18.) GEORGE, ST, KNIGHTS OF. See *GAR-  
 TER*. There have been various orders under this  
 denomination, most of which are now extinct;  
 particularly one founded by the emperor Frederick  
 III. in 1470, to guard the frontiers of Bohemia  
 and Hungary against the Turks; another called *St  
 George of Aflima*, founded by the kings of Ara-  
 gon; a 3d and 4th in Austria and Carinthia;  
 and a 5th, in the republic of Genoa, &c.

(19.) GEORGE, ST, RELIGIOUS OF. Of these  
 there are divers orders and congregations; parti-  
 cularly canons regular of St George in Alga, at  
 Venice, founded by Bartholomew Colonna, in  
 1396, and established by Pope Boniface IX. in  
 1404. Pope Pius V. in 1570, gave these canons  
 precedence of all other religious. There is an-  
 other congregation in Sicily.

(20.) GEORGE THE KING'S ISLAND, KING, the  
 name given by Capt. Cook to OYAHETE.

(21.) GEORGE TOWN. See *GEORGETOWN*.

GEORGHAM, a town on the coast of De-  
 vonshire. SW. of Ilfracomb.

GEORGENBERG, a town of Silesia, in the  
 county of Oppeln, 9 miles N. of Beuthen.

GEORGENBURG, a town of Prussian Lithua-  
 nia, 2 miles S. of Insterburg.

GEORGENTHAL, a town of Upper Saxony,  
 in the county of Gotha, 6 miles S. of Gotha.

GEORGE'S BANE, ST, a fishing bank of Mas-  
 sachusetts, on the Atlantic, E. of Cape Cod; ex-  
 tending between Lon. 67. 50. and 68. 40. W. and  
 from Lat. 41. 15. to 42. 22. N.

GEORGE'S CAPE, ST, a cape of St George's  
 Island, 18 miles E. of Cape Blaize. Lat. 29. 38. N.

GEORGE'S

**CHANNEL, ST.** the channel between the coast of England and the SE. of Ireland.

**GEORGE'S ISLAND, ST.** an island of England in Cornwall, opposite to E. and W. Loc.

**GEORGE'S ISLANDS, KING.** See KING.

**GEORGE'S ISLANDS, ST.** islands in the Gulf of Mexico, on the coast of E. Florida, nearly opposite to the mouth of the Apalachicola. Lon. 84. 50. W. Lat. 29. 30. N.

**GEORGE'S KEY, ST.** a small island of North America, off the coast of Honduras. It is likewise called *Cafina* or *Cayo Cafina*. By a convention, in 1786, the English logwood-cutters in the bay of Honduras were permitted, under certain restrictions, to occupy this island.

(1.) **GEORGE'S RIVER, ST.** a river of the United States, in the district of Maine, which becomes an arm of the sea, 2 leagues SW. of Penobscott Bay.

(2.) **GEORGE'S RIVER, ST.** a very broad but short river of Maryland, in St Mary's county.

(3.) **GEORGE'S, ST.** the largest of the Bermuda Islands, lying 500 miles E. of the continent of N. America. Lon. 63. 30. W. Lat. 32. 45. N.

(4.) **GEORGE'S, ST.** the capital of the island of Grenada, formerly called *Fort Royal*, from its fort. It is seated on the W. side of the island, on a spacious bay, and has one of the best harbours in the British W. Indies. It was lately fortified.

(5.) **GEORGE'S ST.** a small island of Maritime Austria, in the gulf of Venice, lying to the S. of Venice. In it there is a Benedictine monastery, whose church is one of the finest in Italy.

(6.) **GEORGE'S, ST.** a village of the State of Delaware, in Newcastle county, 45 miles SW. of Philadelphia.

(7, 8.) **GEORGE'S, ST.** two English villages: 1. in Gloucestershire; and, 2. in Somersetshire; both near Bristol.

**GEORGETOWN,** the name of a district and 7 towns, in the United States, viz.

1. **GEORGETOWN,** a large maritime district of S. Carolina, bounded on the NE. by N. Carolina, SE. by the Atlantic, SW. by the Santee and N. W. by Camden and Cheraws districts. It is 112 miles long from N. to S. and 63 broad; and contain 4 counties, viz. Liberty, Winyaw, Kingston, and Williamsburg. Its population in 1790, (which is said to have been under-rated) was 8991 citizens, and 13,131 slaves. It produces rice, Indian corn, cotton, indigo, wood, &c.

2. **GEORGETOWN,** the capital of the above district, situated near the junction of the Pedee and the Sampitt, 65 miles N. by E. of Charlestown. Lon. 79. 30. W. Lat. 33. 20. N.

3. **GEORGETOWN,** a town of Delaware, capital of Suffex county, 16 miles WSW. of Lewistown, and 103 S. of Philadelphia. Lon. 0. 18. W. of that city. Lat. 38. 46. N.

4. **GEORGETOWN,** a flourishing town of Georgia, on the NE. side of the Ogeechee, 55 miles from Augusta, and 801 from Philadelphia.

5. **GEORGETOWN,** a town of Kentucky, capital of Scott county, on the S. side of the Elkhorn, 11 NNW. of Lexington, and 20 E. by N. fort. Lon. 10. 8. W. of Philadelphia. S. N.

6. **GEORGETOWN,** a town of Maryland, in county, on the S. side of the Sassafras, 9 W. of Warwick, and 61 SW. of Philadelphia. Lon. 0. 46. W. of that city. Lat. 39. 20. N.

7. **GEORGETOWN,** a town of Maryland, in Montgomery county, on the NE. side of the Potomac. It has an academy founded by Protestants and Roman Catholics, on liberal principles, which carries on trade with Europe and the W. Indies, and lies 8 miles N. of Alexandria, and 128 S. of Philadelphia. Lon. 2. 3. W. of that city. Lat. 38. 55. N.

8. **GEORGETOWN,** a town of Pennsylvania, in Fayette county, on the SE. side of the Monongahela, 16 miles SW. of Union.

(1.) **GEORGIA,** a country of Asia, bounded the N. by Circassia, on the E. by Daghestan, the N. by Armenia, and on the W. by the Euxine or Black Sea; comprehending the greater part of the ancient Colchis, Iberia, and Armenia. About the etymology of the name, authors differ. The most probable opinion is, that it is a corruption by softening of *KURGIA*, from the river whence also it is supposed that the inhabitants called by the Persians indifferently *Georgia* and *Georgistan*; and the country *KURGISTAN* and *Georgistan*.

(2.) **GEORGIA, DIVISIONS OF.** Georgia is divided by a ridge of mountains into eastern and western; the former of which is again subdivided into the kingdoms of Caket, Carduel or Cakel, and Goguetia; and the latter into the provinces of Abcassia, Mirets or Imeritia, and Gamsir. Another division is into Georgia Proper, Abcassia, and Mingrelia. A 3d division, and the last of this country, is into 9 provinces; 5 of which (or were lately) subject to the famous prince Heraclius, forming what is commonly called the kingdom of Georgia, of which *Tepals* is the capital, and 4 are under the dominion of David, occupying the kingdom of Imeritia. See *IMERITIA*.

(3.) **GEORGIA, GENERAL APPEARANCE, RUDE AND CLIMATE OF.** This whole country is so extremely beautiful, that some travellers have imagined they had here found the situation of the original garden of Eden. The mountains are covered with forests of oak, ash, beech, chestnuts, walnuts, and elms, encircled with vines growing perfectly wild, but producing vast quantities of grapes. From these is annually made much wine as is necessary for the yearly consumption; the remainder are left to rot on the vine. The wine is so rich, that the Persian Monarch keeps it always at his table. The whole country is fertile, and abounds with cattle and wild fowls of various kinds. The bread is excellent, and the fruits, apples, pears, pomegranates, &c. are of exquisite flavour. Cotton grows spontaneously well as the finest European fruit trees, viz. wheat, millet, hemp, and flax, are raised in the plains, almost without culture. The valleys afford the finest pasturage: the rivers are full of fish; the mountains abound in minerals, and the climate is delicious; so that nature appears to have lavished on this favoured country every blessing that can contribute to the happiness of its inhabitants.

(4.) **GEORGIA, GOVERNMENT OF.** The

t of Georgia is despotic; but, were it be assistance of the Russian troops, the could frequently be unable to carry his into execution. The punishments in crimi- are shockingly cruel; fortunately they re- quent, because it is easy to escape into the neighbouring countries, and because ce is more enriched by confiscating the of the criminal, than by putting him e. Judicial combats are considered as ge of nobility, and take place when the extremely intricate, or when the power est of two claimants are so equal, that an force a decision of the court in his fa- his mode of trial is called *an appeal to the of God.*

**GEORGIA, HISTORY OF.** This country abounded with great cities, as appears : ruins of many of them still visible, ow that they must have been very large, and magnificently built. These were all by the northern barbarians from mount , as the Alans, Huns, Suevi, and others, noted in history for their strength, cou- conquests. In the 13th century, a king ia divided among his 5 sons the provin- rduel and Caket, Imeritia, Mingrelia, and Abcassia. These petty princes were as to unite for their common defence, reak singly to resist a foreign enemy, or check the encroachments of their great to soon became independent. weakness of the Turkish government, have indeed enabled the princes of the country to recover their independence; but the smallness of their revenue has hitherto disabled them from repressing effectually the tyranny of the nobles, and relieving the burdens of the peasants. Of all the Georgian princes, who of late have rendered themselves famous, by shaking off the Ottoman yoke, the most eminent is prince Heraclius. Of this prince, we have the following account by the late profes- sor Guldenstadt when he travelled into these parts in 1770. "Heraclius, or, as he is called, the tzar *Irachi*, is above 60 years old, of a middle size, with a long countenance, a dark complexion, large eyes, and a small beard. He passed his youth at the court and in the army of the cele- brated Nadir Shah, where he contracted a fond- ness for Persian customs and manners, which he has introduced into his kingdom. He has 7 sons and 6 daughters. He is much revered and dread- ed by the Persian khans his neighbours; and is usually chosen to mediate between them in their disputes with each other. When they are at war, he supports one of the parties with a few troops, who diffuse a spirit of courage among the rest, because the Georgian soldiers are esteemed the bravest of those parts; and prince Heraclius him- self is renowned for his courage and military skill. When on horseback he has always a pair of load- ed pistols at his girdle, and, if the enemy is near, a musket slung over his shoulder. In all engage- ments he is the foremost to give examples of per- sonal bravery; and frequently charges the enemy at the head of his troops with the sabre in his hand. He loves pomp and expence; he has adopted the dress of Persia; and regulates his court after the manner of that country. From the example of the Russian troops, who were quartered in Georgia during the last Turkish war, he has learnt the use of plates, knives, and forks, dishes and house- hold furniture, &c."

(6.) **GEORGIA, INHABITANTS OF.** "The in- habitants, (says Sir George Chardin,) are robust, valiant, and of a jovial temper; great lovers of wine, and esteemed very trusty and faithful; en- dowed with good natural parts, but, for want of education, very vicious. The women are gene- rally so fair and comely, that the wives and con- cubines of the king of Persia and his court are for the most part Georgian women. Nature has ad- orned them with graces no where else to be met with: it is impossible to see them without loving them; they are of a good size, clean-limbed, and well shaped." Another traveller, however, of no mean character, thus expresses himself with respect to these women: "As to the Georgian women, they did not at all surprize us; for we expected to find them perfect beauties. They are, indeed, no way disagreeable; and may be counted beau- ties, if compared with the Curdes. They have an air of health that is pleasing enough; but, af- ter all, they are neither so handsome nor so well shaped as is reported. Those who live in the towns have nothing extraordinary more than the others; so that I may, I think, venture to contra- dict the accounts that have been given of them by most travellers." The other inhabitants of Georgia are Tartars, Ossi, and Armenians, called in the

Georgian language *Somabbi*. These last are found all over Georgia, sometimes mixed with the natives, and sometimes in villages of their own. They speak among themselves their own language, but all understand and can talk the Georgian. Their religion is partly the Armenian, and partly the Roman Catholic. They are the most oppressed of the inhabitants, but are still distinguished by that instinctive industry which every where characterizes these nations. Besides these, there are in Georgia considerable numbers of Jews, called, in the language of the country, *Uria*. Some have villages of their own; and others are mixed with the Georgian, Armenian, and Tartar inhabitants, but never with the Ossi. They pay a small tribute above that of the natives.

(7.) GEORGIA, MANNERS AND CHARACTER OF THE PEOPLE OF. The Georgians are Christians of the Greek communion. Their dress nearly resembles that of the Cossacks; but men of rank frequently wear the habit of Persia. They usually dye their hair, beard, and nails with red. The Georgian women employ the same colour to stain the palms of their hands. On their heads they wear a cap or fillet, under which their black hair falls on their forehead: behind, it is braided into several tresses. Their eye-brows are painted with black, so as to form one entire line, and their faces are perfectly coated with white and red. Their robe is open to the girdle, so that they are reduced to conceal the breasts with their hands. Their air and manner are extremely voluptuous. Being generally educated in convents, they can all read and write; a qualification which is very unusual among the men, even of the highest rank. Girls are betrothed as soon as possible, often at 3 or 4 years of age. In the streets the women of rank are always veiled, and then it is indecent in any man to accost them. It is likewise uncivil in conversation to inquire after the wives of any of the company. These, however, are not ancient customs, but consequences of the violences committed by the Persians, under Shah Nadir. Travellers accuse the Georgians of drunkenness, superstition, cruelty, sloth, avarice, and cowardice; vices which are everywhere common to slaves and tyrants, and are by no means peculiar to the natives of this country. The descendants of the colonists, carried off by Shah Abbas, and settled at Perzia, near Ispahan, and in Masanderan, have changed their character with their government; and the Georgian troops, employed in Persia against the Affghans, were advantageously distinguished by their docility, their discipline, and their courage.

(8.) GEORGIA, POPULATION OF. The subjects of Heraclius have been estimated at about 60,000 families; but this, notwithstanding the present desolated state of the country, is probably an under-valuation. The peasants belonging to the queen, and those of the patriarch, pay no tax to the prince, and therefore do not appear on the books of the revenue officers. Many similar exemptions have likewise been granted by the prince to his favourites. Besides, as the impost on the peasants is not a poll-tax, but a tax on hearths, the inhabitants of a village, on the approach of the collectors, frequently carry the furniture of several huts into one, and destroy the

remainder, which are afterwards very built. It is probable, therefore, that the population of Georgia does not fall short of 500,000 souls.

(9.) GEORGIA, REVENUE OF. There can be estimated at about 1,000,000 rubles, or 17,500,000 roubles. They consist of, 1. The custom, 1,750,000.—2. Rent paid by the farmers of the soil at Teflis, 17,500,000.—3. The tribute paid by the Khans of Erivan and Ganja, 700,000.—4. An hearth money levied on the peasants, 2,000,000 to 15,750,000. The common coin here is the *abasse*, of about 15d. value, and a fine coin, stamped at the mint at Teflis. There is a large quantity of gold and silver brought into the country from Persia, in exchange for honey, butter, and blue linen.

(10.) GEORGIA, TRADE OF. The Georgia, being fed by mountain torrents, is not adapted for navigation: the Black Sea, the seat of commerce and civilization might be derived from Europe, has been till very lately, in the exclusive possession of the Turks: the trade to Georgia by land is greatly obstructed by the mountains of Caucasus: and this obstacle is increased by the swarms of predatory robbers which those mountains are inhabited.

(11.) GEORGIA, the most southerly of the United States of America, bounded on the Atlantic Ocean, on the S. by E. and Florida, on the W. by the Mississippi, on the N.E. and N. by S. Carolina and Tennessee, 665 miles long and 262 broad, lying between 31° 17' and 35° 17' Lon. W.; and 30° 17' and 35° 17' Lat. N.

(12.) GEORGIA, CLIMATE, SOIL AND PRODUCTS OF. The winters in Georgia are very pleasant. Snow is seldom or never seen. The soil and its fertility are various, according to the situation and improvements. By culture they produce rice, indigo, cotton, silk, Indian corn, oranges, figs, pomegranates, &c. The staple commodity is the cotton; but a duty is also paid to the raising of tobacco.

(13.) GEORGIA, COUNTIES AND CHIEF TOWNS OF. Georgia, before the revolution, was divided into parishes; afterwards into 3 districts, now into two, called the *Upper* and *Lower*. The *Upper* is subdivided into 24 counties; 9 in the *Upper* District viz. Camden, Glynn, Liberty, Bryan, McIntosh, Effingham, Scriven, and 15 in the *Lower*, viz. Montgomery, Hancock, Greene, Franklin, Oglethorpe, Wilkes, Lincoln, Warren, Jackson, Bullock, Columbia, and 1. The chief towns are SAVANNAH, the capital of the state, AUGUSTA, the late seat of government, LOUISVILLE, the present seat (See these articles;) Sunbury, Brunswick, Washington, St Patricks, Goltsboro, &c.

(14.) GEORGIA, GENERAL APPEARANCE OF. The E. part of the state between the Atlantic ocean, and the Savannah and St Marys rivers is an entirely level tract of 120 miles N. to S. and from 40 to 50 broad, single hill or stone. About 45 miles from

lands begin to be uneven, ridges rising into hills, and these into mountains, terminate in the Alleghany and Appalichians in New York.

**GEORGIA, GOVERNMENT AND CONSTITUTION.** By the constitution established, the legislative power is vested in a series of representatives, both elected by the people, and styled the *General Assembly*. It consists of 24 members, one from each of the 12 counties. A senator must be at least 30 years a citizen of Georgia and 9 years a citizen of the United States: he must also possess at least 250 acres of land, and 2500 l. of property. A member of the house of representatives must be at least 21 years of age, two years a citizen of Georgia and 7 in the United States; he must possess at least 100 acres of land, or property worth at least 500 l. A year's residence entitles a citizen to vote. There are only two judges in the superior court, one presides in each district, and decides in all the most important causes: But there is an inferior court, or court of common pleas in each district, presided in by 3 judges who sit twice a year. The procedure is simple and the causes soon de-

**GEORGIA HISTORY OF.** The settlement of the Savannah and Altamaha was first made in England in 1732, for the accommodation of the poor people in Great Britain and for the farther security of Carolina. The humane and public spirit compared to the benevolent design. Humane and public spirit suggested a plan of transporting a number of indigent families to this part of America. For this purpose they applied to George II. and obtained from him a charter, dated June 9, 1732, for legally carrying into execution what they had generously proposed, called the new province *Georgia*, of the king who encouraged the plan. The first settlement, consisting of 21 persons, was called by the name of, *The Trustees for settling and inhabiting the colony of Georgia*. In November the settlers embarked for Georgia, to be met at Charlestown early in 1733. Mr. Oglethorpe, an active promoter of the settlement, accompanied by William Bull, shortly after his arrival, visited Georgia; and after he had surveyed the country, marked the spot on which the new settlement should be made, as the fittest to begin their

Here they accordingly began to erect a fort; and a number of huts for their accommodation. Such of the settlers as were able to bear arms were embodied, and with officers, arms, and ammunition. A friendly friendship was concluded between the English and their neighbours the Creek Indians, who were the first to show them the way to the country, and to give them the prospect of peace and plenty. But the first English settlers were disappointed of these expectations, it was found that a hardy and bold race of men, who were used to manual labour and fatigue, would be better fitted both to cultivate and defend the in-

land province. Accordingly 570 adventurers, among whom were 150 Highlanders, and 170 Germans, were prevailed on to emigrate to Georgia within 3 years after. But the fundamental regulations established by the trustees of Georgia were ill adapted to the circumstances and situation of the poor settlers, and of pernicious consequences to the prosperity of the province. Yet although the trustees were greatly mistaken with respect to their plan of settlement, it must be acknowledged their views were generous. Like other distant legislators, who framed their regulations upon principles of speculation, they were liable to many errors and mistakes; and however good their design, their rules were found improper and impracticable. These injudicious regulations and restrictions, the wars in which they were involved with the Spaniards and Indians, and the frequent insurrections among themselves, threw the colony into a state of confusion and wretchedness too great for human nature long to endure. Their oppressed situation was represented to the trustees by repeated complaints; till at length finding that the province languished under their care, and weary with the complaints of the people, they in 1752, surrendered their charter to the king, and it was made a royal government. John Reynolds, Esq. was appointed governor, and a legislature similar to that of the other provinces was established.—In 1740, the Rev. George Whitefield founded an orphan-house academy in Georgia, about 12 miles from Savannah. From the time that Georgia became a royal government in 1752, till the peace of Paris in 1763, the colony struggled under many difficulties arising from the want of credit, and the frequent molestations of enemies. The good effects of the peace were sensibly felt. From this time it began to flourish under the care of gov. Wright; and within 10 years only, from 1763 to 1773 its exports arose from 27,021 l. to 121,676 l. Sterling. During the American war, Georgia was overrun by the British troops, and the inhabitants were obliged to flee into the neighbouring states for safety. Since the peace, the population, agriculture, commerce and arts, have increased with astonishing rapidity, though these have been a good deal retarded within these few years by the hostile incursions of the CREEK or MUSKOGULGE Indians, who inhabit the middle parts of the state. See MUSKOGULGE. In 1789, the constitution was new-modelled upon a plan similar to that of the other states. In 1790, a treaty of peace being concluded between the United States and the Indians, the state of Georgia has been ever since increasing in wealth and population.

(vii.) **GEORGIA, INDIAN NATIONS IN.** The middle parts of this state are inhabited by the CREEK or MUSKOGULGE Indians, the most numerous nation of Aboriginal Americans within the United States, consisting of about 20 different tribes united. Their country is fertile, though hilly, and extends from the Mobile to the Atlantic. The CHACKTAWS, CHICKASAWS, and CHEROKEES, have settlements in the N. and W. parts of the state. See these articles.

(viii.) **GEORGIA, INHABITANTS OF.** In the grand convention at Philadelphia in 1787, the inhabitants of this state were reckoned at 90,000,

including 20,000 negroes. At present (1800) the total population is estimated at 100,000 including 30,000 slaves; so that the only increase seems to be in the number of that unfortunate race. The number of Indians in Georgia is estimated at about 32,000. No general character will apply to the citizens of this state. Collected from different parts of the world, as interest, necessity, or inclination led them, their character and manners must of course partake of all the varieties which distinguish the several states and kingdoms from whence they came. There is so little uniformity, that it is difficult to trace any governing principles among them. An aversion to labour seems predominant, owing in part to the relaxing heat of the climate, and partly to the want of necessity to excite industry. An open and friendly hospitality, however, particularly to strangers, is an ornamental characteristic of a great part of this people. As to religion the upper counties are supplied pretty generally by baptist and methodist ministers; but the greater part of the state is without ministers of any denomination.

(ix.) **GEORGIA, ISLANDS OF.** The whole coast of Georgia is bordered with islands, the principal of which are Skiddaway, Waffaw, Ossabaw, St Catharine's, Sapelo, Frederica, Jekyll and Cumberland.

(x.) **GEORGIA, NATURAL CURIOSITIES OF.** Near Augusta, there is a bank of oyster shells 90 miles from the sea: and in Wilkes county, near Washington, there is a remarkable spring which rises from a hollow tree, 5 feet long. The inside of the tree is covered with a coat of matter an inch thick, and the leaves around the spring are encrusted with a peculiar substance as white as snow. The water is said to be an effectual remedy for the scurvy, scrofula, gout, rheumatism and consumption.

(xi.) **GEORGIA, RIVERS OF.** The chief rivers in this state are the Savannah, Turtle river, Little and Great Satilla, Crooked river, and St Mary's which forms a part of the southern boundary of the United States. The rivers in the middle and western parts are the Apalachicola, formed by the Chatahouchee and Flint rivers, Mobile, Pascagoula, and Pearl rivers. All these run southward into the Gulf of Mexico.

(xii.) **GEORGIA, TRADE OF.** The commerce of this state has greatly increased of late. The articles chiefly exported are cotton, rice, tobacco, indigo, fago, lumber, naval stores, leather, deer skins, muskeroot, myrtle, bees wax, corn, and live stock; of which last, the farmers raise from 1000 to 1500 head annually. The exports in 1795 amounted to 695,985 dollars: and in 1799 to 1,396,759. The chief imports are West India goods, tea, wine, cloths, dry goods, fish; cheese, cyder, shoes, &c. Silk, indigo, and fago, are the chief manufactures.

(xiii.) **GEORGIA, UNIVERSITY OF.** A charter was passed in 1785, for erecting a college, with ample and liberal endowments, at Louisville, in a high and healthy part of the country, near the centre of the state. There is also provision made for the institution of an academy in each county of the state, to be supported from the same funds, and to consist of a president and members of the same.

direction of a president and board of trustees pointed for their literary accomplishments the different parts of the state, and invest the customary powers of corporations. This institution thus composed is denominated *University of Georgia*. The funds for the support of this institution are principally in lands, amounting in the whole to about 50,000 acres, a great part of which is of the best quality, and very valuable. There are also nearly 60000 acres lying in bonds, houses and town lots in the city of Augusta. Other public property to the amount of 100000 in each county has been set apart for the purposes of building and furnishing the several academies. The funds originally appropriated for the support of the orphan-house are now applied to rice, plantations and negroes.

(xiv.) **GEORGIA, WESTERN TERRITORY.** This country extends from the Mississippi to the Flint and Apalachicola on the west, and is intersected by many rivers. Great part of it belongs to the Indians. (See § vii.) . . . millions of acres of it were sold a few years ago by the state of Georgia to several companies withstanding a very violent opposition occasioned a general ferment.

(III.) **GEORGIA,** a township of Vermont, Franklin county, on lake Champlain.

(IV.) **GEORGIA, SOUTH,** an island in the Pacific Ocean, discovered and named by James Cook in 1775. See COOK, N° III, § 9. It is 9 leagues long, and its greatest breadth is 15 leagues. It seems to abound with bays and harbours, and the vast quantities of ice render it inaccessible the greatest part of the year. Two rocky islands are situated at the N. end; one named *Hale's* from the person who discovered it. *Bird Islands*, from the innumerable flock of all sorts that were seen near it, from albatrosses down to the least petrels, porpoises and seals were likewise observed. The ice is perpendicular ice-cliffs, of considerable height like those at Spitzbergen. Pieces were observed breaking off, and floating out to sea. Between 33. 13. and 35. 34. W. Lat. 54. 57. S.

(V.) **GEORGIA, WEST.** See N° II, GEORGIANS, the people of Georgia.

(1.) \* **GEORGIC, n. s.** [From *georgon*, Gr.] Relating to the doctrine of agriculture.

Here I peruse the Marston's *georgic*  
And learn the labours of Italian Isidore.

(2.) \* **GEORGIC, n. f.** Some part of the science of husbandry put into a pleasing or poetical form, as in the Georgics of Virgil.

(3.) **GEORGICS** are poetical compositions relating to husbandry. Hesiod and Virgil are the best masters in Georgics. The moderns have produced nothing in this kind, except Rapsodia of Gardening; and the celebrated poem of Cyder, by Mr Philips, who, if he had but the advantage of Virgil's language, would have been second to Virgil in a much nearer manner.

**GEORGIY,** a town of Russia, in the government of Caucasus, 52 miles WNW. of Jambou.

), ST. See **GIORGIO, St.**

**Z**, a town of Walachia, 18 miles  
west, and 24 SE. of Tergovisto.

resemblance of a stork's beak. There are above  
80 species. The common wild sorts, and those  
which are brought from the colder climates, are  
hardy enough, and require little care; but the  
African species, and the others from hot countries  
which make so very beautiful a figure in our  
green-houses, require great care in their culture  
and propagation. These may be propagated by  
seed, which should be sown toward the end of  
March in beds of light earth, carefully shading  
them from the sun, and giving them frequent but  
gentle waterings, till they are well rooted. The  
mats with which these beds are covered are to be  
taken off in gentle showers, and always in the hot  
weather at nights, that the plants may have the  
benefit of the dew. They should remain about  
two months in this bed, by which time they will  
have taken root. Some pots of about 7 inches  
wide should then be filled with light earth, and  
the plants taken up with as much as possible of  
their own earth about them, and planted severally  
in the middle of these pots; when they are to  
be set in a shady place, and watered at times till  
they have taken root. When well rooted, they  
should be set in a more exposed place to harden  
them, and should stand out till the middle of Oc-

tober; but when the mornings begin to grow  
frosty, they must be removed into the green-house,  
and then placed as near the windows as possible,  
and the windows should be opened upon them till  
the weather is very cold. During the winter they  
must be often watered a little at a time, and their  
dead leaves should be pulled off. They must not  
stand under the shade of other plants, nor near a-

ny artificial heat. Those who wish that their  
plants should be large and flower soon, sow the  
seeds on a moderate hot-bed in the spring; when  
they are come up, they should not be drawn weak,  
and the pots into which they are transplanted  
should be plunged into another moderate hot-bed;  
shading them from the sun till they have taken  
root, and gradually inuring them to the open air,  
into which they should be removed in the begin-

ning of June, and placed in a sheltered situation  
with other exotic plants. The shrubby African  
geraniums are commonly propagated by cuttings,  
which planted in a shady border, in June or July,  
will take good root in 5 or 6 weeks; and they  
may then be taken up and planted in separate  
pots, placing them in the shade till they have ta-

ken new root; after which they may be removed  
into a sheltered situation, and treated as the seed-

ling plants. Geranium is recommended as one  
of the greatest vulneraries and abstersgents of the  
vegetable world, and is highly extolled for its  
power of stopping profluvia of the menses, and  
hæmorrhagies of all kinds. Experience confirms  
this, especially among the poor peop. in the  
country; and it were to be wished, that the plant  
could be brought into more esteem in the shops,  
where at present it is disregarded.

(1.) GERARD, Alexander, D. D. professor of divinity in King's college, Aberdeen, and one of his majesty's chaplains for Scotland. He was eldest son of the rev. Gilbert Gerard, minister of Chapel of Garioch, and was born the 22d Feb. 1728. He received the rudiments of his education at Foveran, in Aberdeenshire; but his father dying when he was only ten years old, his mother and the family removed to Aberdeen, where he made such progress at the grammar school, that in two years he was deemed fit for the university. He accordingly entered student at Marischal college, and in 4 years afterwards was admitted A. M.: after which he studied theology at the universities of Aberdeen and Edinburgh. Having been licensed to preach in 1748, he was chosen assistant to prof. D. Fordyce, in 1750, and was afterwards appointed his successor, upon his untimely death, in 1752. See FORDYCE. In 1754, a material alteration being made in the order of teaching philosophy in the university, prof. Gerard was appointed to lay before the public the reasons which had influenced them to deviate from the former practice; which he accordingly did in a small pamphlet, that gave universal satisfaction; wherein he pointed out the inconveniences of the old, and the advantages of the new plan; which was at this time adopted by both colleges. About this time too he was an active member of a respectable literary society, which met once a fortnight at Aberdeen, and of which Drs Blackwell, Beattie, Gregory, Reid, Campbell, and other eminent literary gentlemen were members. On the 5th of Sept. 1759, he was ordained a minister of the church of Scotland; on the 11th of June, 1760, he was appointed professor of divinity in the Marischal college, and minister of the Gray-friars church at Aberdeen; and about the same time he was created D. D. On the 18th June 1771, he resigned both these offices, and was appointed professor of divinity in king's college; in which station he continued equally esteemed by his colleagues, and revered by his pupils, till his birthday 1795, when having just entered his 68th year, he died in consequence of a scirrous tumour, which had begun to appear in his face in 1794; and gradually impaired his constitution. Dr Gerard's character in private life was amiable and exemplary. Kindness to his relations, affability with his dependants, steadiness and warmth in his attachments to his friends, and hospitality to strangers without extravagance or ostentation, were conspicuous in his general conduct. His public discourses, as a minister and professor, were equally marked by distinctness of arrangement, accuracy of composition, and justness of reasoning. His friend, Dr Beattie, (who himself stands high in the republic of letters) assures us, that "he had improved his memory to such a degree, that, in little more than an hour, he could get by heart any sermon of ordinary length; though far from availing himself of this talent, as many would have done, he composed with care all the sermons that he preached." He was author of, 1. An Essay on Taste: 8vo. 1759. 2. Dissertations on subjects relating to the genius and evidences of Christianity: 8vo. 1766. 3. An Essay on Genius: 8vo. 1774. 4. Several Sermons on various subjects, published

from 1760 to 1782; and 5. A part of a gical course, entitled *The Pastoral* published in 1799, by his son, Dr Gilbert who succeeded him in his professorship. *Say on Taste* gained the gold prize medal the Philosophical Society of Edinburgh.

(2.) GERARD, John, a learned Luth. professor of divinity, and rector of the of Jena, his birth-place. He wrote, 1. *mony of the Eastern Languages*; 2. *A the Coptic Church*; and other works esteemed. He died in 1668.

GERMANICUS CÆSAR, Claudius, the son of Drusus, and nephew to the emperor Tiberius, who adopted him. By his mother Antonia, daughter of Mark Antony and Octavia, he was grand-nephew to Augustus. He was much renowned as a general, but still more for his virtues. He took the title of *Germanicus* from his conquests in Germany; but though he refused the empire offered to him by his army, Tiberius, jealous of his success and popularity, caused him to be poisoned, A. D. 29, aged 34. He was a protector of learning; and composed some Greek comedies and Latin poems, some of which are still extant.

GERMANO, ST, a town of Naples, at the foot of Mount Cassano, with an abbey on the top of it. Lon. 13. 59. Lat. 41. 13. N.

(1.) GERMANS, the people of GERMANY.

(2.) GERMANS, CHARACTER AND MANNERS OF THE ANCIENT. The ancient Germans are described by the Greek and Roman writers as resembling the Gauls; and differing from other nations by their tall stature, ruddy complexion, blue eyes, yellow bushy hair, haughty and threatening looks, strong constitutions, and being proof against hunger, cold, and all kinds of hardships. Their native disposition appeared chiefly in their martial genius, and in their singular fidelity. The former they indeed carried to such an excess as came little short of downright ferocity: and as to the latter, they not only valued themselves, but were greatly esteemed by other nations for it; inasmuch that Augustus, and several of his successors, committed the guard of their persons to them, and other nations either courted their alliance, or hired them as auxiliaries: though it must be owned, that their extreme love of liberty, and their hatred of tyranny and oppression, often hurried them to treachery and murder, especially when they thought themselves ill used by those who hired

for in such cases they were easily provoked,

and extremely vindictive. In other cases tells us, they were noble, magnanimous, deficient, without ambition to aggrandize, or invade those from whom they had received no injury; rather choosing to exert strength and valour defensively than to preserve their own than to ravage their neighbours. Their friendship and inter- rather a compound of honest blunt-ness, than of wit, humour, or gall; and strangers were sure to meet with a kin- from them to the utmost of their ability to those who were not in a capacity to them, reckoned it a duty to introduce those who could; and nothing was held testable, than to refuse them either the other. They do not seem, indeed, to taste for elegant entertainments; they every thing, in their houses, furniture, rather plainness and simplicity, than in- nefs and luxury. If they learned of the and Gauls the use of money, it was cause they found it more convenient ancient way of bartering one commodi- ther; and then they preferred those an which had been stamped during the ti Roman liberty, especially such as were ed or cut in the rims, because they co- so easily cheated in them as in some oth- were frequently nothing but copper or over with silver. **GERMANS, FUNERALS AND FEASTS OF THE ANCIENT.** There is scarcely any thing in German customs, though nearly allied in most particulars to the Gauls, were more peculiar than in their funerals. Those of the former were performed with great pomp and magnificence, those of the latter with the same simplicity which they observed in their religious rites. The only grandeur they affected was, to burn the bodies of their great men in peculiar kinds of wood; but then the funeral pile was neither adorned with the clothes of the deceased, nor with any of the furniture of the deceased, nor with fragrant herbs and gums: each man's arms, as his sword, shield, and spear, were deposited, and sometimes his riding horse. The funeral pile, being kindled, the chief mourners, who walked in a gloomy procession round the fire, exhorted the bystanders to follow into it in honour of the deceased. The Romans deposited their ashes in urns, like the Egyptians, and numbers which have been dug up in various parts of the country, and illustrated by dissertations on them, by several learned moderns of France. And the sacrifices they offered for the dead, and all the other superstitious rites attended to them, were done in consequence of the tenets of their ancient religion, which had a strong tendency to the immortality of the soul, and the bliss or misery of a future life. At the same time, as well as in all their other feasts, they were inclined to drinking to excess; and one of the chief promoters of health and strength, and bravery; upon which account, they were very fond of feasts, and before battle, but even in their private meals.

**GERMANS, RELIGIOUS OPINIONS AND CUSTOMS OF THE ANCIENT.** As the ancients did not commit any thing to writing, none of the ancient writers have given us any account of it, it is impossible to guess how much of their great Woden, and his parables received among them. It may have been older than the times of Tacitus, and we know nothing of it, from their care in their religion from strangers; but as their doctrines to posterity by songs and most of their northern poets tell us, have drawn their intelligence from poems, which were preserved among them, may justly suppose, that whatever doctrines contained in them, were formerly prominent: generality of the nation, especially their ancient practice conformable to it. The surest road to this paradise was, to do great deeds, and to die intrepidly in the field; and as none were excluded from the rewards, and betrayers of their country.

ART. II.

It is natural to think, that the signal and excessive bravery of the Germans flowed from this ancient belief of theirs: and, if their females were so brave and faithful, as not only to share with their husbands all the dangers and fatigues of war, but at length to follow them by a voluntary death, into the other world; it can hardly be attributed to any thing else but a strong persuasion of their being admitted to live with them in that place of bliss. This belief therefore, whether received originally from the ancient Celtes, or afterwards taught them by the since deified Woden, seems, from their general practice, to have been universally received by all the Germans, though they might differ one from another in their notions of that future life. The notion of a future happiness obtained by martial exploits, especially by dying sword-in-hand, made them bewail the fate of those who lived to old age, as dishonourable here, and hopeless hereafter: upon which account, they had a barbarous way of sending them into the other world, willing or not willing. And this custom is said to have lasted several ages even after their receiving Christianity, especially among the Prussians and Veneti. These murders were preceded by a fast and followed by a feast.

(5.) **GERMANS, STATURE, CHARACTER, AND MANNERS OF THE MODERN.** The modern Germans in their persons are tall and strong built. The ladies have generally fine complexions; and some of them, especially in Saxony, have all the delicacy of features and shape, that are so bewitching in Britain. Both men and women affect rich dresses, which in fashion are the same as in France and England; but the superior ranks are excessively fond of gold and silver lace, especially those in the army. The ladies at the principal courts differ not much in their dress from the French and English, only they are not so fond of paint as the former. At some courts they appear in rich furs; and all of them are loaded with jewels, who can obtain them. The female part of the burgher families, in many German towns, dress in a very different manner, and some of them inconceivably fantastic, as may be seen in many prints published in books of Travels; but in this respect they are gradually reforming, and many of them make quite a different appearance in their dress from what they did 40 or 50 years ago. The peasants and labourers dress as in other parts of Europe, according to their employments and opulence. In Westphalia, and most other parts of Germany, they sleep between two feather-beds, or rather the upper one of down, with sheets stretched to them, which by use becomes a very comfortable practice. The most unhappy part of the Germans are the tenants of little needy princes, who squeeze them to keep up their own grandeur; but, in general, the circumstances of the common people were far preferable to those of the French, before the revolution. The Germans are naturally a frank, honest, hospitable people, free from artifice and disguise. The higher orders are ridiculously proud of titles, ancestry, and show. The Germans, in general, are thought to want animation, as their persons promise more vigour and activity than they commonly exert even in the field of battle.

B b b

But

But when commanded by able generals, especially Italians, such as Montecuculi and prince Eugene, they have done great things, both against the Turks and the French. The Imperial arms, it has been said, seldom made any remarkable figure against either of those two nations, or against the Swedes or Spaniards, when commanded by German generals. This possibly might be owing to the arbitrary obstinacy of the court of Vienna; but in the two last wars, as well as in the present, the Austrians exhibited prodigies of military valour and genius. Industry, application, and perseverance, are the great characteristics of the German nation, especially the mechanical part of it. Their works of art would be incredible were they not visible, especially in watch and clock making, jewellery, turnery, sculpture, drawing, painting, and certain kinds of architecture. The Germans have been charged with intemperance in eating and drinking; and perhaps not unjustly, owing to the vast abundance of their country in wine and provisions of every kind. But these vices seem now to be wearing out. At the greatest tables, though the guests drink pretty freely during dinner, yet the repast is commonly finished by coffee after 3 or 4 public toasts. But no people have more feasting at marriages, funerals, &c. The German nobles are generally men of so much honour, that a sharper in other countries, especially in England, meets with more credit if he pretends to be a German, than of any other nation. The merchants and tradesmen are very obliging. All the sons of noblemen inherit their fathers titles, which greatly perplexes the heralds. This perhaps is one reason, why the German husbands are not quite so complaisant as they ought otherwise to be to their ladies, who are not intitled to any pre-eminence at the table; nor indeed do they seem to affect it, being neither ambitious nor loquacious, though they are said to be fond of gaming. Many of the German nobility, having no other hereditary estate than a high-sounding title, enter into their armies, and those of other sovereigns. Their fondness for title is attended with many other inconveniences. Their princes think that the cultivation of their lands, though it may treble their revenue, is below their attention; and that, as they are a species of beings superior to labourers, they would demean themselves in being concerned in the improvement of their grounds. The domestic diversions of the Germans are the same as in England; billiards, cards, dice, fencing, dancing, and the like. In summer, people of fashion repair to places of public resort, and drink the waters. As to their field diversions, besides their favourite one of hunting, they have bull and bear baiting. The inhabitants of Vienna live luxuriously, a great part of their time being spent in feasting and carousing; and in winter, when the several branches of the Danube are frozen over, and the ground covered with snow, the ladies take their recreations in sledges of different shapes, such as griffins, tigers, swans, scollop-shells, &c. Here the lady sits, dressed in velvet, lined with rich furs, and adorned with laces and jewels, having on her head a velvet cap; and the sledge is drawn by a horse of tag, set off with plumes of feathers, ribbons, and bells. As this diversion is taken chiefly

in the night time, servants ride before the sledge with torches, and a gentleman sitting on the sledge behind guides the horse.

(1.) GERMANTOWN, a town of New York, in Columbia county, containing 516 citizens, in 1796.

(2. 3.) GERMANTOWN, the name of two towns in North Carolina; 1. in Hyde county, Newbern district; 2. the capital of Stokes county, on a branch of the Dan, 523 miles SW. by S. of Philadelphia.

(4.) GERMANTOWN, a town of Pennsylvania, in Philadelphia county, chiefly inhabited by Germans. It has one principal street, mostly of stone buildings, 2 miles long, with Lutheran and Calvinist churches, Quaker meeting house, &c. Stockings are manufactured to a great extent, and there are several tanneries. It is 7 miles N. of Philadelphia.

(1.) GERMANY, a very extensive empire in Europe, but which, in different ages, has had very different limits. The name, according to the most probable conjecture, is derived from the Celtic words, *Ghar man*, signifying a warlike man, in which their other name, *ALLMAN*, or *ALLMANN*, likewise alludes.

(2.) GERMANY, ANCIENT ACCOUNTS AND EXTENT OF. The ancient history of the Germans is altogether wrapped up in obscurity; nor do we, in many ages, know any thing more of them than what we learn from the history of their wars with the Romans. The first time they are mentioned by the Roman historians, is about A. A. C. 113, when Marcellus subdued Insubria and Liguria, and defeated the *Gefate*, a German nation situated on the banks of the Rhine. From this time history is silent with regard to all these northern nations till the eruption of the Cimbric and Teutonic, who inhabited the most northerly parts of Germany. The event of their enterprise will be found related under the articles AMBRONES, CIMBRI, and TEUTONES. We must not, however, imagine, because these people invaded Italy at the same time, that therefore their countries were contiguous. The Cimbric and Teutonic only dwelt beyond the Rhine; while the Ambrones inhabited the country between Switzerland and Provence. It is indeed very difficult to fix the limits of the country called *Germany* by the Romans. The southern Germans were intermixed with the Gauls, and the northern ones with the Scythians; and thus the ancient history of the Germans includes that of the Dacians, Huns, Goths, &c. till the destruction of the western Roman empire by them. Ancient Germany, therefore, we may reckon to have included the northern part of France, the Netherlands, Holland, *Germany* so called at present, Denmark, Prussia, Poland, Hungary, part of Turkey in Europe, and Muscovy.

(3.) GERMANY, ANCIENT DIVISION OF. The Romans divided Germany into two regions; BELGIC or *Lower Germany*, which lay to the southward of the Rhine; and, 2. GERMANY PROPER or *HIGH GERMANY*.

I. GERMANY, BELGIC, or LOWER GERMAN, lay between the rivers Seine and the Rhine; and in this we find a number of different nations, the most remarkable of which were the following: 1. The *UBII*, whose territory lay betwe

rhine and the Mosæ, (or Mæse,) and whose capital was Cologne. 2. Next to them were the *Tungri*, supposed to be the same whom Cæsar calls *Sibrones* and *Coudrivi*; and whose metropolis, then called *Attuatica*, has since been named *Tonnes*. 3. Higher up from them, and on the other side of the Moselle, were the *Treviri*, whose capital was *Augusta Trevirorum*, now *Triers*. 4. Next to them were the *Tribocci*, *Neuenses*, and *Favonenses*. The former dwelt in Alsace, and had *Argentoratum*, now *Strasbourg*, for their capital: the others inhabited the cities of *Worms*, *Spire*, and *Bentz*. 5. The *Mediomatrici* were situated along the Moselle, about the city of *Niezy* in Lorraine: and above them were situated another German nation, named *Raurici*, *Ravari*, or *Rauriaci*, who inhabited that part of Helvetia, above *Basil*. To the W. and S. of these were the *Nervi*, *Suessones*, *Silvanenses*, *Luci*, *Rhemi*, *Langones*, &c. who inhabited Belgic Gaul. Between the heads of the Rhine and Danube were seated the ancient kingdom of *Vindelicia*, whose capital was called *Lugudunum Vindelicorum*, now *Augsburg*. Below it, on the banks of the Danube were the kingdoms of *Noricum* and *Pannonia*. The first of these was divided into *Noricum Ripense* and *Mediterraneum*. It contained a great part of the provinces of *Austria*, *Styria*, *Carinthia*, *Tyrol*, *Bavaria*, and some others of less note. The latter contained the kingdom of *Hungary*, divided into *Upper* and *Lower*; and extending from *Illyricum* to the *Danube*, and the mountains *Cæthi* in the neighbourhood of *Vandobona*, now *Vienna*.

**GERMANY, PROPER, UPPER, or HIGH GERMANY**, lay beyond the Rhine and Danube. Between the Rhine and Elbe were the following nations: 1. The *Chauci*, *Upper* and *Lower*; who were divided from each other by the river *Visurgæ*, now the *Hefe*. Their country contained what is now called *Bremen*, *Lunenbourg*, *Friesland*, and *Amstergaen*. The upper *Chauci* had the *Cheruci*, and the lower the *Chamavi* on the SE. and the *Frisoni* on the NW. 2. The *Frisoni*, upper and lower, were divided from the lower *Chauci* by the river *Amisfa*, now the *Ems*; and from one another by an arm of the Rhine. Their country retains the name of *Friesland*, and is divided into *East* and *West*; but the latter has been long separated from Germany, as one of the *Seven United Provinces*, and now forms the department of *Ems* in the *Batavian republic*. 3. Beyond the *Frisoni*, (now the *Yssel*), which bounded the country of the *Frisoni*, were situated the *Bructeri*, who inhabited that tract now called *Broccmorland*; and the *Marsi*, about the river *Luppe*. On the other side of that river were the *Usippii* or *Uspites*; and these were famed for often changing their territories, and therefore found in other places. 4. Next to these were the *Juones*, or inhabitants of *Juverna*, between the *Mæse* and the *Rhine*. 5. The *Catti*, another ancient and warlike nation, inhabited *Hesse* and *Thuringia*, from the *Haartzian mountains* to the *Rhine* and *Weser*; among whom were comprehended the *Mattiaci*, whose capital by some thought to be *Marpurg*, by others *Weser*. 6. Next to these were the *Seducii* bordering upon *Suabia*; *Narisci*, or the ancient inhabitants of *Northgow*, whose capital was *Nu-*

*remberg*; and the *Marcomanni*, whose country anciently reached from the Rhine to the head of the *Danube* and to the *Neckar*. The *MARCOMANNI* afterwards went and settled in *Bohemia* and *Moravia*, under their general or king *Mirobodius*; and some of them in *Gaul*, whence they drove the *Boii*, who had settled themselves there. 7. On the other side of the *Danube*, and between the *Rhine* and it, where the *HERMUNDURI*, who possessed the country now called *Misfia* in *Upper Saxony*; though some make their territories to have extended much farther, and to have reached to, or even beyond *Bohemia*, then the seat of the *Boii*, whence its name. 8. Beyond them, on the N. of the *Danube*, was another seat of the *MARCOMANNI* along the river *Albis*, or *Elbe*. 9. Next to *Bohemia* were situated the *QUADI*, whose territories extended from the *Danube* to *Moravia*, and the northern part of *Austria*. These are comprehended under the ancient name of *SUEVI*; part of whom at length forced their way into *Spain*, and settled a kingdom there. 10. Eastward of the *Quadi* were situated the *BASTARNÆ*, and parted from them by the *Granna*, now *Gran*, a river that falls into the *Danube*; and by the *Carpathian mountains*, from them called *Alpes Bastarnicæ*. The country of the *Bastarnæ* indeed made part of the *European Sarmatia*, and so was without the limits of *Germany* properly so called; but we find these people so often in league with the *German nations*, and joining them for the destruction of the *Romans*, that we cannot but account them as one people. Between those nations, seated along the other side of the *Danube* and the *Hercynian forest*, were several others whose exact situation is uncertain, viz. the *Martigni*, *Burii*, *Borades*, *Lygii*, or *Loziones*, and some others, who are placed by our geographers along the forest above-mentioned, between the *Danube* and the *Vistula*. On this side the *Hercynian forest*, were the famed *RHÆTI*, (now *GRISONS*;) seated among the *Alps*. Their country, which was also called *Western Illyricum*, was divided into *Rætia Prima* or *Propria*, and *Secunda*; and was then of much larger extent, spreading itself towards *Suabia*, *Bavaria*, and *Austria*. On the other side of the *Hercynian forest* were, 1. The *SUEVI*, who spread themselves from the *Vistula* to the river *Elbe*. 2. The *LONGOBARDI*, so called, according to some, on account of their wearing long beards; but according to others, on account of their consisting of two nations, viz. the *Bardi* and *Lingones*. These dwelt along the river *Elbe*, and bordered southward on the *Chauci* above-mentioned. 3. The *BURGUNDI*, of whose original seat we are uncertain. 4. The *Semnonæ*, who, about the time of *Tiberius*, were seated on the river *Elbe*. 5. The *ANGLES*, *SAXONS*, and *GOTHS*, were probably the descendants of the *Cimbri*; and inhabited the countries of *Denmark*, along the *Baltic sea*, and the peninsula of *Scandinavia*, containing *Norway*, *Sweden*, *Lapland*, and *Finmark*. 6. The *VANDALS* were a Gothic nation, who, proceeding from *Scandinavia*, settled in the countries now called *Mecklenburgh* and *Brandenburgh*. 7. Of the same race were the *DACIANS*, who settled themselves in the neighbourhood of *Palus Mæotis*, and extended their territories along the banks of the *Danube*.

(4.) **GERMANY, ANCIENT HISTORY OF, TILL CÆSAR'S EXPEDITION.** The above are the names of the German nations, who performed the most remarkable exploits in their wars with the Romans. We also find mention made of the **SCORDISCI**, a Thracian nation, who afterwards settled on the banks of the Danube. About A. A. C. 113, they ravaged Macedon, and cut off a whole Roman army sent against them; the general M. Porcius Cato, grandson to Cato the censor, being the only person who escaped. After this, they ravaged all Thessaly; and advanced to the coasts of the Adriatic, into which, because it stopped their farther progress, they discharged a shower of darts. By another Roman general, however, they were driven back into their own country with great slaughter; and, soon after, Metellus so weakened them by repeated defeats, that they were incapable, for some time, of making any more attempts on the Roman provinces. At last, in the consulship of M. Livius Drusus and L. Calpurnius Piso, the former prevailed on them to pass the Danube, which thenceforth became the boundary between the Romans and them. Notwithstanding this, in the time of the Jugurthine war, the Scordisci passed the Danube on the ice every winter, and being joined by the **TRIBALLI**, a people of Lower Mœsia, and the **Daci** of Upper Mœsia, penetrated as far as Macedon, committing every where dreadful ravages. So early did these northern nations begin to be formidable to the Romans, even when they were most renowned for warlike exploits. Till the time of Julius Cæsar, however, we hear nothing more concerning the Germans.

(5.) **GERMANY, HISTORY OF, FROM CÆSAR'S EXPEDITION TO HIS DEATH.** About A. A. C. 58, Cæsar undertook his expedition into Gaul; during which, his assistance was implored by the **Ædui**, against **Ariovistus**, a German prince who oppressed them. Cæsar, pleased with this opportunity of increasing his power, invited Ariovistus to an interview; but this being declined, he next sent deputies desiring him to restore the hostages he had taken from the **Ædui**, and to bring no more troops over the Rhine into Gaul. To this a haughty answer was returned; and a battle soon after ensued, in which Ariovistus was entirely defeated, and with great difficulty made his escape. In A. A. C. 55, Cæsar having subdued the **Suevones**, **Bellovaci**, **Ambiani**, **Nervi**, and other nations of Belgic Gaul, hastened to oppose the **Usipetes** and **Tencteri**. These nations having been driven out of their own country by the **Suevi**, had crossed the Rhine with a design to settle in Gaul. As soon as he appeared, the Germans sent him a deputation, offering to join him, provided he would assign them lands. Cæsar replied, that there was no room in Gaul for them; but he would desire the **Ubii** to give them leave to settle among them. Upon this, they desired time to treat with the **Ubii**; but in the mean time fell upon some Roman squadrons: which so provoked Cæsar, that he immediately marched against them, and coming unexpectedly upon them, defeated them with great slaughter. They fled in the utmost confusion; but the Romans pursued them to the conflux of the Rhine and the Mæse, where a battle was renewed with such fury, that

about 400,000 of the Germans perished. A this, Cæsar, being resolved to spread the terror of the Roman name through Germany, built a bridge over the Rhine, and entered that country. In this expedition, however, which was his last into Germany, he performed no remarkable exploits. A little before his death, indeed, he had projected the conquest of that as well as of many other countries; but his assassination prevented the execution of these projects.

(6.) **GERMANY, HISTORY OF, FROM CÆSAR'S TIME, TILL THE DEATH OF DRUSUS.** Not further is recorded of the Germans till about A. C. 17, when the **TENCTERI** made an irruption into Gaul, and defeated M. Lollius, proconsul of that province. At last, however, they were pushed, and forced to retire with great loss beyond the Rhine. Soon after this the **Rhæti** invaded Italy, where they committed the greatest devastations, putting all the males they met to the sword without distinction of age; and when they began to take women with child, they consulted their augurs to know whether the child was male or female; and if they pronounced it a male, the mother was immediately massacred. Against these barbarians was sent Drusus, the second son of Livia, a youth of extraordinary valour and great accomplishments. He brought them to battle; in which the Romans proved victorious, and cut in pieces great numbers of them with very little loss. Those who escaped the general slaughter, being joined by the **Vindelici**, fled their rout towards Gaul, with a design to invade that province. But Augustus, upon the notice of their march, dispatched against them **Tiberius** with several chosen legions. He was no less successful than Drusus had been; for having transported his troops over the lake **Brigantium** (now **CONSTANCE**), he fell unexpectedly on the enemy, and gave them a total overthrow, took most of their strong holds, and obliged the whole nation to submit to his own terms. Tiberius, to keep the conquered countries in awe, planted two colonies in **Vindelicia**, and opened from thence a road to **Rhætia** and **Noricum**. One of the cities which he built for the defence of his colonies, he called from his father Drusus, **Drusomagus**; the other by the name of Augustus, **Augusta Vindelicorum**, which cities are now known by the names of **MUNINGHEN** and **AUGSBURG**. He next encountered the **Pannonians**, who had been subdued by **Agrippa**, but revolted on hearing the news of that great commander's death, which happened A. A. C. 11. Tiberius, however, with the assistance of the **Scordisci**, soon forced them to submit. They delivered up their arms, and hostages, and put the Romans in possession of all their towns and strong holds. Tiberius spared their lives; but laid waste their country, plundered their cities, and sent the best part of their youth into other countries. In the mean time, Drusus having prevented the Gauls from revolting, prepared to oppose the Germans who dwelt beyond the Rhine. They had collected the most numerous and formidable army that ever been seen in those parts; with which they were advancing towards the Rhine, when Drusus defeated them as they attempted to cross

and, pursuing his advantage, entered of the Usipetes, now *Relinchen*, and advanced against the Sicambri in the wood of the Lype and Yffel. They were in a great battle, laid waste their burnt most of their cities, and following of the Rhine, approached the Germanic the Frisii and the Chauci between and the Elbe. In these marches the need extremely for want of provisions: himself was often in great danger of need, as the Romans who attended him unacquainted with the flux and reflux of the Rhine. The Roman forces went into their winter quarters; and next year (A. D. 12) Drusus marched against the Teutones, easily subdued. Afterwards, passing (now the Lype) he reduced the Catti, extending his conquests to the Visurgis (or Weser); which he would had he not been in want of provisions, having laid waste the whole country. retreating, the Germans unexpectedly met him in a narrow passage; and having cut the Roman army, cut a great number of pieces. But Drusus having animated the Germans were defeated with such slaughter that the ground was strewed for several days with dead bodies. Drusus found in their camp a quantity of iron chains, which they had taken from the Romans; and so great was the booty, that they had agreed before the division of the booty. After this Drusus built two forts to keep the countries in awe; the one at the confluence of the Lype and the Alme, the other in the Catti on the Rhine. He also made a canal, called in honour of his wife *Flavia*, to convey the waters of the Rhine into the North Sea, which extended 8 miles; and was very convenient for conveying the Roman troops by water to the Frisii and Chauci. The Emperor Augustus, bent on the subduing of the whole of Germany, advanced to the North Sea, attended by Tiberius and the former he sent against the Daci, to the S. of the Danube; and the complete conquest he had so successfully in the western parts of Germany, easily overcame the Daci, and transported of them into Gaul. The latter, of the Rhine, subdued all the nations over to the Elbe; but having attempted to cross this last, he set out for Rome: never, was put to his conquests and violent fever, with which he was seized: turn.

GERMANY, HISTORY OF, FROM DRUSUS'S THAT OF VARUS. After the death of Tiberius again over-ran all those countries Drusus had spent the preceding year had struck some of the northern nations in error, that they sent deputies to sue for peace. This, however, they could not obtain from the emperor declaring that he would conclude a peace with one, unless they But the Catti, or according to some

the Sicambri, could not be prevailed upon to submit; so that the war was carried on, though in a languid manner, for about 18 years. During this period, some of the German nations had quitted their forests, and begun to live in a civilized manner under the protection of the Romans; but Quinctilius Varus being sent to command the Roman forces in that country, he so provoked the inhabitants by his extortions, that not only those who still held out refused to submit, but even the nations that had submitted were seized with an eager desire of throwing off the yoke. Among these was a young chieftain of extraordinary parts and valour, named *Arminius*. He was the son of Sigimer, one of the most powerful chiefs among the Catti, had served with great reputation in the Roman armies, and been honoured by Augustus with the privileges of a Roman citizen, and the title of knight. But his patriotism prevailing over his gratitude, he resolved to improve the general discontent among his countrymen, to deliver them from the Roman yoke. With this view he engaged, underhand, the leading men of all the nations between the Rhine and the Elbe, in a conspiracy against the Romans. To put Varus off his guard, he advised him to show himself to the inhabitants of the more distant provinces, administer justice among them, and accustom them to live after the Roman manner. Varus, being a man of a peaceable temper, readily consented to this insidious proposal; and, leaving the neighbourhood of the Rhine, marched into the country of the Cherusci. Having there spent some time in hearing causes, Arminius persuaded him to weaken his army, by sending out detachments to clear the country of robbers. This done, some distant nations of Germany rose up in arms by Arminius's directions; while those through which Varus was to pass in marching against them, pretended to be in a state of tranquillity, and ready to join the Romans against their enemies. On the first news of the revolt, Varus marched against the enemy with three legions and six cohorts; but being attacked by the Germans as he passed through a wood, his army was almost totally cut off, while he himself and most of his officers fell by their own hands.

(8.) GERMANY, HISTORY OF, FROM GERMANICUS'S FIRST EXPEDITION TO HIS RETURN. This terrible overthrow, though it raised a general consternation in Rome, did not, however, cause Augustus to abandon his enterprise. About two years after (A. D. 12), Tiberius and Germanicus were appointed to command in Germany. The death of Augustus, which happened soon after, prevented Tiberius from going on his expedition; and Germanicus was for some time hindered from proceeding in his, by a revolt of the legions, first in Pannonia, and then in Germany. About A. D. 15, Germanicus having brought over the soldiers to their duty, laid a bridge across the Rhine, over which he marched 12,000 legionaries, 26 cohorts of the allies, and 8 alæ (squadrons of 300 each) of horse. With these he first traversed the Cælian forest (part of the Hercynian, supposed to lie partly in the duchy of Cleves, and partly in Westphalia), and some other woods. On his march, he was informed, that

that the Marſi were celebrating a feſtival with great mirth and jollity. Upon this he advanced with ſuch expedition, that he ſurprized them in the miſt of their debauch; a terrible maſſacre enſued, and the country was deſtroyed with fire and ſword for 30 miles round, without the loſs of a ſingle man on the part of the Romans. This general maſſacre roused the Bruſteri, the Tubantes, and the Uſipetes; who beſetting the paſſes through which the Roman army was to return, fell upon the rear, and put them into diſorder; but the Romans ſoon recovered themſelves, and defeated the Germans with conſiderable loſs. The following year, (A. D. 16.) Germanicus, taking advantage of ſome intestine broils which happened among the Catti, entered their country, where he put great numbers to the ſword. Moſt of their youth, however, eſcaped by ſwimming over the Adrana, (now the Eder,) and attempted to prevent the Romans from laying a bridge over that river; but being diſappointed in this, ſome of them ſubmitted to Germanicus, while the greater part, abandoning their villages, took refuge in the woods; ſo that the Romans, without oppoſition, ſet fire to all their towns, and villages; and having burnt their capital, began their march back to the Rhine. Germanicus had ſcarce reached his camp, when he received a meſſage from Segeſtes, a German prince, in the intereſt of the Romans, acquainting him that he was beſieged in his camp by Arminius. On this he inſtantly marched againſt the beſiegers, entirely defeated them, and took a great number of priſoners; among whom was Thuſfeldis, the wife of Arminius, and daughter of Segeſtes, whom the former had carried off, and married againſt her father's will. Arminius then, more enraged than ever, for the loſs of his wife, whom he tenderly loved, ſtirred up all the neighbouring nations againſt the Romans. Germanicus to avoid engaging ſuch numerous forces at once, detached his lieutenant Cæcina, at the head of 40 cohorts, into the territories of the Bruſteri; his cavalry, under the command of Pedro, entered the country of the Friſii; while he himſelf embarked the remainder of his army, conſiſting of four legions, on a neighbouring lake; and transported them by rivers and canals to the place appointed on the Ecms, where the three bodies met. In their march they found the ſad remains of the legions conducted by Varus, which they buried with all the ceremony their circumſtances could admit. After this they advanced againſt Arminius, who retired and poſted himſelf advantageouſly cloſe to a wood. The Roman general coming up with him, ordered his cavalry to advance and attack the enemy. Arminius, at their firſt approach, pretended to fly; but ſuddenly wheeled about, and giving the ſignal to a body of troops, whom he had concealed in the wood, to ruſh out, obliged the cavalry to give ground. The cohorts then advanced to their relief; but they too were put into diſorder, and would have been pushed into a morafs, had not Germanicus himſelf advanced with the reſt of the cavalry to their relief. Arminius did not think it prudent to engage theſe freſh troops, but retired in good order; upon which Germanicus alſo retired towards the Ecms. Here he embarked with four

legions, ordered Cæcina to reconduct four by land, and ſent the cavalry to march along the ſhore with orders to march along the ſhore. Though Cæcina was to return by ſea, yet Germanicus adviſed him to go with all poſſible ſpeed, a cauſeway, called *the ſea way*, which led acroſs vaſt marſhes, on all ſides with woods and hills. He having got notice of this, arrived at the ſea before him; and filled the woods with ſoldiers who, on the approach of the Romans, and attacked them with great fury. Germanicus was unable to manage their arms in the manner he was obliged to yield; and would have been entirely defeated, had not night put an end to combat. The Germans, encouraged by ſucceſs, inſtead of ſleeping ſpent the night in diverting the courſes of the rivulets in the neighbouring mountains; ſo that the camp of the Romans was ſwamped with water, and their works were overturned; at laſt reſolved to attack the enemy by land, having driven them to their woods, and ſtationed them there, till the baggage and what ſhould paſs the cauſeway, and get out of my's reach. But when his army was ſtationed, the legions poſted on the wings, diſtations, and occupied a field beyond; Cæcina followed them, but the baggage was ſtationed in the mire, as he attempted to croſs it, which greatly embarrassed the foldiers; perceiving this, began the attack, and ſaid, "This is a ſecond Varus, the ſame as he who killed him and his legions," fell on the Romans with expreſſible fury. As he had ordered the baggage to be carried, great numbers were killed; and the ground became ſo ſoaked with their blood, the reſt either fell on their knees, or galloping through the rain in diſorder. Cæcina diſtinguiſhed himſelf in the battle, but his horſe being killed, he would have been taken priſoner, had not the firſt legions taken him. The avarice of the enemy, however, prevented the Romans from deſtruction; for the legions were quite ſpent, and on the morning, the Germans ſuddenly abandoned their baggage. During this reſt, the Romans ſtruggled out of the marſh, and entered the dry fields, formed a camp with ſpeed. The Germans having thus loſt the opportunity of deſtroying the Romans, conſidering the advice of Arminius, attacked them the next morning, but were repulſed with great loſs; after which they gave Cæcina no more trouble till he reached the banks of the Rhine. Germanicus, in the mean time, having collected the legions he had with him down to the ocean, to return by ſea to the Rhine, ſending his veſſels overloaded, delivered the 14th legions to P. Vitellius, deſiring him to reconduct them by land. But this march was attended with great numbers, who were either killed or ſwallowed up by the tide, to which they were as yet unaccuſtomed. Thoſe who eſcaped, loſt their arms, and provisions; and paſſed a melancholy time, ſome of them an eminence, which they had gained up to the chin. The next morning a

y a hasty march, reached the USINGIS, (so thought to be the HOERENSTER,) on the city of Groningen stands. There Germanicus, who had reached that river with his look the legions again on board, and conducted them to the mouth of the Rhine, whence he returned to Cologne, where it was reported they were totally lost.

**GERMANY, HISTORY OF, FROM GERMANICUS'S RETURN TO HIS DECISIVE VICTORY ARMINIUS.** This expedition cost the Romans very dear, and procured very few advantages.

Great numbers of men had perished; and the greatest part of those who had escaped to managers returned without arms, utensils, horse, half naked, lamed, and unfit for service. Next year, however, Germanicus, bent on the reduction of Germany, made vast preparations for another expedition. Having found that the Germans were chiefly indebted for their safety to woods and marshes, their short summers and long winters; and that his troops suffered from their tedious marches than from the enemy, he resolved to enter the country by sea, and thus to begin the campaign earlier, and to reach the enemy. Having therefore built 1000 vessels, with great dispatch, during winter, he sailed them early in the spring, (A. D. 16.) to the mouth of the Rhine; and appointed the island of Batavia for the general rendezvous of his fleet.

When the fleet was sailing, he detached some of his lieutenants, with orders to make an irruption into the country of the Catti; and in the mean time, he himself, upon hearing a Roman fort on the Lupias was besieged, and with six legions to its relief. Silius was repulsed, by sudden rains, from doing more than to take some booty, with the wife and daughter of the king of the Catti; neither did those who were to defend the fort wait the arrival of Germanicus. In the mean time, the fleet arriving at the island of Batavia, the provisions and warlike engines were put on board and sent forward; ships were assigned to the legions and allies; and the army being embarked, the fleet entered the bay formerly cut by Drusus, and from his name called *Flessa Drusiana*. Hence he sailed prosperously to the mouth of the Ems; where, having collected his troops, he marched directly to the Weser, and found Arminius encamped on the opposite bank, and determined to dispute his passage. The next day Arminius drew out his troops in order of battle: but Germanicus, not thinking it prudent to attack them, ordered the horse to be sent under the command of his lieutenants Silius and Emilius; who, to divide the enemy's forces, crossed the river in two different places.

At the same time Carovalda, the leader of the Batavian auxiliaries, crossed the river where the most rapid: but being driven into an ambush, he was killed, together with most of the nobility; and the rest would have been cut off, had not Stertinus and Emilius come to their assistance. Germanicus at the same time passed the river without molestation. Soon after ensued; in which the Germans were defeated with so great a slaughter that the river was covered with arms and dead bodies

for more than 10 miles round: and among the spoils taken on this occasion, were found, as formerly, the chains with which the Germans had hoped to bind their captives.

(10.) **GERMANY, HISTORY OF, FROM GERMANICUS'S VICTORY, TO THE INVASION BY THE DACIANS.** In memory of this signal victory, Germanicus raised a mount, upon which he placed as trophies the arms of the enemy, and inscribed underneath the names of the conquered nations. This so provoked the Germans, though already vanquished and determined to abandon their country, that they attacked the Roman army unexpectedly on its march, and put them into some disorder. Being repulsed, they encamped between a river and a large forest surrounded by a marsh except on one side, where it was inclosed by a broad rampart formerly raised by the Angrivarii as a barrier between them and the Cherusci. Here another battle ensued; in which the Germans behaved with great bravery, but in the end were defeated with great slaughter. After this second defeat, the Angrivarii submitted, and were taken under the protection of the Romans, and Germanicus put an end to the campaign. Some of the legions he sent to their winter-quarters by land, while he himself embarked with the rest on the river Ems, in order to return by sea. The ocean proved at first very calm, and the wind favourable: but all of a sudden a storm arising, the fleet, consisting of 1000 vessels, was dispersed: some of them were swallowed up by the waves; others were dashed in pieces against the rocks, or driven upon remote and inhospitable islands, where the men either perished by famine, or lived upon the flesh of the dead horses with which the shores soon appeared strewed; for, in order to lighten their vessels, and disengage them from the shoals, they had been obliged to throw overboard their horses and beasts of burden, nay, even their arms and baggage. Most of the men, however, were saved, and even great part of the fleet recovered. Some of them were driven upon the coast of Britain; but the petty kings who reigned there generously sent them back. On the news of this misfortune, the Catti, taking new courage, ran to arms; but Caius Silius being detached against them with 30,000 foot and 3000 horse, kept them in awe. Germanicus himself, at the head of a numerous body, made a sudden irruption into the territories of the Marci, where he recovered one of Varus's eagles, and having laid waste the country, he returned to the frontiers of Germany, and put his troops into winter quarters; whence it was soon recalled by Tiberius, and never suffered to return into Germany again. After the departure of Germanicus, the more northern nations of Germany were no more molested by the Romans. Arminius carried on a long and successful war with Maroboduus king of the Marcomanni, whom he at last expelled, and obliged to apply to the Romans for assistance; but, excepting Germanicus, it seems they had at this time no other general capable of opposing Arminius, so that Maroboduus was never restored. After the final departure of the Romans, however, Arminius having attempted to enslave his country, fell by the treachery of his own kindred.

The Germans held his memory in great veneration; and Tacitus informs us, that in their still celebrated him in their songs. Nothing remarkable occurs in the history of Germany from this time till the reign of Claudius I. A war indeed is said to have been carried on by Lucius Domitius, the father of Nero. But of his exploits we know nothing more than that he penetrated beyond the river Elbe, and led his army farther into the country than any of the Romans had ever done. In the reign of Claudius, however, the German territories were invaded by Cn. Domitius Corbulo, one of the greatest generals of his age. But when he was on the point of forcing them to submit to the Roman yoke, he was recalled by Claudius, who was jealous of the reputation he had acquired. In the reign of the emperor Nero, a terrible revolt happened among the Batavians and those German nations who had submitted to the Romans; an account of which will be found under the article ROME. The revolt was with difficulty subdued; but, in the reign of Domitian, the Dacians invaded the empire, and proved a more terrible enemy than any of the other German nations had been.

(12.) GERMANY, HISTORY OF, FROM THE DACIAN INVASION TO THE DEATH OF DECEBALUS. After repeated defeats, Domitian was at last obliged to consent to pay an annual tribute to Decebalus king of the Dacians; which continued to the time of Trajan. But this warlike prince refused to pay tribute; alleging, when it was demanded of him, that he had never been conquered by Decebalus. Upon this the Dacians passed the Danube, and began to commit hostilities in the Roman territories. Trajan, glad of this opportunity to humble an enemy whom he began to fear, drew together a great army, and marched with the utmost expedition to the banks of the Danube. As Decebalus was not apprised of his arrival, the emperor passed the river without opposition, and entering Dacia, laid waste the country. At last he was met by Decebalus with a numerous army. A bloody engagement ensued, in which the Dacians were defeated; though the victory cost the Romans dear: the wounded were so numerous, that they wanted linen to bind up their wounds; and to supply the defect, the emperor generously devoted his own wardrobe. After the victory, he pursued Decebalus from place to place, and at last obliged him to consent to a peace on the following terms: 1. That he should surrender the territories which he had unjustly taken from the neighbouring nations. 2. That he should deliver up his arms, his warlike engines, with the artificers who made them, and all the Roman deserters. 3. That for the future he should entertain no deserters, nor take into his service the natives of any country subject to Rome. 4. That he should dismantle all his fortresses, castles, and strong holds. And, lastly, that he should have the same friends and foes with the Romans. This peace was of short duration. Four years after, (A. D. 105), Decebalus began to raise men, provide arms, entertain deserters, fortify his castles, and invite the neighbouring nations to join him against the Romans as a common enemy.

The Scythians hearkened to his call, but the Jazyges, a neighbouring nation, refused to bear arms against Rome, and defended their country. Hereupon Trajan marched against him; but the Dacian, finding himself unable to withstand him by open force, recourse to treachery, and attempted to murder the emperor. His design proved abortive, and Trajan pursued him into Dacia. That his troops might not be obliged to pass and repass the Danube, he caused a celebrated bridge over that river. See BRIDGE, INDEX. To guard the bridge, two castles to be built; one on each side of the river. Trajan, however, as the season advanced, did not enter Dacia this year, but contented himself with making the necessary preparations. Early in the next spring, Trajan set out for Dacia; and having crossed the Danube by the new bridge, reduced the country, and would have taken Decebalus himself had he not put an end to his own life by falling into the hands of the Romans.

(13.) GERMANY, HISTORY OF, FROM THE DEATH OF DECEBALUS, TO THAT OF AURELIUS. After the death of Decebalus, Dacia was reduced to a Roman province; several castles were built in it, and garrisons sent in them to keep the country in awe. In the reign of Trajan, the Roman empire declined, and the northern nations to be more and more formidable. Dacia indeed was not the Romans till the reign of Gallienus; who succeeded Trajan, caused the bridge over the Danube to be broken, and the barbarians should make themselves masters of it, and invade the Roman territories. At the time of Marcus Aurelius, the Goths and Quadi invaded the empire, and effected an emperor a terrible overthrow. He carried on a war, however, with better success, and invaded their country in his turn. During this war that the Roman army is said to have been saved from destruction, by that event related under the article CHRIS. In the end, the Marcomanni and Quadi, after repeated defeats, brought to the verge of submission; inasmuch that their country would have been reduced to a Roman province, had not Marcus Aurelius been diverted from it by conquests by the revolt of one of his provinces.

(14.) GERMANY, HISTORY OF, FROM THE DEATH OF M. AURELIUS, TO THE DEATH OF CHARLEMAGNE. After the death of Aurelius, the Germanic nations became more and more formidable to the Romans, from being able to invade and attempt the conquest of these northern countries, the greatest difficulty to repress the rage of their inhabitants. But for a particular time, their various invasions of the Roman empire, and its total destruction by them at last. The immediate destroyers of the Roman empire were the Heruli; who, under their king Odoacer, dethroned Augustulus the last Roman emperor, and proclaimed Odoacer king of Italy in 476. The Heruli were soon expelled

hs; and these in their turn were subdued  
 Justinian I, who re-annexed Italy to the eastern  
 empire. But the popes found means to obtain  
 temporal as well as spiritual jurisdiction over  
 a considerable part of the country, while the Lombards  
 subdued the rest. These last proved very  
 lesome to the popes, and at length besieged  
 Rome in his capital. In this distress he applied  
 to Charles the Great king of France; who con-  
 quered both Italy and Germany, and was crown-  
 ed emperor of the west, A. D. 800. See FRANCE,  
 § 13—15.

(.) GERMANY, HISTORY OF, FROM THE BE-  
 GINNING OF THE EMPIRE BY CHARLEMAGNE,  
 TO THE ESTABLISHMENT OF ITS PRESENT CON-  
 STITUTION. The extensive empire erected by  
 Charlemagne the Great, which he himself imprudently  
 endeavoured to divide among his sons during his own  
 reign, (see FRANCE, § 1, 16.) was not long en-  
 dured by his posterity. In France the Carolin-  
 gian race continued to reign for 183 years after  
 Charlemagne; but in Germany, it continued only 74  
 years; producing within that period 6 emperors:  
 Louis I. his son, Lothair I, and Lewis II. his  
 sons; Charles II, his great-grandson; and Lewis  
 III, son of Charles II, and Charles III, who was  
 deposed in 888. The history of these unfortunate  
 emperors is related under the article FRANCE, § 1,  
 19. On the deposition of Charles III, the  
 German princes resumed their ancient independ-  
 ence; and, rejecting the Carolingian race, (ac-  
 cording to some: elected Arnulph, king of Pohe-  
 nia; Others, however, say, this Arnulph was the  
 son of Carloman, a descendant of Charlemagne.  
 As it may, he reigned 12 years, and con-  
 quered his rival Guido, or Guy, who had been  
 in opposition to him, and crowned king of  
 Germany, by pope Formosus in 892; who after  
 the death of Guy, next year, crowned his  
 son Lambert. Arnulph, however, reigned till 899,  
 when he died, and was succeeded by his son Lewis  
 whom some stile the last of the male line of  
 Charlemagne. Upon his death, in 911, the nobles  
 elected Otho, duke of Saxony, but he being old,  
 recommended CONRAD, duke of Franconia, whom  
 they elected accordingly in 912. Conrad dying  
 young, recommended to their election, Henry I,  
 surnamed the Fowler, the son of Otho. Henry con-  
 quered the Danes, Huns, Vandals, and Bohemi-  
 ans, and was succeeded in 937 by his son OTHO I,  
 surnamed the Great; who after reigning 26 years  
 of Germany, was crowned emperor in 962.  
 This he reigned other 10 years; and in 973,  
 was succeeded by his son, Otho II; who dying in  
 983, was succeeded by his son Otho III, a boy of  
 3 years of age. The reigns of most of these mon-  
 archs contain little remarkable, except their con-  
 tention with the popes; for which see ITALY. What  
 immediately merits attention is the progress  
 of the empire in Germany, which was in a great  
 measure opposite to that of the other kingdoms of  
 Europe. When the empire erected by Charle-  
 magne fell asunder, all the independent princes  
 lost the right of election; and those now dis-  
 tinguished by the name of electors had no legal or  
 a right to appoint a successor to the impe-  
 ror. They were only the officers of the  
 emperor's or king's household, his secretary, stew-  
 ard, chaplain, marshal, or master of horse, &c.  
 By degrees, however, as they lived near his per-  
 son, and had independent territories of their own,  
 they increased their influence and authority; and  
 in the election of Otho III, A. D. 984, acquired  
 the sole right of electing the emperor. Thus,  
 while in the other kingdoms of Europe, the dig-  
 nity of the great lords, who were all originally feo-  
 dal or independent barons, was diminished by  
 the power of the king, as in France, and by the  
 influence of the people, as in Great Britain; in  
 Germany, on the other hand, the power of the  
 electors was raised upon the ruins of the emperor's  
 supremacy, and of the people's jurisdiction.

(15.) GERMANY, HISTORY OF, FROM THE ES-  
 TABLISHMENT OF THE IMPERIAL CONSTITU-  
 TION, TO THE ACCESSION OF THE HOUSE OF  
 AUSTRIA. Upon the death of Otho III, in 1002,  
 an interregnum of 4 months ensued; after which  
 the princes elected Henry II, surnamed the Lambe,  
 the grandson of Henry I, who reigned 23 years.  
 Of this emperor's successors, till the accession of  
 the house of Austria, it is only necessary here to  
 give a brief chronological list, as their most impor-  
 tant transactions will be noticed under the article  
 ITALY. Conrad II, surnamed Salicus, the son of  
 Herman, duke of Franconia, was elected in 1024;  
 (see CONRAD II;) and after reigning near 15 years,  
 was succeeded, in 1039, by his son Henry III;  
 who, in 1056, was succeeded by his son Henry IV,  
 though not without opposition, from Rodolph of  
 Suabia, and Herman of Luxemburg. Henry IV,  
 after having reigned no less than 50 years, was de-  
 posed in 1106, by his unnatural son Henry V; on  
 whose death in 1125, Lothaire II, duke of Saxony,  
 was elected. He died in 1137, and next year, the  
 diet chose CONRAD III, duke of Franconia, the  
 son of Frederic, duke of Suabia. He was succeeded  
 in 1152, by his brother Frederic I, surnamed  
 Barbarossa, who having embarked against the in-  
 fidels, and taken Iconium, was drowned in Syria,  
 in 1190. He was succeeded by his son, Henry VI,  
 who behaved so villainously to Richard I. of Eng-  
 land, (see ENGLAND, § 24,) and who was at last  
 poisoned by his wife, Constance, and succeeded by  
 his son, Otho IV, in 1197. But a party of the  
 princes having chosen Philip, duke of Suabia,  
 Henry's brother, a civil war ensued, which end-  
 ed in favour of Otho, Philip being assassinated in  
 1208. But 4 years after, Otho was deposed, and  
 Frederic II, his younger brother, then king of Sic-  
 ily, was elected emperor, and crowned by pope  
 Honorius III, in 1220. Having afterwards offend-  
 ed pope Gregory IX, by making peace with the  
 Sultan of Babylon, Frederic was excommunicated,  
 which gave rise to the factions of the Guelphs and  
 Ghiblins, who by their inveterate virulence against  
 each other, disturbed the empire for several ages.  
 See GUELPHS. Conrad IV. was elected emperor  
 on the death of his father Frederic II, in 1250.  
 See CONRAD IV. He died 4 years after, and was  
 supposed to have been poisoned. His son was still  
 more unfortunate. See CONRAD, N<sup>o</sup> 6. After an  
 interregnum of two years, Richard, duke of Corn-  
 wall, brother to Henry III, king of England, was  
 elected emperor, in 1257; but that prince refusing  
 mostly in England, Alphonso X, king of Castile,  
 was elected in opposition to him. See ALPHONSO X.

VII. OF Luxembourg was then elected, upon whose death in 1313, an interregnum of a year took place, when Lewis V, the son of Lewis D. of Bavaria, by Matilda daughter of Rodolph I, was chosen by one party of the electors, and Frederic, the son of Albert I, by another. But Frederic, being taken prisoner, was obliged to renounce his dignity; and Lewis, being killed by a fall from his horse, in 1347, was succeeded by his other competitor, Charles IV, the son of John, king of Bohemia, and grandson of Henry VII. This prince was a great encourager of learning, and in his reign the golden bull, establishing the Germanic constitution, was given by Pope Innocent VI, in 1356. Charles, dying in 1378, was succeeded by his son Wenceslaus, who was twice imprisoned by the Bohemians, and at last deposed in 1400, when Rupert, Prince Palatine, was elected. Rupert was succeeded in 1410, by Jodocus Margrave of Moravia, who, in 1411, was displaced by Sigismund, K. of Hungary and Bohemia, the son of Charles IV. Albert II, D. of Austria, having married this monarch's daughter, succeeded him in all his dominions in 1437, but reigned only two years. His son Frederic III, archduke of Austria, &c. was elected emperor in 1440; and from this period the imperial dignity continued in the male line of that family for 300 years. His successor Maximilian I. married the heiress of Charles duke of Burgundy; whereby Burgundy and the 17 provinces of the Netherlands were annexed to the house of Austria. Charles V. grandson of Maximilian, and heir to the kingdom of Spain, was elected emperor, A. D. 1519. Under him MEXICO and PERU were conquered by the Spaniards; and in his reign happened the REFORMATION in several parts of Germany; which, however, was not confirmed by authority till 1648, at the treaty of Westphalia.

(17.) GERMANY, HISTORY OF, FROM THE RE-

to much divided, as to threaten a civil war. His ambition, however, ed to reconcile them; but the Bohemians, and threw the imperial committee window at Prague. This gave rise to a civil war, which lasted 30 years. Matthias to have exterminated both parties; ed a confederacy, called the *Evangelical Union*, which was counterbalanced by a Catholic league. Matthias dying in 1618, was succeeded by his cousin FERDINAND II.; but the Bohemians refused to give him the crown, and elected their crown to Frederic the elector, the most powerful Protestant prince and son in law to K. James I. He was so imprudent as to accept of the crown, and lost it, being entirely defeated by the Bohemians, and the imperial generals at Prague; and he was even deprived of the rate, the best part of which was given to the Protestants of Bavaria. The Protestant prince however, had among them at this time several commanders, who were at the head of the army, and continued the war with wonder. Among these were the margrave of Brandenburg, Christian duke of Brunswic, an excellent field. Christian IV. king of Denmark, who was defeated by them; and Richelieu, the French minister, not fond of seeing the house of Austria so powerful. The emperor, on the other hand, had several excellent generals; and Christian, having been defeated by Tilly, an Imperialist of great reputation. The Protestants formed a confederacy at Leipnic, of which the emperor was the head. CHARLES X. GUSTAVUS ADOLPHUS king of Sweden, who was defeated by Tilly, An account of his glorious victories under the article SWEDEN. At last he was killed at the battle of Lutzen in 1632. His Protestant cause did not die with him. F

with both. Lewis XIV. had the two generals Condé and Turenne in his service; the latter had already distinguished himself at exploits against the Spaniards; and, in possession of Leopold, the court of France had the opportunity of confirming the treaty, and attaching to her interest several great princes of Germany. The tranquillity now took place, however, was not upon any permanent basis. War with Spain began in 1668; and the great successes of the Netherlands excited the ambition of Louis XIV. to attempt the conquest of Combray, then under the protection of Austria. This was accomplished in 1672; but the rapid success of Lewis had excited the jealousy of his neighbours to such a degree that a league was formed against him by Holland, and Sweden; and the French were obliged to enter the lists with such formidable enemies, consented to the treaty of Aix-la-Chapelle, by which, among other articles, Combray was restored.

GERMANY, HISTORY OF, FROM THE BEGINNING OF AIX-LA-CHAPELLE, TO THAT OF THE TREATY OF NIMÈGUE. The flames of war were soon renewed by the insatiable ambition of Lewis XIV; who, in 1673, entered into an alliance with Charles II. of England, aimed at the total overthrow of the public. The event of that war will be related under the article UNITED PRO-

vinces. The misfortunes of the Dutch excited the jealousy of the emperor and king of Spain, who declared themselves their allies. Thus opposed by the prince of Orange and the great general Montecuculi, whose artful conduct even the penetrating eye of Turenne could not see, he sat down suddenly before Bonn. He was joined by the prince of Orange, who evaded the vigilance of the French.

Bonn soon surrendered, and several towns in Cologne fell into the hands of the French; who likewise cut off the communication between France and the United Provinces; so that the prince was obliged to recall his armies, and all his conquests with greater rapidity had been made. In 1674 he was defeated by his ally Charles II. of England, and the emperor and elector of Cologne were compelled to renounce their allegiance to him; but, notwithstanding these misfortunes, he continued to make head against his enemies, and effected new conquests. With a powerful army he invaded Franche Comte in person, and in a few weeks reduced the whole province to obedience. In Alsace, Turenne defeated the general at Sintzheim, and ravaged the country; surprised 70,000 Germans; cut in pieces a considerable detachment at Mulhausen; and the elector of Brandenburg, who had been with the chief command, near Colmar; and the duke of Prussia, who had the command of the body a similar fate at Tuskheim; and the whole German forces at last to evacuate the country and repass the Rhine. In consequence of these disasters Montecuculi was recalled, and Turenne. The military skill of the French and Germans seemed to be nearly equal; but the superiority could be adjudged to either,

Turenne was killed by a cannon ball, in reconnoitering a situation for erecting a battery. By his death the Imperialists obtained a decided superiority. Montecuculi penetrated into Alsace; and the French, under de Lorges, nephew to the deceased general, were happy in being able to avoid a defeat. Part of the German army now sat down before Treves, where they were opposed by Marechal Crequi; but his negligence exposed him to such a dreadful defeat, that he was obliged to fly into the city with only 4 attendants. Here he endeavoured in vain to animate the people to a vigorous defence. The garrison mutinied, and, when he refused to sign the capitulation they made, delivered him up prisoner to the enemy. Lewis in the mean time had taken the field in person against the prince of Orange; but the disastrous state of affairs in Germany induced him to recall the prince of Condé to make head against Montecuculi. In this campaign the prince seemed to have the advantage. He compelled the Germans to raise the sieges of Hagenau and Saverne; and at last to repass the Rhine without having been able to force him to a battle. This was the last campaign made by these celebrated commanders; both of whom now retired from the field to spend the remainder of their days in peace. The excellent discipline, however, which the two great French generals had introduced into their armies, still continued to make them very formidable. In Germany, the duke of Lorraine, who had recovered Philippsburgh, was repeatedly defeated by Marechal Crequi, who had been ransomed. In Flanders, the prince of Orange was overmatched by the duke of Orleans and Marshal Luxembourg. A peace was at length concluded at Nimègue in 1679, by which Lewis secured Franche Comte with many cities in the Netherlands; while the king of Sweden was reinstated in those places of which he had been stripped by the Danes and Germans. This tranquillity, however, was of short duration. Lewis prepared for new conquests; possessed himself of Strasburg by treachery; and dispossessed the Elector Palatine and the Elector of Treves of the lordships of Falkenburg, Germanstein, and Valdeutz. On the most frivolous pretences he had demanded Alost from the Spaniards; and on their refusal, seized upon Luxembourg. His conduct, in short, was so intolerable, that the prince of Orange, his inveterate enemy, sought means to unite the whole empire in a league against him. Spain and Holland became parties in the same cause; and Sweden and Denmark seemed also inclined to accede to the general confederacy. Notwithstanding this formidable combination, Lewis seemed still to have the advantage. He made himself master of Philippsburg, Mannheim, Frankendal, Spiers, Worms, and Oppenheim; the palatinate was ravaged dreadfully; the towns were reduced to ashes; and the people, driven from their habitations, were left to perish through the inclemency of the weather and want of provisions. By this cruelty his enemies were rather exasperated than vanquished: the Imperialists, under the duke of Lorraine, resumed their courage, and put a stop to the French conquests. At length all parties, weary of a destructive war, consented to the treaty of Ryswick in 1697.

(20.) GERMANY, HISTORY OF, FROM THE TREATY OF RYSWICK TO THAT OF UTRECHT. By the treaty of Ryswick, Lewis XIV. gave up to the empire, Fribourg, Brisac, Kehl, and Philippsburg; and consented to destroy the fortifications of Strasburg. Fort Louis and Traerbach, the works of which had exhausted the skill of the great Vauban, with Lorrain, Treves, and the Palatinaté, were resigned to their respective princes; inasmuch that the terms to which he now consented, after so many victories, were such as could scarce have been expected under the pressure of the greatest misfortunes. The views of Lewis, however, in consenting to this apparently humiliating treaty, were beyond the views of ordinary politicians. The health of the king of Spain was in such a declining way, that his death appeared to be at hand; and Lewis now resolved to renew his pretensions to that kingdom, which he had formerly by treaty solemnly renounced. His designs in this respect could not be concealed from the vigilance of William III. of Britain; of which Lewis being sensible, and knowing that the emperor had claims of the same nature on Spain, he entered into a very extraordinary treaty with William. This was no less than the partition of the whole Spanish dominions, in the following manner: To the young prince of Bavaria were to be assigned Spain and the E. Indies; the dauphin, son to Lewis, was to have Naples, Sicily, and the province of Guipuscoa; while the archduke Charles, son to Leopold, was to have only the duchy of Milan. By this scandalous treaty the indignation of Charles was roused, so that he bequeathed the whole of his dominions to the prince of Bavaria. This scheme, however, was disconcerted by the sudden death of the prince; upon which a new treaty of partition was concluded between Lewis and William. By this the kingdom of Spain, with the E. India territories, were to be bestowed on the Archduke Charles, and the duchy of Milan upon the duke of Lorrain. The last moments of the Spanish monarch were disturbed by the intrigues of the rival houses of Austria and Bourbon; but the haughtiness of the Austrian ministers so disgusted those of Spain, that they prevailed upon their dying monarch to make a new will. By this the whole of his dominions were bequeathed to Philip duke of Anjou, grandson to Lewis XIV; who, prompted by his ambition, accepted the kingdom bequeathed to his grandson, excusing himself to his allies in the best manner he could for departing from his engagements. For this, however, he was made to pay dear. His insatiable ambition and his former successes had alarmed all Europe. The Emperor, the Dutch, and the king of England, entered into a new confederacy against him; and a bloody war ensued which threatened to overthrow the French monarchy entirely. While this war (of which an account is given under ENGLAND, § 69—74.) was carried on with such success, the emperor Leopold died in 1705. He was succeeded by his son JOSEPH I, who gave the electors of Cologne and Bavar's to the ban of the empire; but being ill served by Prince Lewis of Baden, general of the empire, the French partly recovered their affairs, notwithstanding their repeated defeats. The duke of Marlborough had not all the

success he expected or deserved. Joseph was suspected of a design to subvert the liberties; and it was plain by his conduct he expected England should take the lead in the war, which was to be entire for his benefit. The English were disappointed and selfishness; but he died in he had reduced the Hungarians; and male issue, was succeeded by his brother VI, whom the allies were endeavouring on the throne of Spain, in opposition to the duke of Anjou, grandson to Lewis X.

(21.) GERMANY, HISTORY OF, TREATY OF UTRECHT, TO THE CHARLES VI. When the peace of 1713, Charles at first made to continue the war; but found himself that he was forsaken by the British, he was obliged to conclude a peace at Buda in 1714, that he might arrest the progress of the Turks in Hungary; who had a total defeat from Prince Eugene at Peterwaradin. They received equal importance from the same general before Belgrade, which fell into the hands of the Imperialists; and next year the peace was concluded between them and the Turks. Charles employed his leisure in arrangements for increasing and preserving his dominions in Italy and the Empire. Happily for him, the crown of Great Britain was bestowed on the house of Hanover; an event which gave him a very decisive weight in European negotiations between George I. and the Emperor. Charles was sensible of this; matters were so high a stake, that in 1724 and 1725, a treaty was concluded between George I. and to assist by was factors all over Europe at that time, the powers often changed their old alliances, and concluded new ones contradictory to the old. It is sufficient to observe here, that the Hanover, and its arrangements, were the object of the British ministry; that it was the eternal aim of the party, to favour of his death, for the late emperor, having no male issue, named no other throne next to him, but that of a young prince between George I. and Charles VI; the elector of Saxony, succeeded with the view to the throne of Poland, being a descendant of the Austrian succession. The emperor had very bad success in a war, which he had undertaken chiefly for himself for the great troubles, he had to the house of Bourbon. He died, then dead, and he had no male issue. The system of France, by Cardinal Fleury, happened to be very obtained for him, from the Turks, a man he had reason to expect. On the death of the German elector, only his death, given his eldest daughter, afterwards empress queen, in the duke of Lorrain, a prince who, on the accession of power to the Austrian died in 1740.

Charles VI. was no sooner in the grave than ad so long laboured for must have been own, had it not been for the firmness of II. The young king of Prussia entered conquered Silesia, which he said had been slyly dismembered from his family. The Spain and elector of Bavaria set up claims incompatible with the pragmatic sanction, his they were joined by France; though powers had solemnly guaranteed it. The throne, after a considerable vacancy, was by the elector of Bavaria, who took the title les VII, in Jan. 1742. The French poured nies into Bohemia, where they took Prague; Q. of Hungary, to take off Prussia, ceded rance the most valuable part of the duchy a by a formal treaty. Her youth, her beautiferrings, and the fortitude with which she r, touched the hearts of the Hungarians, ose arms she threw herself and her young id though they had been long remarkable r disaffection to the house of Austria, they l unanimously in her favour. Her geneve the French out of Bohemia; and K. r II. at the head of an English and Hano- rmy, gained the battle of Dettingen, in Charles VII. was at this time miserable on erial throne, and would have given the f Hungary almost her own terms; but she ily and impolitically rejected all accommod- though advised to it by his Britannic majes- best and indeed only friend. This obsti- ve a colour to the king of Prussia to invade ra, under pretence of supporting the impe- nity; but though he took Prague, and sub- ne greatest part of the kingdom, he was orted by the French; upon which he a- ed all his conquests and retired into Silesia. rent confirmed the obsequy of the queen of ry; who came to an accommodation with perior, that she might recover Silesia. He en after in 1745, and FRANCIS I, D. of a, then grand duke of Tuscany, consent to en of Hungary, after surmounting some s, was elected emperor.

GERMANY, HISTORY OF, UNDER FRAN- The bad success of the allies against the and Prussians in the Low Countries, and of the battle of Fontenoy, retarded the oins of the empress queen against the K. of . The latter beat the emperor's brother, ules of Lorraine, who had before driven the us out of Bohemia; and the conduct of the queen, was such, that his Britannic majesty t proper to guarantee him the possession ia, as ceded by treaty. Soon after, the king it, alleging that he had discovered a secret tion between the empress queen, the emf Russia, and the king of Poland, to strip his dominions and to divide them amon- lres, suddenly drove the king of Poland out ony, defeated his troops, and took posses- Dresden; which he held till a treaty was under the mediation of king George II. ch the king of Prussia acknowledged Fran- r emperor. The war, however, continu- e Low Countries, to the disadvantage and t of the Austrians and Dutch, till it was fi-

nished by the treaty of Aix-la-Chapelle, in April 1748. By that treaty Silesia was once more guaranteed to the king of Prussia. It was not long before that monarch's jealousies were renewed and verified; and the empress of Russia's views falling in with those of the empress queen and the king of Poland, who were unaturally supported by France in their new schemes, a fresh war was kindled. The king of Prussia declared against the admission of the Russians into Germany, and his Britannic majesty against that of the French. Upon these two principles all former differences between these two monarchs were forgotten, and the British parliament agreed to pay an annual subsidy of 675,000*l.* to Frederick during the war. The flames of war now broke out in Germany with more violence than ever. The armies of his Prussian majesty, like an irresistible torrent burst in Saxony; totally defeated the imperial general Brown at the battle of Lowositz; forced the Saxons to lay down their arms, though almost impregnably fortified at Pirna; and the elector of Saxony to flee to his regal dominions in Poland. After this, the K. of Prussia was put to the ban of the empire; and the French poured, by one quarter, their armies, as the Russians did by another, into the empire. The conduct of Frederick on this occasion is the most amazing to be met with in history: for a particular account of which, see PRUSSIA. At last, however, the taking of Colberg by the Russians, and of Schweidnitz by the Austrians, was on the point of completing his ruin, when his most formidable enemy, the empress of Russia, died Jan. 5, 1762. George II, his only ally died on the 25th Oct. 1766. The deaths of these illustrious personages were followed by great consequences. The British ministry of George III, sought to finish the war with honour, and Peter III. of Russia, recalled his armies. Frederick the Great was, notwithstanding, so much reduced, that the empress queen, probably, would have completed his destruction, had it not been for the wise backwardness of other German princes, to annihilate the house of Brandenburg. At first the empress queen rejected all terms proposed to her, and ordered 30,000 men to be added to her armies. The visible backwardness of her generals to execute her orders, and the new successes obtained by the king of Prussia, at last prevailed on her to agree to an armistice, which was soon followed by the treaty of Hubertsbuigh, which secured to Frederick the possession of Silesia. Upon the death of her husband, in 1762, her son Joseph II, who had been crowned king of the Romans in 1764, succeeded him.

(24.) GERMANY, HISTORY OF, UNDER JOSEPH II. This prince shewed an active and restless disposition, much inclined to extend his territories by conquest, and to make reformatations in the internal policy of his dominions, yet without taking any proper methods for accomplishing his purposes. Hence he was almost always disappointed; inasmuch that he at last wrote for himself the following epitaph: "Here lies Joseph, unfortunate in all his undertakings." In 1788, a war commenced betwixt him and the king of Prussia; in which, notwithstanding the impetuous valour of that monarch, Joseph acted with such caution, that his adversary could gain no advantage over him;

court procured their possessors an influence over other members, and their general residence there gave them a solid advantage in their constant and early presence at the diet of election. For in times of turbulence several emperors were elected, when princes had not an opportunity to attend. And hence sprung up a sanction to that right, which the high officers of the household had assumed, of electing without any consultation of the other members of the empire. Pope Gregory X. too, either conceiving that they did possess, or willing that they should acquire, this right, exhorted them in a bull to terminate the troubles of Germany by electing an emperor. And since that period they have been held as the sole electors. But the possession of this high power was strengthened by a league amongst themselves called the *electoral union*, which received additional confirmation from the emperor Lewis of Bavaria, and was formally and fully ratified by that famous constitution of Charles IV, termed the *golden bull*; according to which, the territories and the high offices by which the electoral dignity is conveyed, must descend according to the right of primogeniture, and are indivisible. The golden bull declares the number and titles of the electors. (See ELECTOR, § 3.) And this number cannot be increased by the emperor without a previous election by the electors themselves; who, being thus capable of electing and of being elected, may style themselves *Coinperantes*; and they actually exercise part of the imperial authority, when a vacancy happens. But when or before this occurs, the election of the emperor is proceeded to after the following manner: The elector of Mentz, within a month after the emperor's death, summons, as great chancellor of the empire, the rest of the electors to attend on some fixed day within the space of three months from the date of the summons. The electors generally send their ambassadors to the place of election, which is held at Francfort on the Mayne; but saving the right of that city, it may be held elsewhere. When the diet of electors is assembled, they proceed to compose the capitulation, to which the emperor when elected is to swear. The capitulation being adjusted, the elector of Mentz appoints a day for the election. On that day, the gates of the city are shut, and the keys delivered to the elector of Mentz. The electors or their ambassadors, who are catholics, repair in great pomp to mass: and after its celebration they take a solemn oath to choose, unbiassed and uninfluenced, the person that appears most proper for the imperial dignity. After this they repair to the sacristy, where the elector of Mentz asks, if there be any impediment known against their proceeding at present to an election; and next obtains a promise, that the person elected by the majority shall be received as emperor. The declarations of the electoral ambassadors, on these two points, are recorded by two notaries. Then all witnesses withdraw; and the elector of Mentz collecting the suffrages, which are given *voce voce*, and giving his own last, the witnesses are recalled, and he declares the person chosen. But the election is not complete, nor is the new emperor proclaimed, until the capitulation be sworn

to, either by himself or by his ambassador absent. From this time he is styled *elector Romanus* until the coronation takes place. The ceremony confers the title of emperor. According to the golden bull, it should be celebrated at Aix-la-Chapelle, out of respect to Charlemagne who resided there; but saving the right of that city, it may take place elsewhere. The election is performed by the Abp. of Mentz, the elector of Cologne. And when he is seated on the throne, the duke of Saxony delivers into his hands the sword of Charles the Great, with which he makes some knights of the holy Roman Empire, and confers that honour upon such others as are nominated by the respective electors. After the election proceeds to dinner in the great hall, he sits at a table elevated two steps higher than the other electors, and is served by counts of the Empire. The electors, each of whom has a table, are attended by the gentlemen of the respective courts. During the election his presumptive successor may be elected by the Romans. But by an express article of the capitulation, the king of the Romans swears not to interfere with the government during the reign of the emperor; but on his decease, he confirms him emperor without a second election. When no king of the Romans has been elected, and the throne becomes vacant, the government is administered by the vicars of the empire, who are the electors Palatine and of Saxony, the archbishop, palatine and archmarshal of the empire. The vicar of the Palatine has his district, and tribunal of the vicars, which by the golden bull all acts of the vicars are confirmed by the emperor; but they are afterwards confirmed by the emperor; which confirmation, by his capitulation, he is bound to give. There are also vicars of the emperor, constituted by a delegation of the emperor to any prince of the empire, when he is unable to execute it himself. But these vicars are accountable to the emperor; their acts are null and their offices revoked, being contrary to the will of the emperor. When Charlemagne ceased to govern in Germany, the princes and states associated to continue the empire; and to choose an emperor. From that time all electors and princes, except the emperor, receive investiture of their counts and free cities from the emperor. But this investiture is only a sign of the majesty of the empire, which is derived from the emperor. For as the princes of the empire are dependent on that collection from which they derive protection, they shew this dependence on the emperor, by representing the majesty of that union or empire; but in all other respects they are independent and free. These princes or sovereigns may even wage war with the prince wearing the imperial crown, as possessed of other titles and nations unconnected with his imperial state; can the sovereignty of any member be long as he remains loyal to the emperor, loyalty constitutes his duty, and secures his protection. But should he be guilty of rebellion against the emperor, as head of the empire, such a crime would commit him to the punishment of its laws, and he would be pun-

For this crime would be against that collective body of sovereigns whose union constitutes the empire; and therefore any violation of that union is justly punished with deprivation of the territories which render such sovereigns members of the empire. Nor can this punishment of the emperor derogate from the dignity of those princes who derive their sovereignty from this constitution, whose subjection is an act of their own consent; never, no member of the empire can be put under the ban without being first heard, and without the concurrence of the electors, princes, and states, being previously obtained. The next assembly of the states in which the legislative power of the empire resides; and is composed of the electors, princes, prelates, counts, and cities of the empire. It has sat since 1663, and is held usually at Ratisbon. The emperor, at present, presides in person; when absent, his commissary, whose communication of proposals from the emperor to the assembly is called *imperial decree*. The elector of Mentz, as chancery of the empire, is director of the diet; to his chancery are all things addressed, that are to be submitted to the empire; the reading of them by his secretary, to the secretaries of the ministers at the diet, is denominated *per litteras*, and constitutes the form of transmitting orders or memorials to the signature of the emperor. The diet is composed of three distinct colleges, each of which has its particular director. The first is that of electors; of which the abp. of Mentz is the first elector. The 2d is that of princes, which consists of princes, archbishops, and bishops; prelates, abbots, and counts, who are not considered as princes. Each prince spiritual and temporal has a vote, but prelates and counts vote by proxies. The prelates are divided into two colleges, the counts into four; and each bench has only one vote. The archduke of Austria and the abp. of Salzburg are alternately directors of the college of princes. The 3d college is that of the cities of the empire; the director of which is the minister of the city in which the diet happens to sit. In all these colleges, the sentiments of the majority are decisive, except in respect of fundamental laws, which affect the whole empire, and such matters as relate to religion. In these cases, the proceedings are also different. The diet is then considered as consisting of two colleges, the evangelic and the catholic; and if a religious point be proposed, it must meet not only the unanimous concurrence of the proposing college, but must have the majority of the other to pass it. This distinction arose from a constitution called the *evangelic body*; which was established by the Protestant states and princes to protect the Protestant interest in Germany, by giving over the laws for the security of their religion, and, in case of violation, by obtaining redress from the imperial throne. For in any part of the empire, where the count is a Papist and the electors are Protestants, should oppressions arise, redress would be made to the evangelic body by the director. The elector of Saxony is the director of the evangelic body, though he is a Papist; therefore his representations in favour

of the Protestants have the more force; and besides, should he abuse an office which invests him with considerable weight and influence, he could be instantly deprived of it. The first two colleges are styled superior, and in effect constitute the diet; for all points that come before the diet, are generally first deliberated in the college of electors, and then pass from that to the college of princes; in which, if any objection arise, a free conference takes place between the directors of each college. And should they, in consequence of this free conference, concur, they invite the 3d college to accede to their joint opinion; which invitation is generally complied with; but should this college return a refusal, the opinion of the other two colleges is in some few cases engrossed in the chancery, and delivered to the emperor's commissary as the opinion of the empire. The opinion of the 3d college is merely mentioned at the close. However, though the superior colleges do in effect constitute the diet; yet the received maxim is, that no two colleges constitute a majority, that is, the majority of voices at the diet; nor can the emperor confirm the opinion of two colleges as an opinion of the diet. By the peace of Westphalia, a decisive vote was recognized as a right of the imperial cities, which the two superior colleges should not infringe upon: their vote being, by the fundamental law, of equal weight with that of the electors and princes. After a measure is approved by the colleges, it is submitted to the emperor, to receive his negative or confirmation. Should he approve the point, it is published in his name as the resolution of the empire, which states are exhorted to obey, and tribunals desired to consider as such. The diet not only makes and explains laws, but decides ambiguous cases. It must also be consulted before war is made; appoints the field-marshal who is to command the army, and assigns him his council of war. The diet also enters into and makes alliances, but usually empowers the emperor to negotiate them; and foreign states have their ambassadors at the diet, but the diet sends no ministers to foreign courts. See § 33, 35, and 36.

(33.) GERMANY, MODERN GOVERNMENT OF. In the commencement of the empire, justice was administered in the districts of the provinces by counts, and appeals lay from their courts to that of the emperor before the count palatine. But as civil broils shook the power of the emperor, they interrupted also the course of justice. The consequent inconveniences caused several solicitations to be preferred from the states to different emperors for the establishment of a court of justice, which should take cognizance of great as well as small causes. And at length such a court was erected by Maximilian I. under the title of the *Imperial Chamber at Worms*, in 1495; but was removed to Spire in 1533, and to Wetlar in 1696, where it is now held. The members of this court are a judge of the chamber and 25 assessors, partly Protestants partly Papists. The president is appointed by the emperor, the assessors by the states. The court receives appeals from inferior jurisdictions, and decides dubious titles; and all causes before it between princes and princes, or princes and private persons, are adjudged

according to the laws of the respective parties, or according to the Imperial law. This tribunal is under the inspection of visitors appointed by the states; and, during their visitation, the sentences of the court are subject to revision. Appeals lie afterward also from the judgment of the visitors, to that of the diet. The emperors finding themselves deprived of many of their powers, wished to raise their prerogatives by forming a tribunal, of which they should name the judges, and before whom causes in the last resort should come. But Maximilian foresaw, in respect to the new tribunal, that though a consciousness of its importance made the states struggle for its erection, the expenses of its establishment would make them neglect its support; and the event bore witness to his sagacity. But when, through the omissions and negligence of the states, there happened to be a cessation in the distribution of justice by the Imperial chamber, he revived his court of the count Palatinate, or AULIC COUNCIL. And in order to gain the quiet acquiescence of the states, under the mask of a partition of power, and of generous moderation, he desired them to add 8 to the number of assessors, and the salaries of all should be discharged by him. The states swallowed the bait, but soon perceived that they had lost part of their liberty. The emperor, by keeping the tribunal always open, by filling its seats with men of first-rate talents, and by having its sentences duly and speedily executed, drew all causes before it. The states remonstrated, declaring, that the Imperial chamber ought to be not only the supreme, but sole tribunal of that kind. The emperor answered, that he had erected the Imperial chamber in consequence of their solicitations; but as they had not supplied the tribunal with judges, he provided for that deficiency by a constant administration of justice in the establishment of another. The Aulic council now subsists with equal authority, each receiving appeals from interior jurisdictions; but neither appealing to the other, as the *dernier resort* from both must be had to the diet. However, to the Aulic council belong the reserved rights of the emperor; and to the Imperial chamber also are annexed peculiar powers. The Imperial chamber subsists during a vacancy of the throne, under the authority of the vicars of the empire; whereas the Aulic council does not exist until appointed by the succeeding emperor. The Aulic council consists of a president, vice-president, and 17 assessors, of whom 6 are Protestants. The vice-chancellor of the empire is also intitled to a seat; and all decrees issuing from the council pass through his hands to those who are to execute them. This tribunal obtains for the emperor, through the appeals from the courts of other princes, a new authority beside that which he possesses from his reserved rights; but electors and some princes, as those of Hanover, Austria, Brunswick, Swedish Pomerania, and Hesse, are free from this dependence on the emperor, to whose Aulic council their subjects cannot appeal; nor can it take cognizance of ecclesiastical or criminal causes, both of which appertain to territorial justice; which we shall presently consider. The division of the empire into circles is a regulation coeval with the establishment of the Imperial chamber

by Maximilian, in order to strengthen justice with vigour to enforce its decision was into six circles, called the *ancient circles*. These are Franconia, Suabia, Lower Saxony, per Rhine, and Westphalia; but the princes, who at first declined bringing them under the form of circles, were obliged, by the political necessity of the emperor, to adopt them, and increase the number to ten, the four new circles of Austria, Burgoynia, the electorate, and Upper Saxony. Over these are preside directors; to whom the tribunals commit the execution of their decrees. The old circles have two directors each, the new have one each. The office of director is permanent and hereditary, as it belongs always to the first prince in the circle, upon whom rests the highest authority; for all the decrees of the Imperial chamber and Aulic council are put in execution, unless the director will execute them. The directors of the circles are not only engaged in the prosecution of the emperor's wars, but of peace; for in case of imperial war, they are to collect the troops of their circle; and if any state or prince of the empire should suffer violation from other princes, they are to yield protection and enforce the laws. Should there be any tumultuous uprising among the people, the suppression of such uprisings is their duty. The emperor is the executive in the whole empire; the directors are such executive parts called circles; the preservation of which brings at stake, the directors, must hold frequent diets in their respective circles, to consult on and adopt measures for their safety and welfare: the interests of those near to us are generally blended with our own, that they either cannot be pursued without the concurrence of both, there arise negotiations on particular points between the diets of the circles, which are therefore styled *negotiating circles*; and these negotiations being managed amongst the circles of the Upper and Lower Saxony, they are denominated *pondering circles*.

(34.) GERMANY, POPULATION OF. The total population before the present war was estimated at 30 millions.

(35.) GERMANY, POWERS OF THE EMPEROR. The emperor, though his power is diminished, (See § 32 and 33.) still enjoys many privileges, and his power partly appears in the exercise of his reserved rights, or the peculiar powers annexed to the imperial dignity. He has the right of investiture of their dominions; this he is bound as the laws direct to exercise, but promises that they shall be only on such persons as will maintain the title, and can support their rank. He has the title; for the power or privilege of ennobling cannot be obtained from their respective alone. But in some instances even of high importance. For the descendants are incapable of succession, if their rank is inferior to that of their father; but the acquisition of a title ennobles her and removes the collateral line conflicts. The emperor

and universities, grant the privilege of holding. He can also dispense with the tedious minor, and empower princes to assume the government of their own circles.

He decides all rank and precedence, power of *primus preces*, that is, of granting in every chapter of the empire a va-

But he is not above the law; for the ave not only chosen but deposed emperors, however, the capitulation is intended to such rigorous proceedings; but should violation be violated, the electors might remonstrate; and if these remonstrances be without effect, in conjunction with they might resort to more forcible remedies.

GERMANY, POWERS OF THE PRINCES. Every prince is sovereign in his own country, may enter into alliances, and pursue by all measures his own private interest, as he pleases; for if even an Imperial war should break out, he may remain neuter if the safety of the empire be not at stake. Each state or territory appoints in general three colleges for its government. The first is the *geheimderath*, or council; the second is the *regierung*, or revenue; the third the *rentkammer*, or chamber of accounts.

Each of these has a president; and a president of the first college is always president of the empire. The *geheimderath* represents the emperor and superintends the other two. The *regierung* negotiates treaties with other princes, and is in most courts of justice; however, in some states there is a court of justice called *justitz departement* besides the right of conference assigned to the *regierung* by the sovereign; when there is a dispute between princes, there is also an *arbitration*, appointed to decide them.

There must be paid to this privilege of *primus preces* must be called on to appoint an *austrage* must be had to the Imperial tribunal, but there still lies an appeal from the judge of the *austrage*. The *rentkammer* attends to the regulation of domains and estates, to the revenues, and management of the taxes.

The sovereign or prince is arbitrary in laws of the empire; for no new tax or impost can be laid on his country without the consent of the nobles and subjects. For this purpose, he holds a *tag*, or day on which his subjects are assembled, which is once in the period of seven years, and at no other time can he assemble them; he calls together the nobles and deputies of the towns of his dominions; the nobles usually attend in person, but the deputies are representatives. To this assembly the emperor proposes the taxes, &c. and a majority of the emperor proposes the measures. Villages, though they send no deputies to this assembly; they are either already represented by the lords, or because they rank too low in a state of vassalage when compared with the lords; for their inhabitants must mend highways and can be impressed as soldiers; from both these inhabitants of towns are exempt. On the *tag*, the respective quotas also of each

place are fixed, in order to discharge the prince's contingent in case of an imperial war.

(37.) GERMANY, RELIGIONS ESTABLISHED IN. The three religions principally established in the empire are the Roman Catholic, the Lutheran, and the Calvinist. The first prevails in the dominions of the emperor, in the ecclesiastical electorates, and in Bavaria; the second in the Circles of Upper and Lower Saxony, great part of Westphalia, Franconia, Suabia, the Upper Rhine, and in most of the Imperial towns; and the third in the dominions of the landgrave of Hesse-Cassel, and of some other princes. But Christians of almost every denomination are tolerated in many parts of the empire, and there is a multitude of Jews in all the great towns. The Romish superior clergy consist of 8 archbishops, and 40 bishops. The Protestant clergy are governed by consistories under the sovereign prince of each state.

(38.) GERMANY, REVENUE OF. The actual revenue of all Germany has been calculated at nearly 18,000,000 l. Sterling, or 100 millions of dollars. The revenue of the emperor, in time of peace, is only about 20,000 crowns, being the contributions of a few imperial towns; but in case of war, extraordinary aids, called *Roman months*, laid on by the diet, are contributed by the different circles, at the following rate for raising 1½ millions of florins, viz.

	Florins.	Xtr.
Upper Saxony	156,360	15
Lower Saxony	156,360	15
Westphalia	156,360	15
Upper Rhine	101,411	30
Lower Rhine	105,654	5
Franconia	113,481	25
Austria	306,390	20
Bavaria	91,261	5
Suabia	156,360	15

Total 1,343,539 25

The ci-devant circle of Burgundy or Belgium formerly contributed 156,360 fl. 15 Xtr.

(39.) GERMANY, RIVERS OF. The principal rivers of Germany are the Danube, Elbe, Maine, Oder, Rhine, and Weiser.

(40.) GERMANY, SOIL, CLIMATE AND PRODUCE OF. From the great extent of the empire, every variety of soil and climate is to be met with; but it is upon the whole more fertile than otherwise; and in general temperate and healthy. The middle parts are most productive in corn and cattle; the southern abound with excellent wines and fruits, and grain of all kinds. The northern parts, from their coldness, are rather unfavourable to vegetation; yet agriculture throughout improves exceedingly.

(41.) GERMANY, STATE OF LITERATURE IN. Literature is at present in a very advanced state throughout almost all Germany, but particularly in the Protestant states. It is but about half a century since the German language has been purified and cultivated; since which various works of taste and elegance, as well as superior productions in the different sciences, particularly in the dramatic line, have appeared in it.

(42.) GERMANY, TOWNS AND VILLAGES IN. The number of towns in the empire, before the

war, has been estimated at upwards of 2,300; and that of the villages at 20,000.

(43.) GERMANY, TRADE OF. From the central situation of Germany, its commerce with the rest of Europe is very extensive. Its minerals are decidedly the first native articles for trade; after which its medicinal waters, salt, hemp, flax, linen, silk, wines, fruits, corn, cattle, fuffs, cloths, timber, porcelain, wrought iron and steel, drugs, oils and colours, are the principal. The French artizans, exiled by the revocation of the edict of Nantz, enabled Germany to stand in no need of the wrought silks of other countries. Great commercial fairs still exist in Germany.

(44.) GERMANY, UNIVERSITIES, &c. IN. There are 38 universities in Germany; 19 Protestant, 17 Catholic, and two which partake of both; besides a number of literary societies and academic institutions: and education in general is particularly attended to even in the very lowest ranks.

(II.) GERMANY, a township of the United States, in York county, Pennsylvania.

(1.) \* GERME. *n. f.* [*germen*, Latin.] A sprout or shoot; that part which grows and spreads.—Whether it be not made out of the *germe*, or treadle of the egg, doth seem of lesser doubt. *Brown's Vulgar Errors.*

(2.) GERMS, among shipping, a kind of bark used in the shallows on the coast of Egypt, as drawing but little water. They are strong and well built; but have no decks. They have one, 2, or 3 masts according to their sizes. The yards are fixed to the top of the masts, and, as well as the sails, are unmanageable from below. To effect the smallest change, the seaman must go aloft. The burden of these boats is 3 or 6 tons. They are chiefly used to convey goods from Alexandria to Rosetta. In two of these awkward and unmanageable boats, Mr Bray, the carpenter of the Tigris, worked two 68 pound carronades with great effect, under Sir Sidney Smith, in 1799.

(1.) GERMEN, the seed-bud; See BOTANY, *Index.* In assimilating the vegetable and animal kingdoms, Linnæus denominates the germen, the *ovarium* or *uterus* of plants; and affirms its existence to be chiefly at the time of the dispersion of the male dust by the antheræ; as, after its impregnation, it becomes a seed-vessel.

(2.) GERMEN, by Pliny and the ancient botanists is used to signify a bud containing the rudiments of the leaves. See GEMMA.

GERMERSHEIM, a town of Germany, lately in the Palatinate of the Rhine, now included in the French republic, and dept. of Mont Tonnerre. It was erected into a town by Rodolph I, who died in it, in 1290. It was taken in Jan. 1794, by the French; who, however, were defeated near it, on the 29th May, 1794, by the Austrians, with the loss of 1000 men: 400 being killed and 600 taken prisoners. It is seated at the confluence of the Queich and the Rhine, 5 miles S. of Spire, and 5 N. of Philippsburg.

(1.) GERMIGNY, a town of France, in the dep. of Yonne, 3 miles SE. of St Florentin.

(2.) GERMINGY, a town of France, in the dep. of Seine and Marne, 3 miles E. of Meux.

\* GERMIN. *n. f.* [*germen*, Lat.] A shooting or sprouting seed. Out of use.—

Though palaces and pyramids do  
Their heads to their foundations;  
treasure

Of nature's *germins* tumble all toge  
Even 'till destruction sicken; and we  
To what I ask you. *See*

Thou all-shaking thund  
Strike flat the thick rotundity o' th  
Crack nature's mould; all *germins*  
That wake ungrateful man. *Shak.*

GERMINAL, [from *germino*, Lat.  
to bud or spring.] *q. d.* the spring mon  
month in the new French calendar.  
March 21st, and ends April 19th.

\* To GERMINATE. *v. n.* [*germ*  
To sprout; to shoot; to bud; to ]  
This action is furthered by the chalk  
hath within a spirit that will put forth  
*note*, as we see in the chymical trials.

*Hist.*—The seeds of all kinds of vege  
planted near the surface of the earth,  
nient soil, amongst matter proper for th  
of vegetables, would *germinate*, grow  
plentiful the face of the earth. *Woodw.*

(1.) \* GERMINATION. *n. f.* [*germ*  
French, from *germinate*.] The act  
or shooting; growth.—For accelerati  
*nation*, we shall handle the subject of  
rally. *Bacon.*—The duke of Buckingh  
ther kind of *germination*: and surely,  
a plant, he would have been reckoned  
*sponte nascentes*. *Wotton*—There is be  
litude between a terreous humidity  
*germinations*. *Glanv. Scepsis.*—Suppo  
should be carried to the great distanc  
there the whole globe would be one  
there would be no life, no *germinatio*

(2.) GERMINATION, among botanist  
prehends the precise time which the s  
rise after they have been committed  
The different species of seeds are long  
in rising, according to the degree of h  
proper to each. Millet, wheat, and s  
grasses, rise in one day; blite, spir  
mustard, kidney-beans, turnips, and  
days; lettuce and dill, in 4; cucum  
melon and cress, in 5; radish and  
barley, in 7; orach, in 8; purslane,  
bage, in 10; hyssop, in 30; parsley, in 4  
peach, almond, walnut, chestnut, pæ  
poppy, hypocoum, and ranunculus  
one year; rose-bush, cornel-tree, haw  
lar, and hazel nut, in two. The se  
species of orchis, and of some liliaceo  
ver rise at all. Some seeds require t  
almost as soon as they are ripe, otherw  
not sprout or germinate. Of this k  
seeds of coffee and fraxinella. Other  
ly those of the pea-bloom flowers, p  
germinating faculty for a series of ye  
danson asserts, that the sensitive plant  
virtue for 30 or 40 years. Air and w  
agents of germination. The humidit  
alone makes several seeds to rise that  
to it. Seeds too are observed to ri  
without the intervention of earth; bu  
out air is insufficient. Mr *Hombert's*  
on this head are decisive. He put

exhausted receiver of an air-pump, with establish something certain on the cause of germination. Some of them did not rise at all; the greatest part of those which did, made weak and feeble productions. Thus it is for air that seeds, which are buried at a very depth in the earth, either thrive but indifferently do not rise at all. They frequently pre-vent, their germinating virtue for many years in the bowels of the earth; and it is usual, upon a piece of ground being newly cultivated to considerable depth, to observe it soon after sown with several plants, which had not risen there in the memory of man. Were this experiment frequently repeated, it would doubtless be of use in recovering certain species of plants which are regarded as lost; or which perhaps have been neglected to the knowledge of botanists. Some seeds require a greater quantity of air than others. The turnip, for instance, which does not rise till after lettuce has risen, rises before it *in vacuo*; and both will not rise at all, or perish altogether, while crested as freely as in the open air.

**GERMINATION, CHEMICAL EXPERIMENTS ON.** The late discoveries in chemistry have thrown much light on this subject. In 1793, Berthollet discovered, that simple metallic acids are not favourable to the germination of seeds, but that metallic oxyds favour it in proportion to their degree of oxidation. This led to a search for a substance with which oxygen might be so weakly combined as to be easily separated, and he tried oxygenated muriatic acid diluted with water. Cressets (See *LEPIDIUM*), in this acid showed germs at the end of 6 days and in common water at the end of 32 days. The action of the acid on the vegetable is announced by a great number of air-bubbles covering the seeds, which did not take till the water till the end of from 50 to 45 days. These experiments, published in *Humboldt's Flora Subterranea Friburgensis*, and in his *Essay on the Chemical Physiology of Plants*, have been repeated by Messrs Uslar, Plenck, Villdenow &c. See *Dictionnaire de Physique, par Gebelin* were made at a temperature of from 40 to 50° of Reaumur. In 1796, Humboldt made several experiments, and found that, by joining to oxygen, vegetation was still more accelerated. He threw equal quantities of the seeds in cressets into pure water and oxygenated acid, at a temperature of 58° F. Cressets germinated in the acid in 3 hours, but in the water till the end of 26 hours. In the muriatic or sulphuric acid, there was no germination, though according to the experiments of Berthollet, the nitric acid accelerates germination, when greatly diluted with water. Prof. Dreyer caused the seed of a new species of *ORBIA* to germinate in oxygenated mud, though taken from Bocconi's collected plants, 110 or 120 years old. Jacq. Vander Schott at Vienna threw into oxygenated muriatic acid all the old seeds, which he had kept 20 or 30 years at the botanical garden, every attempt to produce vegetation in them proved fruitless, and the greater part of them, even the hardest seeds germinated. A-

mong these were the yellow bonduc, or nickar tree, (See *GUILANDINA*, N° 1.) the pigeon pea, (See *CYTISUS*, N° 2.) the *Dodonaea Angustifolia*, the climbing mimosa, (See *MIMOSA*, N° 19.) and some new species of the *HOPEA*. These are now shewn at Vienna very valuable plants, which are entirely raised by the oxygenated muriatic acid; and are from 5 to 8 inches high. Humboldt made the *clusia rosea* to germinate, the seeds of which had been brought from the Bahama islands by Boose, and had resisted every previous effort to make them vegetate. For this purpose he used a new process, which will be easier for gardeners who cannot procure the oxygenated muriatic acid. He formed a paste by mixing the seeds with the black oxyd of manganese, and then poured over it the muriatic acid diluted with water, in the proportion of half a cubic inch of the acid to 3 of water. The vessel containing this mixture must be covered, but not shut close, lest it should burst. At the temperature of 95°, the muriatic acid becomes strongly oxydated; the oxygenated muriatic gas which is disengaged passes through the seeds; and during this passage the irritation of the vegetable fibres takes place. *Pbilsch. Mag.*

**GERMISCH**, a town of Bavaria, in the bishopric of Freysing, 21 miles S. of Weilheim.

**GERMOR**, a village in Cornwall.

**GERMS**, a town of Austria, 4 m. W. of Zwettl.

(1.) **GERN**, a town of Bavaria, 15 miles W. NW. of Branau.

(2.) **GERN**, a town of Russia, 28 m. SW. of Tula.

**GERNOI**, a fort of Russian Siberia, in Koltivan, on the Irtysh. Lon. 96° E. of Ferro. Lat. 51. 44. N.

**GERNRODE**, an abbey of Saxony, founded in 960; 22 m. W. of Bernburg, and 30 of Dessau.

**GERNSHEIM**, a town of the French republic, in the dept. of Mont Tonnerre, lately in the electorate of Mentz, seated on the Rhine, 18 miles SSE. of Mentz.

**GERNYOSZEG**, a town of Transylvania.

**GERODA**, a town of Germany, in the circle of the Lower Rhine, 8 miles NE. of Duderstadt.

**GERODOT**, a town of France, in the dep. of the Aube, 9 miles E. of Troyes.

**GEROLDSECK HOHEN**, a castle and county of Suabia. The castle is seated on the Kinzig, 3 miles SSE. of Gensbach.

**GEROLDSGRUN**, a village of Franconia, in Bayreuth, 4 miles SW. of Lichtenberg.

(1.) **GEROLDSTEIN**, a town of Germany, in the late county of Blankenheim, now included in the French republic, and dep. of the Rhine and Moselle: seated on the Kill, 14 miles N. of Treves.

(2.) **GEROLDSTEIN**, a town of Germany, in the circle of the Upper Rhine, 7 miles S. of Naftedt.

**GEROLTZHOFFEN**, a town of Franconia, in the bishopric of Wurzburg, 30 miles NE. of Wurzburg.

**GERON**, or **GERON POINT**, a cape of Ireland, in Antrim county, 15 miles NE. of Antrim, and 32 N. of Belfast. Lon. 5. 50. W. Lat. 55. 3. N.

**GERONA**, **GIRONA**, or **GIRONNA**, an ancient town of Spain, in Catalonia, and a bishop's see. In 1694, it was taken by the French and restored at the peace of Ryfwick. In 1705, it was taken by

by the Austrians, and in 1711, it was again taken by the French, under the D. of Noailles. It is seated on a hill, near the Onhal, 44 miles S. of Perpignan, and 47 N.E. of Barcelona. Lon. 2. 52. E. Lat. 42. 10. N.

GERONICON, [from *geron*, Gr. an old man.] a book famous among the modern Greeks, containing the lives of the ancient monks.

GERONTES, [from *geron*,] in antiquity, a kind of judges, or magistrates, in ancient Sparta, answering to what the Areopagites were at Athens. See AREOPAGUS. The senate of gerontes was called GERUSIA, i. e. the assembly or council of old men. They were originally instituted by Lycurgus: their number, according to some, was 28; and, according to others, 32. They governed in conjunction with the king, whose authority they were intended to balance, and to watch over the interests of the people. Polybius defines their office in few words, when he says, *per ipsos, & cum ipsis, omnia administrari*. None were admitted into this office under 60 years of age, and they held it for life. They were succeeded by the EPHORI.

GERONTIC, *adj.* belonging to old men.

GEROPOGON, in botany, a genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is paleaceous, with the points of the paleæ sharp or bristly; the calyx is simple; the seeds of the disc have a feathered pappus; those of the radius have a pappus of five awns.

**GESNER**, Conrad, M. D. a celebrated n and naturalist, born at Zurich in 1516. nished his studies in France, he travelled y, and taught medicine and philosophy at e, with extraordinary reputation. He o much in natural history, that he was d the *German Pliny*. He died Dec. 9, aving 66 works behind him, on botany, r grammar, natural history, &c. Of : principal are, 1. A history of animals, nd fossils: 2. *Bibliotheca Universalis*: A d Latin lexicon. Boerhaave emphatical- him *Monstrum Eruditionis*, "a prodigy ig." Those indeed (as Mr Coxe ob- his Letters on Switzerland) "who are t with the works of this great naturalist

cannot repress their admiration at the amplitude of his knowledge in every species of erudition, and the variety of his discoveries in natural history. Their admiration is still further augmented, when they consider the gross ignorance of the age which he helped to enlighten, and the scanty succours he possessed to aid him in thus extending the bounds of knowledge; that he composed his works, and made those discoveries which would have done honour to the most enlightened period, under the complicated evils of poverty, sickness, and domestic uneasiness." During his last 24 years, however, his salary as a professor, enabled him to live in easy circumstances.

(2.) **GESNER**, John Matthew, an acute German critic, born at Neuburg, in 1691. After superintending the public school of Weinheim for 11 years, he removed to Anspach, and thence to Gottingen, where he was made professor of humanity, and public librarian, &c. He died at Gottingen in 1761. His most esteemed works are, an excellent Latin Dictionary, and his editions of the Classics.

(3.) **GESNER**, Solomon, the celebrated author of the *Death of Abel*, was the son of John Conrad Gesner, bookseller and member of the Great Council, and was born at Zurich in 1730. In his early years he showed no signs of superior abilities; and his progress in education was so slow, that his master gave him up as incapable of any greater attainments than writing and the four first rules of arithmetic. Upon this he was placed under a clergyman, a relation of his father's, who showed himself better acquainted with the art of discovering the natural inclinations of his pupils. He often carried young Gesner with him into the fields, to survey the beauties of nature; and finding that he took pleasure in such lessons, and listened to them with peculiar attention, he repeated some of the most striking passages of the ancient authors, who have written on these subjects, in the most agreeable manner. By this ingenious artifice, young Gesner's mind began to open, and its powers to expand; and it is, perhaps, owing to this circumstance, that he became so fond of the language of Virgil and Theocritus. When he arrived at a proper age, he chose his father's profession. Of 3 printing houses at Zurich, two were occupied by Gesners. The house in which our poet's father had a share, was known by the firm of *Orel, Gesner, and Company*, and was famed for the elegance of the works which it published. But Mr Gesner did not damp his genius, by the drudgery of business. He indulged himself freely in pursuing his favourite object, and his partners never grudged him that time which he devoted to study. In 1752, he made a tour through Germany, not so much to extend his commerce, as to see and be acquainted with those authors who have done honour to their country. The following anecdote is strikingly characteristic of that timidity which often accompanies true genius. When Mr Gesner was at Berlin, he was admitted into a literary society, of which Gleim and Lessing were members. Every member read in turn some pieces of his own composition, and Gesner was very desirous of submitting to these able critics a small work, which was

his first attempt. As each member had done, reading, Gesner was observed to move his hand with a kind of tremour towards his pocket, and to draw it back again without producing any thing. Having not yet published any work, none of the company could guess the cause of a motion which his modesty prevented him from explaining. The piece which he wished, but had not the courage, to show, was his poem, intitled *Night*, which he published on his return to Zurich in 1753. It was considered as an original, of which no model is to be found among the moderns; but in Gesner's opinion, it was only a piece of imaginary painting, or, to use his own words, in one of his letters to Mr Huber who translated his works, "A caricature composed in the moments of folly or intoxication." In this little poem he has introduced a short episode on the origin of the glow-worm, containing a poetical explanation of this natural phosphorus, which has all the beauty of Ovid's *Metamorphoses* without their prolixity. The success of this essay emboldened him to publish a pastoral romance, called *Daphnis*, in three cantos. The applause deservedly bestowed upon this performance induced him to publish his *Idylls* and other rural poems in imitation of Theocritus. Pastoral poetry, which was then little known in Germany but by translations, began to be preferred to every other kind. The only author of note who had preceded him in this line, was Mr Rost of Leipsick, who had the art to unite spirit and simplicity in a kind of writing, which appears insipid without the former, but becomes unnatural and disgusting if it is too abundant. He sometimes throws a delicate veil over those images which are deficient in decency, but it is often too slight. Such was the rival with whom Gesner had to contend. But our poet pursued a different course. Instead of placing, like Rost, his scenes in modern times, he went back with Theocritus to the golden age. The characters of Gesner's *Idylls* are taken from those societies which exist no longer but in the remembrance, or rather in the imagination. His shepherds are fathers, children, and husbands, to whom generosity, beneficence, and respect for the Deity, are sentiments no less familiar than love. These *Idylls* were the favourite object of his pursuit, and that part of his work which acquired him the greatest reputation. His *Death of Abel*, was first published in 1758. It is written, like the rest of his pieces, in poetical prose; and went through three editions in one year. The French edition was followed by others, in Italian, Dutch, Danish, and, lastly, two in English, one in prose and the other in verse. He next published his *First Navigator*, a poem in 3 cantos, which many consider as his masterpiece. He produced likewise, in the dramatic stile *Evagder and Alcimne* in 3 acts; and *Eraslus*, in one act, which was represented with applause at Leipsick and Vienna. But though poetry was Gesner's darling pursuit, and though he enriched German literature with works which will immortalize his name, he did not confine himself to it. In his childhood he had received a few lessons in drawing, and had pursued this study, but without any intention of becoming an artist. At the age of 30, being ex-

cited by the sight of a beautiful collection by his father-in-law, Mr Heidegger, to this treasure, composed principally of Flemish pieces; and to this new taste most sacrificed every other. He at first only to delineate some decorations for 10 pieces of his books; but in 1765, he published landscapes etched and engraved by his other pieces appeared in 1769; and afterwards, he executed ornaments for many which came from his presses; among which his own works and a German translation from Mr Gesner's enthusiasm for his pursuits, and from the time and attention bestowed upon them, we might conclude found little leisure for discharging his citizen. The contrary, however, was the case for he passed almost the half of his life in employments of the state. In 1765 he was elected to the grand council, in 1767 to the 1768 he was appointed bailiff of Bilbac the four guards in 1776; and in 1781 superintendent of waters, which office in 1787 was to him for six years. In all these stations he discharged his duty with the most fidelity. He died of a paralytical disorder on the 24 March, 1788, aged 58. As a past Gesner, if he has been equalled by any, excelled by none. Pastoral poetry is surely very limited, but those who read his works will be convinced, that it is full of much variety. His pastoral romance is not inferior in natural simplicity to the celebrated work of Longus; but it surpasses it in variety of images and incident. *Eraslus*, *Evagder* are instructive and interesting poem count of the contrast between the world and the nature which reigns throughout them; an *Navigator* unites the mildest philosophy with the splendour and imagery of Fairy Land. His dramatic poems abound with interesting characters well delineated, and situations of novelty. His language is that of the most chaste ears might listen to the language which he has described. If he has some humour of Sterne and Fontaine, it is not in their licentiousness. The severest taste in his writings no phrase deserving reproach Gesner's character, as a man, was no less as a husband, a father, a friend, a son, and a citizen, his virtues were equally shining. He was naturally of a melancholic temper but was no enemy to rational mirth; mildness of his temper rendered his conversation ways engaging. Possessed of noble talents united with great modesty, he was simple in external appearance, as well as in his conversation. His language was lively and animated reserve before strangers resembled that which it was only in the presence of those with whom he was acquainted, that his real character shone in its full lustre. His reputation and his name known even in the remotest parts of the world. The late empress, Catharine II, presented him with a gold medal as a mark of her esteem. Many travellers thought they had seen only the artist of Gesner, or procured some of his

It way he had acquired so much reputation; he was ranked among the best artists; and Mr Fueslin, who was himself in the preface to the 3d vol. of his essay on the painters, engravers, architects, sculptors, who have done honour to the world, gives a distinguished place to Mr Gough then living.

**ERIA**, in botany: A genus of the angiosperm order, belonging to the didynamia class and in the natural method ranking unisexual order, *Personate*. The calyx is 5-lobed, and placed on the germen; the corolla is 5-lobed and then recurved; the capsule is bilocular.

**NE**, a town of Bohemia, in Boleslau.  
**NO, POINT**, a cape of Ireland in Sligo: 1 mile W. of Sligo. Lon. 8. 33. W. 2. N.

**NO**, a town of Naples, in Abruzzo Citra, 12 E. of Civita Borella.

**PS**, a town of the United States in 8 miles SSE. of Fort William.

**RIACUM**, in ancient geography, a station for ships of the Morini in Gallia in Cæsar's time, according to Dio, no town; but Florus speaks of it as the *Gessorincenses Muri* are mentioned in his Panegyric. The author of *Geographica*, commonly called *Pentinger's* expressly, that Gessoriacum was in his *Bouonia*. It is now called *Boulogne*.

**EST. n. f.** [*gestum*, Latin.] 1. A deed; an achievement.—

fair them quites, as him befeemed best, dly cau discourse with many a noble *gest*.

PART II.

\* To **GESTICULATE. v. n.** [*gesticular*, Lat. *gesticular*, Fr.] To play antick tricks; to shew postures. *Ditt*.

\* **GESTICULATION. n. f.** [*gesticulatio*, Lat. *gesticulation*, Fr. from *gesticulate*.] Antick tricks; various postures.

**GESTINEN**, a town of the Helvetic republic, in the canton of Uri, 15 miles S. of Altorf.

**GESTRICIA**, or **GESTRICKLAND**, } a province of Sweden, bounded by Helgingia on the N. by the gulf of Bothnia on the E. by Upland, Westmanland, and Dalecarlia, on the S. and by Dalecarlia on the W. It abounds with mines, forests, lakes, and rivers; and is 17 miles long and 10 broad. **GEFLE** is the capital. The Dahl, the finest river in Sweden, meanders through it.

**GESTUNGHAUSEN**, or **GESHAUSEN**, a town of Saxony in Coburg, 7 miles E. of Coburg.

(1.) \* **GESTURE. n. f.** [*gesto*, *gestum*, Lat. *gesto*, Fr.] 1. Action or posture expressive of sentiment.

—Ah, my sister, if you had heard his words, or seen his *gestures*, when he made me know what and to whom his love was, you would have matched in yourself, those two rarely matched together, pity and delight. *Sidney*.—When we make profession of our faith, we stand; when we acknowledge our sins, or seek unto God for favour, we fall down; because the *gesture* of constancy becometh us best in the one, in the other the behaviour of humbly. *Hooker*.—

To the dumbness of the *gesture*.  
One might interpret. *Shak. Timon*.

—Humble and reverend *gestures* in our approaches to God express the inward reverence of our souls. *Duty of Man*. 2. Movement of the body.—

Grace was in all her steps, heav'n in her eye,  
In ev'ry *gesture* dignity and love! *Milton*.

—Every one will agree in this, that we ought either to lay aside all kinds of *gesture*, or at least to make use of such only as are graceful and expressive. *Spectator*.

(2.) **GESTURE**, (§ 1. def. 1.) consists principally in the action of the hands and face; and may be defined, a suitable conformity of the motions of the countenance, and of several parts of the body, in speaking to the subject of discourse. See DECLAMATION and ORATORY.

\* To **GESTURE. v. a.** [from the noun.] To accompany with action or posture.—Our attire disgraceth it; it is not orderly read, nor *gestured* as befeemeth. *Hooker*.—He undertook to *gesture* and muffle up himself in his hood, as the duke's manner was, that none should discern him. *Wotton*.

**GESVALDO**, a town of Naples, in the Principato Ultra, 12 miles NW. of Conza.

(1.) \* To **GET. v. a.** pret. *I got*, anciently *gat*; part. pass. *got*, or *gotten*. [*getan*, *gettan*, Saxon.] 1. To procure; to obtain.—

Thine be the cosset, well hast thou it *got*. *Spenser*.—Of that which was our father's hath he *gotten* all this glory. *Gen. xxxi. 1*.—We *gat* our bread with the peril of our lives. *Sam. v. 9*.—David *gat* him a name when he returned from smiting of the Syrians. 2 *Sam. viii. 13*.—Most of these things might be more exactly tried by the Torricellian experiments, if we could *get* tubes so accurately blown that the cavity were perfectly cylindrical. *Boyle*.—Such a conscience, as has not been want-

ing to itself, in endeavouring to *get* the utmost and clearest information about the will of God, that its power, advantages, and opportunities could afford it, is that great internal judge, whose ab-  
 sultion is a rational and sure ground of confidence.  
*Soub.*—He insensibly *got* a facility, without perceiving how; and that is attributed wholly to nature, which was much more the effect of use and practice. *Locke*.—The man who lives upon alms, *gets* him his set of admirers, and delights in superiority. *Spectator*.—

Sphinx was a monster that would eat  
 Whatever stranger she could get,  
 Unless his ready wit disclos'd,  
 The subtle riddle she propos'd. *Addison*.  
 —This practice is to be used at first, in order to get a fixed habit of attention, and in some cases only. *Watts*.—The word *get* is variously used: we say to *get* money, to *get* in, to *get* off, to *get* ready, to *get* a stomach, and to *get* a cold. *Watts's Logick*. 2. To force; to seize.—Such losses and scatterings cannot easily, by any constable, or other ordinary officer, be *gotten*, when they are challenged for any such fact. *Spenser on Ireland*.—  
 The king seeing this, started from where he sat,  
 Out from his trembling hand his weapon *got*.

*Daniel*.  
 All things, but one, you can restore;  
 The heart you *get* returns no more. *Waller*.  
 3. To win by contest.—

Henry the sixth hath lost  
 All that which Henry the fifth had *gotten*. *Shak*.  
 —He *got* his people great honour, and he made battles, protecting the host with his sword. 1 *Mac*. iii. 3.—To *get* the day of them of his own nation, would be a most unhappy day for him. 2 *Mac*. v. 6.—Auria held that course to have drawn the galleys within his great ships, who thundering amongst them with their great ordnance, might have opened a way unto his galleys to have *gotten* a victory. *Knolles's Hist*. 4. To have possession of; to have. This sense is commonly in the compound preterite.

Then forcing thee, by fire he made thee bright;  
 Nay, thou hast *got* the face of man. *Herbert*.  
 5. To beget upon a female.—These boys are boys of ice; they'll none of her: sure they are bastards to the English, the French never *got* them. *Shak*.

Women with study'd arts they vex;  
 Ye gods destroy that impious sex;  
 And if there must be some t'invoke  
 Your pow'rs, and make your altars smoke,  
 Come down yourselves, and, in their place,  
 Get a more just and nobler race. *Waller*.  
 —Children they *got* on their female captives. *Locke*.—If you'll take 'em as their fathers *got* 'em, so and well; if not, you must stay 'till they *get* a better generation. *Dryden*.—

Has no man, but who has kill'd  
 A father, right to *get* a child? *Prior*.  
 Let ev'ry married man, that's grave and wise,  
 Take a tartuff of known ability,  
 Who shall so settle lasting reformation;  
 First *get* a son, then give him education. *Dorset*.  
 The god of day, descending from above,  
 Mixt with the day, and *got* the queen of love. *Granville*.

6. To gain as profit.—Though creditors will lose one fifth of their principal and use, and landlords

one fifth of their income, yet the debtors will not *get* it. *Locke*. 7. To gain by advantage.—

If they *get* ground and advantage  
 Then join you with them like a rib of  
 8. To earn; to gain by labour.—Harris nor any other way of *getting* or keeping but by trade, so much of our trade as much of our riches must necessarily. *Locke*.—If it be so much pains to count I would spend, what labour did it costors to *get* it? *Locke*. 9. To receive reward.—Any tax laid on foreign goods England raises their price, and makes *get* more for them; but a tax laid on made commodities lessens their price. To learn.—This defect he frequently being harder with him to *get* one fern than to pen twenty. *Fell*.—*Get* by her common and useful words out of his vocabulary. *Watts*. 11. To procure shall show how we may *get* it thus in afterwards preserve and keep it so. To put into any state.—Nature taught make certain vessels of a tree, whi down, not with cutting, but with fr  
 Take no repulse, whatever she d  
 For, *get* you gone, she doth not mean  
 —He who attempts to *get* another n absolute power, does thereby put hi state of war with him. *Locke*.—Befor bring forth, they may be pretty well them a little into heart. *Morimac*.— was taken up in embalming the bodie place very frequently: his greatest pe how to *get* the lovers out of it, the watched. *Guardian*. 13. To prevail duce.—Though the king could not *ge* gage in a life of business, he made h his chief companion. *Spectator*. 14 to hook.—With much communicat tempt thee, and smiling upon thee *ge* crets. *Bechuf*. xiii. 11.—By the mar grandson Ferdinand he *got* into his kingdoms of Bohemia and Hungary After having *got* out of you every th spare, I scorn to trespass. *Guardian*. take; to remove; implying haste or c you to bed on th' instant; I will forthwith. *Shak. Othello*.—Arise, *get* t this land. *Gen*. xxxi. 13.—Left they j our enemies, and fight against us, and up out of the land. *Exodus* i. 10.— speed *got* himself with his followers t town of Mega. *Knolles's Hist*. 16. T force or art.—She was quickly *got* of gain. *Knolles*.—The roving fumes of in evaporating, would oftentimes fall gold in such plenty, as would put b trouble to *get* them off from his rin When mercury is *got* by the help of of a metal, or other mineral body, i pose this quicksilver to have been a j of its own kind. *Boyle*.—They would *get* out those weeds which their own planted, and which now have taken t to be easily extirpated. *Locke on Es* put.—*Get* on thy boots; we'll ride all

**GET off.** To sell or dispose of by some ex-  
—Wood, to *get* his halfpence *off*, offered  
1-*d* pounds in his coin for seventy in li-  
*ast*.  
**To GET, v. a. 1.** To arrive at any state  
ire by degrees with some kind of labour,  
or difficulty; used either of persons or  
—Phidantus was entrapp'd, and saw round  
in, but could not *get* out. *Timon*.—  
u knew he walk'd o'er perils, on an edge  
likely to fall in than to *get* o'er. *Spoken*.—  
stranger shall *get* up above thee very high,  
u shalt come down very low. *Dante*.—  
he fox bray'd what a number of shifts  
was he had to *get* from the hounds; and  
said he had but one, which was to climb  
*Bacon*.—Those that are very cold, and e-  
y in their feet, cannot *get* to sleep. *Bacon's*  
*ist*.—I utterly condemn the practice of the  
mes, that some who are prick'd for sheriffs,  
re sit, should *get* out of the bill. *Bacon's*  
*to Villiers*.—He *got* away unto the Christi-  
d hardly escaped. *Knolles*.—He would be  
locks before they could *get* out of Anne-  
*letta's Hill*.—She plays with his rage, and  
ave his anger. *Denham*.—The luttant air  
away in bubbles. *Bacon*.—There are few  
whole minute parts stick so close together,  
it is possible to meet with some other  
these small parts may *get* between, and to  
them. *Boyle*.—There was but an insinua-  
tion of the liquor upon the recess of what-  
was that *got* through the cork. *Boyle*.—Al-  
the universe, and every part thereof, are  
of full excellency, yet the multiplicity  
is so various, that the understanding falls  
a kind of despondency of *getting* through  
t a task. *Hale's Origin of Mankind*.—If there  
be any leak at the bottom of the vessel,  
y little water would *get* in, because no air  
*get* out. *Wilkins's Math. Mag.*  
beav'n, in what a labyrinth am I led!  
ld *get* out, but she detains the thread. *Dryd.*  
have I seen some fearful hare maintain  
urise, 'till tir'd before the dog she lay;  
ha, stretch'd behind her, pants upon the  
plain,  
pow'r to kill, as she to *get* away. *Dryden*.  
more oily and light part of this mass would  
ve the other, and swim upon it. *Burnet's*  
—Having *got* through the foregoing part  
t us go on to his next argument. *Locke*.—  
moving of the pains we feel, is the *getting*  
nifery, and consequently the first thing to  
, in order to happiness, absent good. *Locke*.  
iving *got* into the sense of the epistles, we  
t compare what he says, in the places  
e treats of the same subject, we can hard-  
straken in his sense. *Locke*.—I *got* up as fast  
ble, girt on my rapier, and snatched up  
when my landlady came up to me. *Tatler*.  
shalus would let no body *get* upon him  
ander the Great. *Addison*.—  
orison'd fires, in the close dungeons pent,  
to *get* loose, and struggle for a vent;  
; their way, and undermining all,  
with a mighty burst whole mountains fall.  
*Addison*.

When Alma now, in different ages,  
Has finish'd her ascending stages,  
Into the head at length she *gets*,  
And there in publick grandeur sits,  
To judge of things. *Prior*.  
—I resolv'd to break through all measures to *get*  
away. *Swift*. 2. To fall; to come by accident.  
—Two or three men of the town are *got* among  
them. *Tatler*. 3. To find the way; to insinuate  
itself.—When an egg is made hard by boiling,  
since there is nothing that appears to *get* in at the  
shell, unless some little particles of the water, it  
is not easy to discover from whence else this  
change proceed: than from a change made in the  
texture of the parts. *Boyle*.—  
He taves; his words are loose  
As heaps of sand, and scattering wide from  
sense;  
So high he's mounted in his airy hopes,  
That now the wind is *got* into his head,  
And turns his brains to frenzy. *Dryd. Sp. Fryar*.  
—A child runs to overtake and *get* up to the top  
of his shadow, which still advances at the same  
rate that he does. *Locke*.—Should dressine, feait-  
ing, and balls once *get* among the Cantons, their  
military roughness would be quickly lost. *Addison*.  
—The fluids which surround bodies, upon the  
surface of the globe, *get* in between the surface of  
bodies, when they are at any distance. *Cibyne's*  
*Phil. Princ*. 4. To move; to remove.—  
*Get* home with thy fewel made ready to set;  
The sooner, and easier carriage to *get*. *Tusser*.  
5. To have recourse to.—The Turks made great  
haste through the midst of the town ditch, to *get*  
up into the bulwark to help their fellows. *Knolles*.  
—Lying is so cheap a cover for any miscarriage,  
and so much in fashion, that a child can scarce be  
kept from *getting* into it. *Locke*. 6. To go; to  
repair.—They ran to their weapons, and furiously  
assail'd the Turks, now fearing no such matter,  
and were not as yet all *got* into the castle. *Knolles's*  
*Hist*.—A knot of ladies, *got* together by themselves,  
is a very school of impertinence. *Swift*. 7. To  
put one's self in any state.—They might *get* over  
the river Avon at Stratford, and *get* between the  
king and Worcester. *Clarendon*.—We can neither  
find source nor issue for such an excessive mass of  
waters, neither where to have them; nor, if we  
had them, how to *get* quit of them. *Bacon's*  
*Tutor*.—Without his assistance we can no more  
*get* quit of our affliction, than but by his permis-  
sion we should have fallen into it. *Hale's Prop.*  
*for Death*.—There is a sort of men who pretend  
to divest themselves of partiality on both sides,  
and to *get* above that imperfect idea of their sub-  
ject which little writers fall into. *Pop. on Homer*.  
—As the obtaining the love of valuable men is the  
happiest end of this life, so the next felicity is to  
*get* rid of fools and scoundrels. *Pope to Swift*. 8.  
To become by any act what one was not before.  
The laughing sot, like all unthinking men,  
Bathes and *gets* drunk; then bathes and drinks  
again. *Dryden*.  
9. To be a gainer; to receive advantage.—  
Like jewels to advantage *get*,  
Her beauty by the shade does *get*. *Waller*.  
10. To GET off. To escape.—The gallies, by the  
benefit

benefit of the shores and shallows, *got off*. *Bacon's War with Spain*.—

Whate'er thou dost, deliver not thy sword;  
With that thou may'st *get off*, tho' odds oppose thee. *Dryden*.

11. To *GET over*. To conquer; to suppress; to pass without being stopped in thinking or acting.—'Tis very pleasant to hear the lady propose her doubts, and to see the pains he is at to *get over* them. *Addison*.—I cannot *get over* the prejudice of taking some little offence at the clergy, for perpetually reading their sermons. *Swift*.—To remove this difficulty, Peterborough was dispatched to Vienna, and *got over* some part of those disputes. *Swift*. 12. To *GET up*. To rise from repose.—Sheep will *get up* betimes in the morning to feed against rain. *Bacon's Nat. History*. 13. To *GET up*. To rise from a seat. 14. To remove from a place.—*Get you up* from about the tabernacle of Koran, Dathan, and Ahiram. *Num. xvi.* 15. To *get*, in all its significations, both active and neutral, implies the acquisition of something, or the arrival at some state or place by some means; except in the use of the preterite compound, which often implies mere possession; as, *he has got a good estate*, does not always mean that he has acquired, but barely that he possesses it. So we say *the lady has got black eyes*, merely meaning that she has them.

(1.) GETA, M. Septimius Antoninus, the son of the emperor Severus, and brother to Caracalla. In the 8th year of his age, he was moved with compassion at the fate of some of the partizans of Niger and Albinus, who were to be executed, and his father struck with his humanity retracted the sentence. After Severus's death, he reigned at Rome conjointly with his brother; but Caracalla, who envied his virtues and was jealous of his popularity, ordered him to be poisoned; and this not being effected, he murdered him in the arms of his mother Julia, who in attempting to defend him, received a wound in her arm, from the hand of her worthless son, A. D. 212. Geta had not reached the 23d year of his age, and the Romans lamented the death of so virtuous a prince, while they groaned under the cruelties and oppressions of Caracalla.

(2.) GETA, in geography. See GASTA.

GETÆ, an ancient nation of Thrace, who dwelt on both sides of the Ister, near Scythia, supposed to be the ancestors of the Dacians and Goths; or according to others, of the Walachians or Moldavians.

GETCHAO, a town of China, in the province of Chang tong, 27 miles ESE. of Lu.

GETTIN, Lady Grace, an English lady of uncommon parts, daughter of Sir George Norton of Abbots-Leigh in Somersetshire; was born in 1675; and became the wife of Sir Richard Gethin, of Gethin-Crett in Ireland. She was mistress of great accomplishments, natural and acquired, but did not live long enough to display them; for she died in her 21st year. She was buried in Westminster abbey, where a beautiful monument with an inscription is erected over her; and, to perpetuate her memory, provision was made for a sermon to be preached in Westminster abbey yearly, on Ash-Wednesday for ever. She wrote in look-

papers, a work which, after her death, was published under the title *quæ Gethiniana*; or, Some remains of ingenious and excellent lady, Grace lately deceased. Being a collection of courses, pleasant apophthems, and witty sayings. Written by her, for the most part of essay, and at spare hours." Lond. 1700.

GETHSEMENE, [גתסמנה. Heb. i. e. ley of fat, or fertility.] in ancient geography a village at the foot of Mount Olivet, whither Christ sometimes retired in the night-time in a garden belonging to this village; there he suffered the agony in which he sweated blood, and was arrested by Judas and his band. It is described by Maundrel as an even plot of not above 57 yards square, lying between Mount Olivet and the brook Cedron.

GETHYLLIS, in botany: A genus of the monogynia order, belonging to the decadecary of plants; and in the natural method under the 9th order, *Spartocææ*. The corolla is five-lobed, and the stamina are in six different positions; the capsule is trilocular.

GETSTORFF, a town of Germany 16 miles SE. of Meissau.

GETTENDORFF, a town of Austria 8. of Aigen.

\* GETTER. *n. f.* [from *get*.] 1. One who cures or obtains. 2. One who begets on.—Peace is a very lethargy, a *getter* of tard children than war's a destroyer of men.

\* GETTING. *n. f.* [from *get*.] 1. Acting; acquisition.—Wisdom is the principle therefore get wisdom; and with all the get understanding. *Prov. iv. 7.* 2. Gain.—Who hath a state to repair may not neglect small things; and it is less dishonour to bridge a petty charge than to stoop to borrowings. *Bacon*.—The learned families rather than their *gettings*, to be a porting child. *Swift*.

GETTYSBURG, a town of Pennsylvania 9 miles N. of the Mary and 118 W. by S. of Philadelphia.

GETTILL. See GAVILL.

GETTILIA. See GAVILLIA.

GETZENDORF, two towns of Austria on the Rhenish, 12 miles SE. of Vienna and four miles S. of Zutterdorf.

GEVAUDAN, or } a ci-devant province of France, in Languedoc, bounded on the N. by Auvergne, E. by S. by Cevennes, and W. by Rouergue mountains and barren; and now four départements of LOZERE.

GEVELSBERG, or GRETTERSBERG of Westphalia, in the county of Mark SE. of Brakenstein.

GEVER, or St GOAR. See GOAR.

GEVES, a town and river of Africa, river St Domingo.

GEVEZE, a town of France, in the diocese of Vilaine, 7½ miles NNW. of Rennes.

GEVIEZ, a town of Moravia, in the Olmutz, 12 miles SW. of Muhlitz.

(1.) GEUL, a river of Germany, which falls into the Meuse, 5 miles below Maestricht.

**UL**, a town of the French republic, in the Lower Meuse, and ci-devant duchy of Lorraine, 5 miles N. of Wyck.

**U**, **AVENS**, or **HERB BENNET**, a genus of the *Lygama* order, belonging to the icosantherous plants; and in the natural method under the 35th order, *Senticose*. The leaf is divided into 10 parts; there are 5 petals, and the seed has a jointed awn. There are 5 of which the 3 following, both natives of France, are the most remarkable:

**M RIVALE**, with a very thick, fleshy, woody root, hairy leaves, and upright stalks, the flowers are high, terminated by purple flowers on one side. Of this there are varieties with yellow flowers. The root is said to be efficacious in curing the dropsy; and it is daily used for this purpose by the natives and other inhabitants of North France.

Sheep and goats eat the plant; cows, and swine, are not fond of it.

**M URBANUM**, with thick fibrous roots, a bitter taste, rough, serrated leaves, and round, hairy stalks, terminated by large flowers, succeeded by globular fruit. The herb is sown in spring before the stem comes out; if infused in ale, give it a pleasant flavour, and is a stomachic virtue. The taste is mild and aromatic, especially when the plant is in dry situations; but in moist, it hath little virtue. Both these species are propagated either by the root or seed.

**U**, a town of France, in the dep. of the Rhone, 7 miles S. of Dijon.

**U**, a town of Saxony, in the bishopric of Meissen, 3 miles E. of Zeitz.

**U**, a town of Saxony, near Cothen.

**U**, *U*. *n. f.* [*pegaw*, Sax. *ioraw*, Fr.] a rattle; a toy; a bauble; a splendid plaything that metal they exchanged for the mean and *geugaw* which the others could not value. — *Prefer that which Providence pronounced to be the staff of life, bearing geugaw that has no other value than vanity has set upon it. L'Esrange.* — Children, when they throw one toy away, a more foolish *geugaw* comes in play. *Dryden.*

*U*, *U*. *n. f.* [*geugaw*, Sax. *ioraw*, Fr.] a rattle; a toy; a bauble; a splendid plaything that metal they exchanged for the mean and *geugaw* which the others could not value. — *Prefer that which Providence pronounced to be the staff of life, bearing geugaw that has no other value than vanity has set upon it. L'Esrange.* — Children, when they throw one toy away, a more foolish *geugaw* comes in play. *Dryden.*

Some loose the hands of friendship, cancel nature's laws of honesty and tawdry *geugaws*. *Philips.* Images were fans, silks, ribbands, lace, and other *geugaws*, which lay so thick that the heart was nothing else but a toyshop. *Wardian.*

**U**, *U*. *n. f.* [*geugaw*, Sax. *ioraw*, Fr.] a rattle; a toy; a bauble; a splendid plaything that metal they exchanged for the mean and *geugaw* which the others could not value. — *Prefer that which Providence pronounced to be the staff of life, bearing geugaw that has no other value than vanity has set upon it. L'Esrange.* — Children, when they throw one toy away, a more foolish *geugaw* comes in play. *Dryden.*

**U**, a ci-devant territory of France, in the dep. of Bresse; bounded by Mount Jura, the lake of Geneva, and Switzerland. It was ceded to France by the duke of Savoy, in 1704, and forms the department of Ain.

(2.) **GEX**, a town of France, in the dep. of Ain, at the foot of Mount St Claude; 10 miles NNW. of Geneva, and 36 NE. of Mantua. Lon. 6. 1. E. Lat. 46. 20. N.

**GEYER**, a town of Upper Saxony, among the mines. Vitriol, sulphur, alum, arsenic, &c. are manufactured in it. It is 6 miles WSW. of Wolkstein.

**GEYERSBERG**, a town of Bohemia, 18 miles ENE. of Koniggratz, and 18 ENE. of Chrudim.

**GEYRACH**, a town of Germany in Stiria.

**GEYSA**, or **GEYSS**, a town of Germany, in the circle of the Upper Rhine, and bishopric of Fulda; 15 miles NE. of Fulda.

**GEYSS-RUCKEN JAFFELER**, a mountain of Germany, between Upper Carniola and Cilley, 6 miles NE. of Stein.

**GEZAEI**, a town of Turkey in Irak Arabic, on the Euphrates, 120 miles NE. of Bassora.

**GEZAN**, or **DSJEZAN**. See **DSJESAN**.

**GEZIRA**, a town of Asiatic Turkey, in the prov. of Diarbekir, in an island formed by the Tigris, 70 miles NW. of Mouful. Lon. 40. 50. E. Lat. 36. 36. N.

**GEZIRAT**, a town of Turkey, in Diarbekir, 60 miles SE. of Diarbekir.

**GEZIRAT INDAHAD**, or the ISLE OF GOLD, an island of Egypt, in the Nile, 2 miles S. of Fouad.

**GEZULA**, or **GAZULA**, a country of Africa, S. of Morocco, the inhabitants of which are allies of the emperor. They are numerous, and are reckoned the most ancient people of Africa. They have no towns, but live in camps and villages, and are hospitable to strangers. They have an annual fair, which lasts 2 months. The country abounds in corn, pasture, copper and iron.

**GEFOLL**, a town of Austria, 8 m. W. of Crems.

**GHALEFKA**, a town of Arabia Felix.

**GHANA**, or **GHANARA**, a town of Africa, in Wangara, on the Niger. Lon. 15. 56. E. Lat. 15. 30. N.

\* **GHASTFUL**. *adj.* [*gast* and *fulle*, Saxon.] Dreary; melancholy; dismal; fit for walking spirits. *Obsolete.*—

Here will I dwell apart,  
In *ghastful* grave, 'till my last sleep  
Do close mine eyes:  
Help me, ye baneful birds, whose shrieking sound  
Is sign of dreary death. *Spenser's Pastorals.*

\* **GHASTLINESS**. *n. f.* [from *ghastly*.] Horror of countenance; resemblance of a ghost; paleness.

\* **GHASTLY**. *adj.* [*gast*, or *ghost*, and *like*.] 1. Like a ghost; having horror in the countenance; pale; dreadful; dismal.—

Why looks your grace so heavily to-day?  
—O, I have past a miserable night;  
So full of ugly sights, of *ghastly* dreams,  
So full of dismal terror was the time. *Shakespeare.*  
—Envy quickly discovered in court Solymann's changed countenance upon the great bassia, and began now to shew her *ghastly* face. *Knolles's Hist. Death.*

Grinn'd horrible a *ghastly* smile, to hear  
His famine should be fill'd. *Milt. Par. Lost.*

—Those departed friends, whom at our last separation we saw disfigured by all the *ghastly* horrors of death, we shall then see assisting about the majestic

jestick throne of Christ, with their once vile bodies transfigured into the likeness of his glorious body, mingling their glad acclamations with the hallelujahs of thrones, principaities and powers. *Boyle.*

He came, but with such alter'd looks,  
So wild, so *ghastly*, as if some ghost had met him,  
All pale and speechless. *Dryd. Spanish Fryar.*  
I did not for these *ghastly* visions send;  
Their sudden coming does some ill portend.

*Dryden's Indian Emp.*

2. Horrible; shocking; dreadful.—

To be less than gods  
Disdain'd; but meaner thoughts learn'd in their flight,  
Mangled with *ghastly* wounds through plate and mail. *Milton.*

I who make the triumph of to-day,  
May of to-morrow's pomp one part appear,  
*Ghastly* with wounds, and lifeless on the bier!

*Prior.*

\* **GHAISTNESS.** *n. f.* [from *ghast*, Sax.] Ghastliness; horror of look. Not used.—

Look you pale, mistress?

Do you perceive the *ghastness* of the eye. *Sh. Oth.*

(1.) **GHEDI**, a district of the Cisalpine republic, in the department of Meta, containing 5 parishes, and 7000 souls.

(2.) **GHEDI**, a well built town in the above district, between the Naviglio and Seriola, containing 3200 citizens.

**GHEIRA**, a town of Asiatic Turkey in Natolia.

**GHEIVE**, a town of Natolia, 20 m. E. of Hnik.

**GHEME**, a town of Italy, in the Novaresc, 13 miles NNW. of Novara. The Novaresc was annexed to the Cisalpine republic, in Nov. 1800.

**GHENT**, or **GAUNT**, a city of the French republic, capital of the department of the Scheldt, and the capital of the cisalpine province of Austrian Flanders. It is situated on 4 navigable rivers, the Scheldt, the Lys, the Lieve, and the Aboze, which, with a great number of canals run through it, and divide it into 25 little isles, over which there are 200 bridges. Among these there is one remarkable for a statue of brass of a young man who was condemned to cut off his father's head; but as he was going to strike, the blade flew into the air, and the head remained in his hand, upon which they were both pardoned. There is a picture of the whole transaction in the town house. Ghent is surrounded with walls and other fortifications, and is tolerably strong considering its circumference. The streets are large and well paved, the market places spacious, and the houses built with brick. The largest market-place is remarkable for the statue of Charles V. which stands upon a pedestal in the imperial habit. That of Cortere has a fine walk, between several rows of trees. In 1737 a fine opera-house was built, and a guard-house for the garrison. Near the town is a very high tower, with a handsome clock and chimera. The great bell weighs 11,000 lb. Ghent was anciently the capital of the Nervii, and after them of the Vandals, who gave it the name of *Randa*, or *Randa*, whence *Ganda* and *Ghent* are supposed to have been derived. Godoacer of Flanders first surrounded it with walls; and in 1397 Philip, the 2<sup>d</sup> H. of Flanders, enlarged it. Prince John, the 2<sup>d</sup> son of Edward 1<sup>st</sup> of England, was born

in it, hence named *John of Gaunt* the emperor Charles V; but the inhabitants have no reason to venerate his memory; repeated oppressions, he provoked them 1539; whereupon he put to death 26 pal citizens, banished many others, and their estates; deprived the city of arms and artillery; fined the citizens of crowns, and ordered the magistrates in procession with ropes about their necks. This famous for the pacification signed for settling the tranquillity of the 17 was taken by Lewis XIV, in 1678, at the treaty of Nimueguen. The possession of it again after the death of Spain. In 1706, it was taken by Marlborough; and by the French it was retaken the same year. The French by surprise after the battle of Fontenoy the peace of Aix-la-Chapelle it was retaken the 14th Nov. 1792, it was taken by the French under Gen. Labourdonnais welcomed by the inhabitants. In they evacuated it, upon the desertion of the French; but recovered it again in July the Austrians under Clairfait retreated well seated for trade, on account of canals. It carries on a great commerce and has linen, woollen, and silk. The number of citizens is about 70,000; population is not proportionable to which Charles V. thus boasted to "I have a *glorie*" (said he, alluding name *Gand*), "in which I could put 100,000 of Paris." Ghent lies 24 miles S. of Antwerp, and 30 miles S. of London. Lat. 51. 4. N.

**GHERKEDDE**, a town of Turkey.

**GHERGISTAN MOUNTAINS**, a range of mountains in Asia, 15 leagues N. of Candahar.

**GHERGONG.** See **GORGONG.**

**GHERIAH**, or **GHERIAH**, a town in Cochin, on the W. coast, the capital of the pirate Angia, taken by Adm. Watton and Col. C. when his fleet was destroyed, and by the British and Madagascars. It lies NNW. of Goa, and 295 S. by E. of London. Lat. 16. 45. N.

\* **GHERKIN.** *n. f.* [from *garcin*, cucum. ber.] A small pickled cucumber.

**GHERKMA**, or **GHERMA**, a town in the desert of Berber. Lon. 18. 25. E.

**GHERMANSLI**, a town of Turkey.

**GHERKZE**, a town of Africa, in the desert of Berber.

\* **To GHESS.** *v. n.* [See **To GUESS**.]

by critics considered as the true but *gess* has universally prevailed.

**GHEURL**, a town of Natolia.

**GHEUTSI**, a town of Caiaman.

**GHEUSSI**, a town of Caiaman.

**GHEYSSQUAS**, a nation of Hottentots, which, as well as from the country and Biquas, it is separated by a canal.

In dress, weapons, instruments of music, for dancing and hunting, &c. the

ring nations, except that their ornaments, and composed of the bones of sheep's feet, to which, by some peculiar process, a dazzling whiteness. Their women are lively, and cheerful; yet with all their gaiety, they are remarkable for modesty, and to warm a climate, is doubtless a virtue to be admired. M. Vaillant, who visited this people near Orange river, nowhere met with a nation so truly generous, though he had nothing to give in exchange, but the two days that he staid with them, sent him bowls of milk, evening and morning a lamb, and several sheep for his tribe. A practice, for which no satisfactory reason has been assigned, universally prevails among their tribes, of semi-castration, by cutting off the left testicle. Yet, as Kolben observes, this operation is commonly performed by the parents, on the birth of the child, though sometimes till the 3d year is completed.

**NELO**, a town of the Cisalpine republic, in the department of Tessino, and ci-devant of Pavia.

**KILAN**, or **KILAN**, a province of Persia, bordering on Russia. See **KILAN**.

**HILAN**, ST. See **GHISLAIN**, ST.

**HINALA**, a kingdom of Africa.

**GUINALA**, or **GUINALA**, the capital of the kingdom, seated on the river Grande. Lon. N. Lat. 10. 20. N.

**GHANAH**, or **GHANAH**. See **GHANAH**.

**GHUC**, a town of Turkey, in Natolia.

**GONG**, or **GHERGONG**, a city of India, the capital of Assam. It is encompassed by a high hedge of bamboos, and has 4 gates. The king's palace is surrounded by a causeway, on each side with a close hedge of bamboo, and a ditch on the outside. It is adorned with ice-work and carving. Plates of brass like mirrors are placed within and without, so that 3000 carpenters and 1200 labourers were employed in this work for two years, before it was completed. The wealth of Assam is chiefly in Ghirgong. Gold being found in every part of the country, among the sand of the rivers, and is the source of revenue. From 12, to 20,000 men are constantly employed in washing the sand, and the gold is paid by the rajah. The country around Ghirgong is fertile, and abounds with gum lac, excellent fruits, as mangoes, plantains, oranges, citrons, cocoa nuts, limes, pine apples, &c. **GHILAS**, a species of tamarind, of an excellent quality. Rice and lentiles are the chief crops. There are numerous in the neighbouring forests. **Ghirgong** is seated on the Burrampooter, 125 E. of Patna. Lon. 95. 35. E. Lat. 26.

**GHILAIN**, ST. or **ST GHILAN**, a town of the Cisalpine republic, in the department of the North, and ci-devant prov. of French Hainault, seated on the river, 5 miles W. of Mons. It was taken by the British, in June, 1792. Lon. 3. 53. E. Lat. 53. N.

**GHIRA**, a town of the Cisalpine republic, in

the dep. of the Lario, and late duchy of Milan; 30 miles NW. of Milan.

(1.) **GHIZNI**, or **GAZNA**, an ancient empire of Asia, formerly very powerful. See **GAZNA**.

(2.) **GHIZNI**, or **GAZNA**, the capital of the above empire, lies 54 miles S. of Cabul, and 150 E. of Candahar. See **GAZNA**. Lon. 68. 20. E. Lat. 33. 40. N.

**GHOER**, a town of the Batavian republic, in the dep. of Yffel, and ci-devant prov. of Overysel; seated on the Regge, 10 miles NNE. of Borkeloo.

(1.) \* **GHOST**. *n. f.* [*gast*, Sax.] 1. The soul of man.—

Vex not his *ghost*: O, let him pass! He hates him,

That would upon the rack of this rough world Stretch him out longer. *Shak. King Lear.*

Often did I strive

To yield the *ghost*; but still the envious flood Kept in my soul. *Shak. Rich. III.*

2. A spirit appearing after death.—

The mighty *ghosts* of our great Harrys rose, And armed Edwards look'd with anxious eyes, To see this fleet among unequal foes,

By which fate promis'd them their Charles should rise. *Dryden.*

3. To give up the **GHOST**. To die; to yield up the spirit into the hands of God.—

Their shadows seem

A canopy most fatal, under which Our army lies ready to give up the *ghost*. *Shak.*

4. The third person in the adorable Trinity, called the Holy Ghost.—

(2.) **GHOST**, *v. i. def. 2.* See **APPARITION**, § 3; and **SPECTRE**.

(3.) **GHOSTS**, ANCIENT OPINIONS RESPECTING. The ancients supposed every man to be possessed of three different ghosts, which after the dissolution of the body were differently disposed of. These ghosts they distinguished by the names of *Manes*, *Spiritus* and *Umbra*. The *manes*, they fancied, went down into the infernal regions; the *spiritus* ascended to the skies; and the *umbra* hovered about the tomb, as being unwilling to quit its old connections. Thus Dido (*Virg. Æn. iv. 384.*) threatens Æneas after death that she will haunt him with her *umbra*, whilst her *manes* rejoice in his torments below. This idea of a three-fold soul is very clearly expressed in those lines, which have been attributed to Ovid:

*Bis duo sunt homini: MANES, CARO, SPIRITUS, UMBRA:*

*Quatuor ista loci bis duo suscipiunt. Terra tegit CARNEM, tumulum circumvolat UMBRA,*

*Orcus habet MANES, SPIRITUS, atra petit.*

(4.) **GHOSTS**, MODERN SUPERSTITIOUS NOTIONS RESPECTING. "A Ghost" (says captain Grose in his *Provincial Glossary*;) "is supposed to be the spirit of a person deceased, who is either commissioned to return for some especial errand, such as the discovery of a murder, to procure restitution of lands or money unjustly withheld from an orphan or widow—or having committed some injustice whilst living, cannot rest till that is redressed."

fed. Sometimes the occasion of spirits revisiting this world, is to inform their heir in what secret place, or private drawer in an old trunk, they had hidden the title-deeds of the estate; or where, in troublesome times, they buried their money and plate. Some ghosts of murdered persons, whose bodies have been secretly buried, cannot be at ease till their bones have been taken up, and deposited in consecrated ground with all the rites of Christian burial." For a farther enumeration of the popular superstitions respecting ghosts, we refer the reader to Capt. Grose's work, above quoted.

(5.) GHOSTS, PHILOSOPHICAL INQUIRY INTO THE SUBJECT OF. See SPECTRE, § 2.

(1.) \* To GHOST. *v. a.* [from the noun.] To haunt with apparitions of departed men. Obsolete.—

Julius Cæsar,

Who at Philippi the good Brutus *ghosted*,

There saw you labouring for him. *Shak.*

(2.) \* To GHOST. *v. n.* To yield up the ghost; to die. Not in use.—Euryalus taking leave of Lucretia, precipitated her into such a love-fit, that within a few hours she *ghosted*. *Sidney.*

\* GHOSTLINESS. *n. f.* [from *ghostly*.] Spiritual tendency; quality of having reference chiefly to the soul.

\* GHOSTLY. *adj.* [from *ghost*.] 1. Spiritual; relating to the soul; not carnal; not secular.—Save and defend us from our *ghostly* enemies. *Comm. Prayer*.—Our common necessities, and the lack which we all have, as well of *ghostly* as of earthly favours, is in each kind so easily known, but the gifts of God, according to these degrees and times, which he in his secret wisdom seemeth meet, are so diversely bestowed, that it seldom appeareth what all receive; what all stand in need of, it seldom lieth hid. *Hooker*.—The graces of the spirit are much more precious than worldly benefits, and our *ghostly* evils of greater importance than any harm which the body feelth. *Hooker*.—To deny me the *ghostly* comfort of my chaplains, seems a greater barbarity than is ever used by Christians. *King Charles*. 2. Having a character from religion; spiritual.—

Hence will I to my *ghostly* friar's close cell,  
His help to crave, and my dear hap to tell.

*Shak. Romeo and Juliet.*

The *ghostly* father now hath done his shrift.

*Shak. Hen. VI.*

GHOUMEL, a town of Africa, in the kingdom of Pholey, on the Joto. Lon. 11. 15. W. Lat. 16. 12. N.

GHOORBOND, a town of Africa, in Cabul, 42 miles NW. of Cabul. Lon. 67. 52. E. Lat. 34. 55. N.

GHOWRI, a town of Asia, in the kingdom of Balk. Lon. 66. 56. E. Lat. 35. 40. N.

GHUNFUDE, a sea port of Arabia, on the Red Sea, belonging to the Sherife of Mecca, 145 miles S. of Mecca. Lat. 19. 7. N.

GIABER, or GEBER. See GEBER, N. 1.

GIAPFA. See JAFFA, and JOPPA.

GIAGH, in chronology, a cycle of 12 years, in use among the Turks and Cathayans. Each year of the giagh bears a name of some animal; the first that of a mouse; the 2d that of a bullock; the 3d a lynx or leopard; the 4th a hare; the 5th a

crocodile; the 6th a serpent; the 7th a 8th a sheep; the 9th a monkey; the 10th 11th a dog; and the 12th a hog. divide the day into 12 parts, called *gi* distinguish them by the names of animals. *giagh* contains two of our hours, and into eight *kebs*; so that a *keb* is a quarter hour.

GIAIDHOFF, a town of Stiria, 8 miles of Graz.

(1.) \* GIALALINA. *n. f.* [Italian.] a bright gold colour, found in the kingdom of Naples, very fine, and much valued by *Woodward's Met. Foss.*

(2.) GIALALINA, or } in natural hills  
GIALLOLINO, } fine yellow pigmented also NAPLES YELLOW.

GIALU, a town of Transylvania, SSW. of Clausenburg.

GIAMANI, a town of Persia, 28 miles of Susa.

\* GIAMBEUX. *n. f.* [*jambes*, French] or armour for legs; greaves.—

The mortal steel spiteously entail  
Deep in their flesh, quite through the  
That a large purple stream adown the  
*beux* falls.

GIAMOBASH, a town of Asiatic Turkey, 20 miles SSE. of Smyrna.

GIANNONI, Peter, an Italian author of Naples in 1680. He wrote a History of which is admired for its purity of style and purity of sentiments. It gave such offence to the court of Rome that he was obliged to flee; where he died in 1748.

(1, 1.) \* GIANT. *n. f.* [*geant*, French Latin.] A man of size above the ordinary men; a man unnaturally large. It is observed the idea of a giant is always associated with brutality, and wickedness.—

Now does he feel his axle

Hang loose about him, like a *giant's*  
Upon a dwarfish thief. *Shak.*

Gates of monarchs

Are arch'd so high that *giants* may jet  
And keep their impious turbans on,  
Good-morrow to the sun. *Shak.*

Woman's gentle brain

Could not drop forth such *giants* rude  
Such Ethiop words. *Shak. As.*  
Fierce faces threat'ning wars,  
*Giants* of mighty bone, and bold em

—Those *giants*, those mighty men, as renowned, far exceeded the proportion, and strength of those *giants* remembered by his own time. *Raleigh's Hist.*—

The *giant* brothers, in their cave  
found

I was not forc'd with ease to quit my  
*Dryde*

By weary steps and slow

The groping *giant* with a trunk of pig  
Explor'd his way.

Neptune, by pray'r repentant, rav  
Afflicts the chief t'avenge his *giant* foe  
Great Polypheme of more than mort

GIANTS, ARGUMENTS RESPECTING THE  
 CE OF. The traditions of all ages have  
 us with so many extravagant accounts  
 of incredible bulk and strength, that  
 once of such people is now generally dis-

It is commonly thought, that the  
 man has been the same in all ages; and  
 even pretended to *demonstrate* the im-  
 existence of giants mathematical-  
 these our countryman M'Laurin has been  
 explicit. But his arguments and com-  
 drawn from the disproportion between  
 ion of parts in small models and large  
 f human workmanship, are by no means  
 ; because, along with an increase of  
 any animal, we must always suppose a  
 nal increase in the cohesion of the parts  
 ly. Large works sometimes fail when  
 d on the plan of models, because the  
 of the materials whereof the model is  
 f of the large work, are the same; but  
 ce in this respect will produce a very re-  
 difference in the ultimate result. Thus,

model is made of fir wood, the model  
 m and strong enough; but a large work  
 of fir, when executed according to the  
 he model, may be so weak that it will  
 ce from its own weight. If, however,  
 use of iron for the large work instead  
 e whole will be sufficiently strong, even  
 e exactly according to the plan of the  
 he like may be said with regard to large  
 animals. If we could find an animal  
 nes exceeded in hardness and strength  
 of other animals as much as iron ex-  
 such an animal might be of a monstrous  
 et be exceedingly strong. In like man-  
 suppose the flesh and bones of a giant  
 tly superior in hardness and strength  
 f other men, the great size of his body  
 o objection at all to his strength. The  
 trovery therefore, concerning the exist-  
 ants, must rest on the credibility of the  
 iven by those who profess to have seen

not on any arguments drawn *a priori*.  
 icture we are told of *giants*, who were  
 rom the marriages of the *sons of God* with  
 rs of men. See ANTEDILUVIANS, § 6.  
 ge indeed has been differently interpre-  
 o render it doubtful whether the word  
*giants* does there imply any extraordi-  
 e. In other parts of scripture, how-  
 s, with their dimensions, are mentioned  
 nanner that we cannot possibly doubt;  
 aic of Og king of Bashan, Goliath, and  
 n. 1 Chron. xv, 4—8. The rev. Mr  
 er of Latheron, in Caithness, mentions  
 atherland the last proprietor of Berry-  
 who lived in the end of the 15th cen-  
 measured 9 feet 5 inches high. See  
*air's Stat. Acc.* xvii. p. 27,—30.

NTS, M. LE CAT'S ACCOUNT OF. M.  
 a memoir read before the Academy of  
 Rouen, gives the following account of  
 are said to have existed in different a-  
 anc historians have given 7 feet of height  
 their first hero; and in our days we  
 en 8 feet high. The giant who was  
 PAR. II.

shown in Rouen in 1735, measured 8 feet some  
 inches. The emperor Maximin was of that size;  
 Shenkius and Platerus, physicians of the last cen-  
 tury, saw several of that stature; and Goropius  
 saw a girl who was 10 feet high.—The body of  
 Orestes, according to the Greeks, was eleven feet  
 and a half; the giant Galbara, brought from A-  
 rabia to Rome under Claudius Cæsar, was near  
 10 feet; and the bones of Secondilla and Pufio,  
 keepers of the gardens of Sallust, were but six  
 inches shorter. Funnam, a Scotsman, who lived  
 in the time of Eugene II. King of Scotland, measured  
 11½ feet; and Jacob le Maire in his voyage  
 to the Straits of Magellan, reports, that on the  
 17th Dec. 1675, they found at Port Desire several  
 graves covered with stones; and having the curi-  
 osity to remove the stones, they discovered human  
 skeletons of 10 and 11 feet long. The chevalier  
 Scory, in his voyage to the peak of Teneriffe,  
 says, that they found, in one of the sepulchre  
 caverns of that mountain, the head of a Guanche  
 which had 80 teeth, and that the body was not  
 less than 15 feet long. The giant Ferragus, slain  
 by Orlando nephew of Charlemagne, was 18 feet  
 high. Rioland, a celebrated anatomist, who  
 wrote in 1614, says, that some years before there  
 was to be seen in the suburbs of St Germain the  
 tomb of the giant Iforet, who was 20 feet high.  
 In Rouen, in 1509, in digging in the ditches near  
 the Dominicans, they found a stone tomb con-  
 taining a skeleton whose skull held a bushel of  
 corn, and whose shin-bone reached up to the  
 girdle of the tallest man there, being about 4 feet  
 long, and consequently the body must have been  
 17 or 18 feet high. Upon the tomb was a plate  
 of copper, whereon was engraved, "In this tomb  
 lies the noble and puissant lord, the chevalier  
 Ricou de Vallemont, and his bones." Platerus,  
 a famous physician, declares, that he saw at  
 Lucerne the true human bones of a subject which  
 must have been at least 19 feet high. Valence in  
 Dauphiné boasts of possessing the bones of the  
 giant Bucart, tyrant of the Vivarais, who was  
 slain by an arrow by the count De Cabillon his  
 vassal. The Dominicans had a part of the shin-  
 bone, with the articulation of the knee, and his  
 figure painted in fresco, with an inscription, show-  
 ing that this giant was 22 feet and a half high  
 and that his bones were found in 1705, near  
 the banks of the Morderi, a little river at the foot  
 of the mountain of Cruffol, upon which (tradition  
 says) the giant dwelt." M. Le Cat adds, that  
 skeletons have been discovered of giants, of a still  
 more incredible height, viz. of *Theutobockus* king  
 of the Teutones, found Jan. 11. 1613, 25½ feet  
 high; of a giant near Mazarino, in Sicily in 1516,  
 30 feet; of another in 1548, near Palermo, 30  
 feet; of another in 1550, of 33 feet; of two  
 found near Athens 33 and 36 feet; and of one at  
 Totu in Bohemia, in 758, whose leg bones alone  
 measured 26 feet! But whether these accounts are  
 credited or not, we are certain that the stature of  
 the human body is by no means fixed. We are  
 ourselves a kind of giants in comparison of the  
 Laplanders; nor are these the most diminutive  
 people to be found upon the earth. The Abbé  
 la Chappe, in his journey into Siberia, to observe  
 the last transit of Venus, passed through a village  
 inhabited

inhabited by people called **WOTIACKS**, who were not above four feet high. The accounts of the **Patagonians** likewise, which cannot be entirely discredited, render it very probable, that somewhere in South America there is a race of people very considerably exceeding the common size of mankind, and consequently that we cannot altogether discredit the relations of giants handed down to us by ancient authors; though what degree of credit we ought to give them, is not easy to be determined. See **PATAGONIA**.

(4.) **GIANTS, REBELLIOUS**, in ancient mythology, the sons of **Cælus** and **Terra**. According to **Hesiod**, they sprang from the blood of the wound which **Cælus** received from his son **Saturn**. **Hyginus** calls them sons of **Tartarus** and **Terra**. They are represented as endued with strength proportioned to their gigantic size. Some of them, as **Cottus**, **Briareus**, and **Gyges**, had each 50 heads and 100 arms, and serpents instead of legs. They were of a terrible aspect, and their hair hung loose about their shoulders. **Pallene** and its neighbourhood was the place of their residence. The defeat of the **Titans**, to whom they were nearly related, incensed them against **Jupiter**, and they all conspired to dethrone him. Accordingly they reared **Mount Ossa** upon **Pelion**, and **Olympus** upon **Ossa**; and from thence attacked the gods with huge rocks, some of which fell into the sea and became islands, and others fell on the earth and formed mountains. **Jupiter** summoned a council of the gods; when being informed that it was necessary to obtain the assistance of some mortal, he by the advice of **Pallas** called up his son **Hercules**; and with the aid of this hero he exterminated the giants **Enceladus**, **Polybates**, **Alcyon**, **Porphyrion**, the two sons of **Alceus**, **Epibaltes** and **Othus**, **Eurytus**, **Clytus**, **Tythyus**, **Pallis**, **Hippolitus**, **Agrius**, **Thoon**, and **Typhon**; the last of whom it was more difficult to vanquish than all the rest. **Jupiter**, having thus gained a complete victory, cast the rebels down to **Tartarus**, where they were to receive the full punishment of their enormous crimes: according to some of the poets, he buried them alive under **Mount Ætna** and different islands.

(II.) **GIANT'S CAUSEWAY**, in geography and natural history, a vast collection of **Basaltic pillars** in the county of **Antrim** in **Ireland**. See **BASALTES**, § 5. The principal or grand causeway (for there are several less considerable and scattered fragments of them,) consists of a most irregular arrangement of many hundred thousands of columns of a black kind of rock, hard as marble: almost all of them are of a pentagonal figure, but so closely and compactly situated on their sides, though perfectly distinct from top to bottom, that scarce any thing can be introduced between them. The columns are of an unequal height and breadth; some of the highest, visible above the surface of the strand, and at the foot of the impending angular precipice, may be about 20 feet; they do not exceed this height, at least none of the principal arrangement. How deep they are fixed in the strand, was never yet discovered. This grand arrangement extends early 200 yards, visible at low water; how far beyond is uncertain: from its declining appearance, however, at low water,

it is probable it does not extend under distance any thing equal to what is seen. The breadth of the principal causeway runs out in one continued range of 600 yards in general; from 20 to 30 feet; at two it may be nearly 40 for a few yards; account are excluded the broken and detached pieces of the same kind of construction detached from the sides of the grand causeway they do not appear to have ever been to the principal arrangement, though frequently been taken into the width of the causeway. It has been the cause why many very dissimilar appearances of this causeway have been observed; the highest part is the narrowest, at the impending cliff from whence the causeway descends, where, for 4 or 5 yards, it is only 10 or 15 feet wide. The columns of this part incline from a perpendicular a little ward, and form a slope on their tops, of unequal height of the columns on the top of which an ascent is made at the foot from the head of one column to the top of the next, gradually, to the top of the great causeway at the distance of 6 yards from the perpendicular position; and lowering several heights, widens to about 20 or 30 feet, and for 100 yards nearly above water. The tops of the columns length being nearly of an equal height, form a grand and singular parade, that it is not walked on, rather inclining to the westward. But from high water mark, as it is washed by the beating surges on every tide, the platform lowers considerably, becomes more and more uneven, so that it is not walked on but with the greatest caution at a distance of 150 yards from the cliff, it is to the east for 20 or 30 yards, and then descends into the sea. The figure of these columns is most unexceptionally pentagonal, or 5 sided; there are very few of any other figure; some few are of 3, 4, and 6 sides, but the majority of them are five-sided, and it is not easy to find any other figure; one must look very nicely to find any other figure: yet what is very extraordinary there are not two columns in ten to be found, that either have their sides square themselves, or whose figures are circular. Nor is the composition of these columns deserving attention. They are not of one piece in an upright position; but composed of short lengths, curiously joined, not by faces, but articulated into each other's socket, or like the joints in the vertebrae of the larger kinds of fish, the one containing a cavity, into which the convexity of the opposite one is exactly fitted. This is not possible but by disjoining the two stones of the concavity or convexity is generally 3 or 4 inches: And the convexity, corresponding concavity, are not conformable to the external angular figure of the columns, but round, and as large as the size or diameter of the column will admit. Consequently, the tops of these columns are in general extremely uneven, the circular edges of the joint are frequent with more than 2 or 3 sides of

d from the edge of the circular part of the  
o the exterior files and angles they are  
diam. It is still farther very remarkable,  
e articulations of these joints are frequently  
d; in some the concavity is upwards, in  
the reverse. This occasions that variety  
sture of concavities and convexities on the  
the columns, which is observable through-  
e platform of this causeway, yet without  
coverable regularity with respect to the  
of either. The length of these particular  
from joint to joint, is various: in general,  
8 to 24 inches, and, for the most part,  
toward the bottom of the columns than  
the top, and the articulation of the joints  
ing deeper. The size or diameter of the  
is as different as their length and figure;  
rall, they are from 15 to 20 inches. There  
traces of uniformity discovered through-  
ole combination, except in the form of the  
which is invariably by an articulation of the  
into the concave of the piece next above  
w it; nor are there any traces of a finishing  
part, either in height, length, or breadth,  
curious causeway. If there is here and  
smooth top to any of the columns above  
there are others just by, of equal height,  
e more or less convex or concave, which  
seem to have been joined to pieces that have  
rashed or by other means taken off. And  
tedly those parts that are always above  
ave, from time to time, been made even;  
e remaining surfaces of the joints must na-  
have been worn smoother, by the constant  
of weather and soaking, than where the  
every tide, is beating upon it, and contin-  
uancing some of the upper stones and expo-  
siting joints. As these columns preserve their  
ers from top to bottom, in all the exterior  
which have 2 or 3 sides exposed to view,  
e may be with reason inferred of the inter-  
columns whose tops only are visible. Yet  
very extraordinary, and equally curious,  
notwithstanding the universal dissimilitude  
columns, both as to their figure and dia-  
and though perfectly distinct from top to  
; yet is the whole arrangement so closely  
ed at all points, that hardly a knife can be  
ced between them either on the sides or

It is really a most curious piece of enter-  
it, to examine the close texture and mee-  
n of such an infinite variety of angular fi-  
s are exhibited on the surface of this grand

From the infinite dissimilarity of the fi-  
f these columns, this will appear a most sur-  
circumstance to the curious spectator, and  
ncline him to believe it a work of human  
e it not inconceivable, that the invention of  
ould construct and combine such an infinite  
of columns, which should have a general  
t likeness, and yet be so universally dissim-  
l their figure, as that, from the minutest  
tion, not two in 10, or 20,000 should be  
whose angles and sides are equal among  
es, or of the one column to those of the  
That it is the work of nature, the atten-  
tator cannot doubt, who carefully surveys

the general form and situation, with the infinitely  
various figuration of the several parts of this cause-  
way. There are no traces of regularity or design  
in the outlines of this curious phenomenon; which,  
in looking the broken and detached pieces of the  
same kind, are extremely scattered and confused,  
and, whatever they might originally, do not at  
present appear to have any connection with the  
principal causeway, as to any supposable design  
or use in its first construction; and as little design  
can be inferred from the figure or situation of the  
several constituent parts. The whole is, indeed,  
extremely confused, disuniform, and destitute of  
every appearance of use or design in its original  
construction. But what, beyond dispute, deter-  
mines its original to be natural, is, that the very  
cliffs, at a great distance from the causeway, espe-  
cially in the bay to the eastward, exhibit at many  
places the same kind of columns, figured and  
jointed in all respects like those of the grand cause-  
way. Some of them are seen near to the top of  
the cliff, which in general, in these bays to the  
E. and W. of the causeway, is near 300 feet in  
height; others again are seen about midway, and  
at different elevations from the strand. A very  
considerable exposure of them is seen in the very  
bottom of the bay to the eastward, near 100 rods  
from the causeway, where the earth has evident-  
ly fallen away from them upon the strand; and  
exhibits a most curious arrangement of many of  
these pentagonal columns, in a perpendicular po-  
sition, supporting, in appearance, a cliff of differ-  
ent strata of earth, clay, rock, &c. to the height  
of 150 feet or more, above. Some of these  
columns are between 30 and 40 feet high, from  
the top of the sloping bank below them; and,  
being longest in the middle of the arrangement,  
shortening on either hand in view, they have ob-  
tained the appellation of *organs*, from a rude  
likeness in this particular to the frontal tubes of  
that instrument; and as there are few broken  
pieces on the strand near it, probably the outside  
range of columns that now appear is really the  
original exterior line, toward the sea, of this col-  
lection. But how far they extend internally into  
the bowels of the incumbent cliff, is unknown.  
The very substance, indeed, of that part of the  
cliff which projects to a point, between the two  
bays on the E. and W. of the causeway, seems  
composed of this kind of materials; for besides  
the many pieces that are seen on the sides of the  
cliff that circulate to the bottom of the bays, par-  
ticularly the E. side, there is, at the very point  
of the cliff, and just above the narrow and high-  
est part of the causeway, a long collection of  
them seen, whose heads or tops just appearing  
without the sloping bank, plainly show them to  
be in an oblique position, and about half-way be-  
tween the perpendicular and horizontal. The  
heads of these, likewise, are of mixed surfaces,  
convex and concave; and the columns evidently  
appear to have been removed from their original  
upright, to their present inclining or oblique po-  
sition, by the sinking of the cliff.

(III.) GIANT'S GRAVE, a village of Ireland, near  
Sligo, where there are some massive ancient monu-  
ments of stone resembling those of STONEHENGE.

(IV.) GIANT'S HEAD, a cape on the E. coast of St Christopher's, E. of Ragged Point.

(V.) GIANT'S LOAD, a large rock in Louth county, Ireland, supposed to be about 40 tons weight, supported by three irregular stones set upright.

(VI.) GIANT'S STAIRS, a large rock near Cove in Cork, Ireland, having the form of steps.

\* GIANTESS. *n. f.* [from *giant*.] A she giant; a woman of unnatural bulk and height.—I had rather be a *gianteſs*, and lie under mount Pelion. *Shak.*—Were this subject to the cedar, she would be able to make head against that huge *gianteſs*. *Howel.*

\* GIANTLIKE. } *adj.* [from *giant* and *like*.]

\* GIANTLY. } Gigantik; valt; bulky.—Single courage has often, without romance, overcome *giantly* difficulties. *Decay of Piety.*—Notwithstanding all their talk of reason and philosophy, which they are deplorably strangers to, and those unanswerable doubts and difficulties, which, over their cups, they pretend to have against Christianity; persuade but the covetous man not to dilly his money, the proud man not to adore himself, and I dare undertake, that all their *giantlike* objections against the Christian religion shall presently vanish and quit the field. *South.*

\* GIANTSHIP. *n. f.* [from *giant*.] Quality or character of a giant.—

His *giantship* is gone somewhat crest-fallen,  
Stalking with less unconſcionable strides,  
And lower looks. *Milton's Agonistes.*

GIARGA, a town of Corsica, 9 m. E. of Calvi.

GIARMAL, a town of Hungary, 20 miles ESE. of Levens.

GIARURA, a town of Candahar.

GIAT, a town of France, in the dep. of Puy de Dome, 27 miles W. of Clermont, and SW. of Riom.

GIAVENNA, a town of Piedmont, in the marquisate of Susa, at the foot of the Cottian Alps, near the Sangon. It has an ancient wall with four gates; and contains 3000 inhabitants. It is 30 miles E. of Susa, and 14½ W. of Turin.

GIAMI, a town of Sardinia, 21 miles ESE. of Algeri.

GIAWLE. See GEFLE, N° 2.

GIB, the rev. Adam, minister of the Associate Congregation at Edinburgh, and for many years an useful and active member of that communion, was born on the 7th of April 1714, at Easter Castletown, in the parish of Muckhart, and county of Perth. He was the 9th son of Mr John Gib, of Easter Castletown. He gave very early proofs of a quick capacity, and strong natural parts. His progress in classical learning and philosophical study was considerable; and his natural sound judgment, and close application remarkably qualified him for the conspicuous office which he filled. After completing the usual course of study at the University of Edinburgh, he was licensed to preach in 1740, and ordained in 1741. He wrote several tracts of which the most distinguished were, his *Sacred Contemplations*, in 3 parts; among which his *Essay on Liberty and Necessity* attracted very general attention. He died at Edinburgh on the 18th of June 1788, much regretted by those who knew him best.

GIBBAROW, a river in Donegal, I.

off once a fortnight, and is used in var-  
embalming, and medicine.

JN, Edward, Esq; a late celebrated  
historian, born at Putney in Surrey,  
th, 1737. He was the eldest son of Ed-  
ward, Esq; and Judith Porten, daughter  
of a merchant in London. His family  
ended from John Gibbon, architect to  
III, who possessed lands in Kent. His  
on till his 15th year was extremely feeble,  
those of his brethren and sisters who all  
in infancy: and he complains, that "the  
his education was broken, as often as he  
was from the school of learning to the bed  
his." To the care and attention of his  
aunt he ascribes his preservation from a  
early death. In 1745 he was sent to the  
school at Kingston; in Jan. 1749, to  
Westminster: and in April 1752, to that of  
where he matriculated in Magdalen col-  
lege: professors of which he blames greatly  
his remissness and inattention to his moral  
and religious principles. In consequence  
he became a convert to the Roman catho-  
lic his 16th year. To cure the young ca-  
tholic his errors, and bring him back to the  
Protestant faith, his father, within 3 weeks after  
his conversion, (June 30th, 1753) sent him to  
Lausanne, and entrusted him to the tutorage  
of Richard, a Calvinist minister at Lausanne,  
whom Gibbon mentions with gratitude, as a  
skilful preceptor. Under his tuition, he  
made great progress in the Latin, Greek, and  
French; in history, geography, logic, and  
mathematics; and was also soon reclaimed from  
the error of Popery: so that on Christmas 1754,  
and the sacrament in the church of Lau-  
sanne had he communicated with 3 dis-  
courses before he was 18 years old. These  
opinions however, successively adopted  
and rejected, and the repeated changes so rapidly  
made in the one to the other, perhaps contri-  
buted to weaken our author's faith in revelation,  
and led to his final change to Deism, as much  
is evident from the usual of M. Voltaire's writings, or his  
acquaintance with that author, to whom he in-  
debted himself in 1757. About this time Mr  
Gibbon fell in love with Mad. Susan Curchod,  
the minister of Crassy, a lady whom  
he considered as possessed of every accomplishment,  
both natural and mental, that can adorn a woman. But  
without the consent of the young lady and her pa-  
rents, he was secretly obtained, yet his father's tyranni-  
cal opposition, which, "after a painful struggle,"  
deprived him of this inestimable  
source of matrimonial felicity for life. The  
next year he married to a man who will be  
remembered in history, as our author is in litera-  
ture the celebrated M. Neckar. In spring  
1761 he returned to England, and was agreed  
upon by his father; at whose house at  
Hampshire, he finished a work he had  
begun at Lausanne, entitled *Essai sur l'étude de la*  
*philosophie* which he published in 1761, 12mo,  
and dedicated to his father. Previous to this  
he had been appointed a captain in the  
British Militia, in which he served two  
years, which was of use to him, by making

him better acquainted with English manners,  
principles, and parties, than perhaps he might  
otherwise have been. After the peace in 1763,  
he went abroad; and after visiting Paris, where he  
was introduced to Mess. D'Alembert and Diderot,  
returned to his favourite residence at Lausanne.  
Having spent some time there, he made the tour  
of Italy; and at Rome, on the 15th Oct. 1764,  
while musing amidst the ruins of the capitol, the  
idea of his great work first started into his mind.  
Upon his return to Hampshire in June 1765, he  
found his father involved in pecuniary difficulties,  
and to relieve him, consented to the sale of part of  
the estate. After commencing a history of the  
revolutions of Switzerland, which he suppressed,  
he engaged in a Journal entitled, *Memoires Lite-  
raires de la Grand Bretagne*, and published 2 vols  
for 1767 and 1768; but his partner in this under-  
taking, a native of Switzerland, going abroad,  
when the 3d vol. was nearly finished, the work  
was discontinued. Bp. Warburton having about  
this time published an interpretation of the 6th  
book of Virgil's *Æneid*, he criticised it with equal  
asperity and success. But it is thought, that if  
the bishop had then possessed his former mental  
vigour, he would have chastised Mr Gibbon in  
such a manner, as to have made him afterwards  
somewhat more modest in his great work; in  
which, with all his petulant confidence, he often  
shows great inaccuracy in his quotations. Nor  
could it well be otherwise, as he himself acknow-  
ledges, that he often contented himself with bor-  
rowing his quotations, not from the original au-  
thors, but at second hand. But the taste of the  
times favouring the spirit of scepticism that ap-  
peared in his work, errors of this kind, which in  
a defender of Christianity would have been re-  
ckoned unpardonable, as so many *pious frauds* in-  
tended to deceive the reader, were either entirely  
overlooked, or considered as very venial faults,  
in the *History of the Decline and Fall of the Roman*  
*Empire*. Of this work the 1st vol. was published  
in 1776, and met with extraordinary success; the  
2d and 3d vols appeared in 1781; and the  
4th, 5th, and 6th, in 1787, established Mr Gibbon's  
name as a historian. Eulogiums were lavished on  
him from all quarters, to such a pitch indeed, that  
some of them, particularly those of Mr Hume and  
Dr Robertson, have even been reckoned *suave*.  
That Mr Hume should have been highly delighted  
with a work tending strongly to enforce his own  
principles, is not surprising; but the high pane-  
gyric bestowed by a *Minister of the Gospel*, upon  
a work, one main object of which is to prove that  
Christianity is not of divine original, is certainly  
quite out of character. Dr Zimmerman repre-  
sents Mr Gibbon as even excelling both these emi-  
nent historians in point of style. "All the dignity,  
(he adds,) all the charms of historic style, are united  
in Gibbon; his periods are melody itself, and  
all his thoughts have nerve and vigour." But o-  
thers, while they give our author full credit for  
acuteness of penetration, fertility of genius, luxu-  
riance of fancy, elegance of style, harmony of  
language, and beauty of epithets, &c. object,  
that, "the uniform flatness of his diction some-  
times imparts to his narrative a degree of obscu-  
rity, unless he descends to the miserable expedi-

ent of a note to explain the minuter circumstances: and that, "his style on the whole is much too artificial; and this gives a degree of monotony to his periods, which extends almost to the turn of his thoughts." "But a more serious objection (they justly add,) is his attack upon Christianity; the loose and disrespectful manner in which he mentions many points of morality, regarded as important on the principles of natural religion; and the indecent allusions and expressions, which too often occur in the work. An attack upon Christianity is not censurable merely *as fact*; it may proceed from the purest and most virtuous motives: but in that case, the attack will never be carried on in an insidious manner, and with improper weapons; and Christianity itself, so far from dreading, will invite every mode of fair and candid discussion. Our historian often makes, when he cannot readily find, an opportunity to insult the Christian religion. Such indeed is his eagerness in the cause, that he stoops to the most despicable pun, or to the most awkward perversion of language, for the pleasure of turning the scripture into ribaldry, or calling Jesus an impostor. Yet of the Christian religion has Mr Gibbon himself observed, that 'it contains a pure, benevolent, and universal system of ethics, adapted to every duty and every condition of life.' Such an acknowledgment, and from such a writer, too, ought to have due weight with a certain class of readers, and of authors likewise; and lead them seriously to consider, how far it is consistent with the character of good citizens, to endeavour by sly insinuations, oblique hints, indecent sneers, and profane ridicule, to weaken the influence of so pure and benevolent a system as that of Christianity, acknowledged to be admirably calculated for promoting the happiness of individuals and the welfare of society." (*Supplem. to the Encyc. Brit.* Vol. I. p. 707.) Various answers to Mr Gibbon's attack on Christianity, were published by Dr Chelsum, Dr Randolph, Lord Hailes, Dr Watson Bp. of Llandaff, Dr White, Mr Apthorpe, Mr Davis, Mr Taylor, Dr Priestley, and others. To most of these our author, made no reply, though his posthumous memoirs show he felt the weight of these answers, particularly those of Lord Hailes, Dr White, and Mr Taylor. Mr Gibbon's chief arguments on this subject, with satisfactory answers, are inserted under the article CHRISTIANITY, § 8, 9. Notwithstanding our author's zeal for the modern opinions in religion, he was no friend to the new opinions in politics. Being introduced into the House of Commons, as M. P. for Liskeard, in 1774, he uniformly supported administration with his vote, during the American war; and upon the French Revolution he adopted Mr Burke's creed, in every thing but his reverence for church establishments. Soon after the downfall of Lord North's administration, he returned to Lausanne, but his Swiss friend dying, and French politics prevailing in Berne, he left his *Paradise*, as he styled it, and returned to London in June 1793. He did not however enjoy this retreat long. His constitution had suffered much from repeated attacks of the gout, and a swelling of his ancles; and after having been tapped for a hydrocele, he died at London, *gout in his stomach*, on the 16th-Jan. 1794;

in the 57th year of his age. Of his eloquence shall only say, that his erudition was conversation captivating, his memory his penetration uncommon, and his eloquence ready and elegant, though with all these advantages he was not a public speaker. His private correspondence and journals appear to have been a dutiful son, a lover, and an affectionate friend.

(1.) \* GIBBOSITY. *n. f.* [*gibbosité*, *gibbosus*.] Convexity; prominence; protuberance.—When ships, sailing contrary ways, meet, they fight one of another, what should take the fight of ships from each other, but the interjacent water? *Ray*.

(2.) GIBBOSITY, in surgery, denotes a protuberance or convexity of the body, as in the hump-backed. Infants are much more subject to gibbosity than adults, and it proceeds from external than internal cause, as a blow, or the like, frequently thus affecting the tender bones of infants. When it proceeds from an internal cause, it is generally from the ossification of the ligaments that sustain the caries of its vertebræ; though the spine is sometimes flexed forward, and the vertebræ thus affected, are too strong and repeated action of the muscles. This, if not timely redressed, and fixed as the bones harden, till it is totally irretrievable; but when the disease is in the infant, and the person young, there are many ways of cure. The common method is by a pasteboard, wood, or steel, which presses principally on the gibbous part; long wearing may set all right. There are also a different instrument, called the gibbous, much more efficacious, though not so convenient in the wearing. By the use of this instrument, the parts are always prevented from growing, and are often cured. During the application of the gibbous, the parts should be often rubbed with spirit of turpentine, volatile alkali, or proof spirit, and with a strengthening plaster.

(1.) \* GIBBOUS. *adj.* [*gibbus*, Lat. French.] 1. Convex: protuberant; subject to inequalities.—The bones will rise, and the *gibbous* member. *Wijeman*.—

A pointed flinty rock, all bare and  
Grew *gibbous* from behind the mountain

—The sea, by this access and recess, fills  
empty shells, wears them away, reduces  
that are concave and *gibbous* to a flat.  
*Nat. Hist.* 2. Crookbacked.—I demand  
camels of Bactria came to have two humps  
on their back, whereas the camels of Arab  
have one? How oxen, in some countries,  
continue *gibbous*, or hunch-backed? *B*

(2.) GIBBOUS, in astronomy, is used  
to denote the enlightened parts of the moon,  
is moving from the first quarter to the  
full to the last quarter: for at the  
dark part appears horned or falcate  
light one hunched out, convex, or *gibbous*.

\* GIBBOUSNESS. *n. f.* [from *gibbous*.]  
Convexity; prominence.—To make the  
earth discernible, suppose a man lifted in  
the air, he may have a spacious horizon; but

distance, the convexity and gibbous-  
vanish away, and he would only see a  
flat. *Beattie.*

**JAMES, A. M.** a celebrated Scottish  
born at Aberdeen, in 1674. He was  
Peter Gibbs of Footleesmire, merchant  
n, who was a Roman Catholic, but a  
nour; for, parties running high about  
and his two dogs *Whig* and *Tory*, in  
both parties;—an offence for which  
ates of Aberdeen summoned him before  
condemned the two dogs to be hanged  
! Young Gibbs was educated at the  
College, where he took his degree of  
out 1694, he travelled into Holland,  
pent some years with an eminent archi-  
where, in 1700, he was introduced to  
f Mar; who generously assisted him  
y and recommendatory letters, to en-  
complete himself under the best Italian  
about 1710, he left Italy and returned  
, where he found his noble patron in  
with the queen. An act being passed  
; 50 new churches, Mr Gibbs was employ-  
ve a specimen of his abilities by planning  
ing St Martin's church, St Mary's in the  
d several others. Among many other  
difices planned by him, and built by his  
ve shall only mention the Radcliffe Libra-  
rd; the King's College, Royal Library,  
; House at Cambridge, and the D. of  
s monument. He died 5th Aug. 1754,  
, leaving a fortune of £15,000.

**AT. n. f.** [*gib* and *cat.*] An old worn-

as melancholy as a *gibcat*, or a lugg'd  
r. *Shakefp.*

**n. f.** [from the verb.] Sneer; hint of  
y word or look; scoff; act or expres-  
n; taunt.—

the sneers, the *gibes*, and notable scorns  
ell in ev'ry region of his face. *Shak.*

The rich have still a *gibe* in store,

be monstrous witty on the poor. *Juv.*

uld hate from the bottom of their hearts,

on would be too strong for little *gibes*

ent. *Spektator.*—

ie dean, if this secret should come to his

er have done with his *gibes* and his jeers.

*Swift.*

**GIBE. v. a.** To reproach by con-

hints; to flout; to scoff; to ridicule;

th scorn; to sneer; to taunt.—

rioting in Alexandria, you

ket up my letters, and with taunts

my missive out of audience. *Shak.*

the beasts as I describe them,

eir features, while I *gibe* them. *Swift.*

**GIBE. v. n.** [*gaber*, old French, to

dicule.] To sneer; to join censorious-

contempt.—They seem to imagine that

ected of late a frame of some new reli-

gurniture whereof we should not have

from our enemies, lest they should as-

ugh and *gibe* at our party. *Hooker.*—

en he saw her toy, and *gibe*, and geer,

the bounds of modest merry-make,

ance he despis'd. *Spens'er.*

Why that's the way to choke a *gibing spirit*;  
Whose influence is begot of that loose grace  
Which thallow laughing hearers give to fools.

*Shakepeare.*

Thus with talents well endu'd

To be scurrilous and rude,

When you pertly raise your snout,

Flee and *gibe*, and laugh and flout. *Swift.*

**GIBEAH**, a city of Benjamin, lying N. of Je-  
rusalem about 20 or 30 furlongs, and built upon  
a hill, as its name imports. This city gave birth  
to Saul, the first king of Israel, for which reason  
it is often called *Gibeab of Saul*.

**GIBEL**, or **MONTÉ GIBELLO**, the modern  
name given to Mount *Ætna* by its inhabitants.  
See *ÆTNA*, and *ETNA*.

**GIBELIN**, a town of Palestine, 8 m. E. of Gaza.

**GIBELINS**, or } See **CONRAD III**, **GERMANY**,  
**GIBELLINS**, } § 14, and **GUELPHS**.

(1.) **GIBELLO**, a town of Italy, in the Palavi-  
cin, 2½ miles NE. of Buffetto.

(2.) **GIBELLO**, **MONTÉ**. See **GIBEL**.

**GIBELYN**, Count, a French author born in  
1725, who wrote a celebrated work entitled, *Le*  
*Monde Primitif comparé a Monde Moderne*; for  
which the French Academy twice awarded him  
their annual prize of 1200 livres. He died in 1784.

**GIBEON**, a city seated on an eminence about  
40 furlongs N. of Jerusalem, and not far from Gi-  
beah. See **GEBÁ**. It was the capital of the Gi-  
BEONITES.

**GIBEONITES**, an ancient nation of Canaan,  
who, hearing of Jothuah's great conquests, saved  
their lives at the expence of their liberty by a represen-  
tation of their belonging to a very remote country,  
and their desire of making an alliance with the He-  
brews. See **JOSHUA**, ix. 3—27. The Gibeonites  
were descended from the Hivites, and possessed  
4 cities; viz. Chephurah, Beeroth, Kirjathearim,  
and Gibeon; which were afterwards given to the  
Benjamites, except the last, which fell to the tribe  
of Judah. The Gibeonites continued subject to  
those burdens which Jothuah had imposed on them,  
and were very faithful to the Israelites, till the  
dispersion of that nation.

\* **GIBER. n. f.** [from *gibe*.] A sneerer; one  
who turns others to ridicule by contemptuous  
hints; a scoffer; a taunter.—You are well under-  
stood to be a more perfect *giber* of the table, than  
a necessary bencher of the capitol. *Shak. Cor.*—

He is a *giber*, and our present business

is of more serious consequence. *B. Jonf. Cust.*

\* **GIBINGLY. adv.** [from *gibe*.] Scornfully;  
contemptuously.—

His present portance.

*Gibingly* and ungravelly he did fashion

After th' inveterate hate he bears to you. *Shak.*

(1.) \* **GIBLETS. n. f.** [According to *Minsheu*  
from *gobbet*, *gabbet*: according to *Junius* more  
properly from *giller*, game, Fr.] The parts of a  
goose which are cut off before it is roasted.—

'Tis holyday: provide me better cheer:

'Tis holyday; and shall be round the year:

Shall I my household gods and genius cheat,

To make him rich who grudges me my meat?

That he may loll at ease; and pamper'd high,

When I am laid, may feed on *giblet* pie? *Dr. Perf.*

(2.) **GIBLETS** include the heart and liver, with

*Shak.*

the feet, gizzard, &c. Giblets make a considerable article in cookery: they are boiled and stewed; made into ragouts, giblet-pies, &c.

GIBLOU. See GEMBOURS.

GIBOLDEHAUSEN, a town of Germany, in the circle of the Lower Rhine, and territory of Eichsfeld; 6 miles N. of Dudenstadt.

GIBON, a town of Cuba, 22 m. NE. of Bayamo.

GIBRALEON, a town of Spain, in Seville, on the Odiel, 44 miles W. of Seville. Lon. 9. 45. E. of Teneriffe. Lat. 37. 20. N.

(1. 1.) GIBRALTAR, a famous promontory, or rather peninsula, of Spain, in Andalusia, but belonging to Great Britain. By the ancients it was named *Calpe*, and was also called one of the *Pillars of Hercules*; by the Arabians it is called *Gebel Tarek*, that is, "the mount of Tarek," from *Tarek*, the name of the Saracen general who conquered Spain in the beginning of the 8th century. The whole is an immense rock, rising perpendicularly about 440 yards, measuring from N. to S. about two English miles, but not above one in breadth, from E. to W.

(2.) GIBRALTAR, a town on the above promontory, (N<sup>o</sup> 1.) which lies along the bay on the W. side of the mountain on a decline; by which the rains pass through it, and keep it clean. The old town was considerably larger than the new, which at present consists of between 400 and 500 houses. Many of the streets are narrow and irregular: the buildings are of different materials; some of natural stone out of the quarries, some of a facitious or artificial stone, and a few of brick. The people are supplied with fresh provisions chiefly from the coast of Barbary, with fruit, roots, and vegetables of all sorts from thence, or from their own gardens. Besides what is properly called the town, there are several spacious and commodious public edifices; such as barracks for the soldiers, apartments for their officers, magazines of different kinds, storehouses for provisions, &c. The town may be said to have two ports; the first lying to the N. and proper only for small vessels; the other is very commodious for large vessels, and has a fine stone quay. It lies 16 miles N. of Ceuta, 45 SE. of Cadiz, and 70 S. of Seville. Lon. 5. 17. W. Lat. 36. 8. N.

(3.) GIBRALTAR, BAY OF. The bay is very beautiful and capacious, being in breadth about 5 miles, and in length 8 or 9, with several small rivers running into it. It is very advantageous to the place. There is no ground to be found in the middle of it at 100 fathoms depth, so that a squadron may lie there in great safety; the breezes from it are very refreshing; and it contributes likewise to the subsistence of the inhabitants, by supplying them with plenty of fish.

(4.) GIBRALTAR, HISTORY OF, TILL ITS CAPTURE BY JOHN DE GUZMAN, in 1462. This important fortress seems to have been first particularly noticed as a place of consequence in the year 712. At that time the general of the caliph Al Walid landed with an army of 12,000 men, on the isthmus between Mons Calpe and the continent; and that he might secure an intercourse with Africa, ordered a castle to be built on the face of that hill. Part of the building still remains: and from an inscription discovered above the principal gate, ap-

pears to have been finished in 725. It continued in the possession of the Saracens till 1333, when it was taken by Perez de Guzman, uncle of Ferdinand IV, king of Castile. In 1333, however, it was surrendered to the son of the emperor Fez, who came to the assistance of the king of Granada. An attempt was made in 1349 by Alphonso XI, king of Castile, when the fortresses had been reduced to the extremity, a pestilential fever broke out in the camp, which carried off the king himself, and a great part of his army; after which the fortress was abandoned. The fortresses continued in the possession of the Saracens of Fez, until when it was taken by Joseph III, king of Granada. A design of attacking it was formed by de Guzman in 1435; but the enterprise miscarried through his imprudence, he was defeated and slain. However, it was taken by de Guzman in 1462; since which time it has remained in the hands of the Christians.

(5.) GIBRALTAR, HISTORY OF, TILL ITS CAPTURE BY THE ENGLISH. In 1540, the town was surprised and pillaged by Piali Haradin, a corsair of Barbarossa's; but the pirates were fallen in with some Sicilian galleys, were defeated, and all either killed or taken. In the reign of Charles V. the fortifications of Gibraltar were modernised, and such additions made as rendered them almost impregnable. But in consequence of the resolution adopted by the court of Britain, to assist the archduke Charles in his pretensions to the Spanish crown, Sir Rooke was sent with a powerful fleet into the Mediterranean, and an attempt on Gibraltar resolved upon. On the 21st of July, 1704, the British fleet were landed upon the isthmus under the command of the duke of Hesse Darmstadt; and on the refusal of the Spaniards to surrender, a cannonade was begun between the fleet and the town, which continued for 5 or 6 hours, the Spaniards were driven from many of their guns, especially at the north head. The admiral perceiving, that by this part of the fortification, the reduction of the town would be facilitated, ordered out some boats to take possession of it. On their approach the Spaniards sprung a mine, which destroyed a great part of the works, killed two lieutenants, and wounded about 60 more. Notwithstanding this disaster, the assailants kept possession of the works, and took a small bastion, (now the gun battery,) half way between the mole and the town. On this the governor capitulated, and the prince of Hesse took possession of the town on the 24th. The garrison, consisting of 1500 men, was allowed to depart with the honours of war; and the Spaniards who chose to remain were allowed the same privileges they had enjoyed under Charles V. The works were found very strong, and the place provided with ammunition and military stores; yet the capture was held of little value at the British court. See ENGLAND, § 72.

(6.) GIBRALTAR, HISTORY OF, TILL THE END OF THE SIEGE IN 1704-5. This was achieved with the loss of about 600 British soldiers, and 216 wounded on the part of the English; the prince of Hesse remained governor; and

were left at Lisbon under the command of John Leake, to succour the garrison if there was an occasion. The loss of such an important post, however, having alarmed both the King of Madrid and Paris, orders were sent to the Marquis de Villadarias, a Spanish grandee, to go to it. The prince of Hesse immediately wrote to Sir John Leake for assistance; but the latter had time to comply with his request. The French fleet arrived, and debarked six thousand men to assist the Spaniards; after which they moved to the westward, leaving only six frigates in the bay. The trenches were opened on the 10th, about which time Sir John arrived with five English and Dutch ships; but hearing the French were about to attack him with a force, he returned to reside. Having left Lisbon to make preparations for this purpose, he accomplished the work with such expedition that on the 29th he returned, and brought with him three frigates, a fire ship, two frigates, a tartan, and a store ship. After receiving some reinforcements, supplied the garrison with six months provisions, and sent on board the sailors to assist in repairing the breaches. The Spaniards supposing that the garrison would be able to hold their guard, on account of the vicinity of the sea, formed the rash design of attempting to retake the place though the British admiral opposed it. In this mad attempt 500 brave men were associated, taking the sacrament never unless they accomplished their purpose. The attack was conducted by a goat-herd to the south of the rock near the cave-guard. This they did, and lodged themselves the first night in the tower of St Michael: the next they scaled the city wall; surprised and massacred the garrison on the hill; where afterwards, by ropes and pulleys, several hundreds of the party designed for the assault were hauled up; but being they were attacked by a party of grenadiers, all either killed or taken. Notwithstanding these misfortunes the Spaniards continued to intercept the provisions sent to the garrison, expecting that, on the arrival of their succours, the garrison would be obliged to retire, and the French to surrender. They continued their fire with additional fury, dismounted many guns, and did essential injury to the works in several different places. The prince of Hesse, however, exerted his utmost to disappoint their designs. As it was probable that they would attempt to storm the curtain, a curvette was placed in the ditch, which was filled by the tide, and a row of palisades placed parallel to the wall. The chambers of the mine under the curtain were loaded; but on a sudden the Spaniards discovered the design, and threatened an attack on which the garrison had on the declivity of the rock to flank the glacis, and overlook their works. While affairs were in this situation, the succours they had long expected arrived in the bay, Dec. 7, 1704; and in two days a considerable quantity of ammunition was landed. These had sailed from Cape Verde, and were in danger of falling into the

PART II.

hands of the enemy, whose fleet they mistook for their own; but escaped by being becalmed, so that they could not get up to them. Sir John Leake, having thus powerfully reinforced the garrison, set sail for Lisbon, where he arrived about the end of the year. In the beginning of 1705, the Spaniards were reinforced by a considerable body of infantry, and on the 11th Jan. made an attack on the King's Lines, but were repulsed. The attack was renewed next day by 600 grenadiers, French and Walloons, supported by 1000 Spaniards, under lieutenant-general Fuy. They showed an intention to storm a breach which had been made in the Round Tower at the extremity of the King's Lines, and another in the entrenchment on the hill. The retrenchment which covered the latter, with part of the entrenchment joining the precipice of the rock, was defended at night by a captain, 3 subalterns, and 90 men; but the captain usually withdrew, with two subalterns and 60 men, at day-break. The Round Tower was defended by 180 men, commanded by a lieutenant-colonel. The marquis, by deserters from the garrison, had obtained intelligence of the strength of these posts, and planned his attack accordingly. The detachment for the upper breach mounted the rock at midnight, and concealed themselves in the cliffs until the captain had withdrawn; after which, advancing to the point of the entrenchment, they threw grenades on the subaltern and his party, so that they were obliged to leave the place. At the same time 300 men stormed the Round Tower, where lieutenant-colonel Bar made a vigorous defence, though the enemy annoyed them on the flanks with great stones and grenades. Observing, however, the Spaniards marching down to cut off his retreat from the town, he retired; and, by getting over the parapet of the King's Lines, descended into the covered way, where the English guards were posted. Thus the garrison were alarmed; all the regiments were assembled at their proper posts; and captain Fisher endeavoured to stop the progress of the enemy with 17 men, but they were repulsed, and himself taken prisoner. At last, however, the Tower was retaken by lieutenant-colonel Moneal at the head of 400 or 500 men, after it had been in the possession of the enemy upwards of an hour. The garrison were now farther reinforced by six companies of Dutch troops and 200 English soldiers, with provisions and stores. The assailants, however, were still determined to go on. The marquis de Villadarias was superseded by Marischal Tesse a Frenchman, with whom Admiral Pointis was desired to co-operate in blocking up the place. The Marischal joined the army with 4 fresh battalions, besides 8 companies which had been sent before; the ordnance, which had been greatly injured, was exchanged, and the works put into the best repair. On the part of the English, a reinforcement was ordered under Sir Thomas Dike and Sir John Hardy, to join Admiral Leake at Lisbon: which being effected, the whole fleet, consisting of 23 English, 4 Dutch, and 8 Portuguese men of war, having on board two battalions of land forces, set sail from Lisbon. And happily for the besieged, the incessant rains and storms had retarded the operations of the land forces, and great

G 2 5

15

ly distressed the enemy's fleet; 3 of their ships having been forced from their anchors. At this critical period Sir John Leake, with the allied fleet, entered the straits, when the few remaining French ships put out to sea, and he immediately gave chase. Three men of war were taken; the admiral's ship and another driven on shore, and burnt; and the rest made the best of their way to Toulon. The garrison was now so well supplied, that Marshal Tesse withdrew his troops from the trenches, and formed a blockade, drawing an intrenchment across the isthmus to prevent the garrison from ravaging the country. The prince of Hesse remained for some time in the place, where he repaired the batteries, and made fortifications; after which he joined the archduke Charles at Lisbon. As the latter, however, was resolved to try his fortune with the earl of Peterborough in Valencia and Catalonia, the prince was sent back to Gibraltar to prepare part of the garrison for embarkation, and soon after was followed by the whole fleet. Major General Ramos was now appointed governor of Gibraltar, in which only two new battalions were left, as nothing was to be feared from the enemy. In the course of this siege the Spaniards lost 10,000 men including those who died of sickness; while the garrison lost only 400. The new governor brought with him 400 men for the greater security of the place; but soon resigned his government to Col. Roger Elliot, during whose time Gibraltar was made a free port by a special order from queen Anne.

(7.) GIBRALTAR, HISTORY OF, TILL THE END OF THE SIEGE IN 1727. Col. Elliot was succeeded by Col. Congreve before 1714, and he by Col. Cotton soon after. In 1720 the Spaniards threatened another attack, but the design was abandoned. At last, however, in the end of 1726, they assembled an army near Algiers, encamping on the 20th Jan. 1727 on the plain below St Roche, and erecting a battery on the beach to protect their camp. Though Adm. Hopson was then at anchor in the Bay of Gibraltar, yet, as he had not heard of the commencement of hostilities between Britain and Spain, he allowed the boats of the latter to pass with provisions, arms, and ammunition, between Algiers and the camp, at the same time that his ship *Kane*, who had been a second time sent from Minorca, lay under similar embarrasment. The operations of the Spaniards, however, seemed to evidently to tend towards an attack; and the governor thought proper to order a detachment of 1000 men to be sent to the town to leave it, and to attend their quarters, and to order under his presence the *Comodoro Les Torres*, commander of the Spanish fleet, to sail to a place near 20 leagues distant from the coast, and to send some ships to advise with the command of the garrison. The governor then endeavoured to keep out of his reach, but with little success; and he endeavoured to force him; but to little effect, the Spanish commander reproach that he had not obeyed the governor's orders, and having made preparations for the attack, however, was obliged to suspend it on the 10th Feb. 1727, when he sailed for Minorca, having brought home his ship *Kane*, and a number of other vessels, and the naval force, and a great number of men of war, that the

Spanish general had commenced hostilities, encroaching so far on the liberties of the Strait, however, the governor sent to the Spaniards to know the reason of breaking ground on the garrison; but received for answer, that in his master's territories, and was unable to any other person for his conduct, this the governor opened the batteries Mole and those of Willis upon the Spaniards; however, they persisted in carrying on operations, and at night marched a detachment to the Devil's Tower, where they began to communicate with their other works. The governor was now informed by some deserters that the enemy were forming a mine in a trench near Willis's Battery, with a design to blow the plot being thus discovered, a party was immediately stationed to cut off the communication. On the 22d Feb. the Spaniards sent the garrison with 17 pieces of cannon and mortars; and the day following a brig left Gibraltar to send a reinforcement to Minorca. On the 3d of March the Spaniards sent a new battery of 22 guns, on the 6th another of 15 guns, and upon the same Mole, the guns of which annoyed the western flank of their approach; this time the garrison had kept up a constant well directed fire from the batteries upon the works of the enemy; but this being old frequently burnt; by which the latter were also greatly distressed by the shells sent from the Devil's Tower, since the beginning of the siege, had their home bound ships, and greatly annoyed the garrison by bringing tea prizes into the Bay, and the arrival of a reinforcement from Minorca, they fled to the westward, leaving the Spaniards to defend themselves the best way they could. The enemy continued to augment their cannon and erect new ones, until they amounted to 62 cannon besides mortars; and on the 15th, the governor received intelligence that a general assault was intended. However, on the 12th, when news of the preliminaries of a general peace were received, the course of the siege, and the loss of the Spaniards, computed at near 2000 men, besides which could not be ascertained. The garrison amounted only to 2000; a very slender force, considering that during the siege and 30 mortars bombarded the batteries.

(8.) GIBRALTAR, HISTORY OF, TILL THE TAKING OF THE SPANISH FLEET. For upwards of half a century, no force was made on Gibraltar; but the hostilities presented by the Spanish ambassador at London, at the commencement of the war, was soon followed by an interruption of communication betwixt Spain and Great Britain, and a direct intention of attacking it, however, it did not till the month of July 1705, when it was completely blockaded up by a fleet of 27 gun ships, several frigates, galleys, &c. &c. after they began to form a camp below St Roche, 3 miles from the town; the garrison at this time consisted of 2500

Officers, with a company of engineers and artificers; but the greatest expectations were formed of the abilities and valour of Gen. Elliott, governor. See ELLIOTT. As soon as the breaking of the communication with Spain indicated approaching hostilities, the governor took every precaution that could be suggested by military men; but though informed of the rupture between the two courts, and though he beheld the operations of the enemy, he used no means to exempt them till the 12th Sept. when the batteries of Green's Lodge, Willis, and Queen Charlotte were opened for a few hours, with a view to disturb the workmen. From this time to the beginning of 1780 the enemy continued the blockade by sea and land, but without doing any damage to the works or garrison; and it was not till the 12th of January that a single person was killed. This happened to be a woman, who, sitting near one of the houses, was slightly hurt by a shot from the enemy. In the mean time, however, the usual supplies of provisions being cut off, the garrison began to feel all the horrors of war. All the necessaries of life were very scarce, and to be procured only at most exorbitant prices. Veal, mutton, and beef, sold at from 1s. to 4s. per lb. fresh pork from 2s. to 3s. 1 beef and pork 15d. fowls 18s. per couple; 5s. 21s.; fire wood, 8s. per cwt.; a pint of good water, 15d.; a small cabbage, 5s.; and an ill bunch of outer leaves, 6d.; Irish butter and candles, 2s. 6d. per lb.; and eggs 6d. each. A rock, however, is almost surrounded by water, it was natural to suppose, that in such a situation of other provisions great benefit would be derived from the ocean; but the fishermen being all foreigners, and under no regulation, took advantage of the scarcity in the garrison, exact a most exorbitant price for the fish. Matters remained long in this state, the garrison must have fallen into the hands of the enemy.

They were however, effectually relieved in consequence of the repeated victories gained by Admiral Rodney over the Spanish fleets, on the 8th and 10th Jan. 1780: (See ENGLADD, § 102.) The British proved equally serviceable to the garrison and detrimental to the enemy, who were now in great want of provisions and materials for shipping. The crews of the last of these important victories were sent to Gibraltar on the evening of the 17th, and two days more the garrison was completely relieved by the arrival of the fleet and convoy; they were farther reinforced by a regiment of Highlanders, consisting of 1051 men, officers included. An opportunity was also taken of sending to the fleet all the invalids and women in the garrison; with whom they set sail on the 10th leaving in the bay only the Edgar and Panther of the line, with two frigates.

**GIBRALTAR, HISTORY OF, TO THE DESTRUCTION OF THE FLOATING BATTERIES.** On the departure of the British fleet the blockade was immediately resumed; and notwithstanding the supplies lately received, the garrison soon again to experience the want of fresh provisions. It had hitherto received these in abundance from the coast of Barbary; but the friendship of the emperor of Morocco was now trans-

ferred from Great Britain to Spain in a manner totally unprecedented. His partiality towards the latter was the more surprising, as Britain had given no provocation, and the enmity between Spain and Morocco seemed to be founded on such causes as could never cease to operate. Thus, however, the garrison became daily more and more distressed, from being obliged to make constant use of their salt provisions, and even this with the strictest economy. The industry and resolution of the brave British seamen and officers, indeed, sometimes overcame all obstacles, so that they found means to procure the necessary refreshments; though in so doing they were exposed to the utmost danger from the enemy. At the same time the defence of the garrison was so vigorous, that while it continued to be supplied even in this scanty manner, the Spaniards began to lose all hope of reducing it; for which reason they formed a project of burning all the British shipping in the bay. The night fixed for executing this scheme was the 6th of June 1780, when ten fire ships, favoured by an uncommon darkness, stood over from the Spanish to the British side of the bay. Their design was to set fire to the store-houses and shipping nearest the water side; but having been too precipitate in firing their ships, they met with a very heavy cannonade, and the attempt was frustrated. On this occasion the skill and intrepidity of the British seamen was eminently displayed. Having manned their boats, they grappled the fire-ships already in flames; and, notwithstanding the danger of their exploding, towed them clear of the vessels under the walls, and extinguished them. The failure of this project was a grievous disappointment to Don Barcelo the Spanish admiral, who lay ready with his Squadron to intercept the British vessels that might attempt to escape; while the batteries on their line were ready to bombard the town, if the fire-ships had succeeded in causing any conflagration on shore. The failure of this attempt was soon followed by other disasters. As soon as they had, with great labour, constructed new batteries, they were destroyed by the besieged; and their mortification on these occasions was the greater, as the governor allowed them to complete their works before he commenced his destructive operations. Thus the labour of many days was often lost in a few hours, and was again resumed with as little prospect of success as before. The garrison were now considerably annoyed by the Spanish gun-boats, to which indeed the shipping were equally exposed. These were vessels from 30 to 40 tons burden, constructed so that they lay low in the water, which rendered them difficult to be aimed at. They had 15 oars on a side, carried 40 or 50 men, with a 26 pounder on the prow; and, from the facility of managing them, two were deemed, in calm weather, to be a match for a frigate of moderate size. All their efforts, however, could only reduce the garrison to great straits for want of provisions; and to this dreadful inconvenience the British submitted with the most stoical resignation. From Adm. Rodney's departure in Feb. 1780 to October, almost the only provisions in the garrison were such as tended to produce the scurvy; which accordingly

ged in such a manner as to threaten the most fatal consequences. The allowance of salt provisions had hitherto continued undiminished; but now it was judged necessary to reduce the allowance of bread and meat, and to enforce the strictest economy with regard to food. Every thing of this kind that could be practised, however, seemed insufficient to preserve the garrison from absolute want. In the beginning of 1781 provisions became exceedingly scarce, by the almost total expenditure of the public stores, and the vigilance of the enemy's cruisers. About the middle of February the bakers left off work for want of flour; and many of the poorer sort wanted bread. The price of fresh provisions again rose to a most enormous height. Small pigs sold at two guineas; turkeys at three; geese at 30s.; fowls and ducks at 10s.; damaged biscuit 1s. per lb.; pease, 18d.; and all other necessaries in proportion; while the scarcity of fuel was such, that it was sometimes scarcely procurable in quantity sufficient to dress their victuals. The garrison had hitherto derived assistance occasionally from the gardens on the neutral ground, though vast quantities of vegetables had been removed thence by the enemy. Towards the end of October 1780, however, the Spaniards expelled the British from these gardens entirely. From this time the supply of vegetables depended entirely upon cultivation; which, happily for the garrison, was attended with such success, that the produce came at last to be nearly equal to the demand. At last, on the 12th April 1781, supplies were brought by the British fleet under Adm. Darby, Digby, and Ross, though they could not be got in without great difficulty. The gun boats were now much increased in number and strength; infesting the bay in such a manner as greatly to interrupt the debarkation of the stores. As no vessels of the same kind had been prepared to oppose them, they could scarce be prevented from effecting their purpose of burning the storeships. With this view they had approached them every morning in hazy weather to the number of between 20 and 30, several of them carrying mortar-pieces; and as they used both sails and oars, they eluded all pursuit, by withdrawing on the rise of any breeze. To keep off these troublesome guests several stout frigates were stationed along the bay to protect the shipping; but notwithstanding the activity of the British sailors, it was seldom that they could come near enough to do them any damage. In spite of all their endeavours, however, the garrison was effectually relieved; which so irritated the court of Spain, that they determined to exert their utmost force rather than fail in obtaining their favourite object. The works before the town were therefore carried on with more vigour than ever, and the most tremendous preparations made to cause the obstinate garrison feel their resentment. Their batteries were mounted with guns of the heaviest metal, and mortar-pieces of the largest size; the number of the former augmented to near 200, of the latter to upwards of 80. For 3 weeks this prodigious artillery continued to pour forth an almost incessant shower of shot and shells, insomuch that they consumed 100,000 lb. of gunpowder, and threw into the town 4, or 5,000 shot and

shells every 24 hours. By such an bombardment the town was almost totally ruined. The inhabitants experienced every that could arise from the destruction of habitations; several of them were killed or forced to leave the town, and take their tents with what accommodation could be had for them in such scenes of horror and confusion. Numbers took the opportunity to fly with the fleet; while many that remained reduced from a state of opulence to that of want. The conduct of Governor Eliot was humane and compassionate, allowing them a free passage to England, and supplying provisions for the voyage. During this siege, not only the greatest part of the effecting to the inhabitants were destroyed, but confiscations were in many places greatly injured; the remainder was destroyed by the soldiers had arrived at such a pitch of licentiousness they neither regarded nor would obey the laws. They were incited to this destructive conduct by the avarice of some of the inhabitants, who hoarded up and concealed a quantity of articles, to procure an advanced price for them now, therefore, kept no bounds in their waste, and extravagance; a remarkable instance of which is given by Captain Drinkwater, that their roasting a pig by a fire made of gunpowder. To put a stop to these atrocious proceedings, rigorous measures were of necessity adopted; it was intimated, that any soldier caught being drunk or asleep upon his post, or marauding, should be immediately executed. The loss of human lives during this bombardment was less than might have been expected. By the beginning of June 1781, the enemy relaxed considerably in their firing, seldom firing 600 shot in a day; and continued gradually to diminish this number so remarkably, that by the end of August they seldom fired in a day and only discharged 6 or 7, and sometimes not above 3, shot in the night. The batteries, however, were succeeded by the gun-boats, who renewed their attacks every day, keeping the garrison in continual alarm, and never failing to execute more or less execution. To restrain the force, a battery of guns capable of throwing shot to a great distance was erected as near as possible to the enemy; and as it reached the camp, it was determined to open it upon them often as the gun-boats made their attack being soon perceived, they thought it prudent to delist in some measure from that mode of attack. They continued still, however, to improve their works; and for this purpose employed the engineers both of France and Spain; so that by the end of November 1781, they had them brought to such a state of perfection, as filled the minds of the most sanguine expectations. Gov. Eliott, however, far from being dismayed at these formidable bulwarks, sufficient to proceed without molestation to the execution of his scheme, that he might in a moment disengage his labour of so many months, and thus render his disappointment the greater. In the night of the 27th Nov. a chosen party of 2000 men were detached, to destroy the enemies works and

and their success was equal to their most sanguine expectation. They marched out in great silence about 2 o'clock A. M. under the command of general Ross; after which they proceeded to the same circumspection, but with the utmost celerity, to the enemy's works, which they assailed and overthrew with astonishing rapidity. The batteries were instantly thrown into confusion and fled on every side; the guns and mortars were all spiked up; and the men, artificers, and sailors, exerted themselves so vigorously, that in an hour the magazines were blown up, the storehouses of arms, ammunition, and military implements, and all the works had been constructed, were set on fire, and consumed; the whole damage done on this day being estimated at upwards of two millions sterling. For several days after this disaster the Spaniards continued inactive, without even making any attempt to extinguish their batteries, which continued in flames; but in the beginning of December, as if suddenly aroused from their lethargy, upwards of 1000 men were set to work to prepare a great number of fascines, from which it was concluded that they designed to assault the enemy's works. In this they proceeded with great perseverance and diligence; but as the various methods of attack had constantly failed, it was thought, that if the place could be reduced at all, it must be by some means hitherto unattempted. The monarch determined to employ the length of his empire. Among the various projects proposed, that of the chevalier D'Arcon, a French engineer, proved the most acceptable, the expence attending it was immense. He proposed to construct such floating batteries as should be liable to be sunk nor set on fire. The view their bottoms were made of the same timber, and their sides of wood and corked in water, with a layer of wet sand between the planks. Their thickness was such, that they were impervious to cannon shot; and to prevent the escape of red-hot balls, a number of pipes were inserted to carry water through every part of the hull, and pumps sufficient to furnish a constant supply for the purpose. The people at the batteries were sheltered from the bombs by a rope-netting suspended over the sides, that they might roll off, and covered with wet skins to prevent fire. Ten of these floating batteries were constructed out of the hulls of large frigates, some of 50 or 60 guns, cut down for that purpose, and carrying from 10 to 28 guns each. The other half as many in reserve, in case of accident. Each gun was served by 36 artillerymen. These floating batteries were to be attended by 30 large boats carrying guns and mortars, and heavy metal; a great number of ships of the line, frigates, with some hundreds of small boats, were to accompany them with troops, for the execution of what might be judged necessary. On this occasion upwards of 1000 pieces of cannon and 80,000 barrels of gunpowder were sent to the army. A body of 12,000 of the best troops of the kingdom were now added to the Spanish army because of the success; the body of engineers was the best that the kingdom could produce; and numbers of the best families in both, attended the army. Many military gentlemen also came

from various parts of Europe, to be witnesses of what passed at this celebrated siege, which was now compared to the most famous recorded in history. The conducting of it was committed to the duke of Crillon; who had distinguished himself by the conquest of Minorca. Two princes of the blood royal of France, the count of Artois, and the duke of Bourbon, came to be witnesses of this extraordinary enterprise. These behaved with the greatest politeness both to the governor and garrison. The count of Artois transmitted a packet of letters for various individuals in the garrison, which had been intercepted and carried to Madrid, and which he requested that he might be the means of conveying to those for whom they were designed. Both he and the duke of Bourbon signified to general Elliott the high regard they had for his person and character; and the duke of Crillon expressing the same sentiments, intreated him to accept of some refreshments. Gen. Elliott returned a polite answer, but accepted of the present with reluctance, and requested him for the future not to confer any favours of that kind upon him. Such a prodigious armament raised the confidence of the besiegers so high, that they looked upon the conquest of the place as an absolute certainty; and the commander in chief was thought by far too modest, when he said, that the garrison might hold out a fortnight. "It appeared (says Captain Drinkwater) that they meant, previous to their final efforts, to strike if possible a terror through their opponents, by displaying an armament more powerful than had probably ever been brought before any fortress. Forty-seven sail of the line, including three inferior two deckers, ten battering ships, deemed perfect in design, and esteemed invincible, carrying 212 guns; innumerable frigates, xebecs, bomb ketches, cutters, gun and mortar boats, and smaller craft for disembarking men, were assembled in the bay. On the land side were most stupendous and strong batteries and works, mounting 200 pieces of heavy ordnance, and protected by an army of near 40,000 men, commanded by a victorious and active general. In their certainty of success, however, the enemy seemed entirely to have overlooked the nature of that force which was opposed to them; for though the garrison scarcely consisted of more than 7000 effective men, including the marine brigade, they forgot that they were now veterans in this service, had long been habituated to the effects of artillery, and were by degrees prepared for the arduous conflict, that awaited them. We were at the same time commanded by officers of approved courage, prudence, and activity; eminent for all the accomplishments of their profession, and in whom we had unbounded confidence. Our spirits too were not a little elevated by the success attending the firing of red hot shot, which in this attack we hoped would enable us to bring our labours to a conclusion, and relieve us from the tedious cruelty of a vexatious blockade." This was suggested by lieutenant-governor Boyd, and on the 8th Sept. 1782, their advanced works were almost destroyed by it. But as a prelude to the dreadful storm which was about to be poured forth on this garrison, the enemy on the 9th Sept. opened a battery of 64 of their largest cannon, accompanied with a terrible fire from other batteries, and a great

great number of mortars. On this and the following day an attack was made upon the batteries erected on EUROPA POINT, which at that time were entirely under the management of Captain Curtis of the Brilliant frigate, who had distinguished himself, and commanded a brigade of seamen by whom the batteries were served. By these the fire of the Spaniards was so warmly returned, that they not only could make no impression, but were forced to retire, after being so much damaged, that two of their principal ships were obliged to withdraw to the bay of Algeiras to refit. On the 12th the enemy made preparations for their grand and decisive attack. Accordingly, on the morning of the 13th, the 10 floating batteries came forward, under Don Buenventura de Moreno, a Spanish officer of great gallantry, who had signalised himself at the capture of Minorca. Before ten o'clock they had all got into their proper stations, anchoring in a line about 1000 yards from the shore. They then began a heavy cannonade, and were seconded by all the cannon and mortars in the enemy's lines and approaches, at the same time that the garrison opened all its batteries both with hot and cold shot from the guns, and shells from the howitzers and mortars. This terrible fire continued on both sides without intermission until noon; when that of the Spaniards began to slacken, and the fire of the garrison to obtain a superiority. About two o'clock the principal battering ship, commanded by Don Moreno was observed to emit smoke as if on fire, and some men were seen busy upon the roof, searching from whence it proceeded. The fire from the garrison was now kept up without the least intermission or diminution, while that from the floating batteries was perceived sensibly to decrease; so that about 7 P. M. they fired but few guns, and these only at intervals. At midnight the principal ship was seen on fire, and an hour after was completely in flames. Eight more of these batteries took fire successively; and on the 14th, of ships made by them, the multitude of relics, lances, and boats, with which they were surrounded, all came to their assistance, and began to take the men out of the burning vessels. Captain Curtis, who lay ready with the gun-boats to take advantage of any favourable circumstance, came upon them at two A. M. and forming a line on the enemy's flank, advanced upon them with such expedition as to throw them into immediate confusion. At this unexpected attack they were so astonished and disconcerted, that they fled precipitately with all their boats, totally abandoning their floating batteries to be burnt, and all who were in them to perish in the flames. This would undoubtedly have been their fate, had not Capt. Curtis celebrated them from the fire at the imminent risk of his own life and that of his men. In this work he was so eager, that while his boat was alongside of one of the largest batteries, it blew up, and the fragments of the wreck spreading all around to a vast distance, some heavy pieces of timber fell into his boat and pierced through its bottom, killing one man and wounding several others. He crept with difficulty out of this boat, which was sunk, as well as another, by the accident. The floating batteries were all consumed; and the violence with which they exploded was such, that

doors and windows at a great distance on shore burst open. About 400 people were saved; many of whom were picked up from rafts and pieces of timber. Indeed the blow of the batteries as the flames reached their rooms, and the discharge of the guns in such haste as the metal became heated by the fire, rendered the attempt to save them very dangerous. This terrible catastrophe took place in sight of the fleets of France and Spain. It had been proposed that they should co-operate upon this important occasion, by attacking the garrison at Europa and such places as appeared most exposed to tempt by sea: which must have occasioned a material division of the garrison's force, and have weakened considerably the vigorous defence used in those parts which were attacked. The reason assigned for this is was the want of wind.

(10.) GIBRALTAR, HISTORY OF, TO THE YEAR 1783. Though this terrible repulse convinced the Spaniards that Gibraltar could not be taken by force, some hope still remained without any further exertions on their part the garrison would be obliged to surrender for want of ammunition and provisions. With this view they continued to blockade it closely, and cut off all communication, flattering themselves that Britain would not be able to collect a fleet sufficient to drive their fleet from the bay; and the fortress was reduced to extremity; so that they imagined must be the case in a few days. Such diligence, however, had been used by a part of the British, that a fleet was already assembled at Portsmouth, consisting of 22 sail of the line, in excellent condition, and filled with the best officers and sailors in Europe. The command was given to Lord Howe, accompanied by Sir John Barrington, Sir Mifbank, Hood, Sir John Hughes, and commodore Hottram, all of whom were of their profession. At the same time a large fleet of merchantmen had just arrived from the Baltic; and a Dutch squadron had been cruising on their own coasts, and was able to penetrate southwards to join the British, had retired into port, and given up the idea of effecting any junction for that season. At the same time the progress of the ships was delayed by contrary winds, and it was not until they had reached the southern coast of Portugal, that they received information of the defeat of the enemy's fleet on the 13th Sept. On the 11th Oct. Lord Howe entered the Straits, and several of the ships destined for Gibraltar came first to anchor, and fired the cannon of the fort, without any molestation from the enemy. The combined fleet in the bay had been much damaged by a storm; two more were driven out of the bay into the Mediterranean; others lost their masts, and they suffered considerably. One in particular, a ship of 70 guns, was carried by the storm to the bay, and ran aground under the fortress of Gibraltar, where she was taken by the garrison. Her whole complement of men, consisting of 1000, notwithstanding the endeavours of the British to destroy her, she was safely got off, and repaired. The combined fleet, however,

e 13th, with a view to prevent the rest of the fleet from making good their entrance into it; and at the same time to rejoin the two ships that had separated from the main body by the storm. By the advantage of the wind, they bore down upon the British fleet, which drew up in battle to receive them; but notwithstanding their superiority, they declined coming to an action. On the wind becoming more favourable next day, Lord Howe took the opportunity to bring in the storeships that were in command the day following the remainder were directed to Gibraltar, the troops for the reinforcement of the garrison were landed, with a supply of powder, and provisions. As they passed through the Straits they were threatened with engagement by the combined fleets; but the latter had a superiority of 12 ships of the line, they kept at a wary distance. Some success was at length obtained on either side. This last relief proved decisive; for though the blockade continued, no news arrived of the preliminaries of peace signed, in the beginning of February, 1783, an attack was made. The news of the success was received with the utmost joy by the Spaniards. Mutual civilities passed between the commanders in chief, and the duke of Crillon by handsome compliments to the governor of Gibraltar for their noble defence; declaring he had exerted himself to the utmost of his ability, and though he had not proved successful, was happy in having his sovereign's approbation of his conduct.

**GIBRALTAR, IMPORTANCE OF, TO GREAT BRITAIN.** Gibraltar is esteemed of very great consequence to Britain. It not only gives the command of the Straits, and their navigation, but affords a safe anchorage and accommodation to our fleets in time of war, and to our merchantmen at all times. It hinders a ready communication by sea between the different ports of France and Spain, and hinders the junction of their fleets in the Mediterranean, or at least renders it so difficult as to be an perpetual check upon the ambition of these states. It awes also the piratical states of Barbary, the emperor of Morocco; inasmuch as the commerce is more safe than that of any other part of Europe, which gives us great advantage in point of freight. It is otherwise highly important to our trade in the Mediterranean and the Atlantic. It procures us the respect of the other powers; who, though far distant, consider this as an instance of her strength, and do not hurt or assist them. It also saves us the expense of squadrons and convoys, upon any disturbance that may happen among the powers, and which would otherwise be necessary for the protection of our navigation.

**GIBRALTAR, POPULATION OF.** The inhabitants, exclusive of the British subjects dependent on the garrison, or who reside there from commerce, consist of some Spaniards, a few Genoese, a considerable number of Genoese, but as many Jews; making in the whole, according to Dr Campbell, between 2, and 3,000, reckoning the garrison, which usually con-

sists of between 3, and 4,000 men; but during the last siege was double that number.

(13.) **GIBRALTAR, STRAITS OF,** a narrow sea, which forms the communication between the Atlantic ocean and the Mediterranean, thereby dividing Europe from Africa; and runs from W. to E. about 13 leagues. In this strait there are 3 remarkable promontories or capes on the Spanish side, and as many opposite to them on the Barbary side. The first of these, on the side of Spain, is Cape Trafalgar, opposite to which is Cape Spartel; and in the neighbourhood of this stood the fortress of Tangier, once in the possession of the British. The next on the Spanish side is Tarifa; and over against it lies Malabata, near the town of Alcazar, where the straits are about 5 leagues broad. Lastly, Gibraltar, facing the mountain of Abyla, near the fortress and town of Ceuta, which make the eastern entry of the straits.

(11.) **GIBRALTAR,** a town of South America, in Terra Firma, and prov. of Venezuela, E. of lake Maracaibo; famous for excellent cocoa and tobacco. It was burnt by the French in 1679. It lies 50 miles SSE. of Maracaibo. Lon. 49. 50. W. of Ferro. Lat. 10. N.

(1.) **GIBSON,** Dr Edmund, bishop of London, was born at Knipe in Westmoreland, in 1669. He early displayed his knowledge in several writings and translations, which recommended him to the patronage of Abp. Tension, who appointed him his domestic chaplain; and soon after rector of Lambeth, and archdeacon of Surry. Becoming thus a member of the convocation, he defended his patron's rights, as president, in 11 pamphlets; he then completed his scheme of the legal duties and rights of the English clergy, under the title of *Codex Juris Ecclesiastici Anglicani*, in folio. Abp. Tension dying in 1715, and Dr Wake, bishop of Lincoln being made Abp. of Canterbury, Dr Gibson succeeded him in the see of Lincoln, and in 1720 was promoted to the bishopric of London. He was extremely jealous of the privileges of the church; and therefore, continually opposed all attempts to repeal the test acts. But his laudable opposition to those licentious assemblies, called *masquerades*, gave great umbrage at court, and effectually excluded him from all further favours. He spent the latter part of his life in publishing letters, charges, occasional sermons, and tracts against the prevailing immoralities of the age. His pastoral letters are justly esteemed matterly productions against infidelity and enthusiasm. His other publications are, 1. An edition of Drummond's *Polemologia*, and James V's *Causticena Rudica*, with notes. 2. The *Chronicon Saxonicum*, with a Latin translation, and notes. 3. *Reliquia Spelmaniana*, the posthumous works of Sir Henry Spelman, relating to the laws and antiquities of England. 4. An edition of *Quintilian de Arte Oratoria*, with notes. 5. An English translation of Camden's *Britannia*, with additions, 2 vols. folio; and, 6. A number of small pieces, that have been collected and printed in 3 vols. folio. He died, aged 79, in Sept. 1748. With regard to his character, he was a true friend to the established church and government, and as great an enemy to persecution. He was usually consulted by the most learned and exalted personages in church and state, and the

greatest deference was paid to his judgment. He possessed the social virtues in an eminent degree; his beneficence was very extensive; and he had so much justice as well as generosity, that he freely gave 2,500*l.* left him by Dr Crow, who was once his chaplain, to Crow's own relations, who were very poor.

(2.) GIBSON, RICHARD, an English painter, commonly called the *Dwarf*, was originally page to a lady at Mortlake; who, observing that his genius led him to painting, generously got him instructed in that art. He devoted himself to Sir Peter Lely's manner, and copied his pictures to admiration. His paintings in water colours were also esteemed. He was in great favour with Charles I. who made him his page of the back-stairs; and he had the honour to instruct in drawing Q. Mary II. and Q. Anne, when they were princesses. He married Anne Shepherd, who was also a dwarf; on which occasion K. Charles I. honoured their marriage with his presence, and gave away the bride. Mr Waller wrote a poem on this occasion, intitled "The Marriage of the Dwarfs;" in which are these lines:

"Design or chance makes others wive,  
"But nature did this match contrive;  
"Eve might as well have Adam fled,  
"As she deny'd her little bed  
"To him, for whom heav'n seem'd to frame  
"And measure out this only dame."

Mr Fenton, in his notes on this poem, observes that he had seen this couple painted by Sir Peter Lely; and that they were of an equal stature, each being 3 feet 10 inches high. However, they had 9 children, 5 of whom arrived at maturity, well proportioned, and of the usual standard of mankind. But what nature denied this couple in stature, she gave them in length of days: for Mr Gibson died in the 75th year of his age; and his wife, having survived him almost 20 years, died in 1709. aged 89.

\* GIBSTAFF. *n. f.* 1. A long staff to gage water, or to shove forth a vessel into the deep. 2. A weapon used formerly to fight beasts upon the stage. *Dict.*

\* GIDDILY. *adv.* [from *gidly*.] 1. With the head seeming to turn round. 2. Inconstantly; unsteadily.—

To roam

*Giddily*, and be every where but at home,  
Such freedom doth abanishment become. *L'Allegre.*

3. Carelessly; heedlessly; negligently.—

'The parts that fortune hath bestow'd upon her,  
Tell her, I ho'd as *giddily* as fortune. *Shakefp.*

\* GIDDINESS. *n. f.* [from *gidly*.] 1. The state of being giddy or vertiginous; the sensation which we have when every thing seems to turn round.—Megrims and *giddiness* are rather when we rise after long sitting, than while we sit. *Bacon's Nat. Hist.*—This blessed thistle, which is so sovereign a medicine against the *giddiness* of the brain; 'tis this will settle it. *Holyday.*—

Vain show and noise intoxicate the brain,

Begin with *giddiness*, and end in pain. *Young.*

2. Inconstancy; unsteadiness; mutability; changeableness.—There be that delight in *giddiness*, and count it a bondage to fix a belief. *Bacon.* 3. Quick rotation; inability to keep its place.—The indig-

nation of Heaven rolling and turning length such a *giddiness* seized upon 3 that it fell into the very dregs of secta

4. Frolick; wantonness of life.—

Thou, like a contrite penitent  
Charitably warn'd of thy sins, do'st  
These vanities and *giddinesses*.

GIDDRI, a town of Albania; 8 n  
Alessio.

\* GIDDY. *adj.* [*gidig*, Sax. I know whether this word may not come from *gader*, to be in motion, *gad*, *gid*, *giddy*,] ginous; having in the head a whirl, of circular motion, such as happens by drunkenness.—

Them rev'ling thus the Tentyri  
By *giddy* heads and stagg'ring legs be

*Tate*

than light airs, and recollected turns,  
 most brisk and *giddy* paced times. *Shak.*  
**J**, a town of Asia, in Cabulistan; 50 m. bul.

**DN,** [דגן, Heb. *i. e.* a destroyer.] the  
 shi, a Manassite, who had a very extra-  
 tall to deliver the Israelites from the op-  
 e the Midianites. Having effected their  
 e by supernatural aid, he was chosen  
 Isra-1, A. M. 2559, and died in 2793.  
 s vi. vii. and viii.

**HEHRI,** a town of Natolia.  
**LA,** a town of Russia, in Viborg.  
 a town of France, in the department of  
 miles N. of Orleans.

**HENSTEIN,** a town of Lower Sax-  
 duchy of Magdeburg, 1 m. N. of Halle.  
**ULISZKI,** a town of Samogitia, 24 m. enne.

**LOYCE,** a town of Lithuania, in Wilna,  
 8NW. of Wilna.  
**NGEN,** a town of Norway, in Chris-  
 18 miles NW. of Stavanger.

**UM,** a town of Norway, in Aggerhuus,  
 9. of Christiania.  
 a town of France, in the dep. of Loiret,  
 rovince of Orleans, on the Loire; con-  
 4,200 citizens. It is 33 miles SE. of  
 and 76 of Paris. Lon. 2. 43. E. Lat. 47.

**EN,** an imperial town of Suabia, on  
 7; 20 miles W. of Donauwert, and 28  
 Augsburg. Lon. 27. 51. E. Ferro. Lat.

**OR,** or } a town of Barbary, in Tripoli,  
**OR,** } 10 miles S. of Tripoli.  
 a river of France, which runs into the  
 miles below Lyons.

**CE,** an episcopal town of Naples, in  
 Itra, containing 13 churches, and 4 mo-  
 34 miles N. of Reggio, and 62 SSW. of  
 1.

**NONY,** a town of Lithuania, in Wilna,  
 E. of Lida.

**EAGLE.** *n. f.* [Sometimes it is written  
**An eagle** of a particular kind.—These  
 not be eaten, the swan and the pelican,  
*r-eagle. Lev. xi. 18.*

**PART II.**

**GIESCHENHAGEN,** a town of Germany, in  
 Holstein, 1 mile NW. of Segeborg.

**GIESIM,** a town of Nubia, between Sennaar  
 and Abyssinia, 150 miles ESE. of Sennaar.

**GIESMANSDORF,** a town of Silesia, in Neisse,  
 3 miles WNW. of Neisse.

**GIESSEN,** a strong town of Germany in Hesse  
 Cassel, on the Lahn, with a citadel, arsenal, and  
 university. It is 6 miles E. of Wetzlar, 16 WSW.  
 of Marburg, and 36 NE. of Mentz. Lon. 8. 41.  
 E. Lat. 50. 25. N.

**GIEZ,** a river of France, in the dep. of Rhone  
 and Loire, and ci-devant province of Lyonnais.

**GIEZAN,** a town of Samogitia, 22 miles ESE.  
 of Rokone.

**GIFANIUS,** Obertus, or Hubert, LL. D. a  
 learned critic and civilian, born at Bueren in Guel-  
 derland, in 1534. He studied at Louvain and Pa-  
 ris, and erected the German Library at Orleans,  
 where he took his degree, in 1567. He taught  
 civil law and philosophy at Strasburg, Altdorf, and  
 Ingoldstadt, and wrote several tracts, besides com-  
 ments on ancient authors. Though bred a Pro-  
 testant, he turned Roman Catholic, and was made  
 counsellor to the Emperor Redolph. He was very  
 avaricious, and is accused of suppressing the MSS.  
 of Fruterius, a youth of extraordinary genius,  
 who died at Paris, aged 25, and left them to his  
 care. Gifanius died at Prague in 1604.

**GIFFAUMONT,** a town of France, in the dep.  
 of the Marne, 12 miles SE. of Vitry.

**GIFFEN,** or **GUFFEN,** a river of Wales, in  
 Caernarvonshire, running into the Conway.

(1.) **GIFFORD,** Andrew, D. D. an eminent  
 English divine and antiquarian, born Aug. 17th,  
 1735. He was the son of Emanuel Gifford, mi-  
 nister of the Baptist church at Bristol, and was e-  
 ducated at Tewksbury, under the rev. Mr Jones,  
 and the celebrated Dr Ward. He joined his fa-  
 ther's church, and was baptised in 1723; preach-  
 ed to the meeting at Nottingham in 1725; and  
 was ordained and settled at London, Feb. 5, 1735.  
 In 1731, Sir Richard Ellys appointed him his  
 chaplain. In 1754, the Marischal college of A-  
 berdeen presented him with a diploma, creating  
 him D. D. He was also admitted a member of  
 the Society of Antiquaries, and, in 1757, was ap-  
 pointed assistant Librarian to the British Museum.  
 He was much esteemed as a pathetic and evange-  
 lical preacher; and died 19th June, 1784, leaving  
 his museum and library to the Baptist Academy at  
 Bristol.

(2.) **GIFFORD,** a village of Scotland, in East Lo-  
 thian, in Yester parish, containing about 400 in-  
 habitants in 1790.

(3.) **GIFFORD,** a small river in East Lothian, re-  
 markable for an extraordinary flood on the 4th  
 Oct. 1754, which carried down many trees and  
 most of the bridges in the parish of Yester, though  
 no uncommon quantity of rain had previously  
 fallen.

**GIFHORN,** a town of Germany, in Lunen-  
 burg-Zell, on the Allier, 19 miles E. of Zell.

**GIFONI,** a town of Naples, in Principato Citra,  
 7 miles ENE. of Salerno.

(1.) \* **GIFT.** *n. f.* [from *give.*] 1. A thing given  
 or bestowed; something conferred without price.  
 H h h — They

—They presented unto him *gifts*, gold, and frankincense and myrrh. *Mat. ii. 11.*—

Recall your *gift*, for I your pow'r confess;  
But first take back my life, a *gift* that's less.  
*Dryd. Aureng.*

2. The act of giving.—

Creator bounteous, and benign,  
Giver of all things good, but fairest this  
Of all thy *gifts*, nor envyest. *Milton.*  
Thee all things living gaze on, all things thine  
By *gift*. *Milton.*

3. The right or power of bestowing.—

They cannot give;  
For had the *gift* been theirs, it had not here  
Thus grown. *Milton.*

—No man has any antecedent right or claim to that which comes to him by free *gift*. *South.*

4. Oblation; offering.—Many nations shall come with *gifts* in their hands, even *gifts* to the king of heaven. *Tob. xiii. 11.* 5. A bribe.—Thou shalt not wrest judgment, thou shalt not respect persons, neither take a *gift*; for a *gift* doth blind the eyes of the wife. *Deut. xvi. 19.* 6. Power; faculty.—

And if the boy have not a woman's *gift*,  
To rain a shower of commanded tears,  
An onion will do well for such a shift. *Shak.*

She was lovely to attract  
Thy love, not thy subjection, and her *gifts*  
Were such as made government well seem'd  
Unseemly to bear rule. *Milton.*

—He who has the *gift* of ridicule, finds fault with any thing that gives him an opportunity of exerting his talent. *Addison.*

(1.) *GIFT*, (*Donum*), in law, is a conveyance which passeth either in lands or goods; and is of a larger extent than a grant, being applied to things moveable and immoveable; yet as to things immoveable, when taken strictly, it is applicable only to lands and tenements given in tail; but *gift* and *grant* are too often confounded.

(3.) *GIFTS*, NEW YEAR'S. See *STRENÆ*, and *YEAR*.

\* *GIFTED*. *adj.* [from *gift*.] 1. Given; bestowed.—

Magic of my enemies the scorn and gaze,  
To grind in brazen fetters, under task.  
With my heav'n *gifted* strength. *Milt. Agon.*

2. Endowed with extraordinary powers. It is commonly used ironically.—Two of their *gifted* brotherhood, Hacket and Coppinger, got up into a pease cart, and harangued the people to dispose them to an insurrection. *Dryden*.—There is no talent so pernicious as eloquence, to those who have it not under command: women, who are so liberally *gifted* by nature in this particular, ought to study the rules of female oratory. *Add. Freeb.*

(1.) \* *GIG*. *n. f.* [Etymology uncertain.] 1. Any thing that is whirled round in play.—Playthings, as tops, *gigs*, and battledores, should be procured them. *Locke.* 2. [*Gigia*, *Maudick*.] A fiddle. Now out of use.

(2.) *GIG*, } *GIGG*, or *JIG*, in music or dan-

(1.) *GIGA*, } cing, a gay, brisk, sprightly composition, and yet in full measure, as well as the *Allemand*, which is more serious. *Manage* takes the word to arise from the Italian *giga*, a musical instrument mentioned by *Dante*. Others suppose it to be derived from the Teutonic *gig*, or *gigete*,

“a fiddle.” This is a favourite air in nations of Europe: its characteristic is denoted by the  $\frac{6}{8}$ , or  $\frac{12}{8}$ : it consists of two bars out any determinate number of bars.

(2.) *GIGA*, in geography. See *GIGANTICK*. *adj.* [*gigantes*, Lat.] to a giant; big; bulky; enormous; like ed; atrocious—

Others from the wall defend  
With dart and jav'lin, stones, and  
fire;  
On each hand slaughter and *gigantic*

I dread him not, nor all his giant  
Tho' fame divulg'd him father of five  
All of *gigantick* size, Goliath chief.

The son of Hercules he justly seem  
By his broad shoulders, and *gigantic*

The Cyclopean race in arms arose  
A lawless nation of *gigantick* foes.

*GIGANTOMACHY*, *n. f.* in the  
the war of the giants. See *GIANT*, §

*GIGEAU*, a town of France, in the  
Herauld, 7 miles S. of Montpelier.

*GIGG*. See *GIG*.

\* To *GIGGLE*. *v. n.* [*gichelen*, D.]  
laugh idly; to titter; to grin with m  
It is retained in Scotland.—

We shew our present joking, *gigg*

I, or GHILAN, a considerable province  
lying on the SW. side of the Caspian  
s supposed to be the HYRCANIA of the  
It is very agreeably situated, having

the sea on one side and high mountains on the o-  
ther; and there is no entering it but by narrow  
passes, which may easily be defended. The sides  
of the mountains are covered with many sorts of  
fruit trees, and in the highest parts of them there  
are deer, bears, wolves, leopards, and tigers;  
which last, the Persians have a method of taming,  
and hunt with them as we do with dogs. Gilan  
is one of the most fruitful provinces in Persia;  
and produces abundance of silk, oil, wine, rice,  
and tobacco, besides excellent fruits. The inha-  
bitants are brave, and of a better complexion than  
the other Indians; and the women are extremely  
handsome. Resht is the capital.

GILARZA, a town of Sardinia, SE. of Bosa.  
GILATTELK, a town of Pennsylvania.

GILBERD, or William, a physician, born  
(1.) GILBERT, } at Colchester, in 1530, the  
eldest son of the recorder of that borough. Ha-  
ving spent some time in both universities, he went  
abroad; and at his return settled in London, where  
he practis'd with considerable reputation. He  
became a member of the college of physicians,  
and physician in ordinary to Q. Elizabeth, who  
gave him a pension. He was also physician to K.  
James I. He died in 1603, aged 63, in Colche-  
ster, where a handsome monument was erected to  
his memory. His books, globes, instruments,  
and fossils, he bequeathed to the college of phy-  
sicians, and his picture to the school gallery at Ox-  
ford. He wrote, 1. *De Magnete, magnetisque corpo-  
ribus, et de magno magnete tellure, physologia nova*;  
Lond. 1600, fol. 2. *De mundo nostro sublanari, phi-  
losophia nova*; Amsterdam, 1651, 4to. He also in-  
vented two mathematical instruments for finding  
the latitude at sea without the help of sun, moon,  
or stars. A description of these instruments was  
afterwards published by Thomas Blondenille in  
his *Theories of the planets*.

(2.) GILBERT, Sir Humphrey, a brave officer  
and skilful navigator, born about 1535, in Devon-  
shire, of an ancient and honourable family. He  
inherited a considerable fortune from his father.  
He was educated at Eaton and Oxford. Being  
introduced at court by his aunt Mrs Catherine  
Ashley, then in the queen's service, he was diver-  
ted from the study of the law, and commenced  
soldier. Having distinguished himself in several  
military expeditions, particularly that to Newha-  
ven, in 1563, he was sent over to Ireland to assist  
in suppressing a rebellion; where, for his signal  
services, he was made commander in chief and  
governor of Munster, and knighted by the lord  
deputy, Sir Henry Sidney, Jan. 1, 1570. He re-  
turned soon after to England, where he married  
a rich heiress. In 1572, he sailed with a squadron  
of 9 ships to reinforce Colonel Morgan, who me-  
ditated the recovery of Flushing. In 1576, he  
published his book on the NW. passage to the  
East Indies. In 1578, he obtained an ample pa-  
tent, empowering him to possess in N. America  
any lands then unsettled. He sailed to Newfound-  
land, but soon after returned to England without  
success; nevertheless, in 1583, he embarked a se-  
cond time with five ships, the largest of which put  
back on account of a contagious distemper on  
board. He landed on Newfoundland on the 31  
Aug. and on the 5th took possession of the har-  
bour

hour of St John's. By virtue of his patent, he granted leases to several people; but though none of them remained there at that time, they settled afterwards in consequence of these leases: so that Sir Humphrey deserves to be remembered as the real founder of the vast N. American empire. On the 20th of Aug. he put to sea again, on board a small sloop; which on the 29th foundered in a hard gale of wind. Thus perished Sir Humphrey Gilbert; a man of quick parts, a brave officer, a good mathematician, a skilful navigator, and of a very enterprising genius. He also was remarkable for his eloquence, being much admired for his patriotic speeches in the English and Irish parliaments. His work entitled "A discourse to prove a passage by the north-west to Cathaia and the East Indies," is a masterly performance, and is preserved in Hakluyt's collection of voyages, vol. iii. p. 11. The style is superior to most, if not to all, the writers of that age; and shows the author to have been a man of considerable reading.

GILBERTINES, an order of religious, thus called from St Gilbert of Semprigham, in Lincolnshire who founded it about 1148: The monks observed the rule of St Augustine; and were accounted canons; and the nuns that of St Benedict. The founder erected a double monastery, or rather two contiguous to each other, the one for men, the other for women, but separated by a very high wall. He founded 13 monasteries of this order, viz. 4 for men alone, and 9 for men and women together, which had in them 700 brethren and 1500 sisters. At the dissolution there were about 25 houses of this order in England and Wales.

GILBERT'S ISLAND, an island near the SW. coast of Terra del Fuego. Lon. 71. 7. W. Lat. 55 13. S.

GILBERTSTOWN, a town of Virginia, 30 m. N. of Charlottesville.

GILBOA, in ancient geography, mountains of Samaria, stretching from W. to E. on the confines of the half tribe of Manasseh, and of the tribe of Issachar; and to the S. of the valley of Jezreel, beginning westward at the city of Jezreel, at the foot of these mountains, reaching almost quite to the Jordan, 6 miles from Scythopolis. They are famous for the death of Saul and Jonathan, and the defeat of the Israelites by the Philistines.

GILCHRIST, Dr Ebenezer, an eminent Scots physician, born at Dumfries in 1707. He studied medicine at Edinburgh, London and Paris; and obtained the degree of M. D. from the university of Rheims. In 1732, he returned to Dumfries, where he practised medicine till his death. Few physicians of the 18th century have exercised their profession in a manner more respectable or successful than, Dr Gilchrist. Endowed by nature with an acute judgment and an active genius, he soon distinguished himself by departing from established but unsuccessful modes of practice. Several of his improvements have procured him great and deserved reputation at home and abroad. His usefulness was not confined to his own neighbourhood. He was often consulted by letter from the most distant parts of the country. In different collections are to be found several of his valuable performances: But those which do him the great-

est honour, are two dissertations on Nerves, in the Medical Essays and Observations published by a Society in Edinburgh; and on the use of Sea voyages in medicine in 1757, and 1771. By the former, the art of physic was first turned to a species which is now found to prevail universally in the country; and the liberal use of wine, was the first among the moderns to be adopted in these fevers by judicious physicians of the present age. His life on sea voyages proves from experience utility in various distempers, particularly in the Scurvy. Dr Gilchrist died in 1774.

GILD, or GUILD. See GUILD.

\* To GILD, v. a. pret. *gilded*, or *gilt* Saxon. 1. To wash over with gold with foliated gold.—

The room was large and wide,  
As it some *gilt* or solemn temple were  
Many great golden pillars did appear  
The massy roof.

To *gild* refined gold, to paint the  
To throw a perfume on the violet.

*Shak*

And the *gilded* car of day  
His glowing axle doth allay  
In the steep Atlantick stream.

Purchasing with our time and care  
We lose our freedom in a *gilded* snare

When Britain, looking with a just  
Upon this *gilded* majesty of Spain,  
And knowing well that empire must  
Whose chief support and sinews are

Her joy in *gilded* chariots, when all  
And love of ombre after death survive

2. To cover with any yellow matter.—  
Thou did'st drink

The stale of horses and the *gilded* puc  
Which beasts would cough at.

*Shak. Ant*

3. To adorn with lustre.—  
No more the rising sun shall *gild* th  
Nor evening Cynthia fill her silver horn

*Pope*

4. To brighten; to illuminate.—The  
passion of joy was not that trivial, van  
perfidious thing, that only *gilds* the app  
and plays upon the surface of the so  
5. To recommend by adventitious orna

For my part, if a lie may do thee  
I'll *gild* it with the happiest terms I can

*Shak*

Yet, oh! th' imperfect piece move  
light;

'Tis *gilded* o'er with youth, to catch  
*Dryden's*

GILDAS, surnamed *the Wise*, a celest  
tial monk born in Wales in 511. Who  
educated is uncertain. Some say he was  
Ireland; others, that he visited France  
All agree, that after his return to E  
became a most assiduous preacher of t  
Du Pin says he founded a monastery at  
Britain. Gildas is the only British aut  
6th century whose works are printed.  
ry of Britain is valuable on account of

as containing the only information we concerning the times of which he wrote; his style is inelegant.

DEHAUSZ, a town of Germany, in the Westphalia, 3 miles SW. of Benheim.  
 GILDER. *n. f.* [from *gild*.] 1. One who lays the surface of any other body.—*Gilders* have a piece of gold in their mouth, to be the spirit of the quick-silver. *Bacon's Nat. Ve* have here a *gilder*, with his anvil and *Broom*. 2. A coin, from one shilling hence, to two shillings. *Pbil.*—

I am bound  
 to sea, and want *gilders* for my voyage. *Shak.*  
 GILDING. *n. f.* [from *gild*.] Gold laid surface by way of ornament.—Silvering ly and canker more than *gilding*, which, ight be corrected with a little mixture of here is profit. *Bacon's Phys. Rem.*—The of the Annunciation, all but one corner covered with statues, *gilding*, and paint. *son Italy.*—

old laureate Dryden Pimp and Fry'rengage,  
 I not strip the *gilding* off a knave,  
 plac'd, unpenion'd, no man's heir or slave?  
*Pope.*

GILDING signifies also the art of spreading covering a thing over with gold, either in liquid.

GILDING, ANCIENT ACCOUNTS AND MODS OF. This art was known among the Greeks, though it never arrived among them at the height to which the moderns have carried. *Say* assures us, that the first gilding seen at Rome was after the destruction of Carthage, under the reign of Lucius Mummius, when they began to gild the ceilings of their temples and the Capitol being the first place on which this enrichment was bestowed. But he that luxury advanced on them so hastily, that a little time you might see all, even private poor persons, gild the very walls, vaults, and their houses. We need not doubt but that the same method with us, of beating and reducing it into leaves; though they used to carry it to the same height. Pliny relates, that they only made 750 leaves of four fingers out of a whole ounce. But he adds, that they could make more; that the thickest called *bractea Prænestina*, from a statue of the god at Prænestine gild with such leaves; and the thinner sort were called *bractea questoria*. The ancients had no way to lay the gold on bodies that would not endure the fire, but with whites or size, neither of which will endure the fire; so that they could only gild such places as were sheltered from the moisture of the weather. The Greeks called the composition on which they did their gilding on wood LEUCOPHÆUM or *serpion*; which is described as a sort of glutinous compound earth, serving in all probability for the gold stick and bear polishing. But particulars of this earth, its colour, ingredients. antiquaries and naturalists are not agreed upon.

GILDING, MODERN METHODS OF. The modern gilders also use gold leaves of divers thickness; but there are some so fine, that a thou-

sand do not weigh above 4 or 5 drachms. The thickest are used for gilding on iron and other metals; and the thinnest on wood. But we have another advantage over the ancients in the manner of using or applying the gold: the secret of painting in oil, discovered in later ages, furnishes us with means of gilding works that shall endure all the injuries of time and weather, which to the ancients was impracticable. The lustre and beauty of gold have occasioned several inquiries, and discoveries concerning the different methods of applying it to different substances. Hence the art of gilding is very extensive, and contains many particular operations and various management. It is divided into true and false gilding.

i. GILDING, FALSE. A colour of gold is given by painting and by varnishes, without employing gold. Thus a very fine golden colour is given to brass and to silver, by applying upon these metals a gold-coloured varnish, which, being transparent, shows all the brilliancy of the metals beneath. Many ornaments of brass are varnished in this manner, which is called *gold lackerings*, to distinguish them from those which are really gilt. Silver leaves thus varnished are put upon leather, which is then called *gilt leather*. See LACKER. Amongst the false gilding may also be reckoned those which are made with thin leaves of copper or brass, called *Dutch leaf*. In this manner are made all the kinds of what is called *gilt paper*.

ii. GILDING, TRUE. In the true gilding, gold is applied to the surface of bodies. The gold intended for this purpose ought in general to be beat into thin leaves, or otherwise divided into very fine parts.

(1.) GILDING OF METALS. One method of applying gold upon metals is this: The surface of the metal to be gilt is first to be cleaned; and then leaves are to be applied to it, which, by means of rubbing with a polished blood-stone, and a certain degree of heat, are made to adhere perfectly well. In this manner silver leaf is fixed and burnished upon brass in the making of what is called *French plate*, and sometimes also gold leaf is burnished upon copper and upon iron. Gold is applied to metals in several other manners. One of these is by previously forming the gold into a paste or amalgam with mercury. To obtain a small amalgam of gold and mercury, the gold is first to be reduced into thin plates or grains, which are heated red-hot, and thrown into mercury previously heated, till it begins to smoke. Upon stirring the mercury with an iron rod, the gold totally disappears. The proportion of mercury to gold is generally as 6 or 8 to one. With this amalgam the surface of the metal to be gilded is to be covered; then a sufficient heat is to be applied to evaporate the mercury; and the gold is lastly to be burnished with a blood-stone. This method of gilding by amalgamation is chiefly used for gilding copper, or an alloy of copper with a small portion of zinc, which more readily receives the amalgam; and is also preferable for its colour, which more resembles that of gold than the colour of copper. When the metal to be gilt is wrought or chafed, it ought to be previously covered with quicksilver before the amalgam is applied, that this may be better spread: but when the surface

of the metal is plain, the amalgam may be applied directly to it. The quicksilver or amalgam is made to adhere to the metal by means of a little *amalgam*, which is rubbed on the metallic surface at the same time, by which this surface is cleansed from any rust or tarnish which might prevent the union or adhesion of the metals. But the use of the nitrous acid in this operation is not, as is generally supposed, confined merely to cleanse the surface of the metal to be gilt from any rust or tarnish it may have acquired; but it also greatly facilitates the application of the amalgam to the surface of that metal, probably in the following manner: It first dissolves part of the mercury of the amalgam; and when this solution is applied to the copper, this latter metal having a stronger disposition to unite with the nitrous acid than the mercury has, precipitates the mercury upon its surface, in the same manner as a polished piece of iron precipitates upon its surface copper from a solution of blue vitriol. When the metal to be gilt is thus covered over with a thin precipitated coat of mercury, it readily receives the amalgam. In this solution and precipitation of mercury, the principal use of the nitrous acid in the process of gilding appears to consist. The amalgam being equally spread over the surface of the metal to be gilt by a brush, the mercury is to be evaporated by a heat just sufficient for that purpose; for if it be too great, part of the gold may also be expelled, and part of it will run together, and leave some of the surface of the metal bare: while the mercury is evaporating, the piece is to be from time to time taken from the fire, that it may be examined, that the amalgam may be spread more equally by the brush, that any defective parts of it may be again covered, and that the heat may not be too suddenly applied to it. When the mercury is evaporated, which is known by the surface being entirely become of a dull yellow colour, the metal must then undergo other operations, to acquire the fine gold colour. First, the gilded piece of metal is rubbed with a scratch brush (which is a brush composed of brass wire) till its surface is made smooth; then it is covered over with a composition called *gilding wax*, and is again exposed to the fire till the wax be burnt off. This wax is composed of bees wax, sometimes mixed with some of the following substances; red ochre, verdigris, copper scales, alum, vitriol, borax: but according to Dr Lewis, the saline substances alone are sufficient, without any wax. By this operation the colour of the gilding is heightened; and this effect seems to be produced by a perfect dissipation of some mercury remaining after the former operation. This dissipation is well effected by this equable application of heat. The gilt surface is then covered over with a saline composition, consisting of nitre, alum, or other vitriolic salt, ground together, and mixed up into a paste with water or urine. The piece of metal thus covered is exposed to a certain degree of heat, and then quenched in water. By this method its colour is further improved, and brought nearer to that of gold. This effect seems to be produced by the acid of nitre (which is dissolved in the vitriolic acid of the alum or other salt) acting during the exposure to heat) acting

upon any particles of copper which may be left to lie on the gilded surface. Lastly, some think that they give an additional lustre to gilt work, by dipping it in a liquor prepared by boiling some yellow materials, as sulphur, turmeric, or furmeric. The only advantage of this operation is, that a part of the yellow matter, as the sulphur or turmeric, remains in the hollows of the carved work, in which the gilding is apt to be more imperfect, and which it gives a rich and solid appearance. Iron cannot be gilt by amalgamation, unless previously coated with copper by dipping in a solution of blue vitriol. Iron may also receive a golden coat from a saturated solution of gold in aqua regia, mixed with spirit of wine, the iron having a greater affinity with the acid, from which it therefore precipitates the gold. The method most commonly employed of fixing gold upon iron is, of burnishing gold leaf upon it when heated, as to become blue; and the operation will be perfect if the surface has been previously smoothed or grained. Another method is mentioned of fixing upon metals, and also upon earthen ware and glass; viz. to fuse gold with regulus of antimony to pulverise the mass which is sufficiently done to admit that operation, to spread this upon the piece to be gilt, and expose it to a moderate fire that the regulus may be evaporated, and the gold remains fixed. The inconveniences of this method, according to Dr Lewis, are, that the powder does not adhere to the piece, and does not be equally spread; that part of the gold is melted along with the regulus; that glass is cracked with the heat necessary for the evaporation of the regulus of antimony; and that copper is dissolved and corroded by the regulus, and to have its surface rendered uneven. On gilding by amalgamation Dr Lewis has the following remarks: "The two principal inconveniences in this method are, One, that the workmen are exposed to the fumes of the mercury, and generally, sooner or later, have their health greatly impaired by them. The other, the loss of the mercury, for though it is said to be detained in cavities made in the chimney for that purpose, yet the greater part of it is lost. From some trials I have made, it appeared that both these inconveniences, particularly the first and most considerable one, might in some measure be avoided, by means of a furnace of a due construction. If the communication of the furnace with its chimney, instead of being open to the fire, is made under the grate, the ash-pit and other apertures beneath the grate, closed, and the mouth of the furnace left open; the current of air which otherwise would have entered beneath the grate now at the top, and, passing down through the grate to the chimney, carries with it and sweeps away completely both the vapour of the fuel and the fumes of such matters as are placed upon it: the mouth of the furnace should be raised a little above the fire than the grate part, and an iron plate laid over it, that the air may enter only at the grate where the workman stands; who will be thus effectually secured from the fumes and the heat of the fire at the same time have full liberty of introducing and removing the work. If the furnace is made of strong forged (not malle-

be sufficiently durable: the upper chimney may reach above a foot and a half the level of the fire: over this is a large tube, leaving an interval of six or eight inches all round between it and the chimney: the height of 10 or 12 feet, is the better. The external air, passing between the chimney and the outer pipe, prevents the chimney from being much heated, so that the fumes will condense against its sides. The quicksilver, which, falling down to the bottom, is there caught in a hollow rim, forming inwards a portion of the lower chimney, is conveyed, by a pipe at one side, into a receiver. Some metals, particularly silver, may be gilded in the following manner: Let gold be dissolved in aqua regia. In this solution pieces of the metal to be gilded, and burnt to black ashes, being rubbed on the surface of the filaments of a wet linen rag, apply the particles which they contain, and which by their adhesion adhere very well. The remaining silver is to be washed off; and the surface of the metal, which in this state does not shine, is to be burnished with a blood-stone, and will acquire a fine colour of gold. This gilding is very easy, and consumes a small quantity of gold. Most gilt ornaments, such as ruff boxes, and other toys of much value, are nothing but silver gilt.

**OF UNMETALLIC BODIES.** As gold will adhere well merely by contact to the surface of metallic substances, when gold is applied to the surface of an unmetallic body, it must be previously covered with a tenacious substance by which the gold is made to adhere. These substances are called *sizes*. Some of these are animal and others of vegetable nature, and others of mineral. Upon them the gold is applied, and pressed down with the finger or a hard's foot: and when the work is to be finished and polished, a hard instrument, called a *d-g's tooth*, is used. When the work is required to be kept moist, it ought to be prepared with a composition of drying oil and turpentine ground together: otherwise a water size, which is prepared by boiling cut-burthen or white leather in water, and adding to this some chalk or whiting: several sizes must be laid upon the wood, and a layer of the same size mixed with wax. Lastly, another mixture called *gold size*, applied above these; upon which the gold is to be fixed. This gold size, the purpose is to make the gold leaf capable of being fixed, is composed of tobacco-pipe ash, with some ruddle or black lead, and a little tallow or oil of olives. The metal may be gilt by applying first a very thin varnish, upon which the gold leaf is to be laid, when the varnish is hardened, may be fixed. This varnish is prepared by boiling linseed oil in a brass vessel until the oil is fitted, and by diluting the same with 4 or 5 times its quantity of oil

of turpentine; and that it may dry sooner, it may be ground with some white lead. Gold leaf may also be applied to glass, porcelain, and other vitrified matters. As the surface of these matters is very smooth, and consequently is capable of a very perfect contact with gold leaves, these leaves adhere to them with some force, although they are not of a metallic nature. This gilding is so much more perfect, as the gold is more exactly applied to the surface of the glass. The pieces are then to be exposed to a certain degree of heat, and burnished slightly to give them lustre. A more substantial gilding is fixed upon glass, enamel, and porcelain, by applying to these substances powder of gold mixed with a solution of gum arabic, or with some essential oil, and a small quantity of borax; after which a sufficient heat is to be applied to soften the glass and the gold, which is then to be burnished. With this mixture any figures may be drawn. The powders for this purpose may be made, 1. By grinding gold leaf with honey, which is afterwards to be washed away with water. 2. By distilling to dryness a solution of gold in aqua regia. 3. By evaporating the mercury from an amalgam of gold, taking care to stir the mass near the end of the process. 4. By precipitating gold from its solution in aqua-regia, by applying to it a solution of green vitriol in water, or some copper, and perhaps some other metallic substances.

(1.) GILEAD, the son of Machir, and grandson of Manasse: His posterity had their inheritance allotted them in the mountains of Gilead, so named from him.

(2.) GILEAD, a descendant of the above mentioned patriarch, and the father of JEPHTHAH.

(3.) GILEAD, BALM OF. See N<sup>o</sup> 4. and AMYRIS, y 3, 4.

(4.) GILEAD, MOUNTAINS OF. The mountains of Gilead were part of that ridge which runs from Mount Lebanon southward, on the east of the Holy Land; gave their name to the whole country which lies on the east of the sea of Galilee, and included the mountainous region, called in the New Testament, TRACHONITIS. Jer. (xxii. 6.) seems to say, that Gilead begins from mount Libanus. Jacob, at his return from Mesopotamia, came in six days to the mountains of Gilead, (Gen. xxxi. 21. &c.) where this patriarch, with Laban his father-in-law, raised a heap of stones, in memory of their agreement and covenant, and called it *Gilead*, i. e. "an heap of witnesses," and which Laban called *Jegar-sabadutha*. These mountains were covered with trees abounding with gum, called the *balm of Gilead*, which the Scripture commends much. (Jer. viii. 21. xlvii. 11. li. 8.) The merchants who bought Joseph came from Gilead, and were carrying balm into Egypt, Gen. xxxv. 25.

GILEADITES, the descendants of GILEAD. Being invaded by the Ammonites, &c. they chose Jephthah for their general, who vanquished all their enemies.

(1.) GILES, John, D. D. and M. D. a native of St Albans, who flourished in the 13th century, and was the first Englishman who entered among the Dominicans. He was physician in ordinary to

GILL, Thomas, was professor of medicine at the University of Montpellier. He was the son of John Gill, Esq. of Edinburgh, who was distinguished in the 6th century of the last century as a magnificent family. He gave all his estate to the University of Montpellier, France, where he continued there 3 years. His talents were attributed to him; he was a member of the University of Languedoc, known as the University of St Giles's. In the reign of James II. he was a member of Gorton, whose descendants were in the country of Edinburgh. He was buried in the church of Edinburgh. For this donation, the magnificent charter in favour of Mr Preston's name was given to the nearest heir of the name of Gill, who carried it in all processions. He was buried in St Giles's, and appointed a chaplain in an annual mass for the soul of Mr Preston and his wife, that a tablet containing his name and account of his pious donation, should be placed in the chapel.

GIL, an ancient geography, a place between the Euphrates and Jordan, noted for the first entrance of the Israelites on this side Jordan, and the passage from Jericho. It sometimes also denotes a place. Joshua xii. 23.

GILDE, a town of Prussia, in Smoland.

GILNBURG, a town of Prussia, in Ober-Saxony, 8 SSW. of Konigsberg.

GILMER, or GELMER, a prince of the Empire, descended of Genesic. See BARBARY.

GILPIN, a town of Cheshire.

GILL, John, D. D. a Protestant dissenting minister of the Baptist denomination, the son of Edward Gill, a deacon of the Baptist church at Northampton, in Northamptonshire, was born at Northampton, Nov. 23, 1697. He was early sent to a grammar-school in the neighbourhood; where he very soon surpassed boys much his seniors, and excelled them in the common school books, and in the most of the Latin classes, and made great proficiency in the Greek language. His celebrity as a scholar, and his strong attachment to books, was soon observed by the neighbouring clergy, who frequently met and conversed with him at a bookseller's shop, to which he almost constantly resorted for reading; which gave rise to a proverbial saying, "Such a thing is as certain, as that John Gill is in the bookseller's shop." He left the grammar school, however, early, owing to the bigotry of his master, who insisted, that the children of dissenting parents, as well as those that belonged to the establishment, should attend him to church. To pave the way, therefore, for the completion of his studies, without such conformity, efforts were made by several ministers of different denominations, to get him upon his hands in London. But the same spirit of learning, however, being in-

vincible, these difficulties could neither damp the ardent desire of knowledge, nor damp application. For though his time was devoted to the business of his father; yet he far improved his leisure hours, as to be he was 19, to read all the Greek authors that fell in his way. He studied logic, moral and natural philosophy; the Hebrew language so as to read it without any other assistance than Buxtorf's grammar and lexicon. Neither the pursuing, however, nor his other necessary could eradicate those religious impressions in early life. On Nov. 1, 1716, he made public profession of his faith before the church at Kettering, and was baptised by Thomas Wallis. Of this church Mr Gill had been long a member before he was called to the ministry; soon after which, he removed to Ferrers, to pursue his studies *universis*; but his stay there was soon interrupted by an invitation to London, to preach to the church at Horslydown, over which he was called pastor, in 1719, which office he fulfilled upwards of 51 years. Mr Gill had not been long in London before rabbinical learning, of which he had acquired considerable knowledge, became the object of pursuit. To facilitate his progress through the intricacies of this labyrinth, he traded an acquaintance with one of the learned Jewish rabbis. He read the Talmuds, the Rabbot, their ancient commentaries, the book Zohar, and whatever else of that kind he was able to procure. Of the languages he made himself a complete master; there was no branch of literature which he did not attempt and attain; it may be truly affirmed, that in this line, the literature do not exhibit a character by which he was excelled. In 1743, he published a commentary on the New Testament, in 2 vols. of immense reading and learning; his ever diligent and arduous work, attracted the attention of the Royal College and University of Alton, which procured for him, without either his merit or his knowledge, a diploma, creating him a Doctor in Divinity. This intelligence was communicated to the Rev. Mr. and Mrs. Pollock; who declared, "that of his knowledge of the scriptures, of the Oriental languages, and of Jewish antiquity, and the reputation gained by his works; the university had, without his solicitation, unanimously agreed to confer on him the degree of Doctor in divinity." Dr Gill's sentiments on a divine, were Calvinistic: "And perhaps (says the rev. Mr Toplady, a minister of the church of England) since the days of Arianism, written so largely in defence of the doctrine of grace; and certainly no man has treated this subject in all its branches, more judiciously, and successfully. What was said of Edward the Black Prince, that he never undertook a battle which he did not win; what has been said of the great Duke of Marlborough, that he never undertook a siege which he did not win; may be truly said of Dr Gill, that he never undertook a study which he did not master."

justly accommodated to our great and divine; who, so far as the distinctions of the gospel are concerned, is an error which he did not force upon his hearers, nor ever encountered an opponent he did not baffle and subdue. His labours, were exceeded only by the sanctity of his life and conversation. From his entrance on the ministry to his dissolution, not one of his most intimate friends was ever able to charge him with a shadow of immorality. Himself, by his writings, demonstrated that the race does not lead to licentiousness."

“while true religion and sound sense are a single friend remaining in the British works and name of Gill will be revered.” He died at Camberwell, London, aged 73 years, 10 months and 10 days the Doctor married Mrs Elizabeth whom he had many children, two of whom survived him. Mrs Gill died in 1764. 1. A Commentary on the Old and New Testament, in 9 vols fol. 2. A Body of Divinity, 4to. 3. The Cause of God and Truth, 8vo. 4. A Treatise concerning the Prophecies of the Old Testament respecting the Messiah. A Dissertation on the antiquity of the Hebrew Language, Letters, Vowel Points, &c. 5. Sermons on the Canticles, folio; with a number of sermons and controversies on different subjects.

LL. n. f. [*agulla*, Spanish; *gula*, Lat.] A gullet at each side of a fish's head.—

The Leviathan,  
like a promontory, sleeps or swims,  
as a moving land, and at his gills  
and at his trunk spouts out a sea.

*Milton.*  
The form of respiration under water by the gill fins; not behind the most fishes, but before them. *Walton.* The gill, of farther passage quite bereft,  
the mesh with gills entangl'd left.

*King's Fisherman.*  
The gills that hang below the beak of a fowl. The cock hath great and swelling gills, and the hen hath less. *Bacon's Nat. Hist.* 3. The gill, the chin.—In many there is no pale, but, contrariwise, redness about the gills, which is by the sending forth of the appetite to revenge. *Bacon's Nat. Hist.* long bag of flesh hanging down from the people in Piedmont. *Swift.* 4. The gill, a measure of liquids the fourth part of a pint.—Every bottle rinsed with wine: some, out of the cistern, will rinse a dozen with the gill, the wine at every second bottle: some enough. *Swift.* 5. A kind of measure the tanners.—They measure their wine by the gill, which containeth a pint. In the northern counties it has half a pint measure. 7. [From *gillian*, the old name of writing *Julian*, or *Jubiana*.] The gill of a woman in ludicrous language.—

PART. II.

I can, for I will,  
Here at Burley o' th' Hill,  
Give you all your fill,  
Each Jack with his Gill. *Ben Jonson's Gypsies.*  
8. [*Cicelidonium*.] The name of a plant; ground ivy. 9. Malt liquor medicated with ground ivy.

(3.) GILL, in geography, a township of Massachusetts in Hampshire county, on the W. bank of the Connecticut.

(4.) GILLS of Fish. See ZOOLOGY.  
GILLEM'S BAY, a bay on the S. coast of St Christophers, half a league W. of Basseterre.

GILLES, Peter, a learned and enterprising French author, born at Albi, in 1490. After studying the Latin and Greek languages, philosophy, natural history, &c. he travelled through France and Italy. In 1535, he dedicated a work to Francis I, wherein he advised that monarch to send learned men to travel into foreign countries for the improvement of science; in consequence of which the king sent Gilles into the Levant. But having received no remittances from France, during his journey, he was at last obliged to enlist for subsistence in the army of Soliman II. In another voyage he was taken by a pirate, and carried into Algiers. By the generosity of cardinal Armagnac, he obtained his liberty; after which he went to his benefactor at Rome; where he died in 1555.

GILLESKAAL, a town of Norway.  
(1.) GILLESPIE, the rev. James, D. D. an eminent divine of the church of Scotland, late Princ. of St Mary's College, in the University of St Andrews. He was the son of Mr Jas. Gillespie, Minister of Arngalk; born in 1722, and studied at St Andrews, where he received all his academical honours. He was ordained minister of Abdie, in Fifeshire, on the 18th March, 1747; translated to Dumbarny, about 1750; and thence to St Andrews, Nov. 3d, 1757. This charge he resigned, on being appointed Principal, on the 14th Sept. 1779. He married, 1st. Isabella Dick, daughter of Mr W. Dick, minister of Cupar in Fife, in 1748, by whom he had 11 children: and 2d Jean Fortune, daughter of Capt. Geo. Fortune, in 1772, by whom he had 4 children. Of these 12 have survived him. He died 2d June, 1791, aged 69. Twelve Sermons, selected from his MSS. by his successor, Dr G. Hill, and which, (to use the Doctor's words,) form “a valuable accession to the stores of sacred literature,” were published after his death, at Perth, in 8vo, 1796; with a prefatory advertisement, from which we extract the following brief sketch of his character, drawn more at large by Dr Hill, in his funeral sermon:—“In the private intercourse of life, he was gentle and amiable. Although little disposed to obtrude himself in conversation, he contributed to the cheerfulness of every company, both by his polished address, and by the happy art of introducing, in the most pleasing manner, something suited to the time, the place, and the persons. His long experience in the management of affairs led him to disapprove of rash and violent measures, and he was always a counsellor of peace. Yet he was ever ready to make allowance for those who did not listen to the counsels, which he mildly suggested. Forbearing, fair, and candid, he never failed to put the best construction upon the motives and actions of

of all around him. He studied to gain his brother by kindness, and he knew how to turn away wrath by a soft answer. The world can ill spare spirits such as his."

(2.) GILLESPIE, the rev. Thomas, a late pious and popular divine of the church of Scotland, who, in consequence of a very singular and unprecedented stretch of ecclesiastical power, by the ruling party in that establishment, was deposed in May 1752, not for any immorality, but merely for acting according to his conscience; and became afterwards the founder of the sect, since denominated the *Church or Presbytery of Relief*. See RELIEF. Mr Gillespie was born at Clearburn in the parish of Duddingstone, 2 miles SE. of Edinburgh, where his father kept a brewery. After receiving the rudiments of his education at Edinburgh, he completed his studies under the rev. Dr Doddridge at Northampton. He was ordained minister of Carnock, in Fifeshire, in 1741, and had been 10½ years minister of that parish, when he was ejected. His friends soon after built a church for him in Dunfermline, and Mr Boston of Jedburgh and some others joined in communion with him. He lived about 20 years after this, during which period he saw many Relief churches planted in different parts of the kingdom. He published a small tract, entitled *An Essay on the Continuance of Immediate Revelations of Past and Future Events, in the Christian Church*: and after his death was published his *Treatise on Temptation*. The rev. Dr Erskine of Edinburgh wrote prefaces to both these tracts. Mr Gillespie married Miss Riddle, but they had no children. He died in April 1773. The following character of him is extracted from *Historical Sketches of the Relief Church*, published in 1773, soon after his death, by the rev. Mr James Smith, who succeeded him in the Relief church at Dunfermline. "This good man was acknowledged even by his enemies, to be eminently pious. Though his natural faculties were no way uncommon, he was exceedingly diligent in the discharge of his duty; he was remarkably zealous for religion. Though his pulpit talents were not the most shining, yet his zeal, his piety, and the persecution he suffered, rendered him very popular. His manners were rigid: his mind austere. The integrity of his heart made him liable to imposition. Little acquainted with the world, he was far from being a scheming politician, insinuating flatterer, or calculated to take a lead in society. To a warmth of temper was added an inflexibility of mind, which inclined him to adhere tenaciously to all his opinions: convinced that he suffered for righteousness' sake, he gloried in his persecution. His ejection out of the church was the mean of bringing him into public view. He once was tainted with Independent principles, yet afterwards heartily approved of the Presbyterian scheme," &c.

\* GILLHOUSE. *n. f.* [*gill* and *house*.] A house where *gill* is sold.—

Three shall each alehouse, three each *gillhouse* mourn,

And answering ginshops sorer sighs return. *Pope*.  
GILLIES, John, D. D. a late learned and pious divine of the Church of Scotland, author of a History of the propagation of the Gospel in America, during the 16th, 17th, and 18th centuries. He was

born in 1711, and after having passed usual course of study, at the different ordained one of the ministers of Glasgow 29th July, 1742. He died at Glasgow 29th March, 1796, in the 84th year of 54th of his ministry, much regretted. gregation and numerous acquaintance spondents. He was fond of literatures his manners, and zealous for Christ liberal to Christians of all denomi wrote notes on *Milton's Paradise Lost*.

(1.) GILLINGHAM, a parish of Kent, 3 miles below Chatham, and on the side of the Medway. Part of Chatham this parish; and here is a castle well furnished with guns that command the river, there being more than 170 embrasures for cannon; which the progress of any enemy who should be by Sheerness fort, before they could reach here. Here are also copper works. At this place many men who came over with the princes Alfred, were barbarously murdered by him. It was in remote times the property of Canterbury, who had here an elegant old hall of which is now converted to a school.

(2.) GILLINGHAM, a parish of Englishsetshire, on the Stour, near the forest, is one of the largest parishes in the county, 41 miles in circuit, and containing 64 parishes. It lies on the borders of Wilts and Somerset, NW. of Shaftsbury. It has a manufactory of iron. Near it are the traces of an ancient city of Norman or Saxon kings, 320 feet long and 100 feet broad, surrounded by a rampart of earth. King John resided here, and king John repaired the castle. Edward I. received the assize of the county. Edward I. Christmas here in 1270; the house was built by the letter L, in length 120 feet by 40, and the foot of the letter 48 by 40. The house contained 168,000 square feet enclosed by a moat, now dry, in 1699 feet deep, and 20 broad. The rampart to have been 30 feet thick. In 1694, it received damage of near 40000l. by a fire.

(3.) GILLINGHAM FOREST, an ancient Dorsetshire, near the above parish, 10 miles long, and one broad; famous for the Danes by King Edmund Ironside.

GILLORI, an island of W. Florida.

GILLSAY, an island of Scotland, betwixt Lewis and N. Uist.

(1.) GILLY, or LOUGH GILLY, a lake, in Sligo county, 2 miles W. of Sligo.

(2.) GILLY SUR LOIRE, a town of France, in the dep. of Saone and Loire, 4½ miles S. of M. Lancy.

(1.) \* GILLYFLOWER. *n. f.* [Either from *July-flower*, or from *gireflée*, Fr.] Or rather *Julyflowers*, so called from that they blow in July, may be reduced to these and white, purple and white, scarlet & Mortimer's *Aspidandry*.—In July come 36 of all varieties. *Bacon*.—

Fair is the *gillyflower* of gardens for the Fair is the *marygold*; for *potage met*.

(2.) GILLYFLOWER. See CHEIRANTHUS, N° 2.

GILMANTOWN, a township of N.

Strafford county; containing 775 citizens and 2613 in 1790.

**MOLO**, a large island of the Pacific Ocean of the Moluccas, lying between 1° Lat. 2° Lat. N. and between 125° and 128°

It belongs to the Dutch; but does not contain any of the fine spices, though it lies near the islands. The natives are fierce and cruel

**MOLO**, the capital of the above island. **PIN**, Bernard, an eminent English divine, descended from an ancient and honourable family in moreland, and born in 1517. Being bred in the Roman Catholic religion, he for some time studied it, and at Oxford held a disputation with the afterwards bishop of Worcester, and for the Protestant faith; but was afterwards another disputation with Peter Martyr, and again seriously to examine the contested

Being presented to the vicarage of North-Durham, he resigned it, and went abroad to visit eminent professors on both sides; and years absence returned a little before the death of Q. Mary I, satisfied in the doctrine of reformation. He was kindly received by Dr Tostall, Bp. of Durham; who soon presented him the archdeaconry of Durham, and of Easington. Though the persecution was at its height, he boldly preached against the errors, and corruptions of the times, by in the clergy; on which a charge consisting of 13 articles was drawn up against him, presented in form to the bishop. But Dr Tostall dismissed the cause in such a manner as to save his nephew, without endangering himself. He soon after presented him to the rich living of Spring. He was again accused of heresy, and again protected; when his enemies enraged at this second defeat, laid their complaints before Dr Bonner, Bp. of London; who immediately gave orders to apprehend him. Upon Mr Gilpin bravely prepared for martyrdom, and ordering his steward to provide him a garment that he might make a decent appearance at the stake, set out for London. Luckily, however, he broke his leg on the journey; which retarded his arrival until the queen's death. He was immediately set at liberty, he returned to North-Durham, where he was received by his parish with the sincerest joy. Upon the deprivation of the Popish bishops, he was offered the see of Easington, which he declined; and confining himself to his rectory, discharged all the duties of a minister in the most exemplary manner. He was satisfied with the advice he gave in public, and used to instruct in private; and made his parish come to him with their difficulties. He was most engaging towards those whom he thought well-disposed; his very reproof was softened, that it seldom gave offence; the benevolence, with which it was urged, made it appear the effect of friendship. By these means in a few years he made a great change in the neighbourhood, and gave an evidence what reason a single man may effect, when he has it. He was particularly anxious to improve the minds of the younger part of his flock; preferred to mix religion with their labours, and

amidst the cares of this life to have a constant eye upon the next. He attended to every thing which might be of service to his parishioners, and was very assiduous in preventing law-suits. His hall is said to have been often thronged with people, who came to him about their differences. Though little acquainted with law, he decided equitably, and that satisfied; nor could the royal commission have given him more weight than his own character gave him. His hospitable manner of living was the admiration of the whole country. He spent in his family every fortnight 40 bushels of corn, 20 bushels of malt, and a whole ox; besides a proportionable quantity of other provisions. Strangers and travellers found a cheerful reception. All were welcome that came; and even their beasts had so much care taken of them, that it was said, "If a horse was turned loose in any part of the country, it would immediately make its way to the rector of Houghton's." Every Sunday, from Michaelmas to Easter, was a public day with him. During this season he wished to see all his parishioners and their families. For their reception, he had three tables well covered: the first for gentlemen, the second for husbandmen, and the third for day-labourers. This piece of hospitality he never omitted, even when losses, or a scarcity of provision, made its continuance rather difficult. When he was absent from home, no alteration was made in his family expences; the poor were fed, and his neighbours entertained as usual. Notwithstanding the extent of his parish, Mr Gilpin thought the sphere of his benevolence too confined. It grieved him to see everywhere, in the parishes around, so great a degree of ignorance and superstition, occasioned by the negligence of the clergy in those parts. To supply, as far as he could, what was wanting in others, every year he regularly visited the most neglected parishes in Northumberland, Yorkshire, Cheshire, Westmoreland, and Cumberland; and that his own parish in the mean time might not suffer, he was at the expence of a constant assistant. In each place he stayed 2 or 3 days, called the people about him, and laid before them, the danger of leading wicked or even careless lives; explaining to them the nature of true religion; instructing them in the duties they owed to God, their neighbour, and themselves: and showing them how greatly a moral and religious conduct would contribute to their present as well as future happiness. As he had all the warmth of an enthusiast, though under the direction of a very calm judgment, he never wanted an audience, even in the wildest parts; where he roused many to a sense of religion, who had contracted the most inveterate habits of inattention to every thing serious. And wherever he came, he used to visit all the gaols, few in the kingdom having then any appointed minister. By his labours, and affectionate manner of behaving, he is said to have reformed many very abandoned persons in those places. He employed his interest likewise for criminals, whose cases he thought attended with any hard circumstances, and often procured pardons for them. There are two tracts upon the borders of Northumberland, called READSDALE and TINEDALE, of all barbarous places in the north at that time

the most barbarous. Before the Union, these places were called the *debatable land*, as subject by turns to England and Scotland, and the common theatre where the two nations acted their bloody scenes. They were inhabited by a kind of desperate banditti, rendered fierce and active by constant alarms; who lived by theft and plunder on both sides of the barrier; and what they plundered on one side, they exposed to sale on the other; thus escaping justice on both sides. In this dreadful country, where no man would even travel who could avoid it, Mr Gilpin never failed to spend some part of every year. He generally chose the Christmas holidays, because he found the people at that season most disengaged, and most easily assembled. He had set places for preaching, which were as regularly attended as the assize towns of a circuit. If he came where there was a church, he made use of it: if not, of barns, or any other large buildings; where great crowds of people were sure to attend him, some for his instructions, and others for his charity.— This was a very difficult and laborious employment. The country was so poor, that what provision he could get, extreme hunger only could make palatable. The inclemency of the weather, and the badness of the roads, through a mountainous country, and at that season covered with snow, exposed him likewise often to great hardships. Sometimes he was overtaken by the night, the country being in many places desolate for several miles together, and obliged to lodge out in the cold. At such times, he made his servant ride about with his horses, whilst he himself on foot used as much exercise as his age and the fatigues of the preceding day would permit. All this he cheerfully underwent, esteeming such services well compensated, by the advantages which he hoped might accrue from them to his unimpaired fellow creatures. The disinterested pains he took among these barbarous people, and the good offices he was always ready to do them, drew from them the warmest and sincerest expressions of gratitude. Indeed, he was little less than adored among them, and might have brought the whole country almost to do what he pleased. One instance is related, that shews how greatly he was revered. By the carelessness of his servants, his horses were one day stolen. The news was quickly propagated, and every one expressed the highest indignation at the theft. The thief was rejoicing over his prize, when by the report of the country, he discovered *subosc* horses he had taken. Terrified at what he had done, he instantly came trembling back, confessed the fact, returned the horses, and declared “he believed *the devil would have jerked him directly*, had he carried them off knowing them to have been Mr Gilpin’s.” The value of Mr Gilpin’s rectory was about 400 l. a-year: an income, indeed, at that time considerable, but yet in appearance very disproportionate to the generous things he did: Indeed, he could not have done them, unless his frugality had been equal to his generosity. His friends, therefore, could not but wonder to find him, amidst his great and continual expences, propose to build and endow a grammar-school: a design, however, which his exact economy soon en-

abled him to accomplish, though the cost it amounted to upwards of 5000 l. His no sooner opened, than it began to flourish: there was so great a resort of young people that the town was soon not able to accommodate them. He put himself, therefore, to the inconvenience of sitting up a part of his own that purpose, where he seldom had ten or 30 children. Some of these were persons of distinction, whom he board rates; but the greater part were poor whom he not only educated, but maintained: he was at the expence of boarding in the town many other poor. He used to bring several every year from parts where he preached, particularly, and Tinedale. As to his school, he needed able masters in it, whom he procured from Oxford, but himself likewise constant in it. To encourage and quicken the spirits of his boys, he always took particular notice of the most forward: he called them *his sons* and sent for them often into his study to read with them himself. When he met a poor scholar on the road, he made trial of his capacities, and if the answers pleased him, he provided for his education. Besides those sent from his own school to the university, he likewise sent from his own school to the university, who were in circumstances to do for themselves, what farther assistance he could afford. By these means he induced many to allow their children a liberal education, which otherwise would not have done it. He thought it enough to afford the means of a cademical education to these young men, and endeavoured to make it as beneficial as he could. With this view he held correspondence with their tutors; and the youths themselves frequently write to give him an account of their studies. Every other year he made a journey to the university to inspect their behaviour. This care was not fruitless; for many of them became ornaments to the church, as instances of piety. Every third year, a very large quantity of money was sent wholly for the poor: and every fourth year a quantity of bread they were sent to the poorest were distributed. Four times in the year a dinner was sent to the poor; when they received from him a certain quantity of corn, and a sum of money. At Christmas they had always an ox sent to them. In his walks abroad, he carried home with him poor people, and had them clothed as well as fed. He took great care to inform himself of the circumstances of the poor, that the modesty of the sufferer might prevent his relief. But the money was, in his opinion, that which chiefly prevented their seeking under them. If he had lost a heart, he would send him if a farmer had had a bad year, he would send him an abatement in his tithes. If he was able, he took the misfortune

elf; and, like a true shepherd, exposed his flock. But he was most forward of those who had large families; such never meet with his bounty, when they want for their children in the world. In the villages where he preached, as well as in the neighbourhood, his generosity and beneficence continually exercised; particularly in the parts of Northumberland. "When his journey," says an old MS. life of

he would have sol. in his purse; and, at home, he would be so nobles in debt, would always pay within a fortnight of the gaols he visited, he was not only to give the prisoners proper instructions, to purchase for them likewise what they wanted. Even upon the public he never let slip an opportunity of doing.

He has often been known to take off, and give it to an half-naked traveller; and he has had scarce money enough in it to provide himself a dinner, yet would away part of that little, or the whole, if any who seemed to stand in need of it. returning home, he saw in a field several crowding together; and judging something ordinary had happened, he rode up, and that one of the horses in a team had dropped down dead. The owner of it; how grievous a loss it would be to him, in bade him not be disheartened: "I'll save (says he), honest man, that horse of pointing to his servant's.—" Ah! mistaken the countryman, my pocket will not catch a beast as that." "Come, come (said gin,) take him, take him; and when I see money, then thou shalt pay me." This divine, who deservedly obtained the glories of the Father of the Poor, and the Father North, died in 1583, in the 66th year of age.

GIMON, a township of New Hampshire, in county.

GILT. *n. f.* [from *gild*.] Golden show; and on the surface of any matter. Now ob-

servant's gainfulness and our *gilt* are all besmirch'd, and rainy marching in the painful field. *Shakspeare*.  
 Thou wast in thy *gilt*, and thy perfume, sought thee for too much curiosity: in thy own knowest none, but art despis'd for the *gilt*. *Shakspeare*.

GILT. The participle of GILD, which signifies the *gilt* chariot never mark'd its way.

GILT-HEAD. *n. f.* [*gilt* and *head*.] 1. A bird. — He blended together the *gilt-heads*, the brains of pheasants and peacocks, and the necks of pheasants, and the necks of peacocks. *Haleswill*.

GILT-HEAD, in ichthyology. See SPARUS.

GILT-TAIL. *n. f.* [*gilt* and *tail*.] A worm to come from his yellow tail.

GIM. *adj.* [An old word.] Neat; spruce; dressed.

GIMBAR, a town of Cuba, 6 m. E. of Havannah.

GIMBORN, a lordship and citadel of Germany in Westphalia, 8 m. SSE. of Wipperfurth.

\* GIMCRACK. *n. f.* [Supposed by *Skinner*, to be ludicrously formed from *gin*, derived from *engine*.] A slight or trivial mechanism.—

For tho' these *gimcracks* were away,  
 However, more reduc'd and plain,  
 The watch would still a watch remain;  
 But if the horal orbit ceases,  
 The whole stands still, or breaks to pieces.

—What's the meaning of all these transgressions and *gimcracks*? Jumping over my master's hedges, and running your lines cross his grounds? *Arbutnot's John Bull*.

GIMESCH, a town and castle of Hungary, 10 miles W. of Buckans.

GIMIGLIANO, a town of Naples, in Calabria Ultra; 10 miles E. of Nicastro.

\* GIMLET. *n. f.* [*gibelet*, *guimbelet*, Fr.] A borer with a screw at its point.—The *gimlet* hath a worm at the end of its bit. *Moxon*.

\* GIMMAL. *n. f.* [Supposed by *Skinner* and *Ainsworth* to be derived from *gimellus*, Lat. and to be used only of something consisting of correspondent parts, or double. It seems rather to be gradually corrupted from *geometry* or *geometrical*. Any thing done by occult means is vulgarly said to be done by *geommetry*.] Some little quaint devices, or pieces of machinery. *Hammer*.—

I think by some odd *gimmals* or device  
 Their arms are set like clock's, still to strike on,  
 Else they could not hold out so as they do.

\* GIMMER. *n. f.* [See GIMMAL.] Movement; machinery.—The holding together of the parts of matter has so confounded me, that I have been prone to conclude with myself, that the *gimmers* of the world hold together not so much by geometry as some natural magick. *Morgan*.

GIMONE, a river of France, which runs into the Garonne, near Riviere Verdun.

GIMONT, a town of France, in the department of Gers, 12 miles E. of Auch.

\* GIMP. *n. f.* [See GIM. *Gimp*, in old English, is neat, spruce.] A kind of silk twist or lace.

(1.) \* GIN. *n. f.* [from *engine*.] 1. A trap; a snare.—

As the day begins,  
 With twenty *gins* we will the small birds take,  
 And pastime make. *Sidney*.

Which two, thro' treason and deceitful *gins*,  
 Have slain sir Mordant. *Spenser*.

So strives the woodcock with the *gin*;  
 So doth the coney struggle in the net. *Shakspeare*.

Be it by *gins*, by snares by subtilty. *Shakspeare*.

If those, who have but sense, can shun  
 The engines that have them annoy'd;  
 Little for me had reason done,

If I could not thy *gins* avoid. *Ben Jonson*.

I know thy trains,  
 Though dearly to my cost; thy *gins* and toils  
 No more on me have pow'r, their force is null'd. *Milton*.

He made a planetary *gin*,  
 Which rats would run their own heads in,  
 And come on purpose to be taken,  
 Without th' expence of cheese and bacon.

*Hudibras*.  
 Keep

Keep from flaying scourge thy skin,  
And ankle free from iron gin. *Hudibras.*  
2. Any thing moved with screws, as an engine of torture.—

Typhæus' joints were stretched on a gin.

3. A pump worked by rotatory sails.—The delfs would be so flown with waters, it being impossible to make any adits or foughs to drain them, that no gins or machines would suffice to lay and keep them dry. *Ray.*—A bituminous plate, alternately yellow and black, formed by water driving on the outside of the gin pump of Mostyn coalpits. *Woodw. on Fossils.* 4. [Contracted from GENEVA, which see.] The spirit drawn by distillation from juniper berries.—

This calls the church to deprecate our sin,  
And hurls the thunder of our laws on gin.

*Gin shops sourer sighs return.*

(2.) GIN, in mechanics, a machine for driving piles, fitted with a windlass and winches at each end, where eight or nine men heave, and round which a rope is reeved that goes over the wheel at the top; one end of this rope is seized to an iron-monkey, that hooks to a beetle of different weights, according to the piles they are to drive, being from eight to thirteen hundred weight; and when hove up to a cross-piece, near the wheel, it unhooks the monkey, and lets the beetle fall on the upper end of the pile, and forces the same into the ground: then the monkey's own weight overhauls the windlass, in order for its being hooked again to the beetle.

(3.) GIN. See GENEVA, N° V, § 1, ii.

(4.) GIN, in geography, a town of China, of the 3d rank, in Fetcheli, 10 miles SE. of Chun-te. GINAIRI, a town of Africa, in Kumbo.

GINASERVIS, a town of France, in the dep. of Var, 9 miles NW. of Barjols.

GINERCA, a town of Corsica, seated on a small bay, so named, 13 miles S. of Calvi.

GINESTAS, a town of France, in the dep. of Aude, 7½ m. NW. of Narbonne, and 9 E. of Azille.

GINGEE, a town of Indostan, on the coast of Cooromandel, formerly capital of a kingdom of that name. It is seated on a mountain whose top is divided into 3 points, on each of which is a castle; 34 m. NW. of Pondicherry, and 70 SW. of Madras. Lon. 79. 56. E. Lat. 12. 16. N.

GINGEN, an imperial town of Suabia, 16 m. N. of Ulm. Lon. 10. 13. E. Lat. 48. 39. N.

(1.) \* GINGER. *n. f.* [*Zingiber*, Lat. *gingero*, Italian.] The flower consists of five leaves, shaped somewhat like those of the iris: these are produced in the head or club, each coming out of a separate leafy scale. The ovary becomes a triangular fruit, having three cells, which contain seeds. *Miller.*—The root of *ginger* is of the tuberous kind, knotty, crooked, and irregular; of a hot, acrid, and pungent taste, though aromatick, and of a very agreeable smell. The Indians eat both the young shoots of the leaves and the roots themselves. *Hill's Mat. Med.*

Or waiting *ginger* round the streets to go,  
And visit alehouse where ye first did grow.

*Pope's Dunciad.*

(2.) GINGER. See AMOMUM.

(3.) GINGER, in geography, one of Islands belonging to Britain, 10 miles Virgin Gorda.

\* GINGERBREAD. *n. f.* [*ginger* and kind of farinaceous sweetmeat made of that of bread or biscuit, sweetened with and flavoured with ginger and some of tick feeds. It is sometimes gilt.—An' one penny in the world, thou should'st buy *gingerbread*. *Shak.*—

Her currans there and goosebe spread,

With the enticing god of *gingerbrea*

—'Tis a loss you are not here, to parta  
wrecks frost, and eat *gingerbread* in a  
fire upon the Thames. *Swift.*

\* GINGERLY. *adv.* [I know not w rived.] Cautiously; nicely.—

What is't that you

Took up so *gingerly*?

\* GINGERNESS. *n. f.* Niceness; t *Dis.*

GINGIDIUM, in botany, a genus gynia order, belonging to the pentandr plants. The calyx is an involucrem, near leaves; the corolla consists of 5 ov lated petals; the stamina are 5 filam antheræ roundish; the pericarpium truncated fruit, with 8 striæ; there are ted seeds, in some places plane, and convex.

GINGIRO, or ZINDERO, a barbar dom of Africa, SW. of Abyssinia. See

GINGIVÆ, the gums. See GUMS.

\* GINGIVAL. *adv.* [*gingiva*, Lat. ing to the gums.—Whilst the Italians fit a thread in their pronunciation between so to sweeten it, they make the occlude especially the *gingival*, softer than we d a little of perviousness. *Holser.*

\* GINGLE. *n. f.* [from the verb.] 1 rebounding noise. 2. Affectation in the periods.

(1.) \* To GINGLE. *v. n.* To shake sharp shrill clattering noise should be no  
Her infant grandame's whistle next  
The bells the *gingled*, and the whistle

(2.) \* To GINGLE. *v. n.* 1. To utter clattering noise; to utter a sharp noise successful.—

The foot grows black that was with  
brown's;

And in thy pocket *gingling* halpence

*Gay*

Once, we confess, beneath the patrio  
From the crack'd bag the dropping gun  
And *gingling* down the backstairs, told  
Old Cato is as great a rogue as you.

2. To make an affected sound in perio dence.

\* GINGLYMOID. *adj.* [*gingivæ* & 2 Resembling a ginglymus; approaching t lymphus.—The malleus lies along, fixed to panum, and on the other end is joined t

le, or *ginglymoid* joint. *Holder's Eleb.*

**PLYMUS.** *n. f.* A mutual indenting into each others cavity, of which the *stance.* *Wifeman.*

**O,** Lucas. See **JORDANO.**

**I,** a town of Walachia, on the N. nube; near which the Russians de- ks, on the 2d June, 1771; killing 5000 ng 180 pieces of cannon, with ar- es for 30,000. It is 40 miles SW. and 235 NNW. of Constantinople.

**IO, ST,** or **ST GEORGE,** a strong pine republic, and suburb of Mun- . of Mincio. It was taken by the Bonaparte, on the 15th Sept. 1796,

after an obstinate resistance from the Austrians, who lost 2500 men and 20 pieces of cannon. On the 15th Jan. 1797, Gen. Provera penetrated thus far with 6000 men to relieve Mantua, but was forced to surrender next day, with his whole troops, provisions, ammunition, &c.

(2.) **GIORGIO, ST,** a village of Maritime Austria, in Dalmatia, in the isle of Lefina. Roman urns are found in a hill near it.

(3, 4.) **GIORGIO, ST,** a commune and village of Maritime Austria, in the Veronese.

(5.) **GIORGIO, ST, IN ALGA,** an island of Maritime Austria, W. of Venice; so named from the sea-ware on its coast. It is inhabited by Carmelite friars. Its church and convent were burnt in 1716.

(6.) **GIORGIO, ST, MAGGIONE,** a beautiful island of Maritime Austria, on the coast of Venice, inhabited by Benedictine Monks since A. D. 982. It has a magnificent church with a marble front, fine statues and paintings; a convent and library.

**GIORGIONE,** an illustrious Venetian painter, born in 1478. He received his first instructions from John Bellino; but studying afterwards the works of Leonardo da Vinci, he soon surpassed them both, being the first among the Lombards, who found out the admirable effects of strong-light and shadows. Titian became his rival in this art; and excelled him. The most valuable piece of Giorgione in oil is that of Christ carrying his cross, now in the church of San Rovo in Venice; where it is held in great veneration. He died of the plague, in 1511.

**GIORNICO,** a town of the Helvetic republic, in the canton of Uri; 13 miles N. of Bellinzona.

**GIOSEPPINO,** an eminent painter, so called by way of contraction from *Ciuseppe d' Arpino, i. e. Joseph of ARPINO,* the town where he was born, in 1560. Being carried to Rome very young, and employed by painters then at work in the Vatican to grind their colours, he soon made himself master of the elements of design. His wit and humour gained him the favour of popes and cardinals, who employed him. Gregory XIII. showed him great respect; and Lewis XIII. made him a knight of St Michael. He acquired a light and agreeable manner of designing, though De Piles says, his style neither partook of true nature nor of the antique. His battles in the Capitol are the most esteemed of all his pieces. He died at Rome in 1640.

**GIOSTAH,** a town of Africa, in Mozambique, on a bay near Sofala.

**GIOTTO,** an ingenious painter, sculptor, and architect of Florence, born in 1276. He was the disciple of Cimabue; but far superior to his master in the air of his heads, the attitude of his figures, and in the tone of his colouring; though he could not express liveliness in the eyes, tenderness in the flesh, or strength in the muscles of his naked figures. He was principally admired for his works in mosaic; the best of which is over the grand entrance of St Peter's church at Rome. Alberti says, that in that piece, the expression of fright and amazement of the disciples, at seeing St Peter walk upon the water is so excellent, that each of them exhibits some characteristic sign of his

his terror. He died in 1336, and the city of Florence honoured his memory with a statue of marble over his tomb.

GIOVANAZZO. See GIOVENAZZO.

(1.) GIOVANNI, ST., a town of the Cisalpine republic, in the dep. of Lario.

(2.) GIOVANNI, ST., a village of Maritime Austria, in the isle of Brazza, in Dalmatia.

GIOVELLINO, a town of the French republic, in the island and dep. of Corsica; 25 miles E. of Corte.

GIOVENAZZO, a town and fort of Naples, in the province of Bari, near the sea; 11 miles ESE. of Trani. Lon. 16. 50. E. Lat. 41. 26. N.

\* To GIP. *v. a.* To take out the guts of herrings. *Bailey.*

(1.) GIPPING, a river of Suffolk, which joins the Orwell, and falls into the Stoure.

(2.) GIPPING, a small town in Suffolk.

\* GIPSY. *n. s.* [Corrupted from *Egyptian*; for when they first appeared in Europe, they declared, and perhaps, truly, that they were driven from Egypt by the Turks. They are now mingled with all nations.] 1. A vagabond who pretends to foretell futurity, commonly by palmistry or physiognomy.—The butler, though he is sure to lose a knife, a fork, or a spoon every time his fortune is told him, shuts himself up in the pantry with an old gipsy for above half an hour. *Addison.*

A frantick gipsy now, the house he haunts,  
And in wild phrases speaks dissembled wants.

*Prior.*

In this still labyrinth around her lie  
Spells, philters, globes, and spheres of palmistry;  
A sigil in his hand the gipsy bears,  
In th' other a prophetick sieve and sheers.

*Garth's Dispensat.*

I, near yon stile, three fallow gipsies met;  
Upon my hand they cast a poring look,  
Bid me beware, and thrice their heads they shook.

*Gay.*

2. A reproachful name for a dark complexion.—Laura, to his lady, was but a kitchen-wench; Dido a dowdy; Cleopatra a gipsy; Helen and Hero hidings and harlots. *Sbat.* 3. A name of slight reproach to a woman.—The widow play'd the gipsy, and so did her confidant too, in pretending to believe her. *L'Esrange.*

A slave I am to Clara's eyes:  
The gipsy knows her pow'r and flies. *Prior.*

GIRAFFE. See CERVUS, § I, N° iii.

GIRAGLIA, a small island near the N. coast of Corsica, 23 miles N. of Bastia.

GIRALD BARRY, or } See BARRY, N° 4.  
GIRALD OF WALES, }

(1.) GIRALDI, Lilio Gregorio, an ingenious critic, and one of the most learned men that modern Italy has produced, born at Ferrara in 1479. He was at Rome when it was plundered by the emperor Charles V.; and having thus lost all he had, and being tormented by the gout, he struggled through life with ill fortune and ill health. He wrote, nevertheless, 17 performances, which were collected and published at Basil, in 2 vols folio in 1580, and at Leyden in 1696. *Cassabon*, *Thuanus*, and other authors of the first rank, have bestowed the highest eulogies on him.

(2.) GIRALDI, John Baptist Cantio, an Italian

poet of the same family with the pre-  
x.) born in 1504. He was secretary  
of Ferrara, and professor of Rhetoric;  
died in 1573. His works, which con-  
tragedies, were collected and published  
by his son Celso Giralidi, in 1585.  
him among the best tragic writers li-  
duced.

GIRALDUS CAMBRENSIS. See B.  
GIRAN, a town of Algiers, 25 m. S.  
GIRANCOURT, a town of France  
of Vosges, 5 miles W. of Epinal.

GIRAPIETRA, a town of the ill  
16 miles SW. of Settia.

 Are now confin'd two mighty monarchies.

*Shak. Henry V.*

3. The zodiack.—Great breezes in great circles,  
 such as are under the girdle of the world, do re-  
 refrigerate. *Bacon.*

(2.) The GIRDLE, [*Cingulus* or *Zona*,] in anti-  
 quity, was a belt or band of leather or other mat-  
 ter, tied about the reins to keep that part more  
 firm and tight. It was anciently the custom for  
 bankrupts and other insolvent debtors to put off  
 and surrender their girdle in open court. The  
 reason was, that our ancestors used to carry all  
 their necessary utensils, as purse, keys, &c. tied  
 to the girdle; whence the girdle became a symbol  
 of the estate. History relates that the widow of  
 Philip I. duke of Burgundy, renounced her right  
 of succession by putting off her girdle upon the  
 duke's tomb. The Romans always wore a girdle  
 to tuck up the tunica when they had occasion to  
 do any thing: this custom was so general, that  
 such as went without girdles, and let their gowns  
 hang loose, were reputed idle, dissolute, perions.

(3.) GIRDLE, MAIDEN'S, or VIRGIN'S. It  
 was the custom among the Greeks and Romans  
 for the husband to untie his bride's girdle. Ho-  
 mer, lib. xi. of his *Odyssey*, calls the girdle *μαρ-  
 τυριον ζωναν, maid's girdle*. Festus relates, that it was  
 made of sheep's wool, and that the husband un-  
 tied it in bed: he adds, that it was tied in the  
 Herculean knot; and that the husband unloued  
 it, as a happy presage of his having as many chil-  
 dren as Hercules, who at his death left 70 behind  
 him.

(4.) GIRDLE OF VENUS. The poets attributed  
 to Venus a particular kind of girdle called *CESTUS*,  
 to which they annexed a faculty of inspiring the  
 passion of love. See *CESTUS*, § 2.

\* To GIRDLE. *v. a.* [from the noun.] 1. To  
 gird; to bind as with a girdle.—

Lay the gentle babe, girdling one another  
 Within their innocent alabaster arms. *Shak.*

2. To inclose; to shut in; to environ.—

Those sleeping stones,  
 That as a waist do girdle you about. *Shak.*

Let me look back upon thee, O thou wall,  
 That girdlest in those wolves. *Shak. Timon.*

\* GIRDLEBELT. *n. f.* [*girdle* and *belt*.] The  
 belt that encircles the waist.—

Nor did his eyes less longingly behold  
 The girdlebelt, with nails of burnish'd gold.

*Dryden's Amiel.*

GIRDLE NESS, a cape on the E. coast of Scot-  
 land, 2 miles E. of Aberdeen.

\* GIRDLER. *n. f.* [from *girdle*.] A maker of  
 girdles.

\* GIRE. *n. f.* [*gyrus*, Latin.] A circle descri-  
 bed by any thing in motion. See *GYRE*.

GIREST, or } a town of Persia, in Kerman;  
 GIRET, } 30 miles S. of Ferabat. Lon-  
 57. 55. E. Lat. 27. 50. N.

GIRGASHITES, or GERGESENES, an ancient  
 people of Canaan, whose habitation was beyond  
 the sea of Tiberias, where we find some relics of  
 their

K k k

their name in the city of GERGESA, upon the lake of Tiberias. The Jewish rabbies inform us, that when Joshua first came into the land of Canaan, the Gergashites resolved rather to forsake their country than submit to the Hebrews, and accordingly retired into Africa. Nevertheless, it is certain that a great number of them staid behind, since Joshua (xxiv. 11.) informs us, that he subdued the Gergashites, and they whom he overcame were certainly on this side Jordan. See GADARENES.

GIRGE, a town of Egypt, capital of Said, 400 yards from the Nile, and 3 miles in circumference. It has several mosques, bazars, and squares; and lies 160 miles N. of Syene, and 215 S. of Cairo. Lon. 49. 8. E. of Ferro. Lat. 26. 30. N.

GIRGENTI, a town of Sicily, which occupies part of the site of the ancient AGRIGENTUM. It has only one street fit for carriages, though it has about 15,000 inhabitants. The only antiquities are a Latin inscription of the time of the Antonines, relative to some association between Agrigentum and Lilybæum; and a piece of ancient masonry in the foundations of a church said to be the remains of a temple of Jupiter. At some distance, on the old ground in the vale, stands the cathedral, a clumsy building patched up by barbarous architects with various discordant parts. The baptismal font is made out of an ancient sarcophagus faced with very beautiful basso-relievos. This see is the richest in Sicily, but is less enlightened than the rest of the island. Among the curiosities belonging to the cathedral is an Etruscan vase of rare size and preservation. There are also some golden pateras of extreme rarity. The monastery of San Nicolo is admirably situated on a little eminence in the centre of the city. The range of hills towards the SE. sinks gradually, so as to admit a noble reach of sea and of plain, terminated on each side by thick groves of fruit-trees. Above appear the remains of ancient grandeur, wonderfully contrasted with the humble straw cottages built at their feet. In the orchard of this convent is a square building with pilasters, supposed to have been part of the palace of the Roman prætor. Girgenti has a harbour, formed by a pier carried out in 3 sides of an octagon, with a battery at the head; the light-house is erected on the cliffs on shore. The work is strong and neat, but the Sinocco commands it entirely, and drives in great quantities of sand, which will in time choak up the port. Ships of burden find it difficult to get in, but the magazines in the rocks along the shore are very spacious. Girgenti is seated on the St Baife, 3 miles from the sea, and 47 S. of Palermo. Lon. 13. 24. E. Lat. 37. 28. N.

GIRIA, a town in Cefalonia.

\* GIRL. *n. f.* [About the etymology of this word there is much question: *Meric Casaubon*, as is his custom, derives it from *sign* of the same signification; *Minshew* from *garrula*, Latin, a prattler, or *girella*, Italian, a weathercock; *Junius* thinks that it comes from *berlodes*, Welsh, from which, says he, *barlot* is very easily deduced. *Skinner* imagines that the Saxons, who used *ceorl* for a man, might likewise have *ceorla* for a woman, though no such word is now found. Dr *Hickes* derives it most probably from the Islandick *karlinna*, a wo-

man.] A young woman, or female child. *unlugg'd days was my wife a girl.*

6 miles NW. of Kirkcudbright; a-  
s long from N. to S. and from 3 to

he climate, soil, and surface are very  
; the air is pure and healthy. Agricul-  
ture improved. About 1000 acres are  
gardens, orchards, and plantations.

ion, in 1792, stated by the rev. Mr  
n his report to Sir J. Sinclair, was  
had increased no less than 1363 since

3 to the cotton and other manufact-  
ed at GATEHOUSE, which contained  
ants, in 1792.

*TOWN*, an Indian town of the Uni-  
the North Western Territory.

*TAN*, a parish of Scotland, in Air-  
s long from SW. to NE. and from

. Two thirds of the surface are hilly,  
reen. The soil is various, but chiefly  
ould. In the low grounds the air is

d, and the crops early; but in the  
e climate is cold and moist, and vege-  
 Husbandry is much improved, and

are mostly included. Oats, barley,  
, and potatoes are the chief produce.  
bounds, but is little used. Sea ware  
n the coast, and is used both for ma-  
p. The population, in 1791, stated

as. Thomson, in his report to Sir J.  
1795, and had increased 532 since  
number of sheep was 4280, and of

1700.  
*TAN*, a river of Scotland, which rises  
art of Airshire, and runs into the sea  
*Girvan*, N° 3.

*W*, a post town and burgh of barony in  
ish, (N° 1.) at the mouth of the *Gir-*  
pposite to Ailsa. Its harbour is good

but might be much improved. Vessels can get  
out to sea with almost any wind. *Girvan* contains  
above 1000 inhabitants, and is governed by two  
baillies and a council of ten. Above 100 looms  
were employed in weaving cotton cloth, in 1791.  
Leather and shoes are also manufactured. *Gir-*  
van lies 14 miles SSW. of Ayr, and is 27 NNW.  
of Wigton.

*GIRY*, Lewis, a French lawyer, and one of the  
first members of the French academy, was born  
at Paris, in 1595. He translated Tertullian's A-  
pology and several other works; and died in 1665,  
aged 70.

*GISBORN*, a town in the West Riding of  
Yorkshire, 37 miles SE. of Manchester, 60 W.  
of York, and 219½ NNW. of London. Lon. 2.  
22. W. Lat. 53. 55. N.

*GISBOROUGH*, a town of England, in the  
N. Riding of Yorkshire, on the road from Whit-  
by to Durham, 4 miles from the mouth of the  
Tees, where is a bay and harbour for ships. It

had formerly an abbey, and a church, which, from  
its ruins, seems to have been equal to the best ca-  
thedrals in England. The soil is fertile, and has  
a constant verdure, adorned with field flowers al-  
most all the year. There is some iron and mines

of alum, which were first discovered in the reign  
of K. James I. and have been since very much im-  
proved. Sir Paul Pindar, who first farmed them,  
paid rents to the king 12,000l. to the Earl Mus-  
grave 1540l. and to Sir William Penniman 600l.

and had 800 men by sea and land in constant pay;  
yet he was a considerable gainer, as there was  
then scarce any other to be had, and the price  
was 26l. a ton; but as there are now several o-  
ther alum works in this country, the works here

have for some years been neglected. *Gisborough*  
is 18 miles E. of Stockton, and 22 NW. of Whit-  
by; but its distance from London, by sea, stated

at 224 miles, is by Mr Cruttwell, said to be 248  
N. and by Dr Brookes and J. Walker, only 155  
N. by W. Lon. 0. 55. W. Lat. 54. 35. N.

*GISCO*, son of Hamilca the Carthaginian gen-  
eral, was banished from Carthage by the influence  
of his enemies. Being afterwards recalled, he was  
made general in Sicily against the Corinthians, a-  
bout A. A. C. 309; and by his success and intre-  
pidity, he obliged them to sue for peace. See

*CARTHAGE*, § 5.

\* *To GISE Ground, v. a.* Is when the owner  
of it does not feed it with his own stock, but takes  
in other cattle to graze. *Bailey.*

*GISGI*, a town of Transylvania, near Maros.  
*GISHUBEL*, a town of Bohemia, 20 miles E.  
NE. of Koniggratz.

*GIZING*, a town and fort of Hungary.  
*GISLAVY*, a town of Sweden, in Smaland.

\* *GISLE*. Among the English Saxons, signifies  
a pledge: thus *Fred'sle* is a pledge of peace;  
*Gylfebert* an illustrious pledge; like the Greek *Ho-*  
*merus*. *Camden.*

*GISLEN*, Auger, lord of *BUSBEC*, a man il-  
lustrious on account of his embassies, was born at  
Commines, in 1512; and educated at the univer-  
sities of Louvain, Paris, Venice, Bologna, and  
Padua. He was engaged in several important ne-  
gociations, and particularly was twice sent am-  
bassador by the king of the Romans to the empe-  
ror

ror Soliman. He collected inscriptions, bought MSS. searched after rare plants, inquired into the nature of animals, and, in his 2d journey to Constantinople, carried with him a painter, that he might be able to communicate to the curious the figures of the plants and animals that were little known in the west. He wrote a Discourse of the state of the Ottoman empire, and a relation on his two journeys to Turkey, which are much esteemed. He died in 1592.

GISORS, a town of France, in the dept. of Eure, and ci-devant province of Normandy, seated on the Ept; 27 miles NE. of Evreux, and 28 SE. of Rouen. Lon. 1. 43. E. Lat. 49. 17. N.

GISSA, in ancient geography, an island of Dalmatia, now called PAGO.

GISTAIN, a town of Spain, in Arragon, among the Pyrenees, near France, 15 miles N. of Ainsa.

GISTITZ, a town of Bohemia, in the circle of Boleflau, 4 miles N. of Nimburn.

GISUND, a town of Norway, in Drontheim, 44 miles NW. of Drontheim.

\* GITH. *n. f.* [*nigella.*] An herb called Guinea pepper.

GITI, a town of Asia, in Thibet, 234 miles NNE. of Delhi. Lon. 79. 36. E. Lat. 32. 10. N.

GITSCHIN, a town of Bohemia, 22 miles N. W. of Koniggratz, and 44 NE. of Prague.

GITTAIM, a city of Benjamin, to which the Reerothites fled after the death of K. Saul. It was rebuilt after the return from the captivity.

GITTITES, the people of Gath. See GATH.

\* GITTITH, a Hebrew word occurring frequently in the Psalms, and generally translated *wine presses*. Some think it signifies a sort of musical instrument; others, that the psalms with this title were sung after the vintage; and others, that the hymns of this kind were invented in the city of Gath. Calmet is of opinion, that they were sung by virgins born in Gath: Psal. viii. 1. lxxxii. 1. lxxxiv. 1. Dr Hammond thinks that the psalms with this title were all set to the same tune, and made on the defeat of Goliath the Gittite.

GIVA, a town of Asiatic Turkey, in Natolia, 32 miles SE. of Mileta.

GIVANIROTONDO, a town of Naples, in the Capitanata, 9 miles W. of Mont St Angelo.

GIUBA, FORT, an old castle of Maritime Austria, in the Isle of Pago, and prov. of Quarnaro.

GIUDECCA, a district of Venice.

GIUDUCCA, or ZUECCA. See ZUECCA.

(1.) \* To GIVE. *v. a.* preter. *gave*; part. pass. *given*. [*gifan*, Saxon.] 1. To bestow; to confer without any price or reward; not to sell.—I had a master that *gave* me all I could ask, but thought fit to take one thing from me again. *Temple.*—

Constant at church and change; his gains were sure,  
His *givings* rare, five farthings to the poor.

While tradesmen starve these Philomels are gay;  
For generous lords had rather *give* than pay.

Half useless doom'd to live,  
Pray'rs and advice are all I have to *give*.

2. To transmit from himself to another in speech, or writing; to deliver.—whom thou gavest to be with me of the tree, and I did eat. *Gen.* were eating and drinking, marrying marriage. *Matt.* xxiv. 38.—Those that fast not only every week, but also count of the whole year was *give* Thursday before Christmas. *Gray* *give* an account of these phenomena Aristotle advises not pacts to put false and impossible into their poetical licence to run out into wildness.

3. To put into one's possession; to import; to communicate.—*Give* for our lamps are gone out. *Matt.* *gives* us many children and friends away; but takes none away to gain. *Temple.*—*Give* me, says Arch to stand firm, and I will remove thee.—If the agreement of men first *give* any one's hands, or put a crown that almost must direct its conveyance.

4. To pay a price or reward, or in such that a man hath will be *give* for his. If you did know to whom I *gave* If you did know for whom I *gave* And would conceive for what I *gave* And how unwillingly I left thee You would abate the strength of force.

—He would *give* his nuts for a p and exchange his sheep for shells, sparkling pebble. *Locke.* 5. To yield hold.—Philo, Alexander's father, against a prisoner at a time when he and seemed to *give* small attention, after sentence was pronounced, to the king, somewhat stirred, said, you appeal? The prisoner answer'd lip, when he *gave* no ear, to Phil shall *give* ear. *Baron.*—Constantia for having so tamely *given* an ear to *Speltator.* 6. To quite; to yield place, then stranger, to an honourable. 7. To confer; to impart.—I will *give* thee a son also of her. *Gen.* can *give* that to another which it *Bramb.* against *Hobbes*—What best some places, I *give* to others who not originally. *Dryden's Fob.* 8. To yield without retention.—

All clad in skins of beasts the j *Give* to the wanton winds their i

9. To grant; to allow.— 'Tis *given* me once again to bet

—He has not *given* Luther fairer pl 10. To yield; not to deny.—

I *gave* his wife proposal w Nay, urg'd him to go on; the st Will ruin him. *Row's Amb.*

11. To afford; to supply.—This is the fear of death in them which we and *gave* them courage to all advent —*Give* us also sacrifices and burnt

Sacrifice unto the Lord. *Ex. x. 25.* 12. answer; to commission.—

Prepare the libation and the solemn pray's; give thy friend to shed the sacred wine.

*Pope's Odys.*—God himself requireth the sitting of his hands in prayers; and hath given the understanding, that the wicked, although they shall not be heard. *Hooker.*—

Give me to know this foul rout began, who set it on. *Shak.* For the weak shoot, which else would poorly rise,

The tree adopts, and lifts into the skies; the new pupil fostering juices flow, and forth the gems, and give the flow'rs to glow. *Tickel.*

—The applause and approbation I give your speeches. *Shak. Troil. and Cres.* 15. r; to vent; to pronounce.—

You must be the first that gives this sentence, as that suffers. *Shak. Meas. for Meas.*

Rhodians seeing their enemies turn their gave a great shout in derision of them.

*1 Hist.*—Let the first honest discoverer give a hint, that Wood's halpence have been and caution the poor people not to re-tem. *Swift.* 16. To exhibit; to shew.—

—Hence gives the impossibility of an eternal in any thing essentially alterable or cor-rupt. *Hale.* 17 To exhibit as the product of an action.—

The number of men being divided number of ship, gives 424 men a piece.

*104.* 18. To do any act of which the consequence reaches others.—As we desire to give no offence of judgment in others. *Barnet.* 19.

—To send forth as odours from any body oranges gives the rippling of the wind gives the finest more. *Bacon.* 20. To addict; to

—The Helots, of the other side, shutting their gates, gave themselves to bury their dead, their wounds, and rest their wearied bodies.—

After man began to grow to number, the first thing we read they gave themselves as the tiling of the earth and the feeding of the fowls. *Hooker.*—

Groves and hill altars were raised, in regard to the secret access which superstition gives, might have always been done with ease. *Hooker.*—

The duke is virtuous, mild, and too well given, to be afraid of any man's malice.

—To cry out on evil, or to work my downfall. *Shak.*

—To know him not, Cæsar, he's not dangerous: a noble Roman, and well given. *Shak.*

—The name is Falstaff: if that man should be given, he deceives me; for, Harry, I see it in his looks. *Shak.*—

Huniades, the scourge of the Turks, was dead long before; so was also: after whom succeeded others, given all to the world and ease. *Knalles's Hist.*—

—Though he was a pleasure, yet he was likewise desirous of pleasure. *Bacon's Hen.* VII.—

—He that gives his mind to the most High, will seek out all the secrets of all the ancients. *Eccly.* xxxix. 1.—

—He is much given to contemplation, and the viewing of this theatre of the world. *More against Atheism.*

—They who gave themselves to warlike action and enterprises, went immediately to the palace of Odin. *Temple.*—

—Men are given to this invidious humour of scoffing at personal beauties and defects. *L'Estrange.*—

—Besides, he is too much given to horseplay in his raillery; and comes to battle like a dictator from the plough. *Dryden.*—

—I have some business of importance with her; but her husband is so horribly given to be jealous. *Dryden.*

—What can I refuse to a man so charitably given? *Dryden.* 21. To resign; to yield up.—

—Pitching ourselves in the midst of the greatest wilderness of waters, without victual, we give ourselves for lost men, and prepared for death. *Bacon's New Atl.*—

—Who say, I care not, those I give for lost; And to instruct them will not quit the cost. *Herbert.*

—Who say, I care not, those I give for lost; And to instruct them will not quit the cost. *Herbert.*

Virtue give's for lost, Dearest and overthrown, as seem'd;

Like that self-begot'n bird From out her airy womb now teem'd.

—Since no deep within her gulph can hold Immortal vigour, though oppress'd and fail'd, I give not Heaven for lost. *Milt. Par. Lost.*

—For a man to give his name to Christianity in these days, was to list himself a martyr. *South.*—

—One's given himself for gone; you've watch'd your time, He fights this day unarm'd, without his rhyme. *Dryden.*

—The parents, after a long search for the body, gave him for drowned in one of the canals. *Speck.*

—As the hinder feet of the horse stuck to the mountain, while the body reared up in the air, the poet with great difficulty kept himself from sliding off his back, in so much that the people gave him for gone. *Guardian.* 22. To conclude; to suppose.—

Whence came you here, O friend, and whither bound? All gave you lost on far Cyclopean ground. *Garth's Ovid.*

23. To GIVE away. To alienate from one's self; to make over to another; to transfer.—

The more he got, the more he shewed that he gave away to his new mistress, when he betrayed his promises to the former. *Sidney.*—

If you shall marry, You give away this hand, and that is mine; You give away heav'n's vows, and those are mine; You give away myself, which is known mine. *Shak.*

Honest company, I thank you all, That have beheld me give away myself To this most patient, sweet, and virtuous wife. *Shak.*

—I know not how they sold themselves; but thou, like a kind fellow, gav'st thyself away gratis, and I thank thee for thee. *Shak. Henry IV.*—

—Love gives away all things, that so he may advance the interest of the beloved person. *Taylor's Rule.*—

But we who give our native rights away, And our enslav'd posterity betray.

Are now reduc'd to beg an alms, and go

On holidays to see a puppet-show. *Dryd. Juv.*

—Alas, said I, man was made in vain! How is he *given away* to misery and mortality! *Addison.*

—Theodosius made a private vow never to inquire after Constantia, whom he looked upon as *given away* to his rival, upon the day on which their marriage was to have been solemnized. *Addison.*

—Whatever we employ in charitable uses, during our lives, is *given away* from ourselves: what we bequeath at our death, is given from others only, as our nearest relations. *Atterbury.*

24. To *GIVE back.* To return; to restore.—Their vices perhaps *give back* all those advantages which their victories procured. *Atterbury.*

25. To *GIVE forth.* To publish; to tell.—Soon after it was *given forth*, and believed by many, that the king was dead. *Hayward.*

26. To *GIVE the hand.* To yield pre-eminence, as being subordinate or inferior.—Lessons being free from some inconveniences, whereunto sermons are more subject, they may in this respect no less take than in others they must *give the hand*, which betokeneth pre-eminence. *Hooker.* 27. To *GIVE over.* To leave; to quit; to cease.—Let novelty therefore in this *give over* endless contradictions, and let ancient customs prevail. *Hooker.*—It may be done rather than that be *given over.* *Hooker.*—

Never give her o'er;

For scorn at first makes after love the more.

*Sbak.*

—If Desdemona will return me my jewels, I will *give over* my suit, and repent my unlawful solicitation. *Othello.*—All the soldiers, from the highest to the lowest, had solemnly sworn to defend the city, and not to *give it over* unto the last man. *Knolles's Hist.*—Those troops which were levied, have *given over* the prosecution of the war. *Clarendon.*

But worst of all to *give her over,*

'Till she's as desperate to recover. *Hudibras.*

—A woman had a hen that laid every day an egg: she fancied that upon a larger allowance this hen might lay twice a day; but the hen grew fat, and *gave quite over* laying. *L'Esrange.*—Many have *given over* their pursuits after fame, either from the disappointments they have met, or from their experience of the little pleasure which attends it. *Spectator.* 28. To *GIVE over.* To addict; to attach to.—Zelma, govern and direct me; for I am wholly *given over* unto thee. *Sidney.*—

When the Babylonians had *given themselves over* to all manner of vice, it was time for the Lord, who had set up that empire, to pull it down. *Grew's Cosmol.*—I used one thing ill, or *gave myself* so much *over* to it, as to neglect what I owed either to God or the world. *Temple.* 29. To *GIVE over.* To conclude lost.—Since it is lawful to practise upon them that are forsaken and *given over,* I will adventure to prescribe to you.

*Suckling.*—

'Tis not amiss, e'er y' are *giv'n o'er,*

To try one desp'rate med'cine more;

And where your case can be no worse,

The desp'rate'st's the wisest course. *Hudibras.*

—The abbess, finding that the physicians had *given her over,* told her that Theodosius was just *gone before her,* and had sent her his benediction.

*Spectator.*—Her condition was now c  
rate, all regular physicians, and her  
lations, having *given her over.* *Arbut*

Yet this false comfort never *gives*  
That, whilst he creeps, his vig'rou  
can soar.

Not one foretell's I shall recover;  
But all agree to *give me over.*

30. To *GIVE over.* To abandon.—T  
uniformity throughout all churches, i  
ner of indifferent ceremonies, will be  
and therefore best to *give it over.* *Hook*  
melech, as one weary of the world, *ga*  
and betook himself to a solitary life, a  
monk. *Knolles.*—

Sleep hath forfook, and *giv'n me*  
To death's benumbing opium, as my

The cause for which we fought an  
So boldly, shall we now *give o'er?*

31. To *GIVE out.* To proclaim; to g  
utter.—The father's *gave it out* for a  
whatsoever Christ is said in Scripture to  
ceived, the same we ought to apply c  
manhood of Christ. *Hooker.*—

It is *given out*, that, sleeping in m  
A serpent stung me. So the whole c  
mark

Is, by forged process of my death,  
Rankly abused. *Sba*

One that *gives out* himself prince f  
Son of Polixenes, with his princel's.

—It hath been *given out*, by an hypocri  
who was the first master of my ship, tha  
with me out of England 22,000 piece  
per piece. *Raleigh.*—He *gave out* general  
for the assembly of his council for  
*Knolles's Hist.*—The night was disting  
the orders which he *gave out* to his a  
they should forbear all insulting of the  
*Addison.* 32. To *GIVE out.* To show  
appearance.—

His *givings out* were of an infinite c  
From his true meant design.

She that, so young, could *give c*  
seeming,

To seal her father's eyes up close as c  
33. To *GIVE up.* To resign; to quit;

—The people, weary of the miseries  
would *give him up*, if they saw him thrin

He has betray'd your business, and  
For certain drops of salt, your city R

—The sun, breaking out with his cheerf  
revived many, before ready to *give up*  
for cold, and gave comfort to them all.

*Hist.*—He found the lord Hopeton in tr  
the loss of the regiment of foot at Akton,  
the unexpected assurance of the *giving up*  
del-cattle. *Clarendon.*—Let us *give oursel*  
ly *up* to Christ in heart and desire. *Fayl*

—Such an expectation will never come  
therefore I'll e'en *give it up*, and go and  
self. *Collier.*—I can *give up* to the hist  
your country the names of so many gen  
heroes which croud their annals. *Dryd.*  
clares himself to be now satisfied to the  
in which he has *given up* the cause.

s made between several states disown-  
n to the land in the other's possession,  
common consent, *given up* their pre-  
their natural right. *Locke*.—If they *give*  
o their reasons, then they with them  
l earth and farther enquiry, and think  
o such thing as certainty. *Locke*.—We  
him *give up* again to the wild common  
whatever was more than would supply  
nencies of life. *Locke*.—

s surrender, since his father's death,  
*give up* Africk into Cæsar's hands,  
ke him lord of half the burning zone.

*Addis. Cato.*

to be honest men, *give up* your leaders,  
don shall descend on all the rest. *Cato*.  
h priest threatened to excommunicate a  
erland squire, if he did not *give up* to  
urch lands. *Addison's Freeholder*.—He  
festal deities acting in a confederacy a-  
s, and immediately *gave up* a cause  
excluded from all possibility of success.  
—An old gentleman, who had been en-  
n argument with the emperor, upon his  
ling him he wondered he would *give up*  
on when he had the better, I am never  
says he, to be confuted by one who is  
fifty legions. *Spectator*.—He may be  
o *give up* the clearest evidence. *Atterb.*  
stant health and longevity of men must  
p also, as a groundless conceit. *Bentley*.  
the physicians *giv'n up* all their hopes;  
they add a few days to a monarch?

*Rocue.*

people were obliged to demand peace,  
p to the Komans all their possessions in  
*butb*.—Every one who will not ask for  
ict of God in the study of religion, has  
n to fear he shall be left of God, and  
prey to a thousand prejudices, that he  
onsigned over to the follies of his own  
*utts*.—*Give yourselves up* to some hours

*Watts*. 34. *To GIVE up*. To abandon.  
be *given up* to believe lyes, some must  
*given up* to tell them. *Stillingf.*—Our  
urally *give themselves up* to every diver-  
b they are much accustomed to; and we  
id that play, when followed with assidu-  
esses the whole woman. *Guardian*.—A  
t no sooner communicates his works,  
imagined he is a vain young creature  
to the ambition of fame. *Pope*.—I am  
: this time to *give up* my whole applica-  
ner. *Pope*.—Persons who, through mis-  
chuse not to dress, should not, however,  
atness. *Clarissa*. 35. *To GIVE up*. To  
And Joab *gave up* the sum of the num-  
e people to the king. 2 *Sam*. xxiv. 9.—  
ints were confuted, and he could not  
them up. *Sewist*. 36. *To GIVE away*.  
; not to resist; to make room for. Pri-  
ets, with him, *gave away* to the common  
*arew*.—Perpetual pushing and assurance  
icuity out of countenance, and make a  
possibility *give away*. *Collier*.—

he had he spoken when the cloud *gave*  
y;

The mists flew upwards, and dissolv'd in day.

*Dryden's Æn.*

His golden helm *gives way* with stony blows,  
Batter'd and flat, and beaten to his brows. *Æn.*

37. The word *give* is used with great laxity, the  
general idea is that of transmitting from one to a-  
nother.

(2.) \* *To GIVE*. v. n. 1. To rush; to fall on;  
to give the assault. A phrase merely French, and  
not worthy of adoption.—

Your orders come too late, the fight's begun;

The enemy *gives on* with fury led. *Dryden.*

—Hannibal *gave upon* the Romans. *Hooke. Rom. H.*

2. To relent; to grow moist; to melt or soften;  
to thaw.—Some things are harder when they come  
from the fire, and afterwards *give* again, and  
grow soft; as the crust of bread, biscuit, sweet-  
meats, and salt. *Bacon's Nat. Hist.*—

Only a sweet and virtuous soul,

Like season'd timber, never *gives*;

But though the whole world turn to coal,

Then chiefly lives. *Herbert.*

—Unless it is kept in a hot house, it will so *give*  
again, that it will be better than raw malt. *Mor-*  
*timer*.—Before you carry your large cocks in,  
open them once, and spread them: hay is apt to  
*give* in the cock. *Mort*. 3. To move. A, Fr.  
phrase—

Up and down he traverses his ground,

Then nimbly shifts a thrust, then lends a wound;

Now back he *gives*, then rushes on amain.

*Daniel's C. War.*

4. *To GIVE in*. To go back; to give way. Not  
in use.—The charge was given with so well go-  
verned fury, that the left corner of the Scots bat-  
talion was enforced to *give in*. *Hays*. 5. *To*  
*GIVE into*. [A French phrase.] To adopt; to em-  
brace.—This is a geography particular to the me-  
dalists: the poets, however, have sometimes *given*  
*into* it, and furnish us with very good lights for  
the explication of it. *Addison*.—This consideration  
may induce a translator to *give into* those general  
phrases, which have attained a veneration in our  
language from being used in the Old Testament.

*Pope*.—The whole body of the people are either  
stupidly negligent, or else *giving in* with all their  
might to those very practices that are working  
their destruction. *Swift*. 6. *To GIVE off*. To  
cease; to forbear.—The punishment would be  
kept from being too much, if we *gave off* as soon  
as we perceived that it reaches the mind. *Luc*.

7. *To GIVE over*. To cease; to act no more.  
—If they will speak to the purpose, they must  
*give over*, and stand upon such particulars only  
as they can shew we have either added or abro-  
gated, otherwise than we ought, in the matter of  
church polity. *Hooker*.—Neither hath Christ,  
through union of both natures, incurred the  
damage of either; lest, by being born a man,  
we should think he hath *given over* to be God, or  
that because he continued God, therefore he can-  
not be man also. *Hooker*.—

*Give* not o'er to; to him again; intreat him,

Kneel down before him, hang upon his gown;

You are too cold. *Shak. Meas. for Meas.*

—The state of human actions is so variable, that to  
try things oft, and never to *give over*, doth woun-  
ders.

**GLACIATION.** *n. f.* [from *glaciate.*] The act of forming ice; ice formed.—Ice is plain upon the surface of water, but round in hail, which is hail-glaciation, and figured in its guttulous descent upon the air. *Brown's Vulgar Errors.*

**GLACIERS,** a name given to some very high ridges of ice among the ALPS. Mr Coxe divides these mountains, in general are composed of parallel chains, the highest of which are in the centre, and the others gradually decrease as they recede from thence. The central ridges are covered with pointed rocks; all the valleys, that are not absolutely perpendicular under perpetual snow and ice. On the sides of this ridge are fertile and cultivated lands interspersed with numerous villages, and by numerous streams. The elevated parts of the central chain are covered with snow: the declivities, excepting those that are extremely steep, have all a covering of ice as well as the intermediate parts being filled with vast quantities of ice, terminating in the cultivated valleys. The glaciers, though on a smaller scale, are the same as those chains that are at a distance from the centre: In those which are most remote, scarcely any snow, is observed, unless upon the most elevated summits; and the declivities, diminishing in height and ruggedness, are covered with verdure, until at last they terminate in small hills and plains. Thus the glaciers divide the mountains into two sorts; the first occupying the valleys in the bosom of the Alps, called **VALLEYS**; the second covering the declivities and the tops of the mountains. These are called by Mr Coxe **UPPER and LOWER GLACIERS.**

**UPPER GLACIERS,** THE LOWER, are by far the most numerous; some of them extending several miles in length. They do not communicate with each other, as has been generally supposed, but being parallel to the central chain; and being mostly in a transverse direction, are separated at the higher extremity by inaccessible ridges, and at the lower extend into the cultivated valleys. The thickness of the ice varies in different parts. In the glacier de Bois, which extends more than 15 miles in length, and upwards of 1000 feet, M. Saussure found it generally from 100 to 200 feet; but he was credibly informed that in some places it was not less than 600 feet, and in others more. These vast masses of ice usually rest upon the rocks, and are supported by their own weight, and but weakly supported by the rugged rocks beneath them, they are supported by large crevices, and have an appearance of walls, pyramids, &c. according to the position of the eye in viewing them. In those places where they lie upon even ground, they have only a gentle inclination, the surface of the ice is nearly uniform, the crevices being narrow, and the glacier being crossed by ridges on foot without any difficulty. The surface of the ice is rough and granulated, so that it is difficult to walk upon it, excepting such places as are deep descent. It is opaque, full of small stones, and of the size of a pea, very porous, and resembles a mixture of snow and water.

A vast quantity of stones and earth are brought down from the mountains upon the glaciers,

PART II.

and are by them thrown off on each side according to the descent of the ice. The place on which these rest is more hard and elevated than the rest of the ice, and is very difficult to walk upon; the earth is likewise laid upon them in such regular heaps, that it appears to have been done by art. This collection of earth and stones is termed by the natives the *Moraine*. Mr Coxe, who visited the glacier des Bois, informs us, that the appearance of it at a distance was so tremendous, that it seemed impracticable to cross it. Numerous and broad chasms intersected it in every direction; but entering upon it, the company found that courage and activity were only required to accomplish the task. They had large nails in their shoes and spiked sticks; which on this occasion were found to be particularly serviceable. Having passed the moraine, and descended upon the glacier itself, they found the ice softened by a warm wind which rendered it less slippery than usual. Having walked across it for about a quarter of an hour, they came again to the moraine, along which they continued their journey for half an hour, and then entered upon the great body of the glacier. "Here (says Mr Coxe,) it was curious to observe the numerous little rills produced by the collection of drops occasioned by the thawing of the ice on the upper part of the glacier: these little rills hollow out small channels, and, torrent-like, precipitate themselves into the chasms with a violent noise, increasing the body of waters formed by the melting of the interior surface, and finding an outlet under the immense arch of ice in the valley of Chamouni, from which the *Averon* rushes." As our traveller proceeded on his journey, he was surprised by the noise of a large fragment of rock which had detached itself from one of the highest needles, and bounded from one precipice to another with great rapidity; but before it reached the plain, it was almost reduced to dust. "Having proceeded about an hour (says he) we were astonished with a view more magnificent than imagination can conceive: hitherto the glaciers had scarcely answered my expectations, but now they far surpassed them. Nature had clad herself in all her terrors. Before us was a valley of ice 20 miles in extent, bounded by a circular glacier of pure unbroken snow, named *Taku*, which leads directly to the foot of Mount Blanc, and is surrounded by large conical rocks, terminating in sharp points like the towers of an ancient fortification; to the right rose a range of magnificent peaks, their intervals filled with glaciers; and far above the rest, the magnificent summit of Mount Blanc, his highest point obscured with clouds. He appeared of such immense magnitude, that, at his presence, the circumjacent mountains, however gigantic, seemed to shrink before him, and *hide their diminished heads.* In half an hour we arrived at the moraine, which form a boundary of the valley, crossed it, and proceeded upon a body of ice about three quarters of a mile broad. Here the ice was more even and free from chasms than in the great valley. We then passed a second moraine, and beyond that another mass of ice to a third moraine: descending from thence we came upon the last ridge of ice, broader considerably than the two former, and full of

211

Vol. 2

large chasms: it is separated from the rock only by a very narrow moraine. These moraines contain great quantities of crystal." They continued to ascend the valley of ice, the scene constantly increasing in magnificence and horror; and having walked about 3 miles on the ice, they arrived at last at the foot of the eminence named *Couvercle*, where they were obliged to quit the ice. The doing this was extremely dangerous, and at one place very tremendous. It was a bulging smooth rock, with a precipice of considerable depth terminated by a vast crevice in the ice, which seemed to stop all further progress: a small hollow in the middle, however, afforded room for one foot; and having fixed this, they sprung over to the other side, being helped and directed by the guides who went over first. Having gained the top of the *Couvercle*, they had a view of three of the glaciers, viz. that of *Talsfre* to the left, *L'Estaut* in front, and *Takul* on the right; all uniting in that great one called the *Glacier de Bois*. The *Couvercle* itself is a most extraordinary rock, having the appearance of a large irregular building with many sides; the substance of which is granite. Having reached the top, they were surprised with a thunder-storm, from whence they took shelter under an impending rock. The view was exceedingly magnificent; the glaciers appearing like a rugged expanse of frozen sea bounded by gigantic rocks, and terminated by Mount Blanc. A single rock appeared of a triangular figure covered with Alpine plants; and which, by reason of its contrast with the rugged and snowy mountains in the neighbourhood, has obtained the name of the *Garden*.—During this, as well as other excursions among the Alps, Mr Coxe had occasion to observe that the colour of the sky was of a much deeper blue than in the lower regions.

II. GLACIERS, THE UPPER, may be subdivided into those which cover the summits, and those which extend along the sides of the Alps. Those on the very summit, however, though they have the appearance of ice, are not so in reality, but consist entirely of snow hardened by the extreme cold. M. Saussure found that which covered the top of Mount Blanc to be penetrable, though with difficulty, by a stick; but below this hard crust was a soft snow without coherence. The sides are covered with a mixture of ice and snow; by reason of the superior power of the summer sun to dissolve the snow, which afterwards congeals into hard ice.

(2.) GLACIERS, CONJECTURES RESPECTING THE FORMATION OF THE. Several conjectures have been made concerning the formation of these extraordinary bodies of ice. Mr Coxe agrees with M. Gruner in opinion, that they are produced by the continual dissolution of the snow in summer, and its congelation by the succeeding frosts. Hence, on the summits of the mountains where the sun has very little power, the glacier is soft, and contains no ice: as we descend the mountains the consistence becomes firmer, because there is a considerable mixture of snow-water, the congelation of which augments the hardness; and in the valleys, the glacier is hardest of all, because the portion of water is there much superior to that of the snow. Hence it seems plain, that the glaciers derive their

origin from the melting of the snow or parts of the mountains, and the congeal water as it advances: and to this cause I add the quantity of snow which often into the valleys and congeals along with

(3.) GLACIERS, OPINIONS RESPECTING INCREASE, OR DIMINUTION OF THE. The question concerning the glaciers nature, namely, Whether they are to be considered in a state of increase or diminution? Mr Coxe is of opinion, that they occasionally increase; in proof of which he adduces the following observations. "The borders of the Montanvert are mostly skirted with trees; at its base a vast arch of ice rises to near height; under which the river Aar flows with considerable force, and in a large body. As we approached the ice, we passed wood of firs: those trees which stand at a small distance from the arch are about 80 feet high, and are undoubtedly of a very great age. These and the glacier the trees are of a large size as is evident from their texture and is Others, still smaller, have been overgrown and enveloped in the ice: there seems to be a regular gradation in the age of these trees from the largest which are standing to those that lie prostrate."—Hence our author concludes that the glacier once extended as far as the small firs; but that upon its gradual retreat a number of trees shot up on the spot occupied; since which time the ice has advanced, and overturned the last grown trees they had attained to any considerable size. This he thinks also confirmed by the fact: "Large stones of granite are visible at a small distance from the extremities of the glacier. These stones have certainly fallen from the mountains upon the ice; have been carried on by its progress; and have tumbled into the valley upon the dissolution or sinking of the rocks which supported them. These stones, which are called *Moraine*, form a kind of border along the foot of the valley of ice, and have been carried forward by the glacier in its advance; and extend even to the place occupied by the pines." In opposition to those who maintain that there is a constant accumulation of ice in the Alpine regions, our author makes the following remarks: 1. Between the years 1785 the glacier of Grindelvald had advanced to such a degree, that the spot which it occupied in the former year, was now 1000 paces from that occupied by it in the year 1785 the *Murailles de Glace*, which had been described as forming the border of the valley of Bosson, no longer existed; and you could see the parts which were then occupied by the glacier of Montanvert. Still, however, it may be urged, that these changes only take place in the valleys where the power of the sun is not so great; and that from thence we cannot form an adequate idea of what passes in the high regions, where in all probability more ice than can be dissolved. In support of this it is alleged, that the cold produced by the melting of ice already formed ought to augment it more; and that within the memory of

many places have been covered with were not so before. To these arguments, Mr Coxe replies, that the causes, with the ice in the upper regions, are more powerful than the cold which tends to augment these are, 1. Rain or snow; which falls on the lower glaciers, thaw the ice, infiltrate on its surface, excavate channels, in ways tend to diminish its quantity. Melting, which takes place even from the heat of the ice itself, acts still more powerfully; and is not confined to any particular place. The falling of the snow and ice; both comes gradually from the clouds, and descends from the mountains in great masses, he natives AVALANCHES. When these descend into milder regions, though they may resist the influence of the sun and winds, yet they generally dissolve. They are common in the upper glaciers, though they descend upon the lower, while the descent of snow from the clouds, which takes place in the lower, contributes very little to the mass. 4. All the lower glaciers of ice rest on an inclined plane, are gradually undermined by torrents which are flowing from the upper glaciers, as well as their own lowermost surface. Their foundation thus constantly diminishing, the lower is carried imperceptibly forward into the fields, where an end is necessarily put to it by the heat of the sun. Hence the reason of that strange phenomenon observed by Mr Coxe, that with one hand such ripe corn, and with the other the cold descent of the glacier is demonstrably seen overturned by it, and the moraine preserved at the bottom of the lower glacier. The heat of the sun is an evident cause of the diminution of the glaciers. To this Mr Coxe adds another cause less generally known, viz. winds which blow by night as well as by day in the upper and lower glaciers. The arm winds (says he) are during summer in those parts, that I never crossed a mountain without feeling in some particular positions similar to the air of a hot bath." 6. As the temperature of the earth in the high mountains, where it is not exposed to the piercing of the atmosphere, is found to have a temperature always above the freezing point. As the thickness of the superincumbent ice, is in the present case abundantly sufficient to prevent the access of the atmosphere, it is that the lower surface of it must, by being in contact with the earth, continually decay. With the other argument drawn from the case of the ice in some places, Mr Coxe denies it; but insists, that there is no connection of the whole, but that if it is in some places, it diminishes in others; and in union in this respect was confirmed by frequent the mountains.

**GLACIOUS.** *adj.* [*glacio*, Latin.] Icy; replete.—Although exhaled and placed in various situations, it will crystallize and shoot into various bodies. *Brown's Vulg. Err.*

(1.) \* **GLACIS.** *n. f.* [French.] In fortification, a sloping bank. It is more especially taken for that which runneth from the parapet of the covered way to the level on the side of the field. *Harris.*

(2.) **GLACIS**, in building, an easy insensible slope or declivity. The descent of the glacis is less steep than that of the talus. In gardening, a descent sometimes begins in talus, and ends in glacis. The glacis of the corniche, is an easy imperceptible slope in the cymatorium, to promote the descent and draining off the rain water.

\* **GLAD.** *adj.* [*glad*, Saxon; *glad*, Danish.]

1. Cheerful; gay; in a state of hilarity.—They blessed the king, and went into their tents joyful and glad of heart. *1 Kings* viii. 66.—

*Glad* we return'd up to the coasts of light.

*Milton.*

The wily adder blithe and glad. *Milton.*

Thither they

Hasted with glad precipitance. *Milton.*

2. Wearing a gay appearance; fertile; bright; showy.—The wilderness and the solitary place shall be glad for them, and the desert shall rejoice and blossom as the rose. *Is.* xxxv.—

Then first adorn'd

With their bright luminaries, that set and rose,  
*Glad* Evening and glad Morn crown'd the fourth day. *Milton.*

3. Pleased; elevated with joy. It has generally of, sometimes *at* or *with* before the cause of gladness: perhaps *of* is most proper, when the cause of joy is something gained or possessed; and *at* or *with*, when it is some accident befallen himself or another.—I am glad to see your worship. *Shak. Hen.* IV.—He hath an uncle in Messia will be very much glad of it. *Shak. Much Ado.*—He that is glad at calamities shall not be unpunished. *Prov.*—

He glad

Of her attention, gain'd with serpent tongue,  
His fraudulent temptation thus began. *Milton.*  
—If he be my enemy, let him triumph; if he be my friend, he will be glad of my repentance. *Dryden's Fables.*—

The gaping wound gush'd out a crimson flood;

The Trojan, glad with sight of hostile blood,  
His fauchion drew. *Dryden's En.*

Glad of a quarrel strait I clap the door. *Pope.*

4. Pleading; exhilarating.—

Her conversation

More glad to me than to a miser money is. *Sid.*

5. Expressing gladness.—

Hark! a glad voice the lonely desert cheers:  
Prepare the way, a God, a God appears!

*Pope.*

6. It is used in a familiar sense, approaching to ludicrousness.—I would be glad to learn from those who pronounce that the human soul always thinks, how they know it. *Locke.*

\* **To GLAD.** *v. a.* [from the adjective.] To make glad; to cheer; to exhilarate.—

He saw rich Nestor thaws release the rigour  
Of th' icy North; from frost-bound Atlas hands  
His adamantine fetters fall: green vigour  
Gladding the Scythian rocks, and Lybian sands.

*Crashaw.*

*It glads me*

To see so many virtues thus united,  
To restore justice and dethrone oppression.

*Orway.*

Each drinks the juice that *glads* the heart of  
man.

*Pope.*

If justice Phillips' costly head  
Some frigid rhymes disburles,

They shall like Persian tales be read,

And *glad* both babes and nurses.

*Swift.*

GLADBACH, or } a town of Germany, in the  
GLADBECK, } ci-devant duchy of Juliers,  
now included in the French republic, and dept.  
of the Roer, 16 miles N. of Juliers.

\* To GLADDEN. *v. a.* [from *glad.*] To cheer;  
to delight; to make glad; to exhilarate.—

Oh, he was all made up of love and charms!  
Delight of every eye! When he appear'd,  
A secret pleasure *gladden'd* all that saw him.

*Addison's Cato.*

—A kind of vital heat in the soul cheers and *glad-*  
*dens* her, when she does not attend to it. *Specl.*

\* GLADDER. *n. f.* [from *glad.*] One that  
makes glad; one that gladdens; one that exhilarates.—

Thou *gladder* of the mount of Cytheron,

Have pity, goddess.

*Dryden.*

\* GLADE. *n. f.* [from *gladan*, Sax. to be hot, or  
to shine; whence the Danish *glad* and the obsolete  
English *gled*, a red hot coal.] A lawn or open-  
ing in a wood. *Lucas.* It is taken for an avenue  
through a wood, whether open or shaded, and  
has therefore epithets of opposite meaning.—

So flam'd his eyes with rage and rancorous  
ire;

But far within, as in a hollow *glade*,

Those glaring lamps were set, that made a  
dreadful shade.

*Spenser.*

Lo where they sp'd, how in a gloomy *glade*,  
The lion sleeping lay in secret shade.

*Hubb.*

O might I here

In solitude live savage, in some *glade*,

Obscur'd, where highest woods, impenetrable  
To star or sun-light, spread their umbrage  
broad,

And brown as evening.

*Milt. Par. Lost.*

When any, favour'd of high Jove,  
Chances to pass through this adventurous *glade*,  
Swift as a sparkle of a glancing star  
I shoot from heav'n to give him safe convoy.

*Milton.*

For noonday's heat are closer harbours made,  
And for fresh evening air the op'net *glade*.

*Dryden.*

There, interspers'd in lawns and opening  
*glades*,

Thin trees arise that shun each other's shades.

*Pope.*

By the heroes armed shades,  
Glitt'ring thro' the gloomy *glades*;  
By the youths that dy'd for love,  
Wand'ring in the myrtle grove;  
Restore, restore Eurydice to life!

Oh! take the husband, or restore the wife!

*Pope.*

She smil'd, array'd,  
With all the charms of sun-shine, stream and  
*glade*,

New dress and blooming as a bridal maid.

*Harte.*

GLADENBACH, a town of Germa-  
ny, in the province of Hesse, 8 miles W. of Marburg, a  
Gießen.

\* GLADEN. } *n. f.* [from *gladius*, L.]  
\* GLADER. } Swordgrais: a genus  
of plants that rise with a broad blade like  
*gladius*.

\* GLADFULNESS. *n. f.* [*glad*, a  
Joy; gladness. Obsolete.—

And there him rests in riotous fun  
Of all his *gladfulness*, and kingly.

(1.) \* GLADIATOR. *n. f.* [Latin  
Fr.] A swordplayer; a prizefighter.

Then whilst his foe each *gladiator*  
The atheist, looking on, enjoys the

Besides, in gratitude for such high  
Know I have vow'd two hundred g

*D.*

(2.) GLADIATORS, in antiquity, w  
who fought, generally in the arena at  
the entertainment of the people.

usually slaves, and fought out of necessity  
sometimes freemen adopted the pro-  
fession of prize fighters, for a livelihood. I  
borrowed this cruel diversion from the  
some suppose out of policy, the practice  
of gladiators tending to accustom them  
despite dangers and death.

(3.) GLADIATOR'S COMBATS, OR  
HISTORY OF. From the earliest times

we have any acquaintance in profane  
history had been the custom to sacrifice cap-  
tives of war, to the manes of the great

had died in the engagement: thus in  
the *Iliad*, lib. xxiii. sacrifices twelve

horses to the manes of Patroclus; and  
lib. xi. ver. 81, Æneas sends, captive

der, to be sacrificed at the funeral of  
his father.

In course of time they came  
to sacrifice slaves at the funerals of all per-  
sons of distinction: this was even esteem'd a ne-  
cessary part of the ceremony; but as it would have  
been barbarous to have massacred them,

they were appointed to fight with each  
other, and endeavour'd to save their own

lives, by killing their adversary. This seem'd for-  
tunate to human nature, because there was a possibili-  
ty of escaping death, by an exertion of skill and  
strength.

This occasion'd the profession of gladi-  
atorship to come an art: hence arose masters of  
the art, who taught their pupils, and

men learned to fight and exercise it.

These, whom the Latins call'd *Lanistæ*,  
taught young slaves to be trained up to this  
profession, whom they afterwards sold to such  
persons as had a passion to present the people with  
such spectacles.

These exhibitions were at first perform'd  
in the sepulchre of the deceased, or about  
the sepulchre; but were afterwards removed to  
the amphitheatres, and became ordin-  
ary spectacles.

The first show of gladiators,  
under the name of *gladiatorum*, was exhibited at  
Rome, by the emperor Nero, in the year of Ro-  
me 1000, or the year of our Lord 54, upon  
the death of his father, Nero.

At this occasion there were probably only  
three shows of gladiators. In 537, the three sons  
of the emperor Augustus, who had been

taught by their father, were made gladiators,  
and fought with each other, and with  
other gladiators, in the amphitheatre.

In 537, the three sons  
of the emperor Augustus, who had been

taught by their father, were made gladiators,  
and fought with each other, and with  
other gladiators, in the amphitheatre.

In 537, the three sons  
of the emperor Augustus, who had been

tained the people with the cruel pleasure of gladiators fight in the forum. Cæsar Africanus diverted his army at the siege of Carthage with a show of gladiators, which he gave in honour of his father and uncle, upon the reduction of Spain. In process of time, the Romans became so fond of these entertainments, that not only the heir of a noble and rich citizen lately deceased, but all the magistrates, presented the people with these shows of nature, to acquire popularity. The prætors, consuls, and, above all, the censors, made their court to the people, by giving them frequently with these fights; and these were sometimes the exhibitors of these shows. Suetonius mentions the case of Augustus, August. cap. 44. and Pliny, the *tales*, Epist. lib. vii. As for the emperors, they gratiate themselves with the populace, and were used with combats of gladiators on all occasions; and as these increased, the number of combatants increased likewise. Augustus, in his ædileship, diverted with 320 couple. Even Titus Vespasian gave a show of gladiators, wild beasts, and combats of sea-fights, which lasted 100 days. Trajan continued a solemnity of this kind for 23 days; during which time he brought out 1000 gladiators. Before this time, unbecomingly public, the number of gladiators was so great, that when the conspiracy of Catiline was discovered, the senate ordered them to be dispersed, and secured, lest they should be the disaffected party. See § 7.

**GLADIATORS, LAWS RESPECTING.** These combats became so common, and their consequence a variety of respects so dangerous, that Augustus made a law, that no person should exercise the office of gladiators within two years before he was a candidate for any office. Julius Cæsar made a law, that only a certain number of men should be in Rome at a time; and decreed, that only two shows of gladiators should be presented in a year, and never a couple of combatants in a show; and provided by an order of senate, that no person should have the privilege of gratifying himself with such a solemnity, unless he was a senator or a knight. They were also regulated by Nerva. Claudius restrained these combats to certain occasions; but he soon after undid what he had done, and private persons began to give these combats at pleasure as usual. Some carried this to such a degree of satisfaction so far as to have them at private feasts. And not slaves only, but free men would hire themselves to this infame profession. The master of the gladiators made them swear that they would fight to death; and if they failed, they were put to death either by the sword, or by clubs, whips, or the like. It was usual for the wretches to complain when they were wounded, or to ask for death or seek for it when they were overcome; but it was usual for the master to grant them life when they gave no request, but waited the fatal stroke with intrepidity. Augustus even decreed that death should always be granted them. From this it is evident that men the inhuman sport at length

spread to people of rank and condition; so that Augustus was obliged to issue a public edict that none of the senatorial order should become gladiators; and soon after he laid the same restraint on the knights: nevertheless, Nero is said to have brought upwards of 400 senators and 600 Roman knights upon the arena; though Lipsius takes both these numbers to be falsified, and reduces them to 40 senators and 60 knights: yet Domitian, that other monster of cruelty, refined upon Nero, exhibiting combats of women in the night-time. Constantine the Great, is said to have first prohibited the combats of gladiators in the East. At least he forbade those who were condemned to death for their crimes to be employed; there being an order still extant to the *præfectus prætorii*, rather to send them to work in the mines, dated at Berytus, in Phœnicia, the 1st of October 325. Honorius forbade them at Rome on occasion of the death of Telemachus, who, coming out of the East into Rome at the time of one of these spectacles, went down into the arena, and used all his endeavours to prevent the gladiators from continuing the sport; upon which the spectators of that carnage, fired with anger, stoned him to death. The practice was not, however, totally abolished in the West, before Theodoric, king of the Ostrogoths, put a stop to it entirely, A. D. 500.

(5.) **GLADIATORS, REGULATIONS, AND TERMS USED AMONG THEM.** Some time before the day of combat, the person who presented the people with the shows gave them notice thereof by programmes or bills, containing the names of the gladiators, and the marks whereby they were to be distinguished: for each had his several badge; which was most commonly a peacock's feather, as appears from the scholiast of Juvenal on the 158th verse of the 3d satire, and Turnebus Advers. lib. ii. cap. 8. They also gave notice how long the shows would last, and how many couples of gladiators there were; and it appears, from the 52d verse of the 7th satire of the 2d book of Horace, that they sometimes made representations of these things in painting, as is practised among us by those who have any thing to show at fairs. The day being come, they began the entertainment by bringing two kinds of weapons; the first were staves or wooden files, called *rudes*; and the second were effective weapons, as swords, poniards, &c. The first were called *arma lusoria*, or *exercitoria*; the second *decretoria*, as being given by decree or sentence of the prætor, or of him at whose expence the spectacle was exhibited. They began to fence or skirmish with the first, which was to be the prelude to the battle; and from these, when well warmed, at the sound of the trumpets they advanced to the second with which they fought naked. Then they were said *vertere arma*. The terms of striking were *petere* or *repetere*; of avoiding a blow, *exire*; and when one of the combatants received a remarkable wound, his adversary or the people cried out, *Habet* or *Illoc habet*. The first part of the engagement was called *ventilare*, *præludere*; and the second, *dimicare ad certum*, or *versus armis pugnare*: and some authors think, with much probability, that it is to these two kinds of combat that St Paul alludes in the passage 1 Cor. ix. 26, 27. "I fight, not

as one that beateth the air; but I keep my body under, and bring it into subjection." If the vanquished surrendered his arms, it was not in the victor's power to grant him life. The people during the time of the republic, and the prince or people during the time of the empire, were alone empowered to grant it. The reward of the conqueror was a branch of palm tree, and a sum of money, probably collected among the spectators: sometimes they gave him his congé, or dismissed him by putting one of the wooden files or *rudes* in his hand; and sometimes they even gave him his freedom, putting the pileus on his head. The sign or indication, whereby, the spectators showed that they granted the favour, was *premere pollicem*, which M. Dacier takes to be a clenching of the fingers of both hands between one another, and so holding the two thumbs upright close together; and, when they would have the combat finished and the vanquished slain, *verterunt pollicem*, they bent back the thumb; which we learn from Juvenal, Sat. iii. ver. 36. The gladiators challenged or defied each other, by showing the little finger; and, by extending this, or some other, during the combat, they owned themselves vanquished, and begged mercy from the people: *Vitti ostensam digiti veniam a populo postulabant*, says the old scholiast on Perlius.

(6.) GLADIATORS, VARIOUS KINDS OF. There were various kinds of gladiators, distinguished by their weapons, manner, and time of fighting, &c. as, The *andabata*, mentioned under *ANDABATÆ*: The *catervarii*, who always fought in troops or companies, number against number; or, according to others, who fought promiscuously, without any certain order: The *dimache*, who fought armed with two poniards, or swords, or with sword and dagger: The *effederii*, who fought in cars: The *ficules*, or *Cuararii*, who belonged to the emperor's company; and who, being more robust and dexterous than the rest, were frequently called for; and therefore named also *postulatitii*. Several other kinds are mentioned in the ancient authors.

(7.) GLADIATORS WAR, (*Ubi on Gladiatorum, or Spartacum*.) called also the *juvile war*, was a war which the Romans sustained about A. U. C. 680. Spartacus, Crinrus, and Oenomaus, having escaped, with other gladiators to the number of 74. out of the place where they had been kept at Capua, gathered together a body of slaves, put themselves at their head, rendered themselves masters of all Campania, and gained several victories over the Roman prætors. At length they were defeated in 682, at the extremity of Italy; having, in vain, attempted to pass over into Sicily. This war proved very formidable to the Romans. Cassius was not able to finish it: Pompey the great was forced to be sent as general.

(8.) GLADIATOR, THE DYING, a most valuable monument of ancient sculpture, long preserved in the palace of Chigi, but carried to Paris with the Laoccon, &c. in 1796. This gladiator after having received the mortal stroke, appears particularly careful *ut procumbat laonise*, "that he might fall honourably." He is seated in a reclining posture on the ground, and seems to have just strength sufficient to support himself on his

right arm; and in his expiring moment not abandon himself to grief and dejection, but is solicitous to maintain that firmness of attitude, which the gladiators valued on preserving in this last scene of distress no tokens of fear by his countenance, he sheds one tear. *Quis mediocris gladius quis vultum mutavit unquam? Quis non verum etiam decubuit turpiter?* says that part of his Tusculan, where he describes the astonishing firmness of those periclitators, notwithstanding his remaining have but a few moments to live. The spectators knew how to animate marble, at almost every expression of life.

GLADIATURE, *n. f.* the act of fighting with swords. *Abb.*

GLADIOLUS, CORN-FLAG: A monogynia order, belonging to the triandria class of plants; and in the natural method to the sixth order, *Eufate*. The corolla is partite, and ringent; the stamina ascending and bending upwards. There are 10 species, the most remarkable is,

GLADIOLUS COMMUNIS, the common corn-flag. It has a round, compressed, tubular long sword-shaped leaves; an erect stem 2 or 3 feet high; the top garnished with pretty large flowers of a red or white colour, each 6 petals. They appear in May and are succeeded by plenty of seed. The plants are very hardy, and will thrive in any soil or situation. They are propagated from the roots.

GLADKA, a sort of Russia, in the Caucasus, on the Maiva, 36 m. W.

\* GLADLY, *adv.* [from *gladus*]. With gayety; with merriment; with exultation.—

For his particular, I'll receive his sword, but not one follower. *Shak.*

—You are going to set us right; and vantage every body will gladly see you glory of. *Blount to Pope.*

GLADMORE, a town of Herts, n.

\* GLADNESS, *n. f.* [from *gladus*]. Joy; exultation.—

By such degrees the spreading joy  
In every heart, which fear had trod  
The standing streets with so narrow  
view,

That with less grief the perished the

(1.) GLADSMUIR, a parish of S. E. Lothian, erected in 1695, and contains between 5, and 6,000 acres of ground; 3000 are in tillage; above 500 sown in about 1,600 in pasture, and above 100 in wood. The air is pure, dry and healthy; the soil clayey, shallow and barren. Wheat, oats, and pease, are the chief productions; cabbages and potatoes, are also raised. The population in 1792, stated by the rev. G. Milton, in his report to Sir J. Sinclair, and had decreased 35 since 1755. There were 1400 of horses; of sheep 100, and of cattle 134. Mr GEORGE HERIOT, for

the celebrated Dr WILLIAM ROBERTSON born in this parish.

**OSMURIE**, one of the three villages in the parish, (N<sup>o</sup> 1.) each of which contained families in 1792. On the 21st July a violent storm burst upon the school, in which a tree, which was blown down, shattered the windows, and de- stroyed the roof; whereby two boys were killed, and several others with many of the others, much

**SOME**. *adj.* [from *glad.*] 1. Pleas'd; pleas'd.

Thou' the best angels to and fro descend,  
The best heaven in *gladsome* company.

*Fairy Queen.*  
A *gladsome* ghost in circling troops attend,  
Thy unwear'd eyes behold their friend.

*Dryden.*  
Joy; having an appearance of gayety.  
When they wak'd me with a sprightly lay;  
When heav'n they sung and *gladsome* day.

**DSOMEITY**. *adv.* [from *gladsome.*] Pleas'd and delight.

**DSOMENESS**. *n. f.* [from *gladsome.*] Pleas'dness; delight.

**GLASS**. *n. f.* [*glas*, Saxon, amber; *glaz*, glass; *glair*, Fr. *glareu*, Lat.] The name of an egg.—Take the *glair* of eggs, and wash it as short as water. *Peacocks on Draw-*  
*ing* kind of halbert. *Dict.*

**GLAZING**, (*γ* 1. *def.* 1.) is used as a varnish in painting. For this purpose it is made of a thick and common liquor of unctuous consistence, and commonly with a little brandy or spirit of wine, to make it work more freely, and with a lump of white wax to keep it body and prevent its cracking; and is spread over the picture or painting with a

**GLAZER**. *v. a.* [*glairer*, French; from *glair*.] To smear with the white of an egg.

**GLAZIER**, is still used by the bookbinders.

**GLAZING**, a SW. branch of Lake Miami, in the Western territory of the United States.

**GLAZING**, St Mary's River.

**GLAZING**, a town in Norfolk, SW.

**GLAZING BRIGGS**, or **GLANDFORD**, which last the rev. C. Cruttwell reckons (1792,) a town of Lincolnshire on the Angles, 20 miles N. of Lincoln, and 153 N. by road. It has a great trade in corn, coals, and skins. Lon. 0. 20. W. Lat. 40. 35 N.

**GLAMISS**, a parish of Scotland in the county of Perth, 12 miles long and from 1 to 3 broad. It is a level, lying in the middle of the valley of the Forth, on the N. side of Sidlaw hill; near which it is rocky and mountainous. The air is healthy. The soil is good, well cultivated, and fertile. The population, in 1783, and in 1801, was 11,000.

**GLAMISS**, was 2040, and had increased to 2755. The number of horses was 1190, and of black cattle 1190. There are 7 villages and some antiquities in the parish, and several quarries of excellent free stone

and slates. About 1000 acres of unarable ground are full of thriving plantations.

(2.) **GLAMISS**, an ancient village in the above parish, (N<sup>o</sup> 1.) 4 miles from Kirriemuir, containing about 500 souls in 1790. Near the manse there is an obelisk erected in memory of the murder of K. Malcolm II, in 1034, with several emblematical figures rudely carved on it, representing that bloody transaction.

(3.) **GLAMISS, CASTLE OF**, a very ancient structure in the above parish, the seat of the E. of Strathmore. It belonged originally to the Crown; but was given by K. Robert II, in 1372, to his favourite J. Lyon, who married his daughter. It has been since greatly enlarged.

(4.) **GLAMISS, NEW TOWN OF**, a village in the above parish, near Old Glamiss, (N<sup>o</sup> 2.) containing 140 inhabitants in 1790.

**GLAMORGANSHIRE**, a county of South Wales, said to have derived its name from a contraction of the Welsh words *Gwald Morgan*, or "the country of Morgan," and supposed to have been thus called from a prince of this part of the country, said to have been killed 800 years before the birth of our Saviour. Others derive the name from the British word *Mor*, which signifies the sea; this being a maritime county. It is bounded on the S. and part of the W. by the Bristol channel; on the NW. by Caermarthenshire; on the N. by Brecknockshire; and on the E. by Monmouthshire. It is 48 miles long from E. to W. 27 broad from N. to S. and 116 in circumference. It is divided into 10 hundreds, in which are one city, 7 market towns, 118 parishes about 10,000 houses, and 58,000 inhabitants. It is in the diocese of Llandaff. This county, in the time of the Romans, was part of the district inhabited by the Silures, and had several Roman stations. Thus **BOVERTON**, a few miles S. of Cowbridge, is supposed to be the **BOVIVM** of Antoninus; **NEATH** to be his *Nidum*; and **LOGHOR**, W. of Swansea, to be his *Leucarum*. The principal rivers of this county are the Rhymny, the Taff, the Ogmor, the Avon, the Cleddagh, and the Tawe. The air, in the S. part, towards the sea, is temperate; but the N. part, which is mountainous, is cold and piercing, full of thick woods, extremely barren, and thin of inhabitants. The mountains, however, feed herds of cattle, and send forth streams which add greatly to the fertility of the other parts of the county: they have likewise coal and lead ore. The S. part is so remarkably fertile, pleasant and populous, that it is generally styled the *Garden of Wales*; but it has no manufacture. This county was formerly full of castles, most of which are now decayed. It has many small harbours on the coast, for exporting coals in large quantities to England and Ireland; and provisions to England. It sends two members to parliament, one for the shire, and one for the borough of Cardiff, the capital.

**GLAMOUR**, or **GLAMER**, *n. f.* an old term of popular superstition in Scotland, denoting a kind of magical mist believed to be raised by fore-casters, and which clouded their spectators with visions of things which had no real existence, altered the appearance of those which really did exist, &c.—

The eastern nations have a similar superstition, as we may learn from the Arabian Nights Entertainments and other works of oriental fiction.

\* **GLANCE.** *n. f.* [*glantz*, German, glitter.]  
 1. A sudden shoot of light or splendour.—

His off'ring soon propitious fire from heav'n  
 Consum'd with nimble *glance*, and greatful  
 steam :

The other's not ; for his was not sincere.

*Milt. Par. Lost.*

2. A stroke or dart of the beam of sight.—The aspects which procure love are not gazings, but sudden *glances* and dartings of the eye. *Bacon's Nat. Hist.*—There are of those sort of beauties which last but for a moment ; some particularly of a violent passion, some graceful action, a smile, a *glance* of an eye, a disdainful look, and a look of gravity. *Dryden's Duff.*—

Boldly she look'd, like one of high degree :

Yet never seem'd to cast a *glance* on me ;

At which I inly joy'd, for, truth to say,

I felt an unknown awe, and some dismay. *Harte.*

3. A snatch of sight ; a quick view.—The ample mind takes a survey of several objects with one *glance*. *Watts.*

(1.) \* **To GLANCE.** *v. a.* [from the noun.] To move nimbly ; to shoot obliquely.—

*Glancing* an eye of pity on his losses,

Enough to press a royal merchant down. *Shak.*

(2.) \* **To GLANCE.** *v. n.* 1. To shoot a sudden ray of splendour.—

He double blows about him fiercely laid,

That *glancing* fire out of the iron play'd,

As sparkles from the anvil use,

When heavy hammers on the wedge are sway'd.

*Spenser.*

When through the gloom the *glancing* lightnings fly,

Heavy the rattling thunders roll on high. *Rowe.*

2. To fly off in an oblique direction.—

He has a little gall'd me, I confess ;

But as the jest did *glance* away from me,

'Tis ten to one it maim'd you two outright.

*Shakespeare.*

3. To strike in an oblique direction.—

Through Paris' shield the forceful weapon went,

His corslet pierces, and his garment rends,

And *glancing* downwards near his flank descends.

*Pope.*

4. To view with a quick cast of the eye ; to play the eye.—

O' th' sudden up they rise and dance,

Then sit again, and sigh and *glance* ;

Then dance again, and kiss. *Suckling.*

Mighty dulness crown'd,

Shall take through Grub-street her triumphant round ;

And her Parnassus *glancing* o'er at once,

Behold a hundred sons, and each a dunce.

*Pope's Dunciad.*

5. To censure by oblique hints.—

How can'st thou thus, for shame, Titania,

*Glance* at my credit with Hippolita,

Knowing I know thy love to Theseus. *Shak.*

—Some men *glance* and dart at others, by justifying themselves by negatives ; as to say, this I do

not. *Bacon.*—I have never *glanced* up designed procession of his holiness and ants, notwithstanding it might have after to many ludicrous speculations. *A.* had written verses, wherein he *glanced* reverend doctor, famous for dulness. *S.*

\* **GLANCINGLY.** *adv.* [from *glance*] oblique broken manner ; transiently.—Hawkins hath done something in this brokenly and *glancingly*, intending the course of his own voyage. *Hake-will on*

(1.) \* **GLAND.** *n. f.* [*glans*, Lat. French.]—All the *glands* of a human body are reduced to two sorts, viz. conglobate and merate. A conglobate *gland* is a little body, wrapt up in a fine skin, by which it is separated from all the other parts, only an artery and nerve to pass in, and give a vein and excretory canal to come out. The most important are the *glands* in the brain, the testis, and the testes. A conglomerate *gland* is composed of many little conglobate *glands*, all tied together and wrapt up in the common tunica albuginea. *Quincy.*—The abscesses begun in the body of the *glands*. *Wiseman.*—

The *glands*, which o'er the body  
 Fine complicated clues of nervous tissue  
 Involv'd and twisted with the arteries  
 The rapid motion of the blood obscure.

(2.) **GLANDS.** See ANATOMY, Ind.

(1.) \* **GLANDERS.** *n. f.* [from *gland*] a disease of the horse, is the running of corrupt matter from the nose, which differs in colour according to the degree of malignity, being white, yellow, or black. *Farrier's Dict.*—His horse is pestered with the *glanders*, and like to mose in the clout.

(2.) **GLANDERS.** See FARRIERY, Ind.  
**GLANDEVES**, a town of France, in the department of the Lower Alps, formerly flourishing, but almost deserted, on account of the overflowings of the Var.

**GLANDFORD BRIDGE.** See BRIDGE, Ind.  
**GLANDFORD**, N<sup>o</sup> 2.

\* **GLANDIFEROUS.** *adj.* [*glans*, Lat.] Bearing mast ; bearing acorns, or mast acorns.—The beech is of two sorts, and is distinguished among the *glandiferous* trees. *Mor.*

**GLANDORÉ**, a town of Ireland, in the county of Wick, with an excellent harbour, 3 miles W. and 6 W. of Galley Head. Between the town and Ros, the coast is high and bold, with two small coves : viz. Mellcove on the one side, and Cowcove on the other. Near the harbour is a small inlet ; and on the upper end a deep and narrow glin, called the *Leap*. Lon. 8, 56. W. 22. N.

**GLANDORP**, Matthias, M. D. a physician, born in 1595, at Cologne, in which city his father was a surgeon. After taking his degree at Padua, and visiting the principal universities, he settled at Bremen in 1618, where he practised physic and surgery with success, and made physician to the republic and to the bishop. He published at Bremen, 1. *Chirurgorum*, in 1619 ; 2. *Methodus in chirurgiâ*, in 1623 ; 3. *Tractatus de potestate affectu gratissimo*, in 1628 ; and 4. *De*

*fonticularum et Setonium referatam*, in which were republished, with his life pre- London, in 4to, 1729. He died young. **IDULÆ RENALES.** See ANATOMY, §

**INDULE.** *n. f.* [*glandula*, Lat. *glandule*, A small gland serving to the secretion of —Nature hath provided several *glandules* in this juice from the blood, and no less pair of channels to convey it into the which are called *ductus salivaris*. *Ruy.*

**INDULOSITY.** *n. f.* [from *glandulosus*.] tion of glands.—In the upper parts of e found certain white and oval *glandulo-*

**INDULOUS.** *adj.* [*glandulosus*, Latin ; r, French ; from *glandule*.] Pertaining nds ; subsisting in the glands ; having the glands.—The beaver's bags are not tef- parts official unto generation, but *glan-* stances, that hold the nature of emunc- *osum*.—Such constitutions must be sub- *andulous* tumours, and ruptures of the ks. *Arbutus*.

**GARIFF BAY,** a bay of Ireland, on the ie county of Cork.

**GOWRA,** a town of Ireland, in Cork.

**ANMIRE,** a river of Ireland, in Cork hich runs through a beautiful and fertile untry, somewhat hilly, and falls into the ork harbour.

**ANMIRE,** a town in Cork, seated on the r, (N<sup>o</sup> 1.) about 3 miles from Cork. autiful variety of extensive prospects.

**MORE,** a town of Ireland, in Kilken- es from Dublin.

**ORGA,** a town of Ireland, in Limeric. l. See ANATOMY, § 313, and 318.

**HAMMAR,** a town of Sweden, in the f Nericia, 7 miles NE. of Orebro.

**ANTON,** a town of Ireland, in Cork uniter, 135 miles from Dublin.

**ANTON,** a village of England, SE. of

**TL,** Joseph, a learned and ingenious, l and credulous, writer in the 17th cen- at Plymouth in 1636, and bred at Ox- was a great admirer of Mr Baxter, and a commonwealth. After the restora- blished *The vanity of dogmatizing ;*

F. R. S. and, taking orders in 1662, ed to the vicarage of Frome-Selwood shire. In 1662, he published his *Lux* in 1665, his *Scriptis Scientifica* ; and in *philosophical considerations touching the rbes and witchcraft*. In 1668, he pub- *lstra* ; or, *The progress and advance- vledge since the days of Aristotle*. He dished, *A seasonable recommendation of reason* ; and *Philosophia Pia*, or *A be religious temper and tendencies of the philosophy*. In 1678 he was made a of Worcester, and died in 1680.

**NVILLE,** Bartholomew, an English thor of the 14th century, commonly *domus Anglus*. He was a Francis- cended of the noble family of Suffolk, ed in the reign of Edward III. He

**PART. II.**

wrote a book on natural history, entitled *De Pro- prietatibus Rerum* : which was translated into Eng- lish by John de Trevisa, in 1398.

(2.) **GLANVILLE,** Ranulph, an English lawyer of the 12th century, who first collected the Eng- lish laws into one body.

**GLANWORTH,** and } two small towns of  
**GLANYFREHANE,** } Ireland in Cork.

**GLAPHOW,** a town of England, in Yorksh.

\* **GLARE.** *n. f.* [from the verb.] 1. Over- powering lustre ; splendour, such as dazzles the eye.—

The frame of burnish'd steel that cast a *glare*  
From far, and seem'd to thaw the freezing air.  
*Dryden's Fables.*

—I have grieved to see a person of quality gliding by me in her chair at two o'clock in the morning, and looking like a spectre amidst a *glare* of flam- beaux. *Guardian.*—

Here in a grotto, shelter'd close from air,  
And screen'd in shades from day's detested *glare*,  
She sighs for ever. *Pope.*

2. A fierce piercing look.—

About them round,  
A lion now he stalks with fiery *glare*. *Milton.*

(1.) \* **To GLARE.** *v. a.* [*glaren*, Dutch.] To shoot such splendour as the eye cannot bear.—

One spirit in them rul'd, and every eye  
*Glar'd* lightning, and shot forth pernicious fire  
Among th' accurst, that wither'd all their  
strength. *Milton.*

(2.) \* **To GLARE.** *v. n.* 1. To shine so as to dazzle the eyes.—After great light, if you come suddenly into the dark, or, contrariwise, out of the dark into a *glaring* light, the eye is dazzled for a time, and the sight confused. *Bacon.*—

His *glaring* eyes with anger's venom swell,  
And like the brand of foul Alecto flame.

*Fairfax.*  
—He is every where above conceits of epigram- matick wit, and gross hyperboles : he maintains majesty in the midst of plainness ; he shines, but *glares* not ; and is stately without ambition. *Dryden.*—

The court of Cacus stands reveal'd to fight ;  
The cavern *glares* with new admitted light.

*Dryden's Æneid.*  
Alas, thy dazzled eye  
Beholds this man in a false *glaring* light,  
Which conquest and success have thrown upon  
him. *Addison.*

2. To look with fierce piercing eyes.—  
Thou hast no speculation in those eyes,  
Which thou dost *glare* with. *Shak.*  
Look, how pale he *glares* ! *Shak.*  
Now friends no more, nor walking hand in  
hand ;  
But when they met they made a surly stand,  
And *glar'd*, like angry lions, as they pass'd,  
And with'd that ev'ry look might be their last.  
*Dryden's Fables.*

3. To shine ostentatiously, or with too much la- boured lustre.—The most *glaring* and notorious passages are none of the finest, or most correct. *Felton on the Classics.*

\* **GLAREOUS.** *adj.* [*glaireux*, Fr. *glareus*, Latin ; from *glair*.] Consisting of viscous tras- parent matter, like the white of an egg.

\* **GLARING**, *adj.* Applied to any thing notorious: as, a *glaring* crime.

(1.) **GLARIS**, or } one of the cantons of Switzerland, bounded on the E. by the county of the Grisons, and partly by that of Sargans; on the N. by Gaster, and lake Wahlenstadt; on the E. by the canton of Schwitz; and on the S. by part of the canton of Uri, and of the country of the Grisons. It is a mountainous country, almost entirely surrounded by the Alps.

(2.) **GLARIS**, or **GLARUS**, a city of the Helvetic republic, capital of the above canton, seated in a plain, at the foot of high craggy mountains. The streets are large, and the houses good. It has two churches, one in the middle of the town, and the other without, upon an eminence, in which there is a cavern, with grotesque figures formed by the water that drops therein. Even before the late revolution in 1798, (See **HELVETIC REPUBLIC**;) the government was so very democratic, that every youth of 16 years of age, had a vote in the General Assembly, which met annually on the first Sunday in May. The executive power was in a council of Regency, composed of 48 Protestants and 15 Catholics. The Calvinists and the Roman Catholics have divine service by turns in the same church. The former have increased greatly within these two centuries. It is seated on the Linth, 32 miles E. of Lucerne, and 32. SE. of Zurich. Lon. 9. 11. E. Lat. 46. 58. N.

**GLASCOTE**, a town of Warwickshire, on the S. side of the Anker, opposite to Tamworth.

(1.) **GLASENDORF**, a town of Bohemia, in Konigingratz; 6 miles NW. of Trautenau.

(2.) **GLASENDORF**, a town of Silesia, in Neisse, 10½ miles SW. of Patzschkau.

**GLASER**, Christopher, apothecary to Lewis XIV, was author of a celebrated treatise on Chemistry, which was translated into English and German. He died in 1679.

**GLASFORD**, a parish of Scotland, in Lanarkshire, 8 miles long, and 2 broad at an average, but the breadth is very unequal. The soil is partly strong clay, in other parts mossy, and in others light loam, and remarkably stony, but the stones add to its fertility. Husbandry is very little improved, though the E. part of the parish is inclosed. The population in 1792, stated by the rev. Hugh Mitchell, in his report to Sir J. Sinclair, was 788, and had increased 229 since 1755. That clergyman has since resigned his charge, from scruples of conscience, yet without joining any other sect; and has published his reasons in a pamphlet, bearing the singular title of *An Apology for Apostacy*. There are 3 villages in the parish, which carry on linen and cotton manufactures.

(1, 1.) **GLASGOW**, a large and beautiful city of Scotland in Lanarkshire, on the N. bank of the Clyde; justly esteemed the 2d in the kingdom. The name in the Gaelic language signifies a *gray smith*; whence it has been supposed that some spot in the most ancient part of the city was originally the residence of some blacksmith, who had become so eminent in his profession that the place went by his name. The most ancient part of the city stands on a rising ground. The rest of it is built chiefly upon a plain, bounded on the S. by

the Clyde, and on the N. by a gentle hills lying in a parallel direction with the river. The streets are all clean and well paved; several of them intersecting each other at right angles, produce a very agreeable effect. The 4 principal streets cross one another, and divide the city nearly into 4 equal parts; and the distance from the cross, the centre of intersection, to the extremities, is of great magnificence. The houses, of 4 or 5 floors in height, are built of hewn stone, and generally in an exceeding good taste, and are all of them elegant. The manufacturing houses, the great influx of people, for carrying on the manufactures, the means and encouragement which they afford to population, and the wealth thence derived to individuals, as well as accruing to the community, have all tended lately to increase the grandeur of the city, and the elegance of its buildings. Glasgow lies 10 miles SE. of Dunbarton, 44 W. of Edinburgh, and 60 SW. of Perth. Lon. 4. 55. 51' 32" N.

(2.) **GLASGOW BRIDGE**, QUAY, &c. There are two bridges over the Clyde. The Old Bridge, built about 400 years ago, by Albin, but since repaired and partly rebuilt, consists of 7 arches; and connects the suburb of Glasgow on the opposite side of the river, with the city. The other is the New Bridge, which is built in a very elegant manner. It is 500 feet long, and 12 feet wide; with a commodious road for foot passengers, 5 feet broad on each side, raised above the level of the river, and paved with free stone. It has 7 arches, the faces of which are wrought in a rustic manner, with a strong block cornice above. It was begun in 1668, and finished in 1772.

On the banks of the river eastward, is the Greenock, appropriated to the use of the inhabitants, for the conveniences for washing and drying linen. The streets are all paved with flag stones, and are very agreeable and extensive walks for recreation. On the S. side of the town, westward of the Broomie law, where the Quay is situated, the river here an average of several miles distance, was so shallow, and obstructed by shoals, as to admit only of small boats from Greenock, Port-Glasgow, and the islands; but of late it has been cleared and deepened, so as to admit ships of considerable burthen.

(3.) **GLASGOW CHURCHES**. The Cathedral or High Church, is a magnificent building, and is situated greatly to its advantage, as it is higher than any part of the city. The tower is founded upon 4 large massy pillars, 12 feet each in circumference. It is 25½ feet high within; and is surrounded by a balustrade, in which rises an octangular spire terminating in a lantern. The tower upon the west end is not on the same level, but appears not to have been built, though it is covered over with lead. In the tower is a very large bell 11 feet 4 inches in diameter. The principal entry was from the west; it is 11 feet broad at the base, and 17 feet in height. The west end of the choir is appropriated to the place of divine worship; and is divided from the remaining part by a stone partition, which is closed by another stone wall parting it into a nave. It is impossible to form an adequate idea of the awful solemnity of the place, occasi-

stiffness of the roof and the range of pillars by which the whole is supported. The nave of the church rises 4 steps higher than the choir; and on the W. side stood the organ loft, formerly ornamented with a variety of figures, but now destroyed. The pillars are elegantly executed. The organ one in the centre is 19 feet high. At the ends of the choir are flights of steps upon each side, leading into passages which were formerly the principal entrances to the burying vault immediately under the nave. It is now used as a parish church for the Baron; and is full of pillars, some of which are very massive, which support the arched roof; and is very uncomfortable for devotion. The space under the altar and vestry, now used as a place by the heritors, was formerly employed for keeping relics; and indeed, from the manner in which this place is finished, it evidently was not destined for common use. It is the monument of St Kentigern, with his effigy in a recumbent posture. The whole length of the cathedral within the walls is 284 feet, its breadth 65; the height of the choir, from the floor to the canopy, 90 feet; that of the nave, 110; that of the middle tower, 220 feet. This church was begun by John Achais, (See § 7.) and continued by succeeding bishops, till it was finished in the manner in which it now stands, was a church for which the wealth of the see of Glasgow was not sufficient; so that they were obliged to have recourse to all the churches of Scotland for alms to it. This venerable edifice was in danger of falling a victim to popular fury in 1578; and its preservation to the spirit and good sense of the tradesmen, who, upon hearing the drum for collecting the workmen appointed to demolish it, flew to arms, and declared that no man who pulled down a single stone should be buried under it. Near the cathedral are the ruins of the bishop's palace or castle, enclosed with a high wall of hewn stone by James I.; and the great tower built by Abp. James in 1426. *St Andrew's Church* was begun in 1163, and finished in 1736. It is the finest specimen of modern architecture in the city. It is 110 feet long, 60 wide, and 170 high. Besides the cathedral, which contains 3 congregations, there are 4 churches in the establishment. Their names are the Inner and Outer High Churches; the North Church, St Enoch's, the College church, the Horn, Tron and Wynd. There are also several private chapels, a Highland church, several meeting-houses, and others for sectaries of various denominations.

**GLASGOW, COLLEGE OF.** The front of the building extends along the E. side of the high street, and is upwards of 330 feet long. The gate of the entrance is decorated with rustics, and over the door is the king's arms. The building consists of several principal courts or squares. The first is 280 feet long and 44 broad. The W. side is elevated by 10 stone pillars, on which are placed pilasters supporting the Doric entablature, and ornamented with arches forming a piazza. The spire is on the E. side, is 135 feet high, and has a good clock. Under this is the gateway into the inner and largest court, which is 103 feet long

and 79 broad. Over the entry, in a niche, is a statue of Mr Zacharias Boyd, who was a benefactor to the university. (See *Boyd*.) On the E. side of the court is a narrow passage leading into a handsome terrace walk, gravelled, 122 feet long by 24 feet broad. On the S. side of the walk stands the library; a very neat edifice, well constructed, and containing a very valuable collection of books. Underneath are preserved in cases all the Roman inscriptions found on Graham's Dike, together with altars and other antiquities collected from different parts of Scotland.—Adjoining, there is an observatory, well furnished with astronomical instruments. The college also possesses, by bequest, the late Dr Hunter's famous anatomical preparations, library, and museum: And in the department of natural philosophy, it is furnished with an apparatus which is universally acknowledged to be the most extensive and useful in Britain, and which owes its perfection to the liberality and unremitting labour of Mr Anderson the late professor of that science.

(5.) **GLASGOW, CONSTITUTION AND GOVERNMENT OF.** In 1711, the constitution of the burgh, established in 1690, (See § 7.) underwent some alterations; and in 1748, another set was adopted, and confirmed by the convention of royal burghs. By it the government of the city is vested in a provost and 3 bailies, a dean of guild, deacon convener, treasurer, master of works, 13 merchant and 12 trades councillors. The provost and two of the bailies must be elected from the merchants, and the other bailie from the trades. The provost is styled *lord provost*. He is lord of the police, president of the community, and *ex officio* a justice of the peace for both the burgh and county. The bailie court is held every Friday. The trades consist of 14 incorporations.

(6.) **GLASGOW, GRAMMAR SCHOOL OF.** The grammar school is situated on the NW. side of the town, and was built in 1787. It is a very handsome building, containing a large hall, and six airy commodious teaching rooms, where above 300 scholars are taught.

(7.) **GLASGOW, HISTORY OF.** Of the origin of this city there are no authentic records. So early as A. D. 560, a bishopric is said to have been founded here by St KENTIGERN, the grandson of Loth king of the Picts; but in what state the town then was, is altogether uncertain. Most probably the priests and disciples who attended St Kentigern would contribute considerably towards its advancement. His immediate successors were Baldred and Conwal. The first established a religious house at Inchinna; the second went into Lothian to preach to the Saxons; and both were ranked as saints in the Roman kalendar, Baldred on the 6th of March 608, and Conwal on the 18th of May 612. From this time we have no distinct accounts concerning the city or bishopric of Glasgow, till 1115, when David I. king of Scots attempted to recover the people from the gross barbarity into which they had fallen, and restored to the church those lands of which she had been robbed. From 1116 to the reformation, the records of the bishopric are tolerably complete. The most remarkable particulars they contain are the following. In 1136, John Achais, appointed by

of Glasgow by David I. built and adorned a part of the cathedral, which he consecrated on the 9th of July. He also divided the diocese into the two archdeanries of Glasgow and Teviotdale. In 1174, Joceline, abbot of Melrose, was elected bishop, and made an addition to the cathedral. He also procured charters from K. William I. erecting Glasgow into a royal borough, and appointing a fair to be held there annually for 8 days. In 1335, John Lindsay, bishop of Glasgow, was killed in an engagement at sea with the English, as he was returning home from Flanders. His successor, William Rae, built the stone bridge over the Clyde. In the time of Matthew Glendonig, who was elected bishop in 1387, the great spire of the church, which had been built of wood, was consumed by lightning. His successor, William Lauder, laid the foundation of the vestry of the cathedral, and built the great tower of stone as far as the first battlement. The great tower of the episcopal palace was founded about 1437, on which bishop Cameron expended a great deal of money. In 1447, William Turnbull, of the family of Bedruic in Roxburghshire, was chosen bishop. He obtained from K. James II. in 1450, a charter erecting the town and the patrimony of the bishops into a regality. He also procured a bull from pope Nicholas V. for erecting an university within the city, which contributed more than any thing that had been formerly done towards the enlargement of the town. The population increased exceedingly; the high street, from the convent of the Black friars, to where the cross is now placed, was soon filled up; the ancient road which led to the common being too distant from the new inhabitants, the Gallow-gate began to be built. Soon after, the collegiate church of St Mary (now the Tron church) being founded by the citizens, occasioned the Tron-gate street to be carried westward as far as the church. The rest of the city increased gradually towards the bridge, by the building of the Saltmarket. The borough roads, and the cattle that grazed on the commons, were now found insufficient to maintain the increased number of inhabitants; for which reason a greater degree of attention was paid to the fishing in the river. Many poor people subsisted by this occupation; they were incorporated into a society; and, that they might be at hand to prosecute their business, they built a considerable part of the street then called *Fishers gate*, now *bridge-gate*. Notwithstanding all this, Glasgow did not for a long time attain the rank among the other towns of Scotland which it now holds, though it was erected into an arch-bishopric in 1582. In 1606, it held only the 11th place among them, as appears by Q. Mary's taxation. In 1611, a very ample charter was granted by K. James VI; and in 1626, K. Charles I. granted another. During the civil wars, Glasgow suffered severely. To the nation's attending intestine discord, were added a pestilence and famine; and to complete its misfortune, the fire broke out on the 12th June, 1644, and consumed a third part of the city, constituting a great loss. The loss was estimated at 200,000 l. By the charter given to Bp. Turnbull, the city had been deprived of the privilege of electing a mayor and aldermen, when

was thenceforth exercised by the bishop; the reformation, however, this power being ceded by the citizens, the bishop, the common, and others. The idea that the bishop's borough, and not a royal free town, gave occasion to this unsettled manner of electing the magistracy. But on the 4th of July, 1560, it was declared free by a charter of W. Mary; and, in confirmation, it was in an act of parliament, June 14th, that they have power to elect their own magistrates and freely as Edinburgh or any other royal borough. (See § 5.) By the assize of boroughs in 1695, we find Glasgow reckoned the 1st city in Scotland in point of wealth, which it still continues to hold. But the prosperity of Glasgow, may be ascribed to the union, by which the American trade was opened to the inhabitants. Their assiduous attention to that trade ever since has greatly contributed to raise the city to the pitch of affluence which it at present enjoys. The city is greatly enlarged; and as the inhabitation is free of the inconvenience that attended of a sufficiency of water in the river for their commerce, the magistrates purchased some lands on the south side of the city for that purpose; and so expeditious were they in their harbour, and rearing their town, that a baillie was appointed for the government of GLASGOW; which is now a very considerable city, and lies 21 miles higher the mouth of the river than Glasgow. (See § VI.) In 1725, a great fire, upon the extension of the malt land, wherein 20 persons were killed; and the magistrates of Glasgow were sent to Edinburgh, but acquitted. Bannet, who commanded the troops, and condemned for murder; but afterwards pardoned and promoted. This affair cost 9000 l. During the rebellion in 1745, the city of Glasgow raised two battalions of men for the service of government. The rebels, however, had like to have cost them dear; for, in their journey south, they resolved to burn the city; which would probably have been done, had not Mr Cameron of Lochness, in that case, to withhold his contribution, however, was laid on, and about 14,000 l. of which they recovered upon applying to parliament. About 1750, a considerable change of manners took place among the inhabitants of Glasgow. The frugality and parsimony, had been their general character. But now, when an extensive commerce created manufactures had produced wealth, and of trade and improvement were adopted, people would formerly have been deemed madmen if they had undertaken; a new mode of living, dress, building, and an all-magnificent theatre, &c. were introduced. In 1767, the merchants having proposed a small canal from the firth of Forth to the Clyde, for the conveniency of their trade, several gentlemen, and throughout the kingdom, were of opinion that this canal should be erected.

per scale, than the one originally projected was accordingly obtained, and the cut in the manner described under the ANAL, § 9, and FORTH, § 4. In 1771, it was obtained for making and maintaining the canal and waggon-way from the collieries of Old and New Monkland, of Glasgow. On the 12th March, 1782, a great part of the city was laid under water, the inhabitants were taken out of their houses the Clyde having risen 20 feet above its level, and 18 inches higher than ever it had been to do before.

**GLASGOW, HOSPITALS AND CHARITABLE INSTITUTIONS IN.** 1. The Town's Hospital is a building, consisting of two wings and a tower: the length 156 feet, the breadth of the wings 50 feet, and the depth of the wings 68 feet; and the building is an infirmary 127 feet long and 12 feet broad, the ascent to which is by a flight of 25 steps. The town's hospital was opened for the reception of the poor on the 15th Nov. 1791. Its revenue, in 1791, was 2400 l. 11 s. 5 d. from the general sessions, the town council, and merchants houses, the interest of lands arising from donations; money received from manufactures, and from boarders; and an annual sum made upon the inhabitants. The number of people, maintained in this hospital, was 350; besides 115 children nursed and 145 families supplied with meal and bread. 2. *Muirhead's*, or *St Nicholas's* Hospital was originally appointed to subsist 12 old men and 12 boys; but its revenues have been so diminished, that no more of them now remains but an alms-house of 12 old men and 12 boys. The income is about 1500 l. which is distributed in 1000 s. to old people, and in 500 s. to children. 3. *Hutcheson's* Hospital was founded and endowed in 1639, by James Hutcheson of Lamb-hill, notary public, and his brother, for the relief of 12 old men and 12 boys. The income is about 1500 l. which is distributed in 1000 s. to old people, and in 500 s. to children. 4. *The Merchant's* Hospital is a capital of above 17,000 l. and a revenue of above 1000 l. of which it distributes to 30 other charities about 800 l. yearly. *St Andrew's* Hospital has a revenue of above 1000 l. for the education of boys, was founded by George Wilson, who, in 1778, left that sum for that purpose. This fund is now concentrated, and gives education and clothing to 40 boys, each of whom continues 4 years, before they are admitted annually. There are also several other institutions of private societies for relieving the indigent and instructing them, as *Buchanan's Society*, *Graham's Society*, *the Society of the Sons of the Highland Society*, &c. The last 10 boys apprentices to trades, and first 3 years gives them clothing and education.

**GLASGOW, MANUFACTURES OF.** Although the manufactures of plaids, ropes, soap, &c. carried on in Glasgow, before the union, Mr Gibson is of opinion that the coun-

try to America first suggested the idea of carrying them to any considerable extent. The first attempts with that view were made about 1725; but their increase was not considerable, till great encouragement was given by the legislature to the linen manufacture in Scotland. The first causes of the success of this manufacture were the act of parliament in 1748, whereby the wearing of French cambrics was prohibited under severe penalties; that of 1751, allowing weavers in flax or hemp to settle and exercise their trades any where in Scotland free, from all corporation dues; and the bounty of 1 s. 6 d. per yard on all linens exported at and under 18 d. per yard. Since that time the spirit of manufacture has rapidly increased among the inhabitants of Glasgow; and great variety of goods, and in very great quantities, have been manufactured. Cheeks, lincens, and linen and cotton stuffs, are manufactured to great extent. Inceles were first made in 1732; printed lincens and cottons were begun to be manufactured in 1738; and handkerchiefs first printed in 1754. In 1757, carpets were begun to be made, and have been since carried on to a considerable extent. But the manufacture which has of late years been carried to the greatest extent, and by which immense and rapid fortunes have been made, is **MUSLIN**. The number of labourers employed in this single branch, is wonderful; while the consumption of cotton yarn in manufacturing mullins and calicoes, have occasioned the erection of extensive cotton mills, throughout the country. See **COTTON**, N<sup>o</sup> I, § viii, 1—4. The cotton manufactures, in 1791, employed, in Glasgow and its neighbourhood within 30 miles round, 15,000 looms, and 135,000 persons; who made goods amounting on an average to L. 1,500,000 sterl. per annum. *Statist. Acc.* V. 502. Besides these, numberless other articles are manufactured at Glasgow, of which our limits permit us not to give a detail; such as soap, sugar, iron-mongery, brass, jewellery, bottle and flint glass, pottery, hats, stockings, thread, gloves, shoes, saddles, &c. &c. Types for printing are made by Dr Wilson and Sons, equal, if not superior, in beauty to any in Britain.

(10.) **GLASGOW, MARKETS IN.** The markets in King's Street were erected in 1754, and are justly admired, as the completest of the kind in Britain. The herb market is neat and commodious; and the principal entry is decorated with columns. It is situated in the Candleriggs, and is laid out in the same manner with those in King's Street. Besides the weekly markets on Friday, there are 6 annual fairs held in Glasgow.

(11.) **GLASGOW, PARISHES IN.** Glasgow anciently formed but one parish; but as its population increased, it was afterwards divided into 7 parishes, and more lately into 8, which are named after the 8 churches. See § 3.

(12.) **GLASGOW, POPULATION OF.** At the union, the number of inhabitants was reckoned about 14,000. In 1743, Dr Webster calculated it at 18,366; but in his second report in 1755, it was stated at 23,546 souls, including those in the suburbs. In 1765, when a new division of the parish took place, it was estimated at 28,000. In 1785, an accurate survey was made, when the number was 36,139; besides 1000 in the suburbs.

But

But in 1791, the last and most accurate survey was made for *Sir J. Sinclair's Statistical Account of Scotland*; when the number of houses within the royalty was found to be 10,291, and that of the inhabitants 41,777; besides 20,168 souls in the suburbs and villages of Calton, Anderston, Grahamston, Gorbals, Cowcaddins, Camlachie, &c. So that the total population of the city and suburbs in 1791, was 61,945; and the increase since 1755, 38,399.

(13.) **GLASGOW, PRINTING IN.** Printing of books was first begun here by George Anderson about 1638. But there was no good printing in Glasgow till 1735, when Robert Urie printed several books in a very elegant manner. The highest perfection, however, to which printing has yet been carried in this place, was by the late Robert and Andrew Foulis, (who began in 1740); as the many correct and splendid editions of books printed by them in different languages testify.

(14.) **GLASGOW, PUBLIC HALLS IN.** The *Town House*, or *Talbooth*, is a magnificent and extremely elegant building. The front is adorned with a range of Ionic pilasters; and is elevated on strong rusticated pillars with arches, forming a piazza for merchants and others to shelter themselves from the weather when met upon business. The hall is 52 feet long, 27 wide, and 24 high. It is ornamented with whole length portraits of the kings of Scotland from K. James I, to George III. In 1781, the exchange under the piazzas was greatly enlarged, by taking down the lower part of the town-hall and assembly room; and at the same time by a tontine scheme entered into by the inhabitants, a most elegant coffee-room was added, with a suit of buildings adjoining, for the purposes of a tavern and hotel, assembly room, and offices for notaries, &c. 2. The *Guild-Hall*, or *Merchant's House*, is situated upon the S. side of Bridge-gate street; and is 82 feet long, and 31 wide. The great hall, which is the whole length and breadth of the building is so capacious, that it is better adapted for the reception of great and numerous assemblies than any other in the city. This house is adorned with a very elegant spire 200 feet high.

(15.) **GLASGOW, REVENUE OF.** The revenue amounts to 7,000 a-year. It arises from a duty upon all grain and meal brought into the city; from the rents of lands and houses belonging to the community; from an impost of two pennies Scots upon every Scots pint of ale or beer brewed, in-brought, or sold, within the city; from certain dues payable out of the markets; from the rents of the seats in churches; from the dues of cranage at the quay, weigh-house, &c. The tonnage on the river, the pontage of the bridge, and statute work, being no part of the city's revenue, are kept distinct under the management of commissioners appointed by act of parliament.

(16.) **GLASGOW, TRADE OF.** The first branch of trade, in which the citizens engaged, is said to have been the curing and exportation of salmon, caught in the Clyde. This trade was promoted by one Mr William Elphinstone in 1430; but the first authentic document concerning Glasgow as a trading city is in 1546. Complaints having been made by Henry VIII. of England, that several English

ships had been taken and robbed by vessels coming to Scotland, an order of council was discharging such captures for the future among other places mentioned in this Glasgow. Between 1630 and 1660, 24000000 lb of fish, and other valuable inland commerce was carried on by the inhabitants of Glasgow; and the exportation of salmon and herrings was greatly increased between 1660 and 1707. The citizens who distinguished themselves most during this period were James Gibbon and John Anderson. Gibbon exported in one year 300 lasts of herrings, and sent to St Martin's in France, on board a vessel called the *St Agate*, of 450 tons, 100000 lb of herrings, and 100000 lb of salt. He was the first who imported iron from Stockholm to Glasgow. Anderson is said to have been the first who imported white wines. But the Union with England, by allowing a free trade to America and the W. Indies, opened up a new source of commerce to the Glasgow traders; which they pursued with such ardour and success, that at present the shipping employed in it amounts to 60,000 tons. This commerce, however, has been with several interruptions from the opposition of the English merchants (of whose ruin it is a particular account in *Sir J. Sinclair's Statistical Account*, Vol. 498—500.) as well as from the American Revolution. Yet the spirit and industry of the Glasgow merchants proved so far superior to all opposition, that in 1790, the number of ships employed was 456, and their tonnage 45,000. In 1783, the same enterprising spirit gave birth to a society entitled the *Chamber of Commerce and Manufatures*, which has since obtained a charter, and whose exertions have been of great benefit to the country.

(17.) **GLASGOW, UNIVERSITY OF.** The university owes its origin to bishop Turrill (see § 7.) It was established in 1450; its members were all ecclesiastics; and its principal support derived from the church. In 1560, the university was brought to the verge of ruin by the magistrates, students, and servants, all of whom were expelled. The magistrates, sensible of the loss of the university to the community, endeavoured to restore it in 1572, by bestowing considerable funds, and prescribing regulations for its management. These proving insufficient, K. James VI. in 1577, by a charter called the *New Charter*, renewed the university, and bestowed upon it the town of Govan. Since that period, the university has been considerably enlarged by royal and the donations of private persons. They have also been increased from 4 to 12, and at present the university consists of a rector, dean of faculty, principal, and six professors (six of them in the gift of the crown) and 12 bursars, &c. The archbishop of Glasgow was formerly chancellor of the university; at present, the chancellor is the rector, dean of faculty, principal, &c. The revenue arises from the tithes of Govan, from those of the parishes of Kilbride, and Kilbride, granted by James VI. and confirmed by Charles I. in 1630; from

Calder, Old and New Monkland, charter from Charles II. in 1670; from the archbishoprick; and from several doffered by private persons. The university attended by above 500 students. **ASGOW**, a county of N. Carolina in District; bounded on the N. by Edg. by Pitt, S. by Lenoir, and W. by counties. It contained 2,668 citizens, 1795.

**ASGOW, BARONY OF.** See **BARONY**,

**ASGOW, CORBALS OF.** See **CORBALS**. **ASGOW, NEW PORT**, a parish of Scotland, erected in 1695, about one in extent. It is partly mountainous, the coast for 130 yards back it is nearly level, little higher than the water mark, naturally barren, sandy, and shallow, cultivation has been rendered very fertile. of the mountains is in tillage. The climate is moist but healthy. The population in 1755 exceeded 400 souls; but in 1755, according to Dr Webster's calculation, it had arisen and in 1790, by the rev. Mr J. Forrest's Sir J. Sinclair it was no less than 4,036: there was an increase of 2,341 within 35

**ASGOW, PORT, OR NEW PORT-GLASNEWARK**, a town in the above parish, comprehending the ground sewed by the city of Glasgow for erecting a port to that N<sup>o</sup> 1, y 7.) and the original village of now conjoined with it. These united in a burgh of barony, governed by two and 13 councillors. The revenue is about 2000. The harbour and pier are excellent, belonging to it, in 1791, were employed in the foreign trade, measuring 18; and 34 in the coasting and fishing business 1487 tons. The total number entered at this port, in 1790, was 450, 46,560 tons. The chief imports are sugar, rum, cotton, mahogany, log-wood, timber, iron, and hemp. Port is seated on the S. bank of the Clyde, 21 by N. of Glasgow, and 26 N. of Ayr. **BUTTEN**, or } a town of Hungary, famous for its hot baths, 7 miles from Schem-

**LETTER**, a district of Scotland, in Rosbe parish of Kintail.

**LOUGH, OR GLASSLOUGH**, a town of a Monaghan county, 5 miles NNE. of

**ASS, JOHN, M. A.** the founder of that **DEPENDENTS**, commonly distinguished by the name of **GLASSITES**, and in by that of **SANDEMANIANS**. (See **INDEX**.) His father was minister of Aberdeen he was born at his father's manse in : was educated and obtained the degree at St Andrews; and was, when a very n, ordained minister of Tealing, near His doctrine and ministry were remarkable drew much attention; and even while with the establishment, his peculiar

ideas, of the purity of church communion and government, were observable. In 1727, he published a work, entitled "The Testimony of the King of Martyrs," in which his Independent Principles were fully developed. In that treatise he maintains the inconsistency of any connection between civil establishments and the church of Christ, which is not of this world. This publication, with other concurring circumstances, produced a long controversy between Mr Glas and the Synod of Angus and Mearns. So far, however, from retracting or trimming in his principles, he still more openly avowed and maintained them, in a tract published the following year, entitled, "A Congregation subject to no Jurisdiction under Heaven." He was deposed in 1728, and immediately thereafter connected himself with a few poor people who adhered to him; and although his adherents have never been numerous, the doctrines which he taught have been generally spread through Britain and many parts of America. He was subjected to great poverty for many years, in supporting a numerous family of 13 children; and died at Dundee, in November 1773, highly valued by his friends, and respected by all who knew him. He published many religious Tracts, which were collected and printed in 4 vols 8vo. and since reprinted in five volumes; the leading doctrines in these works, are, 1. The divinity of Christ, and the perfection of his righteousness to justify the ungodly: 2. Purity of Christian Communion: 3. Independence of all human authority in matters of conscience: 4. The strictest subjection to civil government and magistracy in civil concerns: and 5. Unqualified obedience to the commands of Christ and his apostles.

(II.) **GLASS, JOHN**, son of the preceding (N<sup>o</sup> 1.) was born at Dundee, in 1725. He was bred a surgeon, but afterwards became captain of a merchant vessel belonging to London. In 1763, he embarked for Brazil, and took his wife and daughter along with him. In 1765, he re-embarked for London, taking with him his family and all his property. But when the ship came within sight of Ireland, four of the seamen formed a conspiracy and murdered Capt. Glas, his wife and daughter, the mate, one sailor and two boys. The murderers, having loaded the boat with dollars, sunk the ship, landed at Ross, and proceeded to Dublin, where they were apprehended, tried, convicted and executed. Capt. Glas was a man vol. 4to, entitled *A History of the Canary Islands*. of talents and letters. He published a work in 1765

(III.) \* **GLASS**, *adj.* Vitreous; made of glass.— Get the *glass* eyes;

And, like a scurvy politician, seem

To see the things thou do'st not. *Shak. K. Lear.* *Glass* bottles are more fit for this second sining than those of wood. *Mort. Husb.*

(IV. 1.) \* **GLASS**, *n. f.* [*glas*, Sax. *glas*, Dutch, as *Pezan* imagines from *ghis*, British, green. In Erse it is called *klann*, and this primarily signifies clean or clear, being so denominated from its transparency.] 1. An artificial substance made by fusing fixed salts and flint of sand together, with a vehement fire.—The word *glass* cometh from the Belgick and High Dutch, *glais*, from the verb *glansen*, which signifies amongst them to

shine; or perhaps from *glacies* in the Latin, which is ice, whose colour it resembles. *Peacbam.*—*Glass* is thought so compact and firm a body, that it is indestructible by art or nature, and is also of so close a texture, that the subtlest chymical spirits cannot pervade it. *Boyle.*—

Show'rs of grenadoes rain, by sudden burst  
Disploding murd'rous bowels, fragments of steel  
And stones, and *glass*s and nitrous grain aduft.

*Philips.*

1. A glass vessel of any kind.—

I'll see no more

And yet the eighth appears, who bears a *glass*;  
Which shews me many more. *Shak. Macbeth.*

3. A looking-glass; a mirror.—

He was the mark and *glass*, copy and book,  
That fashion'd t'other. *Shak. Henry IV.*

He spreads his subtle nets from sight,

With trinkling *glass*s to betray

The larks that in the m<sup>o</sup>thes light. *Dryd. Hor.*

4. An Hour GLASS. A glass used in measuring time by the flux of sand.—

Were my wife's liver

Infect'd as her life, she would not live

The running of one *glass*. *Shak. Wint. Tale.*

5. The destined time of man's life.—

No more his royal self did live, no more his  
noble sonne,

The golden Meleager now, their *glass*s all were  
run. *Chapman.*

6. A cup of glass used to drink in.—

To this last costly treaty,

That swallow'd so much treasure, and like a *glass*  
Did break i' th' rinsing. *Shak. Henry VIII.*

When thy heart

Dilates with fervent joys, and eager soul

Prompts to pursue the sparkling *glass*s, be sure

'Tis time to shun it. *Philips.*

7. The quantity of wine usually contained in a glass; a draught.—While a man thinks one *glass* more will not make him drunk, that one *glass* hath disabled him from well discerning his present condition. *Taylor.*—The first *glass* may pais for health, the second for good humour, the third for our friends; but the fourth is for our enemies. *Temple.*

8. A perspective glass.—

The moon whose orb  
Through optick *glass*s the Tuscan artist views.

*Milton.*

—Like those who survey the moon by *glasses*, I tell of a shining world above, but not relate the glories of the place. *Dryden.*

(2.) GLASS is derived by some from the Latin word GLASTUM, the name of a plant called by the Greeks *εαρσι*, by the Romans *vitrum*; by the ancient Britons *quadam*, and by the English *swad*. We find frequent mention of this plant in ancient writers, particularly Cæsar, Vitruvius, Pliny, &c. who relate, that the ancient Britons painted or dyed their bodies with glastum, quadam, vitrum, &c. i. e. with the blue colour procured from this plant. And hence, the name *glass*, which has always somewhat of this bluishness in it.

(3.) GLASS, ART OF MAKING. See GLASS-MAKING.

(4.) GLASS, ASTONISHING PROPERTIES OF.

1. Glass is one of the most elastic bodies in nature. It is the force with which glass balls strike each other

be reckoned 16, that wherewith the virtue of their elasticity will be 1

When glass is suddenly cooled, it becomes very brittle; and this brittleness is attended with very surprising phenomena

balls made of annealed glass, with them, will fly to pieces by the heat only, if the hole by which the internal air communicate be stopped

Lately, however, some vessels made of annealed glass have been discovered, with a remarkable property of resisting very given from without, though they suffer by the shocks received from the fall and minute bodies dropped into them

These glasses may be made of any thickness their bottoms must always be thick sides. The thicker the bottom is, the glasses break. One whose bottom

whose bottom breadth in thickness flies with ease at least as the thinnest glass. Some vessels have been tried with strokes sufficient to drive a nail into wood and have held good without break

and have also resisted the shock of several dies, let fall into their cavities, from 2 or 3 feet; as musket balls, piece

other metals, pyrites, jasper, wood But this is not surprising, as other of same shape and size will do the same wonder is, that taking a shiver of the

of a small pea, and letting it fall into ly from the height of 3 inches, in a condense the glass flies, and sometime

moment of the shock; nay, a bit of finer than a grain, dropped into several glass

sively, though it did not immediately yet when set by, they all flew in less quarters of an hour. Some other bodies

the same effect, as sapphire, diamond hard tempered steel, marble bowls. These experiments were made before

Society, and the effects were the same the glasses were held in the hand, and filled with water, or rested on a glass

glasses also broke upon rubbing them slightly with the finger, within half after rubbing. But when made unthin, they did not break. Hollow

green bottle glass, 3 inches thick at bottom, instantly broken by a shiver of flint, about 2 grains, though they had resisted

of a musket bullet from the height of 1000 paces, various but unsatisfactory reasons have been given for these phenomena, by Mr Euler

The effects are evidently occasioned by the motion some subtle fluid with which the interior of the glass is filled; and the motions when once excited in a particular

glass are soon propagated through the greatest part of it, and thus the cause becomes at last too weak to resist them. It can be little doubt that this fluid is the same as that which is called ELASTICITY. It is known to exist in great quantity; and to be capable of supporting glasses even when annealed with the heat if put into too violent a motion. The cooling of glass hastily may make

insistent with its cohesive power, to  
 can by the least increase of motion in  
 uid by friction or otherwise. This  
 ne case when it is broken by rubbing  
 er; but why it should also break by  
 tact of flint and the other bodies a-  
 red, has not yet been satisfactorily  
 r. 3. A most remarkable phenom-  
 ed in glass tubes placed in certain  
 2. When the tubes are laid before a fire  
 tal position, having their extremities  
 jointed, they acquire a rotatory mo-  
 air axis, and also a progressive motion  
 fire, even when their supports are de-  
 fire, so that the tubes will move a  
 wards to the fire. When the progres-  
 f the tubes towards the fire is stopped  
 e, their rotation still continues. When  
 placed in a nearly upright posture,  
 right hand, the motion will be from  
 it they lean to the left hand, their mo-  
 tom W. to E.; and the nearer they  
 the upright posture, the less will the  
 her way. If the tube is placed ho-  
 a glass plane, the fragment, for in-  
 ch window glass, instead of moving  
 re, it will move from it, and about  
 ontrary direction to what it had done  
 t will recede from the fire, and move  
 d when the place inclines towards  
 se experiments are recorded in the  
 N<sup>o</sup> 476. § 1. They succeeded best  
 out 20 or 22 inches long, which had  
 pretty strong pin fixed in cork for  
 causes of these phenomena have not  
 ed. 4. Glass is less dilatable by heat  
 substances, and solid glass sticks are  
 han tubes. This was first discovered  
 in making experiments to reduce  
 a greater degree of exactness than  
 een found practicable; (See *Philos.*  
 vii, p. 663.) and since his experi-  
 ade, one of the tubes 18 inches long,  
 ed with a solid glass rod of the  
 he former was found by a pyrome-  
 4 times as much as the other, in  
 ching to that of boiling oil. On ac-  
 uality which glass has of expanding  
 l, M. de Luc recommends it to be  
 lums; and he says, that its expan-  
 ys equable, and proportioned to the  
 at; a quality which is not to be  
 other substance yet known. *Philos.*  
 474. 5. Glass is more fit for the con-  
 vapours than metallic substances,  
 filled with water, in summer, will  
 f water on the outside, just as far  
 the inside reaches; and a person's  
 on it, manifestly moistens it. Glass  
 moist with dew, when metals do  
 7, § 7. 6. A drinking glass partly  
 er, and rubbed on the brim with a  
 lds musical notes, higher or lower  
 ore or less full; and makes the li-  
 re HARMONICA. 7. Glass is pos-  
 tent electrical virtues. See *ELECTR.*

**BALLS** are circular or otherwise  
 RT II.

shaped hollow vessels of glass, coloured within,  
 so as to imitate the semipellucid gems. The  
 method of doing it is this: Make a strong solution  
 ofisinglass, in water, by boiling; pour a quantity  
 of this while warm into the hollow of a white  
 glass vessel; shake it thoroughly about, that all  
 the sides may be wetted, and then pour off the  
 rest of the moisture. Immediately after this,  
 throw in red lead, shake it and turn it about,  
 throw it into many places with a tube, and the  
 moisture will make it stick and run in waves and  
 pretty figures. Then throw in some blue mass,  
 and make it run in waves in the ball as the red-  
 lead; then do the same with verdegis; next with  
 orpiment, then with red lake, all well ground;  
 always casting in the colours in different places,  
 and turning the glass, that the moisture within  
 may run them into the waves. Then take fine  
 plaster of Paris, and put a quantity of it into the  
 ball; shake it also nimbly about; this will every-  
 where stick firmly to the glass, and give it a strong  
 inner coat, keeping all the colours on very fairly  
 and strongly. These are set on frames of carved  
 wood, and much esteemed as ornaments in many  
 places.

(8.) **GLASS, DIFFERENT KINDS OF.** See **GLASS-MAKING, SECT. VI and XI.**

(9.) **GLASS DROPS.** See **RUPERT'S DROPS.**

(10.) **GLASS, ENGRAVING ON.** This art is quite  
 modern, and owes its origin to the discovery of  
 the fluoric acid. See **CHEMISTRY, § 667.** To  
 perform it, the glass is covered with melted wax  
 or mastic; and when this is hardened, the device  
 or figure is engraved upon it by a needle or other  
 sharp-pointed instrument. A mixture of the flu-  
 oric and sulphuric acids is then put upon the glass  
 or glass plate, and the whole covered with an in-  
 verted China cup to prevent the evaporation of  
 the fluoric acid. In two days the glass plate may  
 be cleared of its coating when all the traces of the  
 needle will be found engraved upon it.

(11.) **GLASSES, DIFFERENT KINDS OF.** Glasses  
 are distinguished, with regard to their form and  
 use, &c. into various kinds, as drinking glasses,  
 optical glasses, looking glasses, burning glasses, &c.

i. **GLASSES, BURNING.** See **BURNING, § 12—17.**

ii. **GLASSES, DRINKING,** are simple vessels of  
 common glass or crystal, usually made in form of  
 an inverted cone. Each glass consists of 3 parts,  
 viz. the calyx or bowl, the bottom, and the foot;  
 which are all wrought or blown separately. No-  
 thing can be more dexterous and expeditious than  
 the manner wherein these parts are all blown;  
 two of them opened, and all three joined to-  
 gether. An idea is only to be had of it, by seeing  
 the operations performed. The glasses chiefly used  
 in England are made of the ashes of fern;  
 crystal glasses being less common. The exceed-  
 ing brittleness of this commodity, notwithstanding  
 the easy rate of each glass, renders the consump-  
 tion thereof very considerable. For the method  
 of gilding the edges of drinking glasses, see **GLAS-  
 SING, § IV, 2.**

iii. **GLASSES, LOOKING.** See **FOLIATING, LOOKING GLASS, and MIRROR.**

IV. GLASSES, MUSICAL. See HARMONICA.  
 V. GLASSES, OPTICAL. See OPTICS, and TELESCOPE. The improvements hitherto made in telescopes by combining lenses made of different kinds of glass, though very great, are yet by no means adequate to the expectations that might reasonably be formed, if opticians could fall on any method of obtaining pieces of glass sufficiently large for pursuing the advantages of Mr Dollond's discovery. Unfortunately, however, though the Board of Longitude have offered a considerable reward for bringing this art to the requisite perfection, no attempt of any consequence has hitherto been made. Mr Keir is of opinion, that the accomplishment of this is by no means an easy task; as it requires not only a competent knowledge of the properties of glass fittest for the purpose (the faults not being evident to common inspection), but a considerable degree of chemical knowledge to invent a composition by which these faults may be avoided; and a dexterity in the execution of the work, which can only be acquired by practice. He, however, thinks, that if the subject were more generally understood, and the difficulties more fully pointed out, for which purpose he makes the following remarks, the end might be more easily accomplished. 1. The rays of light passing through a glass lens or prism, or through any other medium of unequal thickness, are refracted; but not in an equal manner, the blue, violet, &c. being more refracted than the red. 2. Hence it happens, that the rays of light, when refracted by a common lens, do not all unite in one focus, but in reality form as many different foci as there are colours; and hence arise the prismatic colours, or irises, which appear towards the borders of the image formed by the common convex lenses, and which render the vision extremely indistinct. 3. The indistinctness of vision produced by this cause, which is sensible in telescopes of a small aperture, increases in so great a proportion, viz. as the cubes of the diameters, that it seemed impossible to increase the power of dioptric telescopes greatly, without extending them to a very inconvenient length, unless this confusion of colours could be corrected. 4. It was known that different transparent bodies possessed different degrees of refractive power; and until Mr Dollond discovered the contrary, it was supposed, that the refractions of the coloured rays were always in a determined ratio to one another. On this supposition it seemed impossible to correct the faults of refracting telescopes; for it was supposed, that if the dispersion of light produced by a convex lens were counteracted by another lens or medium of a concave form, the refraction would be totally destroyed; and this indeed would be the case, if the two mediums were made of the same matter; and from some experiments made by Sir Isaac Newton, this was supposed to be actually the case in all substances whatever. 5. From considering that the eyes of animals are formed of mediums of different colours, it occurred first to Mr David Gregory, the celebrated professor of astronomy at Oxford, and then to Mr Euler, that, by a combination of mediums which had different refractive powers, it might be possible to remedy the imperfections of dioptric tele-

scopes. It does not, however, appear that any of these gentlemen understood the method on which these phenomena depend. Mr Dollond executed his idea by forming a common lens from two glass lenses with water between them; but his attempt was not attended with success. Mr Dollond, however, was led to this improvement by Mr Klingestern, one of Sir Isaac Newton's experimenters, who had induced even that great philosopher to suppose, that the improvement executed by Mr Dollond was impossible. A experiment was made by Sir Isaac Newton, consisting a glass prism within a prism made of water, in such a manner that the light, which were refracted by the first prism, should pass through and be refracted a second time by the water prism. In this experiment the refraction of the light was entirely counteracted. But when Mr Dollond repeated this experiment, he found, that, contrary to his own expectation, when the angles of the two prisms were proportioned that they counteracted each other's refraction, then colours appeared; on the other hand, when they were so proportioned that the dispersion of the coloured rays was not counteracted, the mean refraction still subsisted. He evidently proved, that the mean refractive powers of glass and water were proportional to one another. 6. To propose an improvement, Mr Dollond proposed several kinds of glass. Crown glass possesses the smallest dispersive power to its refraction; while flint glass possesses the greatest dispersive power in proportion to its refraction, which was also very great. By joining these two exactly together, he formed a wedge of white flint glass whose angle was 25 degrees, and another of crown glass whose angle was 29 degrees, refracted very nearly as 2 to 3; the refracted light from colour. On measuring the refracting powers of these two glasses, he found, that in flint glass, the sine of incidence to the sine of mean refraction as 1 to 1.5; that in crown glass, the sine of incidence to the sine of mean refraction as 1 to 1.2. By these methods of determining the different refractive powers of glass will be found under other experiments. We shall only observe, that two kinds of glass necessary for the construction of achromatic telescopes; one of which shall possess the greatest, the other as great, dispersive power in proportion to their mean refracting powers, as can be found. The difference of glasses in this respect depends on the quality of the ingredients employed in their composition. Crown glass, which is made of sand melted by means of the alkali of tartar, or kelp, both which fluxes consist of vegetable earth, alkali, and is found to give the smallest dispersive power to plate glass, which consists of sand melted with fixed vegetable alkali, with little or no earth, gives a greater dispersive power than flint glass, and

ed by means of minium and fixed alkalis, therefore, that the dispersion of greatest when minium, or probably oxalcalces, are made use of; and that all greater power of dispersion than ve other earths. Mr Zacher of Peter ever, informs us, that he has made a much superior in this respect to flint does not as yet appear whether it be optical purposes than that commonly seems no difficulty in augmenting the power, as that is found to depend on the minium or other flux; but thus we increase also the caputium fault to which all compositions of that kind are mely, the being subject to veins or a running through it. By these, even all as to be imperceptible to the naked s which fall on them are diverted from r direction, and the images thereby infused. This is owing to the great of the veins, as appears by their i received on white paper, when the between the paper and the sun, or t a proper distance. The rays of then made to converge by the supe of the veins, their images appear as bordered with obscure edges on the it glass is so much subject to this kind ion, that it is with difficulty the opti ck out pieces of the five commonly u arge quantity of the glass. It is fa gretted, that the minium which pro tatest dispersive power, is likewise the ce which renders flint glass much more se imperfections than any other. The at the sandy and earthy matters mix fusion; and having not only a confi ce of affinity towards each other, but ot much different from each other, apt to separate. On the other hand, u heavy substance as minium is added by substances, though it has a pretty cy to unite with them, it has none with ali, which is another ingredient in this e some parts of the glass will contain e matter than the rest; particularly e bottom of the pot, which is to full s as to be applied only to the making little value. The veins in this case y the descent of the minium to the h in its passage forms threads or veins other parts of the glass along with correction of this fault appears there ry difficult. M. Macquer informs us, n vain tried to remove it by very long fierce fire; which indeed others have erience not to correct, but to aug . Mr Keir is of opinion that some tion must be discovered, which, along ent refractive power, should possess formity of texture; but he is likewise hat scarce any alteration in this re e made without injuring the colour For optical purposes, however, he ik that an alteration in the colour of its would be very detrimental. " I l (says he), that glasses sensibly tin

ged with colour, might transmit as much or more light than the best flint glass. For the colourless appearance of flint glass is an optical deception. The minium gives it a considerable tinge of yellow, and the alkali inclines it to a bluish cast, besides the colour arising from a greater or less impurity of the materials; so that the glass would actually be very sensibly coloured, unless by the addition of manganese, which is known to give a purplish red. Thus the other tinges are counteracted, but not effaced or destroyed as has been frequently imagined. By the mixture of the three principal colours, red, yellow, and blue, more or less exactly counterpoised, a certain dark shade is introduced, in which, as not any one of the colours predominates, no coloured tinge appears, but the effect is merely a diminution of the transparency of the glass, which, however, is too small for ordinary observation." Mr Kier is even of opinion, that a certain tinge of yellow would in many cases be of service, because it would exclude some of the blue rays, which being most refrangible are most injurious to the distinctness of vision. Very great difficulties must arise in attempting improvements of this kind; as the experiments must all be tried on a very large scale. This is not only attended with a very heavy expence in itself, on account of the quantity of materials employed, but from the heavy duty of excise which is rigorously exacted whether the glass be manufactured into saleable articles or not. It is observed in the manufacture of every kind of glass, that the glass in the middle of the area or transverse section of a pot is much purer and freer from veins and other imperfections than the part which is near the sides, and that the glass at the bottom is the worst of all. Consequently it is chiefly in large pots, such as are used in manufactures, that there is a probability of success. Very fine and beautiful glasses called PASTES and artificial gems, may be made in smaller pots or crucibles; but this glass is suffered to cool and subside in the vessel, by which means the contiguous parts are more uniform in their texture than can be expected in a piece of glass taken out of the pot while hot in the common way, by making it adhere and twist round an iron rod or pipe. But although the method of allowing the glass to cool in the pots is very advantageous for the purposes of the jeweller, it is by no means applicable to those of the optician. Glass cooled in that gradual manner, suffers some degree of crystallization or peculiar arrangement of its parts; the consequence of which is, that the rays of light undergo certain refractions independent on the form of the glass, which greatly affect the distinctness of vision in TELESCOPES.

(21.) GLASS OF LEAD, a glass made with the addition of a large quantity of lead, of great use in the art of making counterfeit gems. The method of making it is this: Put a large quantity of lead into a potter's kiln, and keep it in a state of fusion with a moderate fire, till it is calcined to a grey loose powder; then spread it in the kiln, and give it a greater heat, continually stirring it to keep it from running into lumps; continue this several hours, till the powder become of a fair yellow; then take it out, and sift it fine; this is called *calcined lead*. Take of this calcined lead 15 pounds, and crystalline or other frit 12 pounds; mix these as well as possible; put them in a pot, and set them in the furnace for ten hours; then cast the whole, which will be now perfectly melted, into water; separate the loose lead from it, and return the metal into the pot. After standing in fusion 12 hours more, it will be fit to work. It is very tender and brittle, and must be worked with great care, taking it slowly out of the pot, and continually wetting the marble it is wrought upon. White lead, minium, litharge, and all the other preparations and calces of lead, are easily fused by a moderate fire, and formed into a transparent glass of a deep yellow colour. But this glass is so penetrating and powerful a flux, that it is necessary to give it a greater consistence, to render it fit for use. With this view, two parts of calx of lead, e. g. minium, and one part of sand or powdered flints, may be put into a crucible of refractory clay, and baked into a compact body. Let this crucible, well closed with a luted lid, be placed in a melting furnace, and gradually heated for an hour or an hour and a half; and afterwards let the heat be increased so as to obtain a complete fusion, and continued in that state for the same time; let the crucible remain cool in the furnace; and when it is broken, a very transparent yellow-coloured glass will be found in it. Some add nitre and common salt to the above mixture, because these salts promote the fusion and the more equal distribution of the sand. This glass of lead has a considerable specific gravity, and its lowest part is always the heaviest. It is an important flux in the assays of ores to facilitate their scorifications. It is capable of all the colours of the gems in very great perfection. The methods of giving them are these: for green, take pulverine frit 20 lb. lead calcined 16 lb. sift both the powders very fine; then melt them into a glass, separating the unmixed lead, by plunging the mass in water; after this, return it into the pot, and add brass thrice calcined 6 oz. and one penny-weight of crocus martis made with vinegar; put this in at six different times, always carefully mixing it together; let it finally settle an hour, then mix it together, and take a proof of it; when the colour is right, let it stand 8 hours, and then work it. If, instead of the calcined brass, the same quantity of the caput mortuum of the vitriolum veneris be used, the green is still finer.

(22.) GLASS, OPERA. See DIOPTRICS, *Index*.

(23, i.) GLASS, PAINTING IN, ANCIENT METHODS AND HISTORY OF. The ancient manner of painting on glass was very simple; it consisted

in the mere arrangements of pieces of glass of different colours in some sort of symmetry, situated what is now called *Mosaic-work*. SAIC. In process of time they came to more regular designs, and also to represent heightened with all their shades: yet it proceeded no farther than the contours of things in black with water colours, and hatching peries after the same manner on glasses of colour of the object they designed to paint. For carnation, they used glass of a bright red and upon this they drew the principal lines of the face, &c. with black. At length, for this sort of painting improving cost and the art being found applicable to the painting of churches, basilicas, &c. they found means of incorporating the colours in the glass itself, by heating them in a fire to a proper heat having first laid on the colours. A French artist at Marseilles is said to have given the name of this improvement, upon going to Rome under Julius II.; but Albert Durer and Lucas de Leyden were the first that carried it to any perfection. This art, however, has met with much neglect, and sometimes been almost totally forgotten, which Mr Walpole gives the following account in his *Anecdotes of Painting in England*. The first interruption given to it was by the Reformation, which banished the art out of churches; it was in some measure kept up in the castles of the nobility and gentry in the window seats. Towards the end of Queen Elizabeth's reign it was omitted even there; yet the art did not entirely cease. The chapel of our Lady at Warwick was ornamented anew by Robert Dudley earl of Leicester, and his countess, a painter of the glass painter's name yet remaining, the date 1574; and in some of the churches the art again appears, in 1622, by the hand of no contemptible master. I could supply this gap of 48 years by many dates of windows of glass; but nobody ever supposed that the art was lost so early as the reign of James I. it has not perished since will be evident from the following series, reaching to the present time. The portraits in the windows of the library at Souls, Oxford. In the chapel at Queen's College, there are 12 windows, dated 1518. Philip Rubens painted the glass in the chapel at Warwick, 1574. The windows at Wadhurst, the drawing pretty good, and the colouring by Bernard Van Linge, 1622. In the chapel at the Swan Inn, a window, with the name of the painter, 1623. In the church of St Leonard, Stratford, two windows by Baptista Sutton, 1624. In the chapel at University College, Oxford, 1687. At Christ church, Oxford, a window, aged 84, 1700. Window at Queen's College, by William Price, now living, whose colours are fine, and whose taste in ornamenting is good, and whose taste in ornamenting is far superior to any of his predecessors, equal to the antique, to the good Italian, and only surpassed by his own industry. Price was the only painter in the many years in England. Afterwards one of a plumber at Reading, did some things

the late Henry earl of Pembroke; but his colours soon vanished. At last he found a very beautiful and durable red; but he died in or two, and the secret with him. A Birmingham began the same art in 1756 or 1757, and fitted up a window for Lord Lyttelton, church of Hagley; but soon broke. A little after, one Peckitt at York began the same art, and has made good proficiency. A few years after that art collected some dispersed panes in ancient buildings, particularly the late Lord North, who erected a Gothic temple at Stowe, and fitted it with arms of the old nobility. &c. In the year 1753, one Ascitti, an Italian, who had married a Flemish woman, brought a set of painted glass from Flanders, and sold it for 450 guineas to Mr Bateman of Old Windmill-lane, that I sent Ascitti again to Flanders, and bought me 450 pieces, for which, including the expence of his journey, I paid him 367 r. His wife made more journeys for the same purpose; and sold her cargoes to one Palglazier in St Martin's lane, who immediately raised the price to 1, 2, or 3 guineas for a piece, and fitted up entire windows with and with mosaics of plain glass of different colours. In 1761, Paterson an auctioneer at Effie in the Strand, exhibited the two first sets of painted glass, imported in like manner from Flanders. All this manufacture consisted of scripture histories, stained in black and white, or in small figures of black and white; and flowers in colours, and Flemish coats of arms. The colours used in painting glass are different from those used in painting either in oil or oil colours. For *black*, take scales of iron ore; scales of copper, 1 oz.; jet,  $\frac{1}{2}$  oz.; them to powder and mix them. For *blue*, powder of blue, 1 lb.; sal nitre,  $\frac{1}{2}$  lb.; mix and grind them well together. For *carmin*, take red chalk, 8 oz.; iron scales and scales of silver, of each, 2 oz.; gum arabic, 1 lb.; dissolve in water; grind all together for an hour very stiff; then put it in a glass jar, and let it stand to settle 14 days. For *green*, take red lead 1 lb.; scales of copper, and flint, 5 lb.: divide them into 3 parts; add to them as much sal nitre; put them in a crucible, and melt them with a strong fire; when it is cold, powder it, and grind it on a mill. For *gold colour*, take silver, 1 oz.; iron,  $\frac{1}{2}$  oz.; melt them in a crucible; then the mass to powder, and grind it on a mill; add to it yellow ochre, or brick-dust 1 lb.; and grind them well together with water. For *purple*, take minium, 1 lb.; crown stone, 1 lb.; white flint, 5 lb.; divide into 3 parts, and add to them as much sal nitre; calcine, melt, and grind on a mill. For *red*, take jet, 4 oz.; litharge of silver, 2 lb.; chalk, 1 oz.; powder them fine, and mix them. For *white*, take jet, two parts; white lead, one part; put all into a glass very fine, one part; mix them. For *yellow*, take Spanish brown, ten parts; leaf silver, one part; antimony, half a part; put all into a crucible, and calcine them. In the windows of ancient churches, &c. are to be seen the most beautiful and vivid

colours imaginable, which far exceed any of those used by the moderns, not so much because the secret of making those colours was entirely lost, as that the moderns will not go to the charge of them, nor be at the necessary pains, as this sort of painting is not now so much esteemed as formerly. Those beautiful works which were made in the glass houses were of two kinds. In some, the colour was diffused through the whole substance of the glass. In others, which were the more common, the colour was only on one side, scarce penetrating within the substance above  $\frac{1}{4}$  of a line; though this was more or less according to the nature of the colour, the yellow being always found to enter the deepest. These last, though not so strong and beautiful as the former, were of more advantage to the workmen, as on the same glass, though already coloured, they could show other kinds of colours where there was occasion to embroider draperies, enrich them with foliage, or represent other ornaments of gold, silver, &c. For this purpose they made use of emery, grinding or wearing down the surface of the glass till they got through the colour to the clear glass. This done, they applied the proper colours on the other side of the glass. By these means, the new colours were hindered from running and mixing with the former, when they exposed the glasses to the fire. When the ornaments were to appear white, the glass was only bared of its colour with emery, without tinging the place with any colour at all; and this was the manner by which they wrought their lights and heightenings on all kinds of colour.

(ii.) GLASS, PAINTING IN, MODERN METHOD OF. To paint glass, in the modern way, first design, and even colour, the whole subject on paper. Then choose such pieces of glass as are clear, even, and smooth, and proper to receive the several parts; and proceed to distribute the design itself, or papers it is drawn on, into pieces suitable to those of the glass; always taking care that the glasses may join in the contours of the figures and the folds of the draperies; that the carnations, and other finer parts, may not be impaired by the lead with which the pieces are to be joined together. The distribution being made, mark all the glasses as well as papers, that they may be known again: which done, applying every part of the design upon the glass intended for it, copy or transfer the design upon this glass with the black colour diluted in gum water, by tracing and following all the lines and strokes as they appear through the glass with the point of a pencil. When these strokes are well dried, which they will be in about two days, the work being only in black and white, give a slight wash over with urine, gum arabic, and a little black; and repeat it several times, according as the shades are to be heightened; with this precaution, never to apply a new wash till the former is sufficiently dried. The lights and risings are then given by rubbing off the colour in the respective places with a wooden point, or the handle of the pencil. As to the other colours above-mentioned, they are used with gum-water, much as in painting in miniature; taking care to apply them lightly, to prevent effacing the outlines of the design; or even, for the

greater

greater security, to apply them on the other side; especially yellow, which is very pernicious to the other colours, by blending therewith. And here too, as in pieces of black and white, particular regard must always be had not to lay colour on colour, or lay on a new lay, till the former are well dried. The yellow is the only colour that penetrates through the glass, and incorporates therewith by the fire; the rest, particularly the blue, (which is very difficult to use,) remaining on the surface, or at least entering very little. When the painting of all the pieces is finished, they are carried to the furnace or oven to anneal or bake the colours. The furnace here used is small, built of brick, from 18 to 30 inches square. At six inches from the bottom is an aperture to put in the fuel and maintain the fire. Over this aperture is a grate made of 3 square bars of iron, which traverse the furnace, and divide it. Two inches above this partition is another little aperture, through which they take out pieces to examine how the coction goes forward. On the grate is placed a square earthen pan, 6 or 7 inches deep, and 5 or 6 inches less every way than the perimeter of the furnace. On the one side hereof is a little aperture, for making trials, placed directly opposite to that of the furnaces destined for the same end. In this pan are the pieces of glass to be placed in the following manner: First, the bottom of the pan is covered with 3 strata or layers of quicklime pulverised; those strata being separated by two others of old broken glass, to secure the painted glass from the too intense heat of the fire. The glasses are then laid horizontally on the last or uppermost layer of lime. The first row of glass is covered over with a layer of the same powder an inch deep; over this is laid another range of glasses, and thus alternately till the pan is quite full; taking care that the whole heap always end with a layer of the lime powder. The pan being thus prepared, cover up the furnace with tiles, on a square table of earthen ware, closely luted all round; leaving 5 little apertures, one at each corner, and another in the middle, to serve as chimneys. The fire for the first two hours must be very moderate, and must be increased in proportion as the coction advances, for 10 or 12 hours; in which time it is usually completed. At last the fire, which at first was charcoal, is to be of dry wood, so that the flame covers the whole pan, and even issues out at the chimneys. During the last hours, make essays, from time to time, by taking out pieces laid for the purpose through the little aperture of the furnace and pan, to see whether the yellow be perfect, and the other colours in good order. When the annealing is thought sufficient, extinguish the fire, as quickly as possible; otherwise it would soon burn the colours, and break the glasses.

(24.) GLASS, PAINTING ON, BY MEANS OF PRINTS. See BACK-PAINTING.

(25.) GLASS PORCELAIN, the name given by many to a modern invention of imitating china ware with glass. The method given by M. Reaumur, who was the first that carried the attempt to any degree of perfection, is shortly this: The glass vessels to be converted into porcelain are to be put into a large earthen vessel, such as the com-

mon fine earthen dishes are baked in, or sufficiently large crucibles; the vessels are to be with a mixture of fine white sand, and gypsum burnt into what is called plaster and all the interstices are to be filled up same powder, so that the glass vessels where touch either one another, or the the vessel they are baked in. The vessel then covered down and luted, and the the rest of the work; for this is only to be to a common potter's furnace, and when stood there the usual time of the baking of vessels, it is to be taken out, and the contents will be found no longer glass, but converted into a white opaque substance, which is a good porcelain, and has almost the property that of China. The powder which has served will do again as well as fresh, and that for number of times: nay, it seems ever so often cause of this transformation, says Macquer probably that the vitriolic acid of the gypsum its basis of calcareous earth, and unites with alkaline salt and saline earth of the glass which it forms a kind of selenite, derived from the calcareous selenites, of which matter the glass acquires the quality of porcelain.

(V. i.) GLASS, [from *glafs*, Gael. *l. e. g.* geography, a parish of Scotland, in the shire of Aberdeen and Banff, so called from the steepness of its hills. It is about 8 miles long from SW. and 6 broad. The *Dovern* runs through it. The soil is a deep loam. The usual crops, barley, and pease; along the bank of the river they are pretty early, but the climate cold, the rest are late. Turnips, potatoe, clover, are also cultivated by some. In 1778 farmers had not a peck of meal from a dried corn; but the king's bounty of 500000 served the inhabitants from starving. The *ber*, in 1791, stated by the rev. J. Cooper report to Sir J. Sinclair, was 970; which below that of Dr Webster, in 1755. The are bad, and in some places swampy.

(ii.) GLASS, a river of Scotland, in Inver-shire, which, after receiving the *Cannich* from NW. unites with the *Farrar*, and falls into *Beaully*. See *BEAULY*, N° 2.

(iii.) GLASS, LOCH, a beautiful navigal of Scotland, in Ross-shire, 5 miles long, 1 and 6 from the sea; remarkable for never freezing unless the frost be uncommonly severe. It is a with fine trouts.

(iv.) GLASS, STRATH, a district of Inver-shire, lying on both sides of the river *GLASS*.

\* To GLASS. *v. a.* 1. To see as in a glass or mirror. Not it

Methinks I am partaker of thy passion  
And in thy case do *glafs* mine own debi-

in glass.—

ought all his senses were lockt in his eye,  
is in crystal for some prince to buy;  
and 'ring their own worth, from whence  
y were *glass*,  
out to buy them, along as yon pass.

*Sbakesp.*

v'd grains of silver to lie hid in the small ca-  
vities *glassed* over by a vitrifying heat, in  
wherein silver has been long kept in fu-  
.

ARY, [from *glasra*, Gael. a grayish  
parish of Scotland, in Argyllshire. 22 m.  
12 broad. Its form is nearly a parallel,  
usually from each side, and forming an  
tract of moor-land. The river Ad rises  
extremity, and runs through it. It has  
shery. The salmon are sold on the spot  
lb. The soil consists of loam, clay, and  
it produces tolerable crops of oats, bar-  
tatoes; but it is best adapted for green  
he others are often injured by munda-  
ne Ad, the climate being rainy. The  
in 1792, stated by the rev. Dugald  
in his report to Sir J. Sinclair, was  
had decreased 183, since 1755. There  
horses, 3,200 black cattle, and 1200  
be parish has been partly improved by  
and plantations of trees.

CARRICK POINT, a cape on the E.  
ireland, in Wexford. Lon. 6. 12. W.  
N.

CASE, *n. f.* [from *glass* and *case*.] a kind  
press, with a glass lid or door, and pro-  
cess, nails, shelves, &c. in the inside;  
er horizontally upon a table, counter,  
s, or fixed perpendicularly against a  
ie shops of jewelers, hardware-men,  
rs, toy-men, and other dealers in showy  
isplay their goods to the best advan-  
tage is also applied to those windows  
ps, that are fitted up with shelves, &c.  
as frames on the inside, for exhibiting  
wares they contain to passengers.

ENBURY, a small town in Kent.

ERTON, [Sax. *i. e.* the bare hill.] a pa-  
rish in Wigtonshire, 7½ miles long  
N. and from 1½ to 2 miles 7 furlongs  
e surface is hilly and rugged: the soil

either loam, gravel, peat earth, or clay. The  
weather is variable but mild. Agriculture is great-  
ly improved; particularly on the estates of R. Haw-  
thorn-Stewart, Esq. of Physgill, and Mr Stewart  
of Castle Stewart. "The highly cultivated con-  
dition of the estate of Glasserton," says the rev.  
Dr Davidfon, "is undeniably a fine monument of  
the taste, judgment and ardent public spirit of its  
late proprietor," Adm. Keith Stewart. The po-  
pulation, in 1795, stated by the Dr in his report  
to Sir J. Sinclair, was 900 souls, and the increase  
91, since 1755. The rearing of black cattle of  
the Galloway race is the principal object of the  
farmers. Full grown and well fed oxen, of four  
years old, sell at from 9 l. to 11 l. old cows at 8 l.  
or 10 l. and bullocks of 3 years old, at 7 l. or 8 l.  
Sheep, horses, and swine, are also reared in great  
numbers. Some sheep have been sold at a guinea  
a head. The numbers of none of these cattle are  
specified.

GLASSFORD. See GLASFORD.

(1.) \* GLASSFURNACE. *n. f.* [*glass* and *furnace*.]  
A furnace in which glass is made by liquefaction.  
—If our dreamer pleases to try whether the glow-  
ing heat of a *glass-furnace* be barely a wandering  
imagination in a drowsy man's fancy, by putting  
his hand into it, he may perhaps be awakened in-  
to a certainty that it is something more than bare  
imagination. *Locke*.

(2.) GLASS FURNACE. See GLASS-MAKING, § V.

\* GLASSGAZING. *adj.* [*glass* and *gazing*.] Fi-  
nical; often contemplating himself in a mirror.—  
A whoreson, *glassgazing*, finical rogue. *Sbak.*

\* GLASSGRINDER. *n. f.* [*glass* and *grinder*.]  
One whose trade is to polish and grind glass.—  
The *glassgrinders* complain of the trouble they  
meet with. *Boyle*.

GLASSGRINDING, *n. f.* the art of grinding glass.  
See GLASS-MAKING, § VIII.

\* GLASSHOUSE. *n. f.* [*glass* and *house*.] A house  
where glass is manufactured.—I remember to have  
met with an old Roman Mosaic, composed of lit-  
tle pieces of clay half vitrified, and prepared at  
the *glasshouses*. *Addison on Italy*.

GLASSHUTTEN, a town of Saxony, 3 miles  
from Dresden, near a silver mine.

GLASS-MAKER, *n. f.* one who makes glass.

## G L A S S - M A K I N G .

DEFINITION and HISTORY of GLASS-  
MAKING.

MAKING, *n. f.* the art of making  
or the manufacture of that commo-  
n article we shall give a brief description,  
the materials and art of glass-making,  
several branches connected with it;  
firing, polishing, and colouring of glass.  
The period the art of glass-making was first  
altogether uncertain. Some suppose  
it to be before the flood; and NERI traces  
it at least to the time of Job. But these

are mere conjectures; for the word *Zechuchib*,  
translated *crystal*, (Job xxviii. 17.) admits of vari-  
ous significations, and from the context evidently  
means some precious stone.

The EGYPTIANS boast, that this art was taught  
them by Hermes. Aristophanes, Aristotle, Alex-  
ander Aphrodisicus, Lucretius, and St John the di-  
vine, put it out of all doubt that glass was used in  
their days. Pliny relates, that it was first disco-  
vered accidentally in Syria, at the mouth of the  
river Belus, by certain merchants driven thither  
by a storm at sea; who being obliged to continue  
there, and dress their vituals by making a fire on  
the ground, where there was great plenty of the  
herb

herb kali; that plant, burning to ashes, its salts mixed and incorporated with the sand, or stones fit for vitrification, and thus produced glass; and that, this accident being known, the people of Sidon in that neighbourhood essayed the work, and brought glass into use; since which time the art has been continually improving.

Be this as it may, the first glass-houses mentioned in history were erected in TYRE, where the only staple of the manufacture was for many ages. The sand which lay on the shore for about half a mile round the mouth of the Belus was peculiarly adapted to the making of glass; and the wide range of the Tyrian commerce gave an ample vent for the productions of the furnace.

The first time we hear of glass made among the ROMANS was in the reign of Tiberius, when Pliny relates that an artist had his house demolished for making glass malleable, or rather flexible; though Petronius Arbitrator and others assure us, that the emperor ordered the artist to be beheaded for his invention. It is certain that a plate of glass was found at Herculaneum, which was destroyed, A. D. 80; and that glass vessels were made at Rome under Nero. The earliest mention made of glass windows is by Lactantius in the 3d century.

Before the conquest of BRITAIN by the Romans, glass-houses had been erected in this island, as well as in Gaul, Spain, and Italy. Hence, in many parts of the country are to be found annulets of glass, having a narrow perforation and thick rim, denominated by the remaining Britons *glein-u-naid-reedb*, or *glass adders*, and which were probably in former times used as amulets by the druids. See ANGUINUM OVUM. It can scarcely be doubted, that the Britons were sufficiently well versed in the manufacture of glass, to form out of it many more useful instruments than glass beads. History indeed assures us, that they did manufacture a considerable quantity of glass vessels. These, like their annulets, were most probably green, blue, yellow, or black, and many of them curiously streaked with other colours. The process in the manufacture would be nearly the same with that of the Gauls or Spaniards. The sand of their shores being reduced to a sufficient degree of fineness by art, was mixed with  $\frac{1}{4}$ th of its weight of their native pitch the same with our kelp, and both were melted together. The melt was then poured into a mould, where it was not to harden into a mass, and afterwards replaced in the furnace, where it became transparent by the boiling; and was afterwards figured by blowing, or modelling in the fire, into such vessels as they wanted.

According to Beloe, the first success in making glass for windows, was first introduced into England in 1574, by the Dutch merchants who were employed in glassing the windows of the court of wools in that city, which they had first seen done when first brought over by William of Orange, who was first about the year 1600. The first success in making glass plates of various sizes, and in the making and glass windowed churches, was first done about 1670. They first began to make them in France, from whence they came to England. VENEZIANI, for many years, excelled all other people in the making of its glasses, and in the 17th century, the Venetians were the only people that had the making crystal looking-glasses.

The glass manufacture was first begun in 1557: the finer sort was made at Friars, in London; the fine flint glass, prior to that of Venice, was first made at House, in the Strand, London. This

manufacture appears to have been much improved when it was carried on with pit coal wood; and a monopoly was granted to Mansel, who was allowed to import Venetian flint glasses for drinking, the art which was not brought to perfection in the reign of William III.

The first glass plates, for looking-coach windows, were made in 1673, and by the encouragement of the duke of Devonham; who, in 1670, introduced the use of fine glass into England, by Venice with amazing success. So that within a century, the French and English have not only led but even excelled the Venetians, and no longer supplied from abroad. I have made a considerable improvement in *glass*, by the invention of a method to make large plates, till then unknown, and perfected yet by any but themselves and I. This branch was established in Lancashire and is now very flourishing.

#### SECT. II. Of the THEORY of VITRIFICATION.

WITH regard to the theory of VITRIFICATION we are almost totally in the dark. It seems to be that state in which solid bodies, by the vehement action of fire, fitted to dissipate or carried off in vapour. In such situations there is a plentiful evaporation; solid substance is carried off in vapour, and the heat of a burning speculum, always previously takes place. The transition, between the state of fusion and that of a solid body, appears to be, that in the fire acts upon the parts of the body in such a manner as only to dissolve them, and render them fluid; but in vitrification it acts on the particles, but continues with them, and makes them into a third substance; where it is as much fire as it can contain, and hence their change from that density, except melted off in vapour.

But though we are unable to effect it upon solid bodies without a very violent heat, as in the several processes of crystal, and crystallization, nature may perhaps give us an idea how we can make what we call *glass*, but I believe are called *pyromorphosis*; but if they discover the essential properties, or nature of *pyromorphosis*. The most curious property of glass is its retaining the force of fire, and cannot admit of the best exchange of their fibres, but retaining their force, and still being very hard. The only use of it is for some vessels, and in the making of the most precious stones, and in the making of glass.

It is a common objection to this plan, that kinds of glass are capable of being con-

porcelain by a long continued cementation. This change happens in those kinds of glass which are made of salt and sand; and Dr Lewis has shown that ice is produced by the dissipation of the principle, which is the least fixed of the two. Therefore, we may consider as a substance which the fire has no other effect, than either to dissipate it in vapour.

• *Of the MATERIALS for MAKING GLASS.*

Materials, whereof glass is made, are salt or stones. I. The salt is procured from ashes brought from the Levant, called *or rochetta*. They are the ashes of a plant named KALI, (see SALSOLA, N<sup>o</sup> 1 & 2.) in summer, dried in the sun, and burnt either on the ground, or on iron grates; falling into a pit, grow into a hard mass, fit for use. It may also be procured from kelp, or the ashes of the *fucus vesiculosus*. See FUCUS, N<sup>o</sup> 12; and KELP.

Next the salt, these ashes are powdered and put into boiling water, and there kept till of the water be consumed; the whole is then strained up from time to time, that the ashes separate with the fluid, and all its salts be dissolved; then the vessel is filled up with new water, and boiled over again, till one half be consumed; that remains is a sort of ley, strongly coloured with salt. This ley, boiled over again in coppers, thickens in about 24 hours, and its salt, which is to be luted out, as is done in earthen pans, and thence into earthen pans to drain and dry. This done, it is dried, and thus put into a sort of oven, or furnace, to dry.

There are also other plants which yield a salt fit for use, such as the common thistle, bramble, mulberry, woad, tobacco, fern, and the numerous tribe, as pease, beans, &c. These form a leading flux in the manufacture of glass, and mostly supply the place of the Levant barilla of Spain, and other kinds. For the most part, they are sorted for making both glass and soap.

II. ASH. There are other fluxes used for the making of glass, and for various purposes, such as lead, nitre, sea salt, borax, arsenic, sulphur, and wood ashes, containing the most fixate salts as produced by incineration. In regard to these several fluxes, we may observe in general, that the more calx of lead, or of siliceous earth, that enters into the composition of glass, so much the more fusible, soft, and dense this glass is, and reciprocally the less given to glass, by calxes of lead, are the glasses that are given; on the other hand, glasses that are given by saline fluxes partake of the properties of saline fluxes; they are less heavy, less dense, harder, less brilliant, and more brittle than the glasses containing both saline and siliceous substances. Glasses too saline are easily altered by the action of air and especially those in which alkalis prevail; they are also liable to be injured by acids. Glasses that contain too much borax and arsenic, in the first they appear very beautiful, quickly

PART II.

turnish and become opaque when exposed to air. By attending to these properties of different fluxes, the artist may adjust the proportions of these to sand, or powdered flints, for the various kinds of glass.

II. The sand or stone, called by the artists TARSO, is the second ingredient in glass, and that which gives it the body and firmness. These stones, Agricola observes, must be such as will fuse; and of these such as are white and transparent are best; so that crystal has the precedency of all others. At Venice they chiefly use a sort of pebble, found in the Tefino, resembling white marble, and called *cuogolo*. Indeed Ant. Neri assures us, that all stones, which will strike fire with steel, are fit to vitrify; but Dr Morret shows, that there are some exceptions from this rule. Flints are admirable; and when calcined, powdered, and fused, make a pure white crystalline metal; but the expense of preparing them makes the masters of our glass-houses sparing of their use. Where proper stones cannot be so conveniently had, sand is used. The best for this purpose is that which is white, small, and shining; examined by the microscope, it appears to be small fragments of rock crystal. For green glass, that which is of a soft texture, and more gritty; it is to be well washed, which is all the preparation it needs. Our glass-houses are furnished with white sand, for their crystal glasses, from Lynn in Norfolk and Maidstone in Kent, and with the coarser, for green glass, from Woolwich.

III. Some mention a 3d ingredient in glass, viz. manganese; (see MANGANESE;) but the proportion of it to the rest is very inconsiderable; nor is it used in all glass. It purges off the natural greenish colour, and gives it some other tincture required. For this purpose it should be chosen of a deep colour, and free from specks of a metalline appearance, or a lighter cast. It requires to be well calcined in a hot furnace, and then to undergo a thorough levigation. The effect of manganese in destroying the colours of glass, (and hence called the *soap of glass*;) is thus accounted for by M. Montamy, in his *Traité des Couleurs pour la Peinture en Email*. It destroys the green, olive, and blue colours of glass, by adding to them a purple tinge, and by the mixture producing a blackish brown colour; and as blackness is caused merely by an absorption of the rays of light, the blackish tinge given to the glass by the mixture of colours, prevents the reflection of so many rays, and thus renders the glass less coloured than before. But the black produced by this substance suggests an obvious reason for using it very sparingly in these compositions of glass which are required to be very transparent. Nitre or saltpetre is also used with the same intention; as it serves to free glass prepared with lead as a flux from its yellow-coloured tinge; and in saline glasses, nitre is requisite in a smaller proportion to render them sufficiently transparent, as in the case of looking glass and other kinds of plates.

SECT. IV. *Of the FURNACES used in GLASS-MAKING.*

In this manufacture there are three sorts of furnaces; the 1st, called *calcar*, is for the fire; the 2d, for working the glass; the 3d, for annealing it, is called the *leer*. See *Plat. CLXVII.*

O O O

L. THE

I. The CALCAR is an oven 10 feet long, 7 feet broad, and 2 deep: the fuel, which in Britain is sea coal, is put into a trench on one side of the furnace; and the flame, reverberating from the roof upon the frit, calcines it. See CALCAR, N<sup>o</sup> 3.

II. The GLASS FURNACE, or WORKING FURNACE, is round, of 3 yards diameter, and 2 high; or in that proportion. It is divided into 3 parts, each of which is vaulted. The lower part is properly called the *croron*, and is made in that form. Its use is to keep a brisk fire, which is never put out. The mouth is called the *bocca*. There are several holes in the arch of this crown, through which the flame passes into the 2d partition, and reverberates into the pots filled with the materials. Round the insides there are 8 or more pots placed, and piling pots on them. The number of pots is always double that of the boccas or mouths, or of the number of workmen, that each may have one pot refined to work out of, and another for metal to refine in, while he works out of the other. Through the working holes the metal is taken out of the pots, and the pots are put into the furnace; and these holes are stopped with moveable covers made of lute and brick, to screen the workmen's eyes from the scorching flames. On each side of the bocca or mouth is a boccarella or little hole, out of which coloured glass or finer metal is taken from the piling pot.

III. Above this oven there is the 3d oven, called the LEER, about 5 or 6 yards long, and 4 feet wide, where the vessels of glass are annealed or cooled. This part consists of a tower, besides the leer, into which the flame ascends from the furnace. The tower has two mouths, through which the glasses are put in with a fork, and set on the floor or bottom; but they are drawn out on iron pans, called *frashes*, through the leer, to cool by degrees; so that they are quite cold by the time they reach the mouth of the leer, which enters the *farofel* or room where the glasses are to be stowed.

IV. The FURNACE for the GREEN GLASS is square; and at each angle it has an arch for annealing or cooling glasses. The metal is wrought on two opposite sides, and on the other two they have their colours, into which are made linnen holes for the fire to come from the furnace to bake the frit, and to discharge the smoke. Fires are made in the arches to anneal the work, so that the whole process is done in one furnace.

These furnaces must not be of brick, but of hard sandy stones. In France, they build the outside of brick; and the inner, to bear the fire, is made of a sort of fullers earth, or tobacco-pipe clay, of which they also make the melting pots. In Britain the pots are made of Sturbridge clay. Mr Blancourt observes, that the worst and roughest work in this art is the changing the pots when they are worn out or cracked. In this case, the great working hole must be uncovered; the faulty pot must be taken out with iron hooks and forks, and a new one must be speedily put in its place, through the flames, by the hands only. For this work, the man guards himself with a garment made of skins, in the shape of a pantaloon, that covers him all but his eyes, and is made as wet as possible: the eyes are defended with a proper sort of glass.

SECT. V. *Of the INSTRUMENTS used MAKING.*

THE instruments used in glass making are: 1. A blowing pipe, made of iron, about 2 feet long, with a wooden handle. 2. An iron tongs to take up the glass after it is blown, and to put it into the former. 3. Scissors to cut the glass whil it is soft. 4. A small iron to shape great glasses, &c. 5. An iron with the end of the handle cased with lead to take the metal out of the refining pot into the workmen's pots. 6. A small iron cased in the same manner, to skim the fat that swims at top. 7. Shovels, one to take up the great glasses; another shovel, to feed the furnace with coals. 8. A red iron fork, to stir the matter in the pot. 9. An iron rake for the same purpose, and to take out the metal. 10. An iron fork, to change or pull out the pots of the furnace. 11. And lastly the

GLASS POTS, or vessels in which the glass is melted. Those for the white glass work are made of a tobacco-pipe clay, brought from Wight, which is first well washed, then ground to a fine powder, and afterwards ground to a fine powder which being mixt with water, is the mould with the hands into the proper vessels. When these are thus made, they are afterwards annealed over the furnace. The green glass work are made of a different sort of clay from Staffordshire, and another sort of clay from Staffordshire make these so large as to hold 3 or 4 C.

They have also a small sort called *goblets*, which they set upon the larger, and work a finer and more nice metal fit for the

The clay that is used for this purpose is of the purest and most refractory kind, cleaned from all sandy, ferruginous, and matters; and to this it will be prepared ground crucibles, white sand, calcined ground levigated, or a certain proportion of baked, and pounded not very finely. The quantity of baked clay that ought to be mixed with the crude clay, to prevent the pots from cracking when dried, or exposed to a great heat, is not determined, but depends on the quality of the clay, which is more or less fat. M. de la Hire, in a memoir on this subject, proposes a method of ascertaining it; The bar clay, being mixed in different proportions, is formed into cakes, one inch thick, and six inches long and wide. Let these be dried, and exposed to a violent heat, till they come as hard and as much contracted as they can, and in this state be examined; and the one which has suffered a diminution equal only to an 18th part, is made the standard proportions. He observes, in general, that the proportion of the different clays should be to the fresh as 4 to 5.

SECT. VI. *Of the DIFFERENT KINDS*

THE manufactured glass now in use is divided into 3 general kinds; 1. white glass, 2. coloured glass, and 3. common bottle glass.

first kind there is a great variety; as the and the German crystal glass, which are to the same use: the glass for plates, for looking glasses; the glass for windows lights; and the glass for phials and small And these again differ in the substances as fluxes in forming them, as well as in fineness or fineness of such as are used for y. The flint and crystal, mirror and best glass, not only require such purity in the may render it practicable to free the cely from all colour; but, for the same ther the white Lynn sand, calcined flints, pebbles, should be used. The others do and the same nicety in the choice of rials; though the second kind of window d the best kind of phial, will not be so ey ought, if either too brown sand, or im- be suffered to enter into their composition. ured glass there is also a great variety differing in their colour or other proper- dling to the occasions for which they are

These differences depend on the prepa- d management of the artists by whom manufactured. See SECT. XIV.

is also distinguished into 3 principal kinds, or manner of working it; viz. 1. *Round* that of our bottles, vessels, phials, drink- s, &c. See SECT. X. 2. *Table or window* which there are divers kinds: as crown ous glass, &c. See SECT. XI. and 3. s, or *mirror glass*. See SECT. XII.

#### II. Of the COMPOSITIONS for making BOTTLE and PHIAL GLASS.

A common BOTTLE or GREEN GLASS of sand of any kind, fluxed by the ashes wood, or of any parts of vegetables; to y be added the *scoria* or clinkers of for- ten the softest sand is used, 200 lb. of es will suffice for 100 lb. of sand, which ground and mixed together. The com- with the clinkers consists of 170 lb. of es, 100 lb. of sand, and 50 of clinkers, to be ground and mixed together. If es cannot be ground, they must be bro- small pieces, and mixed with the other thout grinding.

AL GLASS is a kind betwixt the flint- the bottle glass. The best kind may be with 120 lb. of white sand, 50 lb. of un- earl-ashes, 10 lb. of common salt, 5 lb. , and 5 oz. of magnesia. The compo- reen or common phial glass consists of the cheapest white sand, 80 lb. of wood- burnt and sifted, 20 lb. of pearl-ashes, common salt, and 1 lb. of arsenic.

#### II. Of the COMPOSITIONS for making WHITE GLASS and CRYSTAL.

of the whitest tarso, pounded small, and fine as flour, 200 lb. of the salt of pol- 1 lb. mix them, and put them into the st heating it. For an hour keep a mo- , and keep stirring the materials with a ce, that they may incorporate and cal- ber; then increase the fire for 5 hours;

after which take out the matter; which being now sufficiently calcined, is called FRIT, or BOLLITO. See these articles. From the calcar put the frit in a dry place, and cover it up from the dust for 3 or 4 months.

To make the white glass or crystal, take of the crystal frit, set it in pots in the furnace, adding to it a due quantity of manganese: when the two are fused, cast the fluor into fair water, to clear it of the salt called *sandiver*; which would other- wise make the crystal obscure and cloudy. This lotion must be repeated again and again, as often as needful till the crystal be fully purged; or the scum may be taken off by proper ladles. Then set it to boil 4, 5 or 6 days; which done, see whe- ther it have manganese enough; and if it be yet greenish, add more by little and little at a time, taking care not to overdose it, because the man- ganese inclines it to a blackish hue. Then let the metal clarify, till it becomes of a clear and shining colour; which done, it is fit to be blown or form- ed into vessels.

FLINT GLASS, as it is called by us, is of the same general kind with that which in other places is called CRYSTAL glass. It has this name from being originally made with calcined flints, before the use of the white sand was understood; and re- tains the name, though no flints are now used in the composition of it. This flint glass differs from the other, in having lead for its flux, and white sand for its body; whereas the fluxes used for the crystal glass are salts or arsenic, and the body con- sists of calcined flints or white river pebbles, tarso, or such stones. To the white sand and lead a pro- per proportion of nitre is added, and a small quan- tity of magnesia, or manganese. In some works they use a proportional quantity of arsenic to aid the fluxing ingredients.

The most perfect kind of flint glass may be made, by fusing with a very strong fire 120 lb. of the white sand, 50 lb. of red lead, 40 lb. of the best pearl-ashes, 20 lb. of nitre, and 5 oz. of mag- nesia. Another composition of flint glass, which is said to come nearer to the kind now made, is the following: 120 lb. of sand, 54 lb. of the best pearl-ashes, 36 lb. of red-lead, 12 lb. of nitre, and 6 oz. of magnesia. To either of these a pound or two of arsenic may be added, to increase the flux of the composition.

A cheaper composition may be made with 120 lb. of white sand, 35 lb. of the best pearl-ashes, 40 lb. of red-lead, 13 lb. of nitre, 6 lb. of arsenic, and 4 oz. of magnesia; or instead of the arsenic may be substituted 15 lb. of common salt; but this will be more brittle. The cheapest compo- sition for the worst kind of flint glass consists of 120 lb. of white sand, 30 lb. of red-lead, 20 lb. of the best pearl-ashes, 10 lb. of nitre, 15 lb. of common salt, and 6 lb. of arsenic. The best German crys- tal is made of 120 lb. of calcined flints or white sand, 70 lb. of the best pearl-ashes, 20 lb. of salt- petre,  $\frac{1}{2}$  lb. of arsenic, and 5 oz. of magnesia. And a cheaper composition is formed of 120 lb. of calcined flints or white sand, 46 lb. of pearl- ashes, 7 lb. of nitre, 6 lb. of arsenic, and 5 oz. of magnesia.

A glass much harder than any prepared in the common

common way, may be made by means of borax, thus: Take 4 oz. of borax, and 1 of fine sand; reduce both to a subtil powder, and melt them together in a large close crucible set in a wind furnace, keeping up a strong fire for half an hour; then take out the crucible, and when cold break it, and there will be found at the bottom a pure hard glass, capable of cutting common glass like a diamond. This experiment, duly varied, says Dr Shaw, may lead to several useful improvements in making glass enamels, and facitious gems; and shows an expeditious method of making glass, without any fixed alkali, which has been generally thought an essential ingredient in glass; and perhaps calcined crystal, or other substances, added to this salt instead of sand, might make a glass approaching to the nature of a diamond.

SECT. IX. *Of the COMPOSITIONS for making PLATE or MIRROR GLASS.*

THE materials of which this glass is made are much the same as those of other works of glass, viz. an alkaline salt and sand. The salt, however, should not be that extracted from the ashes of the Syrian kali, but that from *BARILLA*, growing about Alicante in Spain. It is very rare that we have the barilla pure; the Spaniards in burning the herb mix another herb with it, which alters its quality; or add sand to it to increase the weight, which is easily discovered, if the addition be only made after the boiling of the ashes, but next to impossible if made in the boiling. From this adulteration threads and other defects in plate glass arise.

To prepare the salt, clean it well of all foreign matters; pound or grind it with a kind of mill, and finally sift it pretty fine. Pearl-ashes properly purified, will furnish the alkaline salt requisite for this purpose; but it will be necessary to add borax or common salt, to facilitate the fusion, and prevent the glass from stiffening in that degree of heat in which it is to be wrought into plates.

To purify the pearl-ashes, dissolve them in four times their weight of boiling water, in a pot of cast iron, kept clean from rust. Let the solution be removed into a clean tub, and remain there 24 hours or longer. Having decanted the clear part of the fluid from the sediment, put it again in the iron pot, and evaporate the water till the salts are left perfectly dry. Preserve them in stone jars, well secured from air and moisture. Pearl-ashes may also be purified in the highest degree, so as to be proper for the manufacture of the most transparent glass, by pulverizing 3 lb. of the best kind with 6 oz. of saltpetre in a glass or marble mortar, till they are well mixed; and then putting part of the mixture into a large crucible, and exposing it in a furnace to a strong heat. When this is red-hot, throw in the rest gradually; and when the whole is red-hot, pour it out on a moistened stone or marble, and put it into an earthen or clean iron pot, with 10 pints of water; heat it over the fire till the salts be entirely melted; let it then stand to cool, and filter it through paper in a pewter cullender. When filtered, put the fluid again into the pot, and evaporate the salt to dryness, which will then be as white as snow.

As to the sand, sift and wash it till the water

come off very clear; and when it is well mix it with the salt, passing the mixture through another sieve. This done, lay them in a sealing furnace for about two hours; at this time the matter becomes very light and in this state they are called *FATT*, and are laid in a dry clean-place, for at least a year, to give time to incorporate. When they employ this they lay it for some hours in the furnace to some the fragments of old and ill made taking care first to calcine them by heat red-hot in the furnace, and thus casting them into cold water. To the mixture must likewise be added manganese, to promote the fusion and purification.

The best composition for looking glass consists of 60 lb. of white sand cleaned, purified pearl-ashes, 15 lb. of saltpetre, 10 lb. of borax. If a yellow tinge should affect a small proportion of magnesia, mixed with an equal quantity of arsenic, should be added. An ounce of the magnesia may be first tried; if this proves insufficient, the quantity should be increased. A cheaper composition consists of white sand, 20 lb. of pearl-ashes, 10 lb. of common salt, 7 lb. of nitre, 2 lb. of arsenic, and 1 lb. of borax.

The matter of which the glasses are made in the famous manufacture of *St Gobin* is a composition of feldspar and of a white sand, carefully cleaned of all heterogeneous matters, afterwards washed several times, and so as to be pulverized in a mill, consisting of pebbles, which are moved by horses. When this is done, the sand is sifted through a sieve and dried. The matter thus far prepared is fit for plate-glass, to be formed either by casting or by blowing. See *SECT. XII.*

SECT. X. *METHOD of WORKING of ROUND GLASS.*

THE working furnace has six boccaures: at one of these, called the *great b* furnace is heated, and the pots or irons are set in the furnace; two other smaller boccaures, serve to lade or take out the metal, at the end of an iron, to work the glass. At the other holes they put in pots of the ingredients, to be prepared, and at last enter into the lading pot. There are 6 pots in the furnace, all made of tobacco pipe clay, which sustain not only the heat of the fire, but the effect of the pulverine, which penetrates nothing else. There are only two of these for working: the rest serve to prepare the glass for them.

The fire is made and kept up with wood, cast in without intermission at six times. When the matter in the pots is sufficiently fused, the workman proceeds to blow or to cast. For this purpose he dips his blowing pipe into the melting pot; and by turning it about, it sticks to the iron more firmly than to the glass. This he repeats 4 times, at each time he draws the end of his instrument, with the hot metal on a piece of plate iron; over which is a stream of water which helps to cool, and so to cast, and to dispose that matter, to bind the

is to be next taken out of the melting after he has dipt a 4th time, and perceiveth it metal enough on the pipe, he removeth immediately to the other end, and blows gently through the iron tube till it engulphs like a bladder about a foot, and lies it on a marble stone a little while to set it; and then he blows a second time, by which he gives it the shape of a globe of about 13 or 20 inches. Every time he blows into the pipe, he moves it quickly to his cheek; otherwise it will be in danger, by often blowing, of being broken into his mouth; and this globe is hardened by returning it to the fire; and is made of any form by stamp irons, which are used for the purpose.

When the glass is thus blown, it is cut off at the neck; which is the narrow part that is left. The method is this: the pipe is held in an iron bar, close by the collet; then cold water being laid on the collet, it is cut about a quarter of an inch, which, with a pair of cut-throats, will immediately break the collet. The operator then dips the pipe into the melting pot, by which he softens the metal as serves to attract the glass, to which he fixes this rod at the bottom, opposite to the opening made in the neck of the collet.

When the glass is carried to the great furnace of the oven, to be heated and blown, which means it is again put into such that, by the help of an iron instrument, is pierced, opened, and widened, being turned. But the vessel is not finished till it is turned to the great bocca; where being turned thoroughly, and turned quickly about at an inclination, it will open to any size, by heat and motion. If any superfluous glass be cut off with the shears; for the rest, it remains in a soft flexible state, and is taken from the bocca, and carried to a table, covered with brands, or coals, to be cooled by turning; as that motion settling, and preserves an evenness in the glass, where, as it cools, it congeals, being first cleared from the slight stroke by the workman.

When the whole body is already made, reduced to a handle, or any other member, he makes them separately; and with the help of hot metal, which he heats the pots with his iron rod; but the work is brought to its true hardness till it has cooled. See SECT. IV.

**METHOD of WORKING or BLOWING WINDOW or TABLE GLASS.**

The method above described, in SECT. X, of blowing window or table glass, is in every particular applicable to the working of window or table glass, when the iron has been dipt the 4th time, instead of rounding it, the workman manages the metal upon the iron rod, and extends 2 or 3 feet in the form of a cylinder; which is put again to the fire, and cooled a second time; and this is repeated till

it is extended to the dimensions required, the side to which the pipe is fixed diminishing gradually till it ends in a pyramidal form; so that, to bring both ends nearly to the same diameter, while the glass is thus flexible, he adds a little hot metal to the end opposite the pipe, and draws it out with a pair of iron pincers, and immediately cuts off the same end with the help of a little cold water, as before.

The cylinder being now open at one end, is carried back to the bocca; and there, by the help of cold water, it is cut about 8 or ten inches from the iron pipe or rod; and the whole length at another place, by which also it is cut off from the iron rod. Then it is heated gradually on an earthen table, by which it opens in length; while the workman, with an iron tool, alternately lowers and raises the two halves of the cylinder; which at last will open like a sheet of paper, and fall into the same flat form in which it serves for use; in which it is preserved by heating it over again, cooling it on a table of copper, and hardening it 24 hours in the annealing furnace, to which it is carried upon forks. In this furnace 100 tables of glass may lie at a time, without injury to each other, by separating them into tents, with an iron shaver between, which diminishes the weight by dividing it, and keeps the tables flat and even.

There are various sorts of window or table glass made in different places for the use of buildings. Those most known among us are enumerated by the author of the *Baileys Dictionary*, as follows:

1. **Old Crown Glass** says Neri, there are two kinds distinguished by the places where they are wrought; viz. **Katholick crown glass**, which is the best and clearest, and was first made at the Bear-parden, on the Bankside, Southwark, but since at K. Tolson's; and there are 24 tables to the case, the table being of a circular form about 3 feet 6 inches in diameter. The other kind, or **Lambeth crown glass**, is of a darker colour, and more inclining to green. The best window or crown glass is made of white sand 60 lb. of purified pearl ashes 30 lb. of salt petre 12 oz. of brax 1 lb. and of arsenic ½ lb. If the glass should prove yellow, magnesia must be added. A cheaper composition for window glass consists of 60 lb. of white sand, 25 lb. of unpurified pearl ashes, 10 lb. of common salt, 5 lb. of nitre, 2 lb. of arsenic, and 1½ oz. of magnesia. The common or green window glass is composed of 60 lb. of white sand, 30 lb. of unpurified pearl ashes, 10 lb. of common salt, 2 lb. of arsenic, and 2 oz. of magnesia. But a cheaper composition for this purpose consists of 120 lb. of the cheapest white sand, 30 lb. of unpurified pearl ashes, 60 lb. of wood ashes, well burnt and sifted, 20 lb. of common salt, and 5 lb. of arsenic.

2. **FRENCH GLASS, or NORMANDY GLASS**, called formerly *Lorraine glass*, is made wholly in the 9 glass works; whereof 5 are in the forest of Lyons, and 4 in the ci-devant county of Eu; the last at Beaumont near Rouen. It is thinner than our crown glass; and when laid on a piece of white paper, appears of a dirtyish green colour. There are but 25 tables of this to the case.

3. **GERMAN GLASS** is of two kinds, the *subite* and the *green*: the first is of a whitish colour, but

is subject to those small curved streaks observed in the Newcastle glass, though free from its blemishes. The green, besides its colour, is liable to the same streaks as the white; but both are straighter and less warped than Newcastle glass.

4. **DUTCH GLASS** is not much unlike Newcastle glass either in colour or price. It is frequently much warped like that, and the tables are but small.

5. **NEWCASTLE GLASS** is that most used in England. It is of an ash colour, and much subject to specks, streaks, and other blemishes; and besides is frequently warped. Leybourn says, there are 45 tables to the case, each containing 5 superficial feet: some say there are but 35 tables, and 6 feet in each table.

#### SECT. XII. METHODS of BLOWING and CASTING PLATE or MIRROR GLASS.

THE largest mirror glasses at St Gobin are run; the middle sized and small ones are blown.

1. **BLOWING THE PLATES.** (See *Plate CLXVII, Fig. 1.*) The workhouses, furnaces, &c. used in making the small kind of plate glass, are the same with those used for the large kind, except that they are smaller, and that the carquailles are disposed in a large covered gallery, over against the furnace.

After the materials are vitrified by the heat of the fire, and the glass is sufficiently refined, the workman dips in his blowing iron, six feet long, and two inches in diameter, narrowed at the end which is put in the mouth, and widened at the other, that the matter may adhere to it. He thus takes up a small ball of matter, which sticks to the end of the tube by constantly turning it. He then blows into the tube, to swell the ball; and carrying it over a bucket of water, which is placed on a support at the height of about 4 feet, he sprinkles the end of the tube to which the matter adheres, with water, still turning it, that by this cooling the matter may coalesce with the tube, and be fit for sustaining a greater weight. He dips the tube again into the same pot, and proceeds as before; and dipping it in the pot a 3d time, he takes it out, loaded with matter, in the shape of a pear, about ten inches in diameter, and a foot long, and cools it at the bucket; at the same time blowing into the tube, and with the assistance of a labourer, giving it a balancing motion, he causes the matter to lengthen; which, by repeating this operation several times, assumes the form of a cylinder, terminating like a ball at the bottom, and in a point at the top.

The assistant is then placed on a stool  $3\frac{1}{2}$  feet high: on this stool there are two upright pieces of timber, with a cross beam of the same, for supporting the glass and tube, which are kept in an oblique position by the assistant, that the master workman may, with a puncheon set in a wooden handle, and with a mallet, make a hole in the mass. This hole is drilled at the centre of the ball that terminates the cylinder, and is about an inch in diameter. When the glass is pierced, the defects of it are perceived; if it is tolerably perfect, the workman lays the tube horizontally on a little iron tressel, placed on the support of the aperture of the furnace. Having exposed it to the heat for

about half a quarter of an hour, he takes and with a pair of long and broad shears, ly sharp at the end, widens the glass, by driving the shears into the hole made with the puncheon while the assistant, mounted on a stool, turns it round, till at last the opening is large enough to make a perfect cylinder at bottom. When this is done, the workman lays his glass on a tressel at the mouth of the furnace to cool; he then gives it to his assistant on the stool, and the large shears cuts the mass of matter up height.

There is at the mouth of the furnace a tool, called **PONTIL**, which is now he used to separate it; it may unite and coalesce with the glass, and perform the office which the tube would do if it was separated from the glass. This piece of iron six feet long, and in the shape of a tube, having at the end of it a handle, a foot long, laid equally upon the tube, and making with it a T. This little tool is used to separate the matter of the glass, about four inches from the tube. This red-hot pontil is presented to the end of the glass, which coalesces immediately with the matter round the pontil, so as to support the tube for the following operation. When they separate the tube from the glass, a few blows with a chisel upon the tube which has been cooled; so that the tube breaks directly, and makes this separation. The tube being discharged of the glass, is carried to the pontil. They next present to the end of the tube the pontil of the glass, laying it on the tube, and redden the end of that glass with the heat of the furnace. The workman may open it with his shears, already opened one end of it, to make a hole in the tube; the assistant holding it on his side, and the workman working on the fore. For the last time, they put the tube to the tressel, that the glass may become quite flat, and the workman cuts it quite off with shears, right over-against the foreman. This he does as before, taking care that the tube and the glass are in the same line.

In the mean time, the man who holds the carquaille comes to receive the glass; he takes a shovel, 2 $\frac{1}{2}$  feet long without the handle, and 4 inches wide, with a small border of an inch in height, the right and left, and towards the handle. Upon this the glass is laid, and the workman with a small stick a foot and a half long, that the cut of the glass is turned up, and the assistant separates the glass from the pontil, by giving a few gentle blows between the two. The glass is then removed to the hot carquaille, where it becomes red-hot; the workman, with an iron tool, flattens it, and widens at the end in form of a T, 4 inches long, and 2 inches wide, and very flat, and not half an inch thick. He then lifts up the cut part of the glass, and turns it of its form of a flattened cylinder, and smooth, by turning it down upon the carquaille. The tool being now turned, the cylinder, performs this operation, and is pushed hard against all the parts. When the glass is thus made quite flat, it is pushed to the bottom of the carquaille, and the furnace with a small iron rake

Fig. 5.

ith a little iron hook. When the carquaiſſe it is ſtopped and cemented as in the caſe glaſſes, and the glaſs remains there for a ſit to be annealed; after which time it is out to be poliſhed. A workman can make 12 glaſs in an hour, and he works and reſts hours alternately.

h was the method formerly uſed for blow-ate glaſs, looking-glaſſes, &c.; but the work- by this method, could never exceed 30 inches gth, and a proportional breadth, becauſe were larger were always found to warp, h prevented them from reflecting the objects ly, and they wanted ſubſtance to bear the ry grinding. Theſe imperfections have been ed by the following invention of the Sieur am Thevart, in France, about 1688.

**CASTING OF RUNNING OF LARGE MIRROR IS PLATES.** The furnace is of a very large ſion, environed with ſeveral ovens, or an- g furnaces, called *carquaiſſes*, beſides others king of frit and calcining old pieces of glaſs. urnace, before it is fit to run glaſs, coſts . It ſeldom laſts above 3 years, and even in me it muſt be refitted every ſix months. It ix months to rebuild it, and 3 months to re-

The melting pots are as big as large hogf- and contain about 2000 weight of metal. of them burſts in the furnace, the loſs of atter and time amounts to 250 l. When the x is red-hot, the materials (ſee SECT. IX.) ut in at three different times, as this helps ſion; and in 24 hours they are vitrified, re- ſettled, and fit for caſting.

*Plate CLXVII, fig. 2,* A represents the boc- r mouth of the furnace; B the ciſtern that ys the liquid glaſs it receives out of the melt- ots in the furnace to the caſting table. Theſe as are filled in the furnace, and remain there- hours after they are filled; and then are ed out by a large iron chain, guided by a y, placed upon a carriage with four wheels, sed C,) by two men. This carriage has no le piece; ſo that when it has brought the ciſ- to the caſting table, D, they ſlip off the bot- of the ciſtern, and out ruſhes a torrent of ng matter upon the table: this matter is con- to certain dimenſions by the iron rulers EE, h are moveable, and retain it, and determine idth of the glaſs; while a man, with the rol- ; reſting on the edge of the iron rulers, re- it as it cools to an equal thickneſs, which is in the ſpace of a minute. This table is ſup- ed on a wooden frame, with truſtles for the enience of moving to the annealing furnace; which, ſtrewed with ſand, the new plate is ed, where it will harden in about 10 days.

hat is moſt ſurpriſing throughout the whole his operation, is the quickneſs and addreſs rewith ſuch maſſy ciſterns, filled with a flaming er, are taken out of the furnace, conveyed to able, and poured therein, the glaſs ſpread, &c. whole is inconceivable to ſuch as have not eye-witneſſes of that ſurpriſing manufacture. ſt as the ciſterns are emptied, they carry them to the furnace and take freſh ones, which empty as before. This they continue to do ng as there are any full ciſterns; laying as

many plates in each carquaiſſe as it will hold, and ſtopping them up with doors of baked earth, and every chink with cement, as ſoon as they are full, to let them anneal, and cool again, which requires about 14 days.

The firſt running being diſpatched, they pre- pare another, by filling the ciſterns anew from the matter in the pots; and after the 2d, a 3d, and even a 4th time, till the melting pots are quite empty. The ciſterns at each running ſhould remain at leaſt ſix hours in the furnace to whiten; and when the firſt annealing furnace is full, the caſting table is to be carried to another. The carquaiſſes, or annealing furnaces, muſt firſt have been heated to the degree proper for them. The oven-ful, or the quantity of matter commonly prepared, ſupplies the running of 18 glaſſes, which is performed in 18 hours, being an hour for each glaſs. The workmen work ſix hours, and are then relieved by others. When the pots are emp- tied, they take them out, as well as the ciſterns, to ſcrape off what glaſs remains, which otherwiſe would grow green by continuance of fire, and ſpoil the glaſſes. They are not filled again in leſs than 36 hours; ſo that they put the matter into the furnace, and begin to run it every 54 hours.

The manner of heating the large furnaces is very ſingular; the two tiſors, or perſons employed for that purpoſe, in their ſhirts, run ſwiftly round the furnace without making the leaſt ſtop: as they run along, they take two billets, or pieces of wood, which are cut for the purpoſe; theſe they throw into the firſt tiſſart; and continuing their courſe, do the ſame for the ſecond. This they hold without interruption for ſix hours ſucceſſiv- ly; after which they are relieved by others, &c. It is ſurpriſing that two ſuch ſmall pieces of wood, and which are conſumed in an inſtant, ſhould keep the furnace to the proper degree of heat; which is ſuch, that a large bar of iron, laid at one of the mouths of the furnace becomes red-hot in leſs than half a minute. The glaſs, when taken out of the melting furnace, needs nothing farther but to be ground, poliſhed, and foliated. See SECT. XIII.

SECT. XIII. *Of the GRINDING and POLISHING of PLATE or MIRROR GLASS.*

GLASS is made transparent by fire; but it receives its luſtre by the ſkill and labour of the grinder and poliſher; the former of whom takes it rough out of the hands of the maker.

I. To grind plate glaſs, they lay it horizontally upon a flat ſtone table made of a very fine-grained- free ſtone; and for its greater ſecurity they platter it down with lime or ſucco; elſe the force of the workmen, or the motion of the wheel with which they grind it, would move it about.

This ſtone table is ſupported by a ſtrong frame A, *Plate CLXVII, fig. 3,* made of wood, with a ledge quite round its edges, riſing about 2 inches higher than the glaſs. Upon this glaſs to be ground is laid another rough glaſs not above half ſo big, and ſo looſe as to ſlide upon it; but cemented to a wooden plank, to guard it from the injury it muſt otherwiſe receive from the ſcraping of the wheel to which this plank is faſtened, and from the weights laid upon it to promote the grinding or triture

triture of the glasses. The whole is covered with a wheel, B, made of hard light wood, about six inches in diameter, by pulling of which backwards and forwards alternately, and sometimes turning it round, the workmen, who always stand opposite to each other, produce a constant attrition between the two glasses, and bring them to what degree of smoothness they please, by first pouring in water and coarse sand; after that, a finer sort of sand, as the work advances, till at last they pour in the powder of smalt. As the upper or incumbent glass polishes and grows smoother, it is taken away, and another from time to time put in its place. This engine is called a *mill* by the artists, and is used only for the largest glasses; for in the grinding of the lesser glasses, they work without a wheel, and have only 4 wooden handles fastened to the 4 corners of the stone that loads the upper plank, by which they work it about.

II. When the grinder, (who finds it very difficult to bring the glass to an exact plainness,) has done his utmost, it is turned over to the polisher; who with the fine powder of tripoli stone, or emery, brings it to a perfect evenness and lustre. The instrument used in this branch is a board, *c c*, furnished with a felt, and a small roller, which the workman moves by means of a double handle at both ends. The artist, in working this roller, is assisted with a wooden hoop or spring to the end of which it is fixed; for the spring, by constantly bringing the roller back to the same points, facilitates the action of the workman's arm. Mr Burroughs invented a curious machine for grinding and polishing glass, of which we have already inserted a description. See BURROUGHS'S MACHINE, and Plate XLIV, fig. 8, 9, and 10.

#### SECT. XIV. Of the COLOURING of GLASS.

EVERY glass pot when new, and first used, leaves a foulness in the glass from its own earthy parts; so that a coloured glass made in a new pot can never be bright or perfectly fine. For this reason, the larger of these, when new, may be glazed with white glass; but the 2d time of using, the pots lose this foulness. To glaze the pots, reduce the glass to powder, and moisten the inside with water; while it is yet moist, put in some of the powdered glass, and shake it about, till the whole inner surface of the pot be covered by as much as will adhere to it, in consequence of the moisture. Throw out the redundant part of the powdered glass; and the pot being dry, set it in a furnace sufficiently hot to vitrify the glass adhering to it, and let it continue there some time; after which, care must be taken to let it cool gradually.

Pots which have served for one colour must not be used for another; as the remainder of the old matter would spoil the colour of the new. The colours must be very carefully calcined to a proper degree; for if they are calcined either too much or too little, they never do well; the proper proportion, as to quantity, must also be carefully regarded, and the furnaces must be fed with dry hard wood. All the processes succeed best when the colour is used dividedly; that is, a part of it in the frit, and the rest in melted metal.

A hard glass, proper for receiving colours, may be prepared by pulverising 12 lb. of the best sand,

cleaned by washing in a glass or flint mixing 7 lb. of pearl-ashes or any fine salt, purified with nitre, 1 lb. of saltpetre of borax, and pounding them together less hard may be prepared of 12 lb. of cleaned, 7 lb. of pearl-ashes purified petre, 1 lb. of nitre,  $\frac{1}{2}$  lb. of borax, arsenic prepared as before.

1. AMETHYST COLOUR. See AMETHYST and § 16, below.

2. BALASS COLOUR. Put into a pot thrice washed in water; tinge this with prepared into a clear purple; to this *catinum*, sifted fine, in small quantities several times: this will make the glass pink, and a little reddish, but not black ways dissipates the manganese. The 1 add manganese, give no more of the *alio* unless the colour be too full. Thus, be exactly of the colour of the balas rub

3. BLACK. The glass-makers for black, take old broken glass of different grind it to powder, and add to it, parcels, a sufficient quantity of a mixture parts zaffer and one part manganese; purified, they work it into vessels, beads are coloured with manganese on

4. BLACK VELVET COLOUR. To give and fine colour to glass, take of cry pulverine frit, each 20 lb. of calc of 4 lb.; set all together in a pot in the furnace heated; when the glass is formed and steel well calcined and powdered, an iron, of each an equal quantity; powder them well; then put 6 oz. of this pot above described metal while in fusion whole thoroughly together, and let them strongly together; then let it stand 4 hours to purify, and after this work be a most elegant velvet black. A very velvet colour is also produced thus: Take of rochetta frit; add 2 lb. of tartar, a manganese, both in fine powder; mix and put them to the metal while in fusion ferent times, in several parcels; let it in fusion after this for four days, and then a glass perfectly black may also be formed, to 10 lb. of either of the compositions for above described, one ounce of zaffer, six manganese, and an equal quantity of iron calcined.

5. BLUE. A full blue may be made 6 dr. of zaffer and 2 dr. of manganese in either of the compositions for hard glass above. For a very cool or pure blue 10 ounce of calcined copper may be used the manganese, and the proportion of zaffer by one half. Glass resembling may be made with ten pounds of either composition for hard glass, three drams scruple of zaffer, and one dram of the or precipitation of gold by tin; or lastly latter ingredient, two drams and two manganese. Or a sapphire coloured glass made by mixing with any quantity of glass one eighth of its weight of beautiful blue glass is also produced from regulus of cobalt.

wn. Venetian Brown with GOLD SPAN-  
 lied also the *philosopher's stone*, is prepa-

Take of the 2d composition for hard  
 e described, and of the composition for  
 each 5 lb. and of highly calcined iron,  
 them well, and fuse them till the iron  
 ly vitrified, and has tinged the glass of  
 nispant yellow brown colour. Powder  
 and add to it 2 lb. of powdered glass of  
 ; grind them together, and thus mix  
 . Take part of this mixture, and rub  
 or 120 leaves of the counterfeit leaf gold  
*ch gold*; and when the parts of the gold  
 ibly divided, mix the powder consi-  
 with the other part of the glass. Fuse  
 with a moderate heat till the powder  
 vitreous mass, fit to be wrought into  
 or vessel; but avoid a perfect liquefac-  
 at would destroy the dissolution of the  
 nd vitrify, at least in part, the matter  
 ey are composed; converting the whole  
 d of transparent olive-coloured glass  
 of glass is procured from Venice, and is  
 great variety of toys and ornaments.

CHIMNEY. A mixture of several ingre-  
 the common matter of glass, will make  
 : the semi-opaque gems, the jaspers, a-  
 cedonies, &c. The way of making  
 what resembles the method of making  
 aper, by several colours dissolved in wa-  
 rs, which are such as will not readily  
 one another when put into water, has  
 re cast upon the paper which is to be

The following is reckoned the best  
 Dissolve 4 oz. of fine leaf silver in a glass-  
 on aquafortis; stop up the vessel, and  
 :—In another vessel, dissolve 2 oz. of  
 in 1 lb. of aquafortis, and let it settle  
 er glass vessel, dissolve in 1 lb. of aqua-  
 of fine silver, first calcined in this man-  
 gamate the silver with mercury, mix  
 m with twice its weight of common  
 rified; put the mixture in an open fire  
 le, that the mercury may fly off; and  
 be left in form of powder. Mix this  
 th an equal quantity of common salt  
 ed, and calcine this for six hours in a  
 ; when cold, wash off the salt by re-  
 lings in common water, and then put  
 nto the aquafortis. Set this solution

—In another vessel, dissolve in 1 lb. of  
 ; oz. of sal ammoniac; pour off the so-  
 dissolve in it a quarter of an ounce of  
 this also aside.—In another vessel, dis-  
 of sal ammoniac in 1 lb. of aquafortis;  
 to the solution cinnabar, crocus martis,  
 , and ferreto of Spain, of each half an  
 this also aside.—In another vessel dis-  
 of aquafortis 3 oz. of sal ammoniac;  
 to it crocus martis made with vinegar,  
 , zaffer, and cinnabar, of each half an  
 each of these be powdered very fine,  
 ntly into the aquafortis. Set this also  
 nother vessel, dissolve 3 oz. of sal am-  
 lb. of aquafortis, and add to it brass  
 ith brimstone, brats thrice calcined,

and scales of iron, of each half an  
 each be well powdered, and put gently  
 PAR II.

into the vessel. Then set this also aside.—In ano-  
 ther vessel, dissolve 2 oz. of sal ammoniac in 1 lb.  
 of aquafortis, and put to it verdigrise 1 oz. red  
 lead, crude antimony, and the caput mortuum of  
 vitriol, of each half an ounce; put these well pow-  
 dered leisurely into the vessel, and set this also a-  
 side.—In another vessel, dissolve 2 oz. of sal am-  
 moniac in 1 lb. of aquafortis, and add orpiment,  
 white arsenic, painters lake, of each half an ounce.  
 Keep the above 9 vessels in a moderate heat for 15  
 days, shaking them well at times. After this pour  
 all the matters from these vessels into one large  
 vessel, well luted at its bottom; let this stand six  
 days, shaking it at times; and then set it in a very  
 gentle heat, and evaporate all the liquor, and  
 there will remain a powder of a purplish green.  
 When this is to be wrought, put into a pot very  
 clear metal, made of broken crystalline and white  
 glass that has been used; for with the virgin frit,  
 or such as has never been wrought, the chalcidony  
 can never be made, as the colours do not stick to  
 it, but are consumed by the frit. To every pot  
 of 20 lb. of this metal put 2 or 3 oz. of this pow-  
 der at three several times; incorporate the pow-  
 der well with the glass; and let it remain an hour  
 between each time of putting in the powders. Af-  
 ter all are in, let it stand 24 hours; then let the  
 glass be well heated, and take an assay of it, which  
 will be found of a yellowish blue; return this many  
 times into the furnace; when it begins to grow  
 cold, it will show many waves of different coloura  
 very beautifully. Then take tartar 3 oz. foot of  
 the chimney 2 oz. crocus martis made with brim-  
 stone, half an ounce; let these be well powdered  
 and mixed, and put them by degrees into the glass  
 at six times, waiting a little while between each  
 putting in. When the whole is put in, let the  
 glass cool and settle for 24 hours; then make a  
 little plat body of it; which put in the furnace  
 many times, and see if the glass be enough, and  
 whether it have on the outside veins of blue, green,  
 red, yellow, and other colours, and have beside  
 these veins, waves like those of the chalcidonyes,  
 jaspers, and oriental agates, and if the body kept  
 within looks as red as fire. When it answers  
 thus, it is perfect, and may be worked into toys  
 and vessel; which will always be beautifully varie-  
 gated; these must be well annealed, which adds  
 much to the beauty of their veins. Pieces of this  
 polished by the lapidary appear like natural stones,  
 and are very beautiful. If in the working the  
 matter grow transparent, the work must be stop-  
 ped, and to be tartar, foot, and crocus martis  
 must be put to it, which will give it a necessary  
 cessary body and opacity, without which it does  
 not show the colours well.

8. CHRYSEOTRIUM. To make this glass made of  
 of 1 lb. of either of the compositions for hard glass  
 described above, and six drams of calcined iron.

9. CORNELIAN. The red cornelian colour  
 may be formed by adding 1 lb. of glass of anti-  
 mony, 2 oz. of the calcined vitriol called *ferret*  
*colony*, and one dram of green mefe or magnesia,  
 to 2 lb. of either of the compositions for hard  
 glass. The glass of antimony and magnesia  
 first used with the other glass, and then powder-  
 ed and ground with the ferret colony; the whole  
 mixture is afterwards fused with a gentle heat of

all the ingredients are incorporated. A glass resembling the **WHITE** cornelian may be made of 2 lb. of either of the compositions for hard glass, 2 drams of yellow ochre well washed, and 1 oz. of calcined bones: grind them together, and fuse them with a gentle heat.

10. **EMERALD.** See § 13.

11. **GARNET.** To give this colour to glass, take equal quantities of crystal and rochetta frit, and, to every hundred weight of this mixture, add 1 lb. of manganese and 1 oz. of prepared zaffer: powder these separately; then mix and add by degrees to the frit while in the furnace. Great care is to be taken to mix the manganese and zaffer very perfectly; and when the matter has stood 24 hours in fusion, it may be worked. Glass of this kind may be made by adding 1 lb. of glass of antimony, one dram of manganese, and the same quantity of the precipitate of gold by tin, to 2 lb. of either of the compositions for hard glass; or the precipitate of gold may be omitted, if the quantities of the glass of antimony and manganese be doubled.

12. **GOLD COLOUR.** Take 10 lb. of either of the compositions for hard glass, omitting the saltpetre; and for every pound add 1 oz. of calcined borax; or, if this quantity does not render the glass sufficiently fusible, 2 oz.; 10 oz. of red tartar of the deepest colour; 2 oz. of magenta; and two drams of charcoal of fallow, or any other soft kind. Precipitates of silver baked on glass will stain it yellow, and likewise give a yellow colour on being mixed and melted with 40 or 50 times their weight of vitreous compositions; the precipitate from aquafortis by fixed alkali seems to answer best. Yellow glasses may also be obtained with certain preparations of iron, particularly with Prussian blue. But Dr Lewis observes, that the colour does not constantly succeed, nor approach to the high colour of gold, with silver or with iron. The nearest imitations of gold which he was able to produce were effected with antimony and lead. Equal parts of the glass of antimony, of that calcined and powdered, and of nitrium, formed a glass of a high yellow. With two parts of glass of antimony, 2 of nitrium, and 3 of powdered tart, the colour approached still more to that of gold. The best composition exhibited a multitude of small speckles interspersed throughout the whole substance, which, as it is less fluid, so range in the mass, but were readily imbedded, as they rose to the air bubbles. Nonetheless, to a small colour, one part of red tartar and one part of manganese, to be mixed with 100 parts of glass. But Kamskel says, that six parts of tartar are barely sufficient, unless the tartar be of a dark red colour, almost blackish; and that he found it convenient to add to the tartar about 1/2 drams weight of powdered chromal. He adds, that the glass was very easy in melting, and that it could be kept undiluted, and worked as it stands in a furnace. Mr Samuel More, in repeating and varying the proportions to render the gold colour more brilliant, found that one ounce of tartar and one ounce of chromal, to 100 lb. of glass, was only necessary to give it a very brilliant yellow; that the tartar should be of a dark red colour; the insoluble part of the tartar should be of a few red precipitates to be the dis-

tinging substance. Mr Pott of common coals give a yellow colour to different coaly matters differ in their tints; that caput mortuum of foot and answer better than common charcoals. The sparkling coal, which remains in after the rectification of the thick animal oils, is one of the most active preparations. This preparation, he says and then burnt again a little in a clay excellent for tinging glass, and gives yellow reddish, or blackish colours, according to the quantity; but the frit must not be very hard for in this case the strong fire will de-colouring substance before the glass melts: the following compositions to be used viz. sand two parts, alkali 3 parts; alkali 2 or 3, calcined borax one; saltpetre is hardly used at all, or very little for yellow glasses, as it too much colours the substance, yet here for the certain proportion of it, easily determined is very necessary; for without it the colouring matter is apt to make the glass and even of an opaque pitchy blackness not certainly appear, that there is any verity in the effects of different colours being probably owing to the different titles of the inflammable matter which stain; so that a little more may be necessary than of another for producing the same degree of colour in the glass. Gold-colour may be diffused through the substance mixing the yellow tales with powder bringing the mixture into fusion.

13. **GREEN, or EMERALD COLOUR.** Prepared to glass by adding 3 oz. of extracted from aquafortis, and two drams of iron, to 9 lb. of either of the compositions for hard glass. The finest method of beautiful colour to glass is this: Purify crystalline metal, that has been put through water, and the same the common white metal or powder common pulverine frit, and 3 lb. of tartar, the red lead well with the salt, and put into a pot in a furnace. In a few hours the metal will be well purified; then cast into water, and separate and take it, then return the metal into the pot, and find a dry lower in fusion; then put a dr of the residuum of the vitriol of a very little chromal tartis; there will be a most lively and elegant green, leave that of the oriental emerald. There are many ways of giving a green to glass, but all inferior to this: To make a SEA GREEN crystalline glass only must be added, a green must be added as first to the crystalline metal must be melted thus, then cast, which swims like oil on its top, then taken off with an iron ladle very carefully to a pot of red lead or this metal, and 1 lb. of calcined tart, and 1 part of the powdered zaffer; the powder must be put into the glass at three times; the metal well at first, and all must be mixed in the pot. After it has been

take out a little for a proof: if it be  
ld more of the powder. In 24 hours  
the powder, the whole will be ready  
t must be well stirred from the bot-  
: colour should be deepest there, and  
the top less coloured, or even quite  
Some use for this purpose half cytal  
rochetta frit, but the colour is finest  
frit is used alone.

COLOUR. See § 7.

COLOUR. M. Magellan says, that  
: of opals are easily imitable by art ;  
: of glass being made which show very  
ours by reflection and by refraction.  
one is preserved in the abbey of St  
Paris, which is green on the outside,  
fine ruby colour when held between  
he light. See OPAL. M. Magellan dis-  
t the red glass of Kunckel, when over-  
burnt in a common fire, produces a  
transmitting one colour by reflection  
by refraction.

LE of a deep and bright colour may  
by adding to 10 lb. of either of the  
; for hard glass, six drams of zaffer  
m of gold precipitated by tin; or 1  
anese and  $\frac{1}{2}$  oz. of zaffer. The co-  
RUBY may be imitated in this way.

A blood-red glass may be made in  
manner: Put 6 lb. of glass of lead,  
common glass, into a pot glazed with

When the whole is boiled and re-  
by small quantities, at short distances  
per calcined to a redness as much as  
proofs is found sufficient; then add  
vder by small quantities at a time, till  
come as red as blood; and contin-  
one or other of the ingredients till the  
te perfect.

To give the true fine red of the ruby,  
ansparency, to glass: Calcine in earth-  
ld dissolved in aqua regia; the men-  
ge evaporated by distillation, more  
ded, and the abstraction repeated 5  
till it becomes a red powder. This  
quires many days in a hot furnace.  
owder is of a proper colour, take it  
hen it is to be used, melt the finest  
and purify it by often casting it into  
hen add, by small quantities, enough  
owder to give it the true colour of a  
an elegant and perfect transparency.  
of tinging glass and enamels by prepa-  
ld was first attempted about the be-  
e 17th century. Libavius, in one of  
tled *Alchymia*, printed in 1606, con-  
the colour of the ruby proceeds from  
at gold dissolved and brought to red-  
: made to communicate a like colour  
gems and glass. On this principle  
*Art of Glass*, dated in 1611, gave the  
: cited. Glauber, in 1648, publish-  
l of producing a red colour by gold,  
which is of the vitreous kind, though  
glass. For this purpose he ground  
it or sand with 4 times its weight of  
salt: this mixture melts in a mode-  
fire, and when cold looks like glass,

but exposed to the air run into a liquid state. On  
adding this liquor to solution of gold in aqua-regia,  
the gold and flint precipitate together in form of  
a yellow powder, which by calcination becomes  
purple. By mixing this powder with 3 or 4 times  
its weight of the alkaline solution of flint, drying  
the mixture, and melting it in a strong fire for an  
hour, a mass is obtained of a transparent ruby  
colour, and of a vitreous appearance; which ne-  
vertheless is soluble in water, or by the moisture  
of the air, on account of the redundancy of the  
salt. Mr BOYLE, in a work published in 1680,  
mentions an experiment in which a like colour  
was introduced into glass without fusion; for ha-  
ving kept a mixture of gold and mercury in diges-  
tion for some months, the fire was at last im-  
moderately increased, so that the glass burst with a  
violent explosion; and the lower part of the glass  
was found tinged throughout of a transparent red  
colour, hardly to be equalled by that of rubies.  
About the same time Cassius is said to have dis-  
covered the precipitation of gold by tin, and that  
glass might be tinged of a ruby colour by melting  
it with this precipitate; though Dr Lewis doubts  
if he was the discoverer of either. He describes  
the preparation of the precipitate and its use; but  
gives no account of the manner of employing it,  
only he says that one dram of gold duly prepared  
will tinge 10 lb. of glass. This process was soon  
after brought to perfection by KUNCKEL; who  
says, that one part of the precipitate is sufficient  
to give a ruby colour to 1280 parts of glass, and  
a sensible redness to upwards of 1900 parts; but  
that the success is by no means constant. Kun-  
ckel also mentions a purple gold powder, resembling  
that of Neri, which he obtained by inspissating  
solution of gold to dryness; abstracting from it  
fresh aqua-regia 3 or 4 times, till the matter ap-  
pears like oil; then precipitating with strong alkali-  
ne ley, and washing the precipitate with water.  
By dissolving this powder in spirit of salt, and  
precipitating again, it becomes extremely fair;  
and in this state he directs it to be mixed with a  
due proportion of Venice glass. ORSCHAL, in a  
treatise intitled *Sol sine Vesca*, gives the following  
process for producing a very fine ruby. He di-  
rects the purple precipitate made by tin to be  
ground with six times its quantity of Venice glass  
into a very fine powder, and this compound to  
be very carefully mingled with the frit or vitreous  
composition to be tinged. His frit consists of  
equal parts of borax, nitre, and fixed alkaline salt,  
and 4 times as much calcined flint as of each of  
the salts; but he gives no directions as to the pro-  
portion of the gold precipitate or mode of fusion.  
Hellot describes a preparation, which, mixed with  
Venice glass, gives a beautiful purple enamel.  
This preparation consists of equal parts of solution  
of gold and of solution of zinc in aqua-regia mixed  
together, with the addition of a volatile salt prepa-  
red from sal ammoniac by quicklime, in sufficient  
quantity to precipitate the 2 metals. The precipi-  
tate is then gradually heated till it acquires a violet  
colour. However, though a purple or red colour,  
approaching to that of ruby, may, by these me-  
thods, be baked on glass or enamels, and intro-  
duced into the mass by fusion, the way of equally  
diffusing such a colour through a quantity of fluid  
glass

glass is still, says Dr Lewis, a secret. The following process for making the ruby glass was communicated to Dr Lewis by an artist, who ascribed it to Kunckel. The gold is dissolved in a mixture of one part of spirit of salt and 3 of aquafortis, and the tin in a mixture of one part of the former with two of the latter. The solution of gold being properly diluted with water, the solution of tin is added, and the mixture left to stand till the purple matter has settled to the bottom. The colourless liquor is then poured off, and the purple sediment, while moist and not very thick, is thoroughly mixed with powdered flint or sand. This mixture is well ground with powdered nitre, tartar, borax, and arsenic, and the compound melted with a suitable fire. The proportions of the ingredients are 2560 parts of sand, 384 of nitre, 240 of tartar, 240 of borax, 28 of arsenic, 5 of tin, and 5 of gold.

19. SEA GREEN. See § 13, and GLASS, § 21.

20. TOPAZ. Glass resembling this stone may be made by pulverizing 10 lb. of either of the compositions for hard glass with an equal quantity of the gold-coloured glass, and fusing them together. Or take crystal frit 15 lb. calcined lead 12 lb. mix them well together, by lifting the pow-

ders through a fine sieve; then set them in a furnace not too hot, and separate the unmixed lead, by casting the whole in water; repeat this twice: then add half gold y and let them incorporate and purify. The colour will be of the true and exact colour of tal topazes.

21. WHITE OPAKE and SEMI-TRANSPARENT glass may be made of 10 lb. of either of the compositions for hard glass and 1 lb. of wax, horn, ivory, or bone; or an opake may be given to glass by adding one part of very white arsenic to ten pounds of glass. Let them be well powdered and mixing them together, and then fused with a moderate heat till they are thoroughly incorporated. A glass of this kind is made in large quantities at a manufacture near London; and used for different kinds of vessels, but as a window glass for enamel in dial-plates and snuff boxes, does not require finishing with much fire, but comes very white and fusible with a moderate heat.

22. YELLOW. See § 12.

For farther particulars respecting COLOURS, DOUBLETS, and other counterfeit GLASS, see the article PASTES.

## G L A

\* GLASSMAN. *n. f.* [*glass* and *man*.] One who sells glass.—The profit of glasses consists only in a small present made by the *glassman*. *Swift*.

\* GLASSMETAL. *n. f.* [*glass* and *metal*.] Glass infusion.—Let proof be made of the incorporating of copper or brass with *glassmetal*. *Bacon's Phys.*

GLASSNEVIN, a pleasant village of Ireland, seated on a rising ground, 2 miles from Dublin.

GLASS-POT. See GLASS-MAKING, SECT. V.

GLASTENBURG, a town of Connecticut, 17 miles WNW. of Wyndham.

\* GLASSWORK. *n. f.* [*glass* and *work*.] Manufactory of glass.—The crystalline Venice glass is a mixture, in equal proportions, of stones brought from Pavia, and the ashes of a weed called kali, gathered in a desert between Alexandria and Rosetta; by the Egyptians used first for fuel, and then they crushed the ashes into lumps like a stone, and sell them to the Venetians for their *glassworks*. *Bacon's Nat. Hist.*

(1.) \* GLASSWORT. *n. f.* [*salicornia*, or saltwort.]—It hath an apetalous flower, wanting the empalement; for the stamina, or chives, and the embryoes, grow on the extreme part of the leaves; these embryoes afterwards become pods or bladders, which, for the most part, contain one seed. The inhabitants near the sea-coast cut the plants up toward the latter end of summer; and, having dried them in the sun, they burn them for their ashes, which are used in making of glass and soap. These herbs are by the country people called kelp. From the ashes of these plants is extracted the salt called sal kali, or alkali, by the chymists. *Mill*.—For the fine glass we use the purest of the finest sand, and the ashes of kali or *glasswort*; and for the coarser or green sort, the ashes of brake or other plants. *Bacon's Vulg. Err.*

That shows his hoar leaves in the

—The magnet attracteth the shining  
Or der brought from the Indies, usual  
in writing dust. *Brown*.

Whose womb produc'd the *glass*  
Bred

The hoary frosts that fall on Wint

The *glassy* deep.

(1.) GLASTONBURY, a town of Somersetshire, anciently called *Av Avalonia*. It is noted for a famous magnificent ruins of which still remains a structure called *the Abbot's kitchen*, entire, and is of a very unusual construction. The monks pretend that it was the relict of Joseph of Arimathea, and of St Patrick of the West Saxons, erected a church in 703, which he and his successors emic that the abbot had the title of *lord*, and the barons in parliament; and not or prince durst set foot on the ille

the abbey stands, without his leave. The manor was about 40,000l. a-year, besides the tithes, and was locked with deer. In 1533, it was ruined by the plague, but rebuilt by K. Edmund I. In 1569, the town and abbey were burnt, and in 1570, destroyed by an earthquake. Richard Wisliff, abbot, who had 100 monks and 400 nuns, was hanged on Torhill, in his pontificals, for refusing to take the oath of allegiance to Henry VIII. Edgar and many other kings were buried here; as well as Arthur, British king. See ARTHUR, N<sup>o</sup> 1, § 3. The abbey has part of a pillar, a door, or a window, of which there still remain the choir, the middle tower and chapels. The sides of the abbey are overgrown with ivy, and the towers are in a melancholy and venerable aspect. Here are two parish churches. This town, under its abbots, was a parliamentary borough, but it lost that and its privilege of a corporate charter, the latter of which, however, was restored to it by Charles II. who granted it a new charter for a free borough. The only manufacture is paper, but the chief support of the place is the ruins of the abbey. The ruins here were formerly called the *Abbat's Palace*; because it was a receptacle for the pilgrims who visited the abbey. At a little distance is an old church and facing the monk's church are three remarkable pyramids, with inscriptions, but so unintelligible, and an image in bishop's robes. Clattonbury is 3 miles SSW. of Wells, W. of London. Lon. 2. 40. W. Lat. 51.

GLASTONBURY, a town of Connecticut, in the north county, on the E. side of the Connecticut river.

GLASTONBURY, a township of Vermont, in the north county.

GLASTONBURY THORN. *n. f.* A species of rose. — This species of thorn produces some of the flowers in Winter, and flowers again in Spring. *Miller*.

GLASTONBURY THORN. See CRATEGUS,

GLAUCOM. See GLASS, N<sup>o</sup> IV, § 2.

GLAUC, a river of Suabia, which runs into the Danube, 2 miles N. of Sultz.

GLAUC, a county of Bohemia, or according to Mr. Cruttwell, of Silesia, on the border of Bohemia, surrounded by mountains. It is bounded to the K. of Prussia by the Q. of Hungary. It is 45 miles in length, and 12 miles in breadth. It has mines of coal, silver, iron, &c. and marble quarries, plenty of good fine springs of mineral water. Jaspazes, &c. are found in it.

GLAUC, the capital of the above county, is situated on the Neisse, and has strong fortifications, with a castle built upon a mountain. It lies 25 miles W. of Neisse, and 88 E. of Breslau. Lon. 16. 50. E. Lat. 50. 25. N.

GLAUC, KOGEL, a mountain of Austria, in the S. of Steyr.

GLAUCER, John Rodolphus, a celebrated chemist, who flourished about 1646. He wrote a great number of treatises on chemistry, which have been translated into French.

All his works have been collected into one volume, intitled, *Glauberus concentratus*, which has been translated into English, and was printed at London in folio, in 1689.

(2—4.) GLAUBER, John, John-Gottlieb, and Diana, two brothers and a sister, all celebrated Dutch painters, born at Utrecht in 1646, 56, and 50. The brothers excelled in landscapes; the sister in portraits and history. John died in 1726; John-Gottlieb in 1703.

(5.) GLAUBER'S SALTS. See CHEMISTRY, *Ind.*

GLAUCE. See CREON, N<sup>o</sup> 1. and CREUSA, N<sup>o</sup> 2.

GLAUCHA, or } a town of Upper Saxony, in  
GLAUCHAU, } Schonburg, on the Mulda,  
containing 600 houses, 6 miles N. of Zuickaw,  
and 45 W. of Dresden.

GLAUCHE, a town of Lower Saxony, in Magdeburgh, adjoining to the Halle, but governed by its own magistrates. It has 4 schools, and 120 teachers.

(1.) \* GLAUCOMA. *n. f.* [*γλαυκωμα*; *gl income*, French.] A fault in the eye, which changes the crystalline humour into a greyish colour, without detriment of sight, and therein differs from what is commonly understood by suffusion. *Quincy*. — The *glaucoma* is no other disease than the cataract. *Sharp*.

(2.) GLAUCOMA, (from *γλαυκος*, sea-green, or sky colour,) is a disease in the eyes, wherein the crystalline humour is turned of a *bluish* or *greenish* colour, and its transparency hereby diminished. To those in whom this disorder is forming, all objects appear as through a cloud or mist; when entirely formed, the visual rays are all intercepted and nothing is seen at all. It is incurable, when inveterate, and in aged persons; and is always very difficult of cure, externals proving of little service. The internals best suited to it, are those used in the gutta serena. See *Opul. C. 7, ar. Glauclimus*, Consul. 94. The glaucoma is usually distinguished from the cataract or suffusion, in this, that in the cataract the whitenss appears in the pupil, very near the cornea; but it shows deeper in the glaucoma. Some late French authors, however, maintain the cataract and glaucoma to be the same disease. According to them, the cataract is not a film, or pellicle, formed before the pupil, as had always been imagined; but an inspissation or induration of the humour itself, whereby its transparency is prevented; which brings the cataract to the glaucoma. According to Mr. Sharp, the glaucoma of the ancient Greeks is the present cataract; but M. St Yves says, it is a cataract accompanied with a gutta serena. See SURGERY.

GLAUCUS, in ancient mythology, a deity of the sea, who, before his deification, was a fisherman of Anthedon. Having one day taken a considerable number of fishes, which he laid upon the bank, he perceived that as soon as they touched an herb that grew on the shore, they received new strength, and leaped again into the sea; upon which he was tempted to taste of the herb himself, and instantly leaped into the sea after them, where he was metamorphosed into a Triton, and became one of the sea gods.

\* GLAIVE. *n. f.* [*glaiue*, French; *gluif*, a hook, Welsh.] A broad sword; a falchion.—

Two

Two hundred Greeks came next in fight well try'd,

Not surely arm'd in steel or iron strong,  
But each a *glave* hath pendant by his side. *Fairf.*  
When zeal, with aged clubs and *glaves*,

Gave chase to rockets and white staves. *Hud.*

\* To GLAVER. *v. n.* [*glave*, Welsh, flattery; *gliswan*, Saxon, to flatter. It is still retained in Scotland.] To flatter; to wheedle. A low word.—Kingdoms have their distempers, intermissions, and paroxysms, as well as natural bodies; and a *glavering* council is as dangerous as a wheedling priest or a flattering physician. *L'Esrange.*

GLAUX, in botany, a genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 17th order, *Calycanthemæ*. The calyx is monophyllous; there is no corolla: the capsule is unilocular, quinquevalved, and pentaspermous.

GLAYSLEY, a small town in Shropshire.

\* To GLAZE. *v. a.* [*To glass*, only accidentally varied.] 1. To furnish with windows of glass.—Let there be two delicate cabinets daintily paved, richly hanged, and *glazed* with crystalline glass. *Bacon's Essays*. 2. To cover with glass, as potters do their earthen ware; [from the French *glaise*, *argilla*.] 3. To overlay with something shining and pellucid.—

Sorrow's eye, *glaz'd* with brining tears,  
Divides one thing entire to many objects.

*Shak. Rich. II.*

—The reason of one man operates on that of another in all true oratory; wherein though with other ornaments he may *glaze* and brandish the weapons, yet it is found reason that carries the stroke home. *Grew's Cosm. Sac.*—White, with other strong colours, with which we paint that which we intend to *glaze*, are the life, the spirit, and the lustre of it. *Dryden's Dufr.*

GLAZERT, a small river of Scotland, in Stirlingshire, formed by the union of 3 rivulets below the church of Campsie. After running with a great rapidity 5 miles, it falls into the Kelvin, opposite Kirkintilloch.

\* GLAZIER. *n. f.* [corrupted from *glazier*, or *glazier*, of *glais*.] One whose trade is to make glass windows. Other manufactures of glass are otherwise named.—Into rabbets the several panes of glasswork are set, and fastened by the *glazier*. *Moxon.*—

The dext'rous *glazier* strong returns the bound,

And gongling sashes on the penthouse found.

*Gay's Trivia.*

And then, without the aid of neighbour's art,  
Perform'd the carpenter's and *glazier's* part.

*Harte.*

(I.) GLAZING, *n. f.* the crusting over earthen ware by a vitreous substance, the basis of which is lead. See GLASS, N<sup>o</sup> IV, § 21.

(II.) GLAZING, ANCIENT METHOD OF. The Romans had a method of glazing their earthen vessels, which in many respects appears to have been superior to ours. The common brown glazing easily scales off, cracks, and in a short time becomes disagreeable to the eye. Besides, it is very easily destroyed by acids; nor can vessels glazed in this manner be even employed to hold wa-

ter, without part of it oozing through the pores. Lead is also destructive to the human body, if acids are unwarily put into vessels glazed with lead, the liquors will receive a very deep impregnation from the metal. The *Rouge*, which is yet to be seen upon urns in several places, appears to have been some kind of varnish; and Pliny gives that it was made of bitumen. He tells us it never lost its beauty, and that at length it was customary to glaze statues in this manner; this varnish sunk deep into the substance of the ware, it was not subject to those cracks which disfigure our vessels; and as it was not able to be corroded by acids, it could not be subject to any of the accidents which may attend the use of vessels glazed with lead.

(III.) GLAZING, MODERN METHOD OF. The workers of common earthen ware, however not at the trouble of thus previously purifying pure glass of lead. Their usual composition for glazing their ware is formed of white glass 10 lb. of red lead 20 lb. of pearl-ashes 20 lb. and common salt 12 lb. Powder the sand by grinding it then add it to the other ingredients, mix them together: after which calcine them some time with a moderate heat, and when they are cold, pound it to powder. When used, temper it with water. The proportion of these ingredients may be occasionally varied, but the ware, after being turned on the wheel in the open air, is covered over with this composition by a brush; and when set in the furnace the violent heat soon reduces it to glass, covering the whole internal and surface of the vessel. Lead, however, is excluded from the composition of some, and other fluxes substituted in its stead. A more perfect glazing may be prepared without lead, consisting of 40 lb. of white sand, 25 lb. of pearl-ashes and 15 lb. of common salt; and prepared before; and a more perfect transparent glazing may be made of sand 40 lb. of wood-ashes 50 lb. of pearl-ashes 10 lb. of common salt 12 lb. The following are the most commonly used at Delft, and the other Dutch manufactories.

1. GLAZING, BLACK. Take 8 parts of lead, iron filings 3, copper ashes 3, and two measures. This when melted will be a brown black; and if wanted blacker, add zaffer to it.

2. GLAZING, BLUE. Take lead-ash 1 lb. clear sand or powdered flints, 2 lb. common salt 2 lb. white calcined tartar 1 lb. or other glass ½ lb. zaffer ¼ lb.; mix them and melt them several times, quenching them in cold water. To have it fine, put the mixture into a glass-furnace for two days. Another blue glazing may be formed of 1 lb. of tartar, ½ lb. of red-lead, ¼ oz. and ¼ lb. of powdered flints, fused or melted above. Or take 2 lb. of calcined lead, add 5 lb. of common salt, 5 lb. of powder of zaffer, tartar, and Venetian glass 1 lb. Calcine and fuse the mixture as before, take of red lead one part, of sand 3 part

8. For a *violet blue* glazing, take 4 oz. of red lead, 5 oz. of powdered litharge, and 1 half a dram of manganese.

9. **GLAZING, BROWN.** Take red lead and each 14 parts, and of manganese two parts; or, of red lead 12 parts, and manganese 10 parts fused. A brown glazing, to be laid on a ground, may be made of manganese, and of red lead and white glass, of each twice fused.

10. **GLAZING, FLESH-COLOURED.** Take 12 parts of litharge, and one of white glass.

11. **GLAZING, GOLD-COLOURED.** Take of litharge, of sand or calcined flint one part; mix these very well together, then run them through a yellow glass with a strong fire. Pound and grind it into a subtil powder, and sift with a well saturated solution of tartar into a paste, which put into a crucible cover it with a cover. Give at first a green fire; then increase it, and until you have a glass, which will be green. Wash the glass again, and grind it to a fine powder. Rub this powder with beer, so that it may be applied by a hair pencil upon the vessels of ware. These vessels when covered with this powder must be first well heated, then put in a ruffle; and, as soon as the glass runs, by holding them over burning vegetation take out the vessels. *Phil. Trans. N° 300.*

Kunckel gives several preparations for coloured yellow glazing. This may be done by fusing a mixture of 3 parts of red lead, antimony, and one of saffron of Mars; melting the powdered mass, and repeating the operation 4 times, or by fusing 4 or 5 parts of red lead and antimony of unce, and of scales of iron half an ounce; or by fusing together 8 parts of red lead, 6 parts of flints, one part of yellow ochre, of antimony, and one part of glass. A gold-coloured glazing may be obtained by fusing red lead and white flints, of each 10 parts, and of filings of iron one part.

12. **GLAZING, GREEN.** Take 8 parts of litharge, 8 of Venice glass, 4 of brass dust or copper; or 10 parts of litharge, 12 of pebble, and one of *esulum* or copper. A fine green glazing may be produced by hemian granite, filings of copper, red Venetian glass, in equal proportions; or white glass, red lead, and filings of copper each; powdering the mass, and adding part of Bohemian granite to two parts of lead. A fine green may also be obtained, by grinding together any of the yellow with equal quantities of the blue glazings; the shades and tints of green will be had by the proportions of the one to the other, the choice of the kind of yellow and blue.

13. **GLAZING, GREEN.** Take 5 lb. of lead ashes, 1 lb. of flint,  $\frac{1}{2}$  lb. of salt,  $\frac{1}{2}$  lb. of tartar, and 1 lb. of copper dust.

14. **GLAZING, IRON-COLOURED.** Take 15 parts of red lead, 14 of white sand or flints, and 1 part of calcined copper. Calcine and fuse this

15. **GLAZING, LIVER-COLOURED.** Take 12

parts of litharge, 8 of salt, 6 of flint, and one of manganese.

9. **GLAZING, PURPLE BROWN.** Take lead ashes 15 parts, clean sand or powdered flints 18 parts, manganese one part, and white glass 15; to which some add one of zaffer.

10. **GLAZING, RED.** Take antimony 3 lb. litharge or red lead 3, and rust of iron one; grind them to a fine powder. Or, take 2 lb. of antimony, 3 of red lead, and one of calcined saffron of Mars; and proceed as before.

11. **GLAZING, SEA GREEN.** See § 6.

12. **GLAZING, WHITE.** For common ware, take 40 lb. of clear sand, 75 lb. of litharge or lead ashes, 26 of pot-ashes, and 10 of salt: Melt these three times into a cake, quenching it each time in clear cold water. Or, take 50 lb. of clean sand, 70 of lead ashes, 30 of wood ashes, and 12 of salt. For a *fine white*: Take 2 lb. of lead and one of tin; calcine them to ashes: of this take two parts, calcined flint, white sand, or broken white glass, one part, and salt one part; mix them well together and melt them into a cake for use. The trouble of calcining the tin and lead may be prevented by procuring them in a proper state. A *very fine white* glazing may be obtained by calcining two parts of lead and one part of tin; and taking one part of this mass, and of flints and common salt of each one part, and fusing the mixture. A white glazing may be also prepared by mixing 100 lb. of masticot, 60 of red lead, 20 of calcined tin or putty, and 10 of common salt; calcining and powdering the mixture several times.

13. **GLAZING, YELLOW.** Take red lead 3 lb. calcined antimony and tin of each 2 lb.; or, according to some, equal quantities of the three ingredients. These must be melted into a cake, then ground fine; and this operation repeated several times. Or, take 15 parts of lead ore, 5 of litharge of silver, and 15 of sand. A *fine yellow* glazing may be procured by mixing 5 parts of red lead, 2 of powdered brick, 1 of sand, 1 of white glazing, and 2 of antimony; calcining the mixture and then fusing it. Or, take 4 parts of white glass, one of antimony, 3 of red lead, and one of iron scales, and fuse the mixture; or fuse 16 parts of flint, one of iron filings, and 24 of litharge. A *light yellow* glazing may be produced with 10 parts of red lead, 3 of antimony, 3 of glass, and 2 of calcined tin. (See § 5.) A *citron yellow* is made of 6 parts of red lead, 7 of fine red brick dust, and two of antimony. This mixture must be calcined day and night for four days, in the ash hole of a glass-house furnace, and at last fused.

(IV.) **GLAZING OF DELFT WARE, PORCELAIN, STONE WARE, &c.** See DELFT, N° 3. PORCELAIN, and POTTERY.

GLAZOV, a town of Russia, in Viatka, on the Tchevtz, 56 miles ESE. of Viatka.

GLEAD, or GLADE. See GLEDE.

\* GLEAM. *n. f.* [*geliona*, Saxon.] Sudden shoot of light; lustre; brightness.—

Then was the fair Dodonian tree far seen  
Upon seven hills to spread his glassome gleam;  
And conquerors bedecked with his green,  
Along the banks of the Autonian stream. *Spens.*

At

At last a *gleam*  
Of dawning light turn'd thitherward in haste  
His travell'd steps. *Milton's Par. Lost.*

As I bent down to look just opposite,  
A shape within the wat'ry *gleam* appear'd,  
Bending to look on me. *Milton's Par. Lost.*  
Mine is a *gleam* of bliss, too hot to last;  
Wat'ry it shines, and will be soon o'ercast.

*Dryd. Aurengzebr.*  
We ken them from afar; the setting sun  
Plays on their shining arms and burnish'd hel-  
mets,  
And covers all the field with *gleams* of fire.

*Addison's Cato.*  
In the clear azure *gleam* the flocks are seen,  
And floating forests paint the waves with green.

*Pope.*  
Nought was seen, and nought was heard,  
But dreadful *gleams*,  
Fires that glow. *Pope's St Cecilia.*

(1.) \* *To GLEAM. v. n.* [from the noun.] 1. To  
shine with sudden conflagration.—

Observant of approaching day,  
The meek-ey'd morn appears, mother of dews,  
At first faint *gleaming* in the dappled East.

*Thomf. Summer.*  
2. To shine.—

On each hand the gushing waters play,  
And down the rough cascade white dashing fall,  
Or *gleam* in lengthen'd vistas through the trees.

*Thomson.*  
(2.) \* *To GLEAM.* Among falconers a hawk is  
said to *gleam*, when she casts or throws up filth  
from the gorge.

\* *GLEAMY. adj.* [from *gleam*.] Flushing; dart-  
ing sudden conflagrations of light.—

In brazen arms, that cast a *gleamy* ray,  
Swift through the town the warrior bends his  
way. *Pope.*

\* *GLEAN. n. f.* [from the verb.] Collection  
made laboriously by slow degrees.—

Plains, meads, and orchards all the day he  
plies;

The *gleans* of yellow theme distend his thighs:  
He spoils the saffron. *Dryden's Virgil.*

\* *To GLEAN. v. a.* [*glaner*, French, as *Sin-  
ner* thinks, from *granum*, Lat.] 1. To gather  
what the gatherers of the harvest leave behind.  
—She came and *gleaned* in the field after the reap-  
ers. *Ruth. ii.*—

He reap'd the field, and they but only *glean'd*.

*Dryden.*  
—The precept of not gathering their land clean,  
but that something should be left to the poor to  
*glean*, was a secondary offering to God himself.  
—*Nelson.*

She went, by hard necessity compell'd,  
To *glean* Palæmon's fields. *Thomf. Autumn.*

2. To gather any thing thinly scattered.—  
Gather

So much as from occasions you may *glean*,  
If aught, to us unknown, afflicts him thus.

*Shak. Hamlet.*  
That goodness

Of *gleaning* all the lord's wealth into one,  
Into your own hands. cardinal, by extortion.

*Shak. H. VIII.*

—They *gleaned* of them in the highways  
sand men. *Judges xx. 45.*—

But Argive chiefs, and Agamemno  
When his resplendent arms flash'd th'  
shady plain,

Fled from his well-known face with we  
As when his thund'ring sword and poi  
Drove headlong to their ships, and  
routed rear. *Dryde.*

—In the knowledge of bodies we must  
to *glean* what we can from particular ex  
since we cannot, from a discovery of  
essences, grasp at a time whole heav  
bundles comprehend the nature and pr  
whole species together. *Locke.*

\* *GLEANER. n. f.* [from *glean*.]  
who gathers after the reapers.—  
For still the world prevail'd, and  
laugh,

Which scarce the firm philosopher ca  
Should his heart own a *gleaner* in the

2. One who gathers any thing slowly a  
ously.—An ordinary coffee-house *glean*  
city is an arrant statesman. *Locke.*

(1.) \* *GLEANING. n. f.* [from *gle*  
act of *gleaning*, or thing *gleaned*.—The  
as the shaking of an olive tree, and as th  
of grapes when the vintage is done. *Joi*  
—The orphan and widow are membe  
same common family, and have a right  
ported out of the incomes of it, as the  
had to gather the *gleanings* of the rich  
vest. *Atterbury.*

(2.) *GLEANING.* By the customs  
countries, particularly those of *Meu*  
tampes, in France, before the revolution,  
and others were forbid, either by the  
servants, to put any cattle into the field  
vent *gleaning* in any manner whatever  
hours after carrying off the corn, und  
of confiscation.

(1.) \* *GLEBE. n. f.* [*gleba*, Latin.]  
soil; ground.—

This, like the *rapory* plots, delight  
bowers;

The grassy garlands loves, and oft at

2. The land possessed as a part of the  
an ecclesiastical benefice.—The ordin  
or revenue of a parsonage is of three  
one in land, commonly called the *gleb*  
in tythe, which is a set part of our goo  
ed to God; the third, in other officin

God and his church by the people. —A trespass done on a parson's *glebe* which is a freehold, cannot be tried in a court. *Ayliffe's Parergon*. —  
 y parishes have not an inch of *glebe*. *Swift*.  
 —*GLEBE*, among miners, signifies a piece of which is contained some mineral ore.  
 —*GLEBOUS*. *adj.* [from *glebe*.] Turfy. *Dist.*  
 —*GLEW*, a town of Courland, 18 miles S. E.

—*GLEBY*. *adj.* [from *glebe*.] Turfy; perhaps following passage fat or fruitful, if it has its meaning. —  
 —*GLEBY* flat'ry! thy malignant seeds  
 In hour and by a fatal hand  
 Diffus'd o'er virtue's *gleby* land,  
 Rising pride amidst the corn appear,  
 To ke the hopes and harvest of the year.

*Prior*.  
 —*GLEBY*, GROUND IVY; a genus of the *eremia* order, belonging to the *didynamia* plants; and in the natural method ranked under the 44th order, *Vestibulate*. Each pair of them come together in the form of a *calyx* is quinquefid. There are 3 specimens most remarkable of which is the  
 —*GLEBY* HEDERACEA, the common ground ivy virtues were formerly attributed to it, which it is now found not to be possessive of, however, it has. The leaves are put into the vat with ale to clarify it and give it strength. Ale thus prepared is often drunk as a *robustic*. The expressed juice mixed with wine, and applied morning and evening, the white specks upon horses eyes. The ivy does not grow near it do not flourish. It is hurtful to horses if they eat much of it. If it is, horses are not fond of it; cows, and swine, refuse it.

—*GLEDE*. *n. f.* [from *glidaglide*, Saxon.] A hawk.—Ye shall not eat the *glede*, the vulture. *Deut.*  
 —*GLEDE*, GLEAD, or KITE. See *FALCO*,

—*GLETSIA*, TRIPLE-THORNED ACACIA, or *ROCUST*; a genus of the *diœcia* order, belongs to the *polygama* class of plants; and in the method ranking under the 33d order, *Lo-*  
 — In this genus, says Mr Lee, "the *berries* and *males* are on the same plant, and *berries* on a different one." The hermaphrodite is quadrifid; the corolla tetrapetalous; the *stamina* six, one pistil and legumen. The *stigma* is triphyllous; the corolla tripetalous, *stamina* six. The female *calyx* is pentafid; the corolla pentapetalous; one pistil and legumen. There are two species, viz.  
 —*GLETSIA INERMIS*, so named because the *stigma* is unarmed, or without thorns. It is a native of America, and in this country re-  
 —*GLETSIA TRIACANTHOS*, a native of Virginia. It is of an upright growth, trunk is guarded by thorns 3 or 4 inches in remarkable manner. These thorns have a coming out of their sides at nearly right angles. Their colour is red. The branches are lined with a white colour; but are likewise  
 — *PART. II.*

armed with red thorns, that are proportionally smaller: they are of several directions, and at the ends of the branches often stand single. The young shoots of the preceding summer are perfectly smooth, of a reddish green, and retain their leaves often until the middle of November. Although there is a peculiar oddity in the nature and position of the spines, yet the leaves constitute the greatest beauty of these trees: they are doubly pinnated, and of a delightful shining green. The pinnated leaves, that form the duplication, do not always stand opposite by pairs on the middle rib; the pinnæ of which they are composed are small and numerous; no fewer than 10 or 11 pair belong to each of them; and as 4 or 5 pair of small leaves are arranged along the middle rib, the whole compound leaf consists often of more than 200 pinnæ of this fine green colour. They sit close, and spread open in fine weather; though during bad weather they droop, and their upper surfaces nearly join, as if in a sleeping state. The flowers are produced from the sides of the young branches in July. They are a greenish catkin, and make little show; though many are succeeded by pods, that have a wonderful effect; for these are exceedingly large, more than a foot, sometimes a foot and a half in length, two inches in breadth, and of a nut-brown colour when ripe. There is a variety of this species, with fewer thorns, smaller leaves, and oval pods. It has nearly the resemblance of the other; though the thorns are not so frequent, and the pods smaller, each containing only one seed. These trees are easily propagated, by seeds received from America in spring, which keep well in the pods, and are for the most part good. They generally arrive in February; and, as soon as possible after, they should be sown in a well sheltered warm border of light sandy earth. If no border is to be found that is naturally so, it may be improved by applying drift sand, and making it fine. The seeds should be sown about half an inch deep: and they will for the most part come up the first spring. If the summer should prove dry, they must be constantly watered; and if shade could be afforded them in the heat of the day, they would make stronger plants by autumn. Attention to this is peculiarly requisite; for as the end of the branches are often killed, if the young plant has not made some progress, it will be liable to be wholly destroyed by the winter's frost, without protection: And this renders the sowing the seeds in a warm border, under a hedge, in a well sheltered place, necessary; for there these shrubs will endure our winters, even when seedlings, and will require no farther trouble; nay, though the tops should be nipped, they will shoot out again lower, and will soon overcome it. They should remain two years in the seed-bed before they are planted out in the nursery. The spring is the best time for the work. Their distances should be one foot by two; the rows should be dug between every winter; and, being weeded in summer, they may continue with no other particular care, until they are set out to remain. These trees are late in spring before they exhibit their leaves, but keep shooting long in autumn.

\* GLEE. *n. f.* [*gligge*, Saxon.] Joy; merriment; gayety. It anciently signified musick played at feasts. It is not now used, except in ludicrous writing, or with some mixture of irony and contempt.—

She marcheth home, and by her takes the knight,

Whom all the people follow with great glee.

*Fairy Queen.*

—Many wayfaires make themselves glee, by vexing the inhabitants; who again foreflew not to baigne them with perfume. *Carow's Survey.*—

Is Blouzelinda dead? Farewel my glee!

No happiness is now reserv'd for me. *Gay.*

The poor man then was rich, and liv'd with glee;

Each barley-head untaxt, and day light free.

*Hart.*

\* GLEED. *n. f.* [from *glosau*, Saxon, to glow.] A hot glowing coal. A provincial and obsolete word.

\* GLEEFUL. *adj.* [*glee* and *full*.] Gay; merry; cheerful. Not used.—

My lovely Aaron, wherefore look'st thou sad,  
When every thing doth make a gleeftal boast?

*Shak.*

\* GLEEK. *n. f.* [*gligge*, Saxon.] Musick; or musician.—What will you give us?—No money, but the glee: I will give you the minstrel. *Shak.*

\* To GLEEK. *v. a.* [*gligman*, in Saxon, is a mimick or a droll.] 1. To facer; to gibe; to droll upon.—

I can gleek upon occasion.

*Shak.*

—I have seen you gleeing or galling at this gentleman twice or thrice. *Shak. Hen. V. 2.* In Scotland it is still retained, and signifies to fool or spend time idly, with something of mimickry or drollery.

\* To GLEEN. *v. n.* To shine with heat or polish. I know not the original notion of this word: it may be of the same race with *glow* or with *gleam*. I have not remarked it in any other place.—

Those who labour

The sweaty forge, who edge the crooked scythe,  
Bend stubborn steel, and harden gleeing armour,

Acknowledge Vulcan's aid.

*Prior.*

(1.) \* GLEET. *n. f.* [It is written by *Skinner glit*, and derived from *glidan*, Saxon, to run softly.] A sanious ooze; a thin ichor running from a sore.—A hard dry eschar, without either matter or gleet. *Wifeman's Surgery.*

(2.) GLEET is chiefly used for the flux of a thin limpid humour from the urethra. See MEDICINE, *Index*.

\* To GLEET. *v. n.* [from the noun.] 1. To drip or ooze with a thin sanious liquor.—His thumb being inflamed and swelled, I made an incision into it to the bone; this not only bled; but gleeted a few drops. *Wifeman.* 2. To run slowly.—Vapours raised by the sun make clouds, which are carried up and down the atmosphere, 'till they hit against the mountainous places of the globe, and by this concussion are condensed, and so gleet down the caverns of these mountains, whose inner parts, being hollow, afford them a basin. *Cheyne's Phil. Princ.*

\* GLEETY. *adj.* [from *gleet*.] Ichory; thin-

ly sanious.—If the flesh lose it's radi the matter change to be thin and gleeft suspect it corrupting. *Wifeman.*

GLEIBERG, or OLITZBERG, a town many, in Nassau Weilburg; 2 miles N. and 8 NW. of Wetzlar.

GLEICHENBERG, a town of Germany, 10 miles N. of Racklburg.

GLEICHENSTEIN, a town and county, in the circle of the Lower Rhin ritory of Eichfeld.

GLEINCK, a town of Austria, 7 m. E.

GLEINSTOTTEN, a town of Stiria SE. of Voitsberg.

GLEISS, a town of Switzerland, in 26 miles E. of Sion.

GLEIWITZ, or GLIWICE, a town in Oppeln, 36 miles SE. of Oppeln.

GLEMISFORD, a village in Suffolk, Clare and Lenham.

GLEMS, a river of Germany, which the Enz, 2 miles N. of Mark-Grobingen emberg.

(1.) GLEN, John, a celebrated print graver in wood, born at Liege, about published a copious work on ancient dresses, ceremonies, &c. illustrated with figures.

(2.) \* GLEN. *n. f.* [*gleann*, Eric.] A dale; a depression between two hills.—

And woos the widow's daughter of

(3.) GLEN. See DEN, § 2.

(4.) GLEN, in geography, a river of Cumberland, running into the Till.

(5.) GLEN, a lake of Ireland, 30 miles WNW. of Londonderry.

(6.) GLEN makes part of the names number of places in Scotland and Ireland some in England, which, according to the meaning of the word, (see § 2.) either are seated in or near them; as following examples:

GLEN-ALMOND, a beautiful valley of Perthshire, about 8 miles N. of Crieff, famous for its picturesque scenery.

GLEN-ALOT, a valley of Scotland, in Perthshire, 14 miles N. of Dornoch.

GLENARM, a town of Ireland, in the Glenarm Bay, 105 miles from Dublin.

GLEN-ARTNEY, a vale of Scotland, Perthshire, 4 miles NE. of Callender.

GLENSHIRE, a valley of Scotland, in Perthshire, in the parish of GLENELG, in which are several ancient castles, exhibiting specimens of ancient Scots architecture. See ARCHITECTURE, *Index*.

GLENBARRIE, a parish of Scotland, in Perthshire, 6½ miles long from N. to S. and lying along the *Bervie* for 3 miles, and 13,965 acres. The soil in the high part is clay, and in the lower, a light loam. The climate is cold but healthy. The crops bear, pease, potatoes, clover, rye-grass &c. Husbandry is much improved, the exertions of Mr Barclay of Urie. The lenity of the late Lord Momboddo, th

and the tenants thriving. The leases are stated for "a life, 19 years, and a life, the possessor, during the 19 years, naming the life with which the lease ends." The population, in 1792, as by the rev. Alex. Thom, in his report to Sir Sinclair, was 1307, and had increased 349, since 1755. There were then 53 ploughs, 161 horses; a considerable number of black cattle, but few sheep in the parish.

**BUCKET**, a parish of Scotland, in Aberdeenshire, 30 miles from Aberdeen. It is 4 miles long and from  $\frac{1}{2}$  to one mile broad, encircled by a rivulet called *Bucket*, which runs into the Don. The soil is a light loam; the climate mild, and in summer warm, which makes the harvest pretty early. The crops are oats and grass. Grasses are beginning to be sown. The population, in 1795, stated by the rev. William Thomson, in his report to Sir J. Sinclair, was 449, and increased 19 since 1755.

**CAIRN**, a parish in Dumfriesshire, 16 miles from E. to W. lying along the rivers Craigie, Dalquhat, and Castlefairn, on the W. side of both sides of the *Cairn*, the name of these rivers when united. It is 15 miles from Dumfries. The soil is light, warm, and fertile in grain and grass. The climate is healthy. The population, in 1795, stated by the rev. Walter Grierson, in his report to Sir J. Sinclair, was 1700, and had decreased 94 since 1755. The number of sheep, on the 1st of January, was above 9000; of horses 135, and of black cattle 2475. There were 27 proprietors, and 100 families in the parish, which was divided into 90 small farms.

**CARR**, a valley of Scotland, in Sutherlandshire, 12 miles N. of Dornoch.

**CARRISH**. See DUTHIL, N° 1.

**CARRICOE**, or } a valley of Scotland, in Argylshire, near Loch Etive; memorable for being the scene of the most cruel and bloody massacre, that ever disgraced the annals of Britain. See ENGLAND, § 67. The rev. Mr. M'Nicol, minister of Lismore and Appin, in his report to Sir J. Sinclair, in 1792, states that a veil could be thrown over this massacre of our history, as it was the most barbarous and unchristianlike action in modern times, sanctioned by any authority from government." See *Sir J. Sinclair's Stat. Acc.* Vol. I, 498.

**CUMBER**, a river of England, in Cumberland, running into the Ullswater.

**CROSS**, a parish of Scotland, in Mid-Lothian, 7 miles W. of Edinburgh, erected in 1616. It is about 3 miles square in extent; and as it lies on Pentland hills, is well adapted for pasturing. Accordingly, about 1200 sheep, 100 horses, and 150 black cattle, are pastured in it. The population, in 1792, stated by the rev. W. Torrance, in his report to Sir J. Sinclair, was 385 souls, and decreased 172 since 1755. There is a distillery, a bleachfield, and 3 mills in the parish; manufactures are a grievance. The chief crops are oats and grass. Limestone, coals, sandstone, granite, and heavy spar, abound; and squirrels are numerous in the woods. See *SCIURUS*, N° 1. There are some vestiges of ancient camps; a stone with a rude inscription is erected in memory of the battle of Pentland hills in 1666.

The late celebrated W. TYTLER, Esq. of Woodhouselee, and J. PHILIP, Esq. of Greenlaw, were natives of this parish.

**CROX**, a romantic valley of Scotland, in Argylshire, between two very high ridges of mountains, on the NE. side of Loch Long.

**DALAGH**, an ancient and once celebrated town of Ireland, 5 miles NW. of Rothdrum, in Wicklow; called also, the *Seven Churches*. Glendalagh signifies "the valley of the two lakes." In this valley, surrounded by high and almost inaccessible mountains, ST KEVIN, about the middle of the 6th century, founded a monastery, which in a short time from the sanctity of its founder was much resorted to, and at length became a bishopric and a religious city. During the middle ages Glendalagh, called by Hoveden *Episcopatus Bistolquienfis*, was held in great esteem, and received valuable donations and privileges; its episcopal jurisdiction extending to the walls of Dublin. About the middle of the 12th century, it became, instead of a holy city, a den of thieves; wherefore Cardinal Papiro, in 1214, united it to the see of Dublin, which union was confirmed by King John. The O'Tools, chiefs of Fithuathal, however, by the assistance of the Pope, continued long after to elect bishops and abbots to Glendalagh, though they had neither revenues nor authority, beyond the district of Tuathal, which was the western part of the county; in consequence of which the city had become nearly a desert, in 1497, when Dennis White, the last titular bishop, surrendered his right. From the ruins still remaining, this city appears to have been a place of consequence, and to have contained 7 churches and religious houses; built in an elegant style, in imitation of the Greek architecture; the walls of the cathedral are yet standing. South of them stands a small church roofed with stone, nearly entire; and in several parts of the valley are a number of stone crosses, some of which are curiously carved, but without inscriptions. In the NW. corner of the cemetery, stands a round tower, 95 feet high, and 15 in diameter; and in the cemetery of a small church, called the *Rosfeart church*, are some tombs of the O'Tools. In a perpendicular projecting rock on the S. side of the great lake, 30 yards above the surface of the water, is the celebrated bed of St Kevin, hewn out of the rock, exceedingly difficult of access and terrible in prospect. Among the ruins have been discovered a number of stones curiously carved, and containing inscriptions in Latin, Greek, and Irish. As this city was in a valley, surrounded on all sides, except the E. by inaccessible mountains, the artificial roads leading thereto are curious: the principal is that leading into the county of Kildare through Glendafon. This road for near two miles is yet perfect, composed of stones placed on their edges, making a firm and durable pavement, about 10 feet broad. At a small distance from St Kevin's bed, on the same side of the mountain, are to be seen the ruins of a small stone building, called *Saint Kevin's cell*.

**DALE**, a town of England, in Northumberland, seated on the Glen.

**DERBY**, a valley of Scotland, in Perthshire, 10 miles N. of Dunkeld.

**GLENDON**, a town of England, in Northamptonshire, near Rothwell.

**GLENDONAN**, a parish of Perthshire, in the middle of the Ochil hills, so named from the DOYAN, which runs through it; 6 miles long from SW. to NE. and 4½ broad. The surface, though hilly, is green and smooth; the soil light and dry. About 200 acres are generally under oats, barley, flax, and potatoes; the rest is appropriated to pasture, for which it is best adapted; feeding about 2000 sheep, 50 horses, and 220 cows. The population in 1792, stated by the rev. J. Brown, in his report to Sir J. Sinclair, was 240, and had increased 20 since 1755.

**GLENEGAD HEAD**, a cape of Ireland, in Donegal. Lon. 7. 4. W. Lat. 55. 20. N.

**GLENELCHAIG**, a district of Scotland, in Ross-shire, in Kintail.

(1.) **GLENELG**, [from *glen*, Gael. a valley, and *selg*, hunting.] a parish of Scotland, in Inverness-shire, about 20 miles square. It is divided into 3 districts, called *Glenelg*, *Knowdort*, and *N. Murrar*. In the two former the soil is good, being partly deep black loam, partly light, and partly sandy gravel. The last is mountainous, rocky, and adapted for feeding cattle. The climate is moist, but healthy. Oats, barley, and potatoes are the chief crops, but in the best seasons, the produce does not maintain three 4ths of the inhabitants. Grazing of sheep and black cattle therefore prevails; and about 1500 stones of wool are sold annually. The population, in 1795, stated by the rev. Colin M'iver, in his report to Sir J. Sinclair, was 2746; and had increased 920 since 1755; notwithstanding 1124 had emigrated at different periods. Of these, 1310 were papists. The roads are bad.

(2.) **GLENELG**, a district in the above parish, in which there are several ancient forts. See *ARCHITECTURE*, § 54, 55.

**GLESELY**, a river of Ireland, in Antrim, which runs into the sea, 3 miles S. of Glron Point.

**GLENISK**, a district of Scotland, in Forfarshire, watered by the North Esk.

**GLEN-FICHAN**, a vale in the W. of Argyle.

**GLEN-FIDDICH**, a valley in Banffshire, 12 miles E. of Inveravan, watered by the Fiddich.

**GLENFIELD**, a village NW. of Leicester.

**GLEN-FINE**, a vale in Argyle, N. of Loch Fine.

**GLEN-FINGLASS**, a valley in Perthshire.

**GLENGAIRNS**, [from *glean*, Gael. *i. e.* a valley, and *garbh-ambain*, the rough water,] a parish of Scotland in Aberdeenshire, united with those of Glenmuick and Tulloch. It lies on both sides of the Gairn, and part of it on the Dee. It extends 6 miles NW. of Tulloch. It has an ancient castle. See **GLENMUICK**.

**GLENGAFE**, a lake in Kirkcudbrightshire, abounding with large yellow trout.

**GLENGARRIFF**, a harbour of Ireland, in Cork, on the NE. part of Bantry Bay.

**GLEN GARRY**, a valley of Scotland, in Inver-shire, N. of Loch Garry.

**GLENGONAR**, a noble river of Scotland, in the parish of Clonfert, Fermanagh, in which a gold has been found. The rev. J. Mac nochie, says "Q. Elizabeth sent down a German to gather gold dust in the waters of Elyan and Glengonar,

both which have their sources in the hills the lead is found. This man wrote an account his discoveries and labours, the MS. of which the Advocates' library. The place where he el the gold took its name from the event, called the *Gold Scour*. There are veins peated in the parish, importing that he great fortune. Be that as it will, the business resumed by order of the late E. of Hopeto discontinued, as being less profitable than e labour. Gold dust is still found on the top rocks; but the searching for it is rather an amusement, than of serious occupation. Titles seldom exceed in size the point of *Sir J. Sinclair's Stat. Acc.* vol. iv, 513.

**GLEN-GRUDY**, a valley of Scotland, in shire, N. of Loch Fairnith.

**GLENHAM, GREAT**, } 2 towns of Engl  
**GLENHAM, LITTLE**, } Framlingham. S

**GLENHOLM**, a parish of Scotland, in shire, seated on Holm's water, and part Tweed; 12 miles SW. of Peebles, and Edinburgh. It is about 5 miles long from The surface being hilly, the greater part laid out in pasture; the soil of the arable is loose and sharp; and produces strong grain, grass, turnips, and potatoes. This is damp. The population in 1791, state rev. Bernard Haldan, in his report to Sir J was 300 souls, and had decreased 92 in The number of sheep was 5,000; of horned black cattle 150. There are relics of the in the parish, and thirlages are not killed.

**GLENICZA**, a river of Poland, which to the Obra, near Koster in Posenia.

**GLEN-INS**, a town of Ireland, in De.

(1.) **GLENISLA**, a valley of Scotland, three districts of Forfarshire; so named Iffa, which runs through it.

(2.) **GLENISLA**, a parish in the shire 18 miles long, but a few miles above 2 is soil is mostly soft and heavy, but in parts a deep strong loam, producing a of bear, oats, turnips, and potatoes. very pure, and largely common. T tion in 1791, stated by the rev. J. Du report to Sir J. Sinclair, was 1,118 sou decreased 214, since 1755. The name cattle was 1676; great numbers of the reared. The ruins of two old castles, to the Airy family, and demolished n still to be seen.

**GLENKENS**, [Gael. *i. e.* the vale on a district of Scotland in Kirkcudbright; comprehending the parishes of Dalry, K phairn, and Bilmacellan.

**GLEN-KINGLASS**, a valley of Scotland, in shire.

**GLEN-LEDNOCK**, a valley of Scotland, 10 miles NW. of Clifden.

**GLEN-LOCHRY**, a valley of Scotland, shire, NE. of Glenorchy.

**GLEN-LUFF**, [Gael. *i. e.* the vale a district, and anciently a parish of Wigtonshire, divided, in 1549, into t named *Old* and *New Luff*. See *LUFF*.

**GLEN-LYON**, a valley in Perthshire.

REE, [Gael. *i. e.* the great valley.]  
 rict of Murrayshire, in the barony  
 abounding with wood. In 1786,  
 on sold his fir woods of Glenmore  
 Company for 10,000 l. This fir is  
 stily, and reckoned equal to New  
 Vessels from 200 to 500 tons have  
 , with masts 60 feet long. There  
 n it, one of them an oval basin, 2  
 er. The other abounds with a pe-  
 f fat green trout.

ORE, a valley in Perthshire, 12 miles  
 Atholl.

STON, a valley of Inverness-shire,  
 Fort Augustus.

WICK, a vale in Angus, NW. of Brechin.  
 WICK, [Gael. *glean muic*, *i. e.* the  
 3 parish of Scotland, in Aberdeen-  
 shire, 15 miles long, lying entirely  
 of the Dee, about 40 miles W. of  
 is united with those of TULLOCH  
 RM, and each of the 3 has a church,  
 pied alternately. These united pa-  
 rishes irregular figure, about 15 miles  
 broad, intersected by the Dee. The  
 mountainous and healthy; the soil, in  
 and shallow, producing good grain,  
 er. The air is pure, dry, and salu-  
 man died in 1792, aged 102; and  
 born in Glenmuick in 1598, died  
 no less than 124. Husbandry is he-  
 : improved. The crops are bear,  
 sic, potatoes, and flax. The popu-  
 lation, in 1792, stated by the rev.  
 in his report to Sir J. Sinclair, was  
 d decreased 153, since 1755. The  
 eep was 13,263; of horses 716, and  
 c 1563.

WICK, a valley in Ross-shire.

DES, the name of two cavities, or  
 ons, in the inferior part of the first  
 neck.

HAY, or } a parish of Scotland, in Ar-  
 NORCHY, } gylsh. bordering on Perth-  
 with that of INISHALL in 1618; dis-  
 it in 1650, and re-united, soon after  
 irth of both is 24 miles; the breadth  
 ey extend for 8 miles on each side of  
 ec AW, N° 3. The surface is mostly  
 . The soil on the low grounds, is a  
 light earth and sand, or rich loam;  
 arley, turnips, and various kinds of  
 atoes. The latter are cultivated with  
 nd form the chief food of the natives  
 is of the year. The population, in  
 by the rev. Dr Joseph McIntyre, in  
 Sir J. Sinclair, was 1669, and had in-  
 nce 1755. The number of sheep was  
 ck cattle are exported, (but the Dr  
 ate the number;) as well as wool,  
 n, tartans, &c. The imports are mer-  
 , and 1000 bolls of meal. The roads  
 , and inns, are good. There is a lead  
 h was wrought for many years; and  
 , ASBESTOS, and beautiful JASPERs,  
 ound in the mountains.

NORCHY, a vale in the above parish,  
 es long and half a mile broad, seated

on the URCHAY, which winds through it, and di-  
 vides it into two equal parts.

(3.) GLENORCHY, a village in the above valley,  
 15 miles NE. of Inveraray, and SE. of Bunaw.

(4.) GLENORCHY, Lady. See MAXWELL.

GLENPRASSIN, a district of Forfarshire.

GLEN-QUEICH, a valley in Perthshire, 10 miles  
 N. of Crieff.

GLEN-RINNES, a valley in Banffshire, 7 miles  
 NE. of Inveravon.

(1.) GLENSHEE, a valley in Perthshire, 15 miles  
 E. of Blair in Atholl.

(2.) GLENSHEE, SPITAL OF, a noted pass into  
 the Grampian mountains, a little S. of the point  
 where the counties of Perth, Angus, and Aber-  
 deen meet. In 1718, a small body of Highlanders,  
 with 500 Spaniards, took possession of it; but on  
 the approach of the king's troops, after retiring  
 to the pass at Strachell, and from one height to a-  
 nother, the Highlanders dispersed, and next day  
 the Spaniards surrendered. *Brookes's Gazetteer*.

(1.) GLENSHEIL, [Gael. *glean sheilich*, *i. e.* the  
 valley of hunting.] a parish of Scotland, in Ross-  
 shire, 21 miles long, from NW. to SE. and from  
 2 to 6 broad. The climate is rainy. The surface  
 is partly mountainous, partly level; the soil on  
 the former is thin, stony and barren; on the lat-  
 ter gravel and light earth. Oats, bear, and pota-  
 toes are the only crops. The population, in 1792,  
 stated by the rev. J. M'Rae, in his report to Sir J.  
 Sinclair, was 721, and had increased 212 since  
 1755. The staple of this parish is black cattle,  
 which are not large, but hardy, and uncommonly  
 elegant. They sell at from 3 l. to 5 l. Horses,  
 sheep, and goats are also reared, but the numbers  
 are not mentioned by Mr M'Rae.

(2.) GLENSHEIL, a district in the above parish,  
 consisting of two narrow valleys, 2 miles distant  
 from each other, and from 1 to 5 miles long,  
 "surrounded on each side by almost perpendicular  
 mountains of a prodigious height." In a narrow  
 pass in these heights, (says Mr M'Rae,) was fought  
 in 1719, the battle of Glenheil, between some  
 English troops and 300, or 400 Spaniards, joined  
 by some Highlanders under the earl of Seaforth,  
 who was dangerously wounded, and soon after his  
 followers gave way, and the Spaniards surren-  
 dered; though the English lost their commander."  
 This seems to be the same battle, stated by Dr  
 Brookes to have happened at Glenshee, in Perth-  
 shire, in 1718. See GLENSHEE, § 2. In 1786,  
 the proprietor, Mr M'Kenzie of Seaforth, was  
 offered *triple rent* for this district by sheep farmers,  
 but he nobly refused it, saying he would *never*  
*prefer sheep to men*; and set the lands to his old  
 tenants, on a very moderate augmentation.

(1.) GLENTANAR, a mountainous parish of  
 Scotland, in Aberdeenshire, 30 miles SW. of A-  
 berdeen, and 30 NW. of Brechin. It is seated on  
 the rivulet *Tanar*, S. of the Dee, and is united to  
 the parish of *Abogue*. The extent of both parishes  
 is 9 miles in length from E. to SW. and 3 in breadth.  
 The soil is sandy, and fertile in rainy seasons. The  
 new husbandry has been introduced, and the E. of  
 Aboyne's own farm of 400 acres is in high cultiva-  
 tion. Oats, barley, turnips, and potatoes, are the  
 chief produce. The population of Aboyne and  
 Glentanar, in 1796, was 1050, and had decreased

645 since 1755. The highest mountain in Glentanar, called *Fir Mount*, is 2,500 feet above the sea level, and affords an extensive prospect of Aberdeen, Montrose, and Arbroath. The Dee runs between the two parishes.

(1.) GLENTANAR, FOREST OF, a large forest of natural wood, in Aberdeenshire, near the above parish, (and perhaps partly in it,) 10 miles long and 6 broad, abounding with excellent Scots fir.

GLENTHAM, a village in Lincolnshire, W. of Market-Raisin.

GLENTIS, a village of Ireland, in Down county, on the Amdrafs. One of the chief fairs for black cattle in Ireland, is held at it.

GLENRATHEN, or LINRATHEN, a parish of Scotland, in Forfarshire. See LINRATHEN.

GLEN-URQUHART, a vale in Inverness-shire.

GLEN-YALDER, a valley in Aberdeenshire, between Loch-Garr and the Dee.

GLEVUM. See GLOUCESTER, N<sup>o</sup> 2.

\* GLEW. *n. f.* [*gluten*, Lat.] A viscous cement made by dissolving the skins of animals in boiling water, and drying the gelly. See GLUE.

(1.) \* GLIB. *adj.* (from *glib*. *Skim.*) 1. Smooth; slippery; so formed to be easily moved.—Liquid bodies have nothing to sustain their parts, nor any thing to cement them: the parts being *glib* and continually in motion, fall off from one another, which way soever gravity inclines them. *Burnet's Theory*.—Habakkuk brought him a smooth strong rope, compactly twisted together, with a noose that slipt as *glib* as a birdcatcher's gin. *Arbutnot.* 2. Smooth; voluble.—

I want that *glib* and oily art

To speak and purpose not, since what I well intend,

I'll do't before I speak. *Shak. K. Lear.*

—There was never so much *glib* nonsense put together in well sounding English. *Locke*.—

Now Curl his shop from rubbish drains;

Three genuine tomes of Swift's remains:  
And then to make them pass the *glibber*,  
Revis'd by Tibbald, More and Cibber. *Swift.*  
Be sure he's a fine spoken man;

Do but hear on the clergy how *glib* his tongue ran. *Swift.*

(2.) \* GLIB. *n. f.*—The Irish have from the Scythians mantles and long *glibs*; which is a thick curled bush of hair hanging down over their eyes, and monstrously disguised them. *Spens. on Irel.*

\* To GLIB. *v. a.* [from the adjective.] To castrate.—

I'll geld them all: fourteen they shall not see,  
To bring false generations; they are coheirs,  
And I had rather *glib* myself than they

Should not produce fair issue. *Shak. Wint. Tale.*

\* GLIBLY. *adv.* [from *glib*.] Smoothly; volubly.—Many who would startle at an oath, whose stomachs as well as conscience recoil at an obscenity, do yet slide *glibly* into a detraction. *Gov. of the Tongue.*

\* GLIBNESS. *n. f.* [from *glib*.] Smoothness; slipperiness.—

A polish'd ice-like *glibness* doth enfold  
The rock. *Chapman's Odyssey.*

—The tongue is the most ready for motion of any member, needs not so much as the flexure of a

joint, and by access of humours ac-  
*ness* too, the more to facilitate its use  
of the Tongue.

GLICAS, or GLYCAS, Michael, a  
rian, who lived in Sicily, about the 11th  
century, and wrote annals of what  
the creation to the death of Alexius  
in 1118. Leunclavius added to it a 5th  
carries it down to the taking of Co  
Glicas was also the author of several  
curious letters.

\* GLIDE. *n. f.* [from the verb.]  
or manner of passing smoothly.—

About his neck

A green and gilded snake had wrea  
Who, with her head nimble in  
proach'd

The opening of his mouth; but so  
Seeing Orlando, it unshook'd itself,  
Add with indented *glides* did slip a  
Into a bush. *Shak. A*

\* To GLIDE. *v. n.* [*glidan*, Saxo  
Dutch.] 1. To flow gently and silent  
By East, among the dusty vallies  
The silver streams of Jordan's cryst

Broke by the jotting land on eith  
In double streams the briny waters.

Just before the confines of the w  
The *gliding* Lethe leads her silent fl

Where stray the muses, in what lan  
In those fair fields where sacred Ihs  
Or else where Cam his winding vale

2. To pass on without change of step.  
Ye *gliding* ghosts, permit me to n  
The mystick wonders of your silent

3. To move swiftly and smoothly aloft

If one of mean affairs

May plod it in a week, why may n  
*Glide* thither in a day? *Shak.*

Shoals of fish, with fins and spini  
*Glide* under the green wave,

He trembl'd every limb, and felt  
As if cold steel had *glided* through b

—All things are beheld as in a hasty mo  
the objects only *glide* before the eye,  
pear. *Dryden.*

\* GLIDER. *n. f.* [from *glide*.] One  
The glance into my heart did *glic*  
Hey ho the *glider*;

Therewith my soul was sharply g  
Such wounds soon waxen wider.

\* GLIKE. *n. f.* [*glig*, Saxon. See  
A sneer; a scoff; a flout. Not now  
Where's the bastard's braves, and  
*glikes*? *Shakespeare.*

GLIKEON, a town of European  
Epirus, 26 miles W. of Atla.

GLIMANY, a town of Poland in L

(1.) \* GLIMMER. *n. f.* [from the  
Faint splendour; weak light. 2. A ki

stony bodies, dispersedly, from their

were an inducement to the writers give those bodies the name of mica. *Woodward*.—Stones which are comets, that are generally plain and parallel; are flexible and elastic; talc, catmuser, of which there are three sorts, or the golden, the white or silvery, &c. *Woodward*.

IMMER, or GLIST. See MICA.  
IMMER. v. n. [*glimmer*, Danish, to new, Dutch, to glow.] 1. To shine

est yet *glimmers* with some streaks of *Sbak*.

th appears so naked on my side, purblind eye may find it out, that side it is so well apparel'd, so shining, and so evident, ill *glimmer* through a blind man's eye. *Sbak*.

re no twilight of the sun's dull ray upon the pure and native day. *Cowley*.  
*glimmering* bowers and glades &c. *Milton*.

ou you' dreary plain, forlorn and wild, of desolation, void of light, the *glimmering* of their livid flames and dreadful? *Milt. Par. Lost*.

The sacred influence appears, and from the walls of heav'n into the bosom of dim night *ring* dawn. *Milton's Par. Lost*.

hese sad shades this chaos in my soul, is of light at length began to roll; motion of an infant ray *ring* thro' the cloud, and promis'd *Prior*.

the winds, extinct the signal lies; *ring* d in the *glimm'ring* socket dies. *Gay*.  
rosy morning *glimmer'd* o'er the dale, to pasture all the lusty males. *Pope*.  
received imperfectly; to appear faint: way the baggage post-boy, who had t, got a *glimmering* who they were. he Pagan priesthood was always in the there was a perceivable *glimmering* h rites in it, though much corrupted.

PSE. n. f. [*glimmen*, Dutch, to glow.] faint light.—

ch vast room in nature, bine, yet scarce to contribute a *glimpse* of light, convey'd so far this habitable, which returns k to them. *Milton*.

ls of things, which now either wholly apprehensions, or which our short- on having got some faint *glimpse* of, dark, grope after. *Locke*. 2. A quick t.—

n the lightning *glimpse* they ran? *Milt*.  
nightless youth was wing'd with vain es;

ood, long misled by wand'ring fires, false lights; and when their *glimpse* gone,

struck out new spangles of her own. *Dryden*.

3. Transitory lustre.—  
There no dear *glimpse* of the sun's lovely face  
Strikes thro' the solid darkness of the place. *Cowley*.

If I, celestial fire, in aught  
Have serv'd thy will, or gratified thy thought,  
One *glimpse* of glory to my issue give;  
Grac'd for the little time he has to live. *Dryd*.

4. Short fleeting enjoyment.—  
If, while this weary'd flesh draws fleeting  
breath,

Not satisfy'd with life, afraid of death,  
If hap'ly be thy will that I should know  
*Glimpse* of delight, or pause from anxious woe;  
From now, from instant now, great fire, dispel  
The clouds that press my soul. *Prior*.

5. A short transitory view.—  
O friends! I hear the tread of nimble feet  
Hasting this way, and now by *glimpse* discern  
Ithuriel, and Zephor, thro' the shade. *Milton*.

—Some God punisheth exemplarily in this world, that we might have a taste or *glimpse* of his present justice. *Hakevill*.—A man used to such sort of reflections, sees as much at one *glimpse* as would require a long discourse to lay before another, and make out in one entire and gradual deduction. *Locke*.—

What should I do! while here I was enchain'd,

No *glimpse* of godlike liberty remain'd. *Dryden*.  
6. The exhibition of a faint resemblance.—No man hath a virtue that he has not a *glimpse* of. *Shakespeare*.

GLIMS-HOLM, one of the ORKNEY islands, a mile and a half S. of Pomona.

GLINA, a river of Croatia, which rises near Creutz, and runs into the Lonia.

GLIN-LOUGH, a lake of Ireland, in the county of Leitrim, 7 miles NNE. of Sligo.

GLINNINO, a town of Russia, in Novogorod.

(1.) GLINSK, a town of Ireland, in Galway.

(2.) GLINSK, a town of Russia, in Tchernigof.

GLINTZENDORF, a town of Austria.

GLINVILLE, a town of Ireland, in Cork.

GLINUS, in botany, a genus of the pentagynia order, belonging to the decandria class of plants; and in the natural method ranking under the 22d class *Caryophyllei*. The calyx is pentaphyllous; there is no corolla; the nectarium is composed of bifid bristles; the capsule is quinqueangular, quinquelocular, quinquevalved, and polyspermous.

GLIRES, the name of Linnæus's 4th order of mammalia. See ZOOLOGY.

GLISSON, Francis, a learned English physician of the 17th century, who was educated at Cambridge, and was made regius professor of the university. In 1634, he was admitted a fellow of the college of physicians in London. During the civil wars, he practised physic at Colchester, and afterwards settled in London. He greatly improved physic by his anatomical dissections, and made several new discoveries of singular use towards establishing a rational practice. He wrote, 1. *De rachitide*, &c. 2. *De lymphæductis nuper repertis*; with the *Anatomica prolegomena*, & *Ataxomia hepatis*. 3. *De naturæ substantia energetica*; seu de viâ vitæ naturæ, ejusque tribus primis facultatibus

*statibus, &c. quarto.* 4. *Trochæus de ventriculo & intestinis, &c.* He discovered the *capsula communis*, or *vagina portæ*.

GLIST. See GLIMMER and MICA.

\* To GLISTEN. *v. n.* [*glittan*, German.] To shine; to sparkle with light.—

The bleating kind

Eye the bleak heaven, and next the *glistening* earth,

With looks of dumb despair. *Thomf. Winter.*

—The ladies eyes *glistened* with pleasure. *Richardson's Pamela.*

\* GLISTER. *n. s.* [Properly written *clyster*, from *κλύω*.] See CLYSTER. It is written wrong even by *Brown*.—

Now enters Bush with new state air,

His lordship's premier minister;

And who, in all profound affairs,

Is held as needful as his *glister*. *Savist.*

—Choler is the natural *glister*, or one excretion whereby nature excludeth another; which descending daily into the bowels, extimulates those parts, and excites them unto expulsion. *Brown's Vulg. Err.*

\* To GLISTER. *v. n.* [*glittan*, German; *gliffieren*, Dutch.] To shine; to be bright.—The wars flame most in Summer, and the helmets *glister* brightest in the fairest sunshine. *Spens. on Irel.*—

'Tis better to be lowly born.

And range with humble livers in content,  
Than to be perk'd up in a *glistering* grief,

And wear a golden sorrow. *Shak. Hen. VIII.*

The golden sun

Gallops the zodiack in his *gliff* ring coach.

*Shakespeare.*

All that *glifters* is not gold. *Shak. M. of Ven.*

You were more the eye and talk

Of the court to-day, than all

Else that *glifters* in Whitehall. *Ben. Jonf.*

—When the sun shone upon the shields of gold and brass, the mountains *gliftered* therewith, and shined like lamps of fire. 1. *Mac. vi. 39.*—It consisted not of rubies, yet the small pieces of it were of pleasant redish colour, and *gliftered* prettily. *Boyle.*

GLITNESS, one of the SHETLAND islands on the E. coast, 11 miles N. of Lerwick.

\* GLITTER. *n. s.* [from the verb.] Lustre; bright show; splendour.—

Clad

With what permissive glory since his fall

Was left him, or false *glitter*. *Milt. Par. Lost.*

—Flourish not too much upon the *glitter* of fortune, for fear there should be too much alloy in it. *Collier.*—Take away this measure from our dress and habits, and all is turned into such paint and *glitter*, and ridiculous ornaments, as are a real shame to the wearer. *Law.*

\* To GLITTER. *v. n.* [*glittan*, Sax.] 1. To

† Dr JOHNSON is in a great mistake here. No such "participial termination" as *AND* is used in any part of Scotland that we know of. It is merely an erroneous orthography of some of our old Scots Poets, from Chaucer and other ancient English bards. The *G*, in the participial termination *ING*, is seldom pronounced in the common Scots dialect; but as *little*, or *less*, are the *A* and *D* of the obsolete termination *AND*. *GLITTERAND* and *Glittering* are called *Glitterin*.

‡ In Scotland we have no such verb as *To GLOAR*. Dr JOHNSON has perhaps heard *gloan*, but he mistakes both the sound and the spelling, when he writes it *gloarand*.

shine; to exhibit lustre; to gleam. are more resplendent than the like; and so is the *glittering* of a blade.

Rem.—

Before the battle joins, from  
The field yet *glitters* with the po

**LOBE**, in geometry. See **SPHERE**.  
**LOBE**, in geography, and astronomy, (§  
 3.) is particularly used for an artificial  
 metal, plaster, paper, or other matter;  
 e convex surface is drawn a map, or re-  
 ion either of the earth or heavens, with  
 al circles conceived thereon. See **GEO-**  
**SECT. X—XV.** Globes are of two  
*restrial* and *cestial*; each of very con-  
 use, the one in astronomy, and the other  
 iphy, for performing many of the opera-  
 ise sciences, in an easy obvious manner,  
 ce conceived without any knowledge of  
 ematical grounds of those arts. The  
 ital parts, common to both globes, are  
 representing that of the world; and a  
 shell, or cover, which makes the body  
 be, on the external surface of which the  
 sion is drawn. See **AXIS**, **POLE**, &c.  
 bes most commonly used are made of  
 d paper. See § 4.

**LOBES, CONSTRUCTION OF.** A wooden  
 ovided, somewhat less than the intended  
 of the globe; and into the extremes  
 wo iron wires are driven for poles: this  
 be the beam, or basis of the whole struc-  
 a the axis are applied two spherical or  
 ispherical caps, formed on a kind of  
 mould or block. These caps consist of  
 d, or paper, laid one lay after another, on  
 f, to the thickness of a crown-piece; af-  
 , having stood to dry and embody, maci-  
 sion along the middle, the two caps  
 ed are slipped off the mould. They are  
 on those of the axis, as before  
 on those of the mould; and to fix them,  
 lges are sewed together with pack-thread,  
 rudiments of the globe thus laid, it  
 rengthened and made smooth and regu-  
 lder to this, the two poles are hisp'd  
 iline semicircle of the size intended;  
 l or plaster, made of whitening, water,  
 heated, melted, and incorporated toge-  
 laubed all over the paper surface. In  
 a as the plaster is applied, the ball is  
 nd in the semicircle, the edge whercof  
 whatever is superfluous and beyond the  
 sion, leaving the rest adhering in places  
 ort of it. After such application of the  
 e ball stands to dry; which done, it is  
 in the semicircle, and fresh matter ap-  
 s they continue alternately to apply the  
 PART II.

composition, and dry it, till the ball every where  
 accurately touches the semicircle, in which state  
 it is perfectly smooth, regular, and firm. The  
 ball thus finish'd, it remains to paste the map  
 or description thereon: in order to this, the map  
 is projected in several gores, or gussets, all of  
 whi h join accurately on the spherical surface, and  
 cover the whole ball. To direct the application  
 of these gores, lines are drawn by a semicircle on  
 the surface of the ball, dividing it into a number  
 of equal parts corresponding to those of the gores,  
 and subdividing those again answerably to the  
 lines and divisions of the gores. There remains  
 only to colour and illuminate the globe; and to  
 varnish it, the better to resist dust, moisture, &c.  
 The globe itself thus finish'd, is hung in a brazen  
 meridian, with an hour circle, and a quadrant of  
 altitude; and thus fitted into a wooden horizon.

(5.) **GLOBES, METHOD OF DESCRIBING THE  
 GORES, OR GUSSETS, FOR THE.** In Chambers's  
 Dictionary, the following method is directed. (See  
*Plate CLXVIII.*) "1. From the given diameter  
 of the globe, find a right line AB, *fig. 1.* equal to  
 the circumference of a great circle, and divide it  
 into 12 equal parts. 2. Through the several  
 points of division, 1, 2, 3, 4, &c. with the interval  
 of ten of them, describe arches mutually intersec-  
 ting each other in D and E; these figures or pieces  
 duly pasted and joined together will make the  
 whole surface of the globe. 3. Divide each part  
 of the right line AB into 30 equal parts, so that the  
 whole line AB, representing the periphery of the  
 equator, may be divided into 360 degrees. 4.  
 From the poles D and E, *fig. 2.* with the interval  
 of 23½ deg. describe arches *a b*; these will be  
 twelfth parts of the polar circles. 5. After the like  
 manner, from the same poles D and E, with the  
 interval of 66½ deg. reckoned from the equator,  
 describe arches *c d*; these will be 12th parts of  
 the tropics. 6. Through the degree of the equa-  
 tor *e*, corresponding to the right ascension of any  
 given star, and the poles D and E, draw an arch  
 of a circle; and taking in the compasses the com-  
 plement of the declination from the pole D, de-  
 scribe an arch intersecting it in *i*; this point *i* will  
 be the place of that star. 7. All the stars of a  
 constellation being thus laid down, the figure of  
 the constellation is to be drawn according to Bayer,  
 Hevelius, or Flamsteed. 8. Lastly, after the same  
 manner are the declinations and right ascensions  
 of each degree of the ecliptic *d g* to be determi-  
 ed. 9. The surface of the globe thus projected  
 on a plane is to be engraven on copper, to save  
 the trouble of doing this over again for each globe.  
 10. A ball, in the mean time, is to be prepar'd  
 of paper, plaster, &c. as before directed, and of  
 the intended diameter of the globe; on this, by  
 means of a semicircle and style, is the equator to  
 be drawn; and through every 30th degree a me-  
 ridian. The ball thus divided into twelve parts,  
 corresponding to the segments before projected,  
 the latter are to be cut from the printed paper,  
 and pasted on the ball. 11. Nothing now remains  
 but to hang the globe as before in a brazen me-  
 ridian and wooden horizon; to which may be ad-  
 ded a quadrant of altitude made of brass, and divid-  
 ed in the same manner as the ecliptic and equator.

If the declinations and right ascensions of the stars be not given, but the longitudes and latitudes in lieu thereof, the surface of the globe is to be projected after the same manner as before; except that, in this case, D and E, *fig. 2.* are the poles of the ecliptic, and *f b* the ecliptic itself; and that the polar circles and tropics, with the equator *g d*, and parallels thereof, are to be determined from their declinations. M. De La Lande, in his *Astronomie*, 1771, *Tom. 3. p. 736.* relates the following methods: "To construct celestial and terrestrial globes, gores must be engraved, which are a kind of projection, or inclosure of the globe (*fig. 3.*) similar to what is now to be explained. The length PC of the axis of this curve is equal to a quarter of the circumference of the globe; the intervals of the parallels on the axis PC are all equal, the radii of the circles KDI which represent the parallels are equal to the cotangents of the latitudes, and the arches of each, as DI, are nearly equal to the number of the degrees of the breadth of the gore (which is usually 30°) multiplied by the sine of the latitude: thus, there will be found an intricacy in tracing them; but the difficulty proceeds from the variation found in the trial of the gores when pasting them on the globe, and of the quantity that must be taken from the paper, less on the sides than in the middle; (because the sides are longer) to apply it exactly to the space that it should cover. The method used among workmen to delineate the gores, and which is described by Mr Bion (*Usage des Globes*, tom. 3.) and by Mr Robert de Vaugendy in vol. 7th of the *Encyclopedie*, is little geometrical, but yet is sufficient in practice. Draw on the paper a line AC, equal to the chord of 15°, to make the half-breadth of the gore; and a perpendicular PC, equal to 5 times the chord of 30°, to make the half-length: for these papers, the dimensions of which will be equal to the chords, become equal to the arcs themselves when they are pasted on the globe. Divide the height CP into 9 parts, if the parallels are to be drawn in every 10°; divide also the quadrant BE into 9 equal parts through each division point of the quadrant as G; and through the corresponding point D of the right line CP draw the perpendiculars HGF and DF, the meeting of which in F gives one of the points of the curve BEP, which will terminate the circumference of the gore. When a sufficient number of points are thus found, trace the outline PIB with a curved rule. By this construction are given the gore breadths, which are on the globe, in the ratio of the cosines of the latitudes; supposing these breadths taken perpendicular to CD, which is not very exact, but it is impossible to prescribe a rigid operation sufficient to make a plane which shall cover a curved surface, and that on a right line AB shall make lines PA, PC, PB, equal among themselves, as they ought to be on the globe. To describe the circle KDI which is at 30° from the equator: there must be taken above D a point which shall be distant from it the value of the tangent of 60°, taken out either from the tables, or on a circle equal to the circumference of the globe to be traced; this point will serve as a centre for the parallel DI, which should pass through the point D, for it is supposed equal

to that of a cone circumscribing the globe which would touch at the point D. Tangents may be traced to every 10 degrees, dividing each parallel, as KI, into three parts, points L and M, and drawing from them through all these division points, curves represent the intermediate meridians between and PB, (as BR and ST, *fig. 4.*) The curve AQ may be described by means of the inclination from different points of the equator may be found in a table; for 10°, it is 320°, 7° 50' = BQ; for 30°, 11° 29', &c. observed in general, that the paper charts are printed, such as the *colombian* itself, is part of a line in six inches upwards, when it is dried after printing; this difference must therefore be corrected in the drawing of the gores: if notwithstanding that, they are found too short, it must be remedied by taking from the surface of the ball a little of the paper with which it is covered; thereby making the dimensions suitable to the gore as it were. But what is singular is, that in drawing moistened with the paste to apply it on the axis GH lengthens, and the side AI in such a manner, that neither the length of the side ACK nor that of the axis GEH are exactly equal to the quarter of the circumference of the globe, when compared to the circumference of the globe, when compared to the copper, or to the numbered side *fig. 4.* Mr Bonne having made several experiments on the dimensions that gores take, after they have been parted ready to apply to the globe particularly with the paper named *jesus*, the use of for a globe of one foot in diameter that it was necessary to give to the copper, the dimensions shown in *fig. 4.* finding that the radius of the globe corresponds to the half breadth of the gore  $\frac{1}{2}$ , the distance AC for the parallel of 10° taken on the right line LM is 12.81, the deviation from the parallel of 10 degrees middle of the gore ED is 4, the line AC is the radius of the parallel of 10° or 12.81, CEF is 4083, and so of the others as in the figure. The small circular cap worked under H, has its radius 253 inches which it would have if the sine of 30° was the radius of it.

(6.) GLOBES, USES OF THE. See PHYSICS, and ASTRONOMY, with the Plates.

 of a small sphere; round; spherical.—  
 : of the atoms of all visible fluids seem-  
 : *globular*, there being no other figure so  
 to the making of fluidity. *Grew's Cos-*

GLOBULARIA. *n. f.* [Latin; *globulaire*,  
 A floiculous flower. *Miller.*

OBULARIA, GLOBULAR BLUE DAISY;  
 the monogynia order, belonging to the  
 class of plants; and in the natural me-  
 thod under the 48th order, *Agregata*.  
 non calyx is imbricated; the proper one  
 inferior; the upper lip of the florets  
 the under one tripartite; the receptacle  
 s. There are several species; but only  
 monly to be met with in our gardens,

LARIA VULGARIS, or common blue  
 has broad thick radical leaves three-  
 the ends, upright stalks from about 6  
 2 inches high, garnished with spear-shap-  
 ed leaves, and the top crowned by a globular  
 blue flowers composed of many florets  
 up. It flowers in June, and makes a  
 earance: but thrives best in a moist shady  
 It is propagated by parting the roots  
 ber.

GLOBULE. *n. f.* [*globule*, French; *glo-*  
*bia*.] Such a small particle of matter as is  
 lar or spherical figure; as the red par-  
 ticle of blood, which swim in a transparent  
 d are easily discovered by the microscope.  
 ll attract one another when they come  
 due distance, and unite like the spheres

of quicksilver. *Quincy*.—The hailstones have op-  
 aque *globules* of snow in their centre, to inter-  
 cept the light within the hoar. *Newton's Opticks*.  
 —Blood consists of red *globules*, twinning in a  
 thin liquor called serum: the red *globules* are e-  
 lastick, and will break; the vessels which admit  
 the smaller *globule*, cannot admit the greater with-  
 out a disease. *Arbutnot on Aiments*.

(2.) GLOBULES. See BLOOD, p 6, 7.

\* GLOBULOUS. *adj.* [from *globulus*.] In form  
 of a small sphere; round.—The whitens of such  
*globulous* particles proceeds from the air included  
 in the froth. *Borl.*

(1.) GLOUCESTER. See GLOUCESTER.

(2.) GLOUCESTER, a village of Northumberland,  
 on the coast, near Ansell.

GLOCHIDION, in botany: A genus of the  
 syncordia order, belonging to the monoclea class  
 of plants. There is no calyx; the corolla consists  
 of six egg shaped concave petals; the stamina are  
 three very small inconspicuous filaments; the an-  
 theræ cylindric and erect; the female flowers have  
 no calyx; the corolla is parted into six; the peri-  
 carpium is a depressed roundish capsule with six  
 cells; the seeds are roundish and solitary.

GLOGAU, or } a duchy or principality of

(1.) GLOGAW, } Silesia, seated on both sides  
 of the Oder, on the borders of Poland. It is di-  
 vided into six circles, and produces plenty of  
 corn, wine, fruits, wood, and iron; and feeds nu-  
 merous flocks of sheep. Various woollen manu-  
 factures are carried on in it.

(2.) GLOGAW, GREAT, a strong town of Sile-  
 sia, the capital of the above duchy, N° 1. It is  
 not very large, but is well fortified on the side of  
 Poland. It has a handsome castle, with a tower,  
 in which several counsellors were condemned by  
 Duke John, in 1498, to perish with hunger. Be-  
 sides the Papists, there is a great number of Pro-  
 testants and Jews. It was taken by assault by Fre-  
 derick II. king of Prussia, in 1741, and the garri-  
 son made prisoners. After the peace in 1742, that  
 king settled the supreme court of justice here, it  
 being, next to Breslaw, the most populous place  
 in Silesia. It is seated on the Oder, 30 miles N.  
 W. of Breslaw; 30 SSW. of Posen, and 113 N.  
 by E. of Prague. Lon. 16. 11. E. Lat. 51. 39. N.

(3.) GLOGAW, LITTLE, or } a town of Silesia,

(3) GLOGAW, UPPER, } in the duchy of  
 Oppelen, belonging to Prussia. It is two miles SE.  
 of Great Glogaw, and 45 NW. of Breslaw. Lon.  
 16. 15. E. Lat. 51. 38. N.

GLOGNITZ, a town of Austria, 13 miles S.  
 of Vienna.

GLOGOVNITZA, a town of Croatia, 4 miles  
 NNE. of Creutz.

\* To GLOMERATE. *v. a.* [*glomerare*, Latin.]  
 To gather into a ball or sphere. A filamentous  
 substance gathered into a ball is said to be *glome-*  
*rated*, but discontinuous particles are *conglobated*.

\* GLOMERATION. *n. f.* [*glomeratio*, Lat.]  
 1. The act of forming into a ball or sphere. 2. A  
 body formed into a ball.—The rainbow consisteth  
 of a *glomeration* of small drops, which cannot fall  
 but from the air that is very low. *Bacon*.

\* GLOMEROUS. *adj.* [*glomerosus*, Latin.]  
 Gathered into a ball or sphere, as a ball of thread.

GLOMMACH, a cataract of Scotland, in Ros-

shire, on the heights of Glenechaig. "The fall of water, (says the rev. Roderick Morison) is very considerable, and rendered awful by the surrounding hills and woods. The light at this place seldom exceeds twilight." *Sir J. Sinclair's Stat. Acc.* VI. p. 253.

**GLOMME**, a river of Norway, in Aggerhuys, which runs into the North Sea at Frederickstadt. About 50,000 trees are annually floated down this river; but, being full of cataracts, it is not navigable.

\* **GLOOM**, *n. f.* [*glomang*, Saxon, twilight.] 1. Imperfect darkness; dismalness; obscurity; defect of light.—

Glowing embers through the room,  
Teach light to counterfeit a gloom. *Milton.*

This the feat,  
That we must change for heav'n? This mournful gloom,

For that celestial light? *Milton's Par. Lost.*

The still night, not now, as ere men fell,  
Wholesome, and cool, and mild; but with black air

Accompany'd; with damps, and dreadful gloom. *Milton.*

Now warm in love, now with'ring in thy bloom,

Lost in a convent's solitary gloom. *Pope.*

2. Cloudiness of aspect; heaviness of mind; fullness.

\* **To GLOOM**, *v. n.* [from the noun.] 1. To shine obscurely, as the twilight. This sense is not now in use.—

His glistering armour made  
A little glooming light much like a shade. *Spenser.*

Scarcely had Phœbus in the glooming East

Yet harnessed his fiery-footed team. *Spenser.*

2. To be cloudy; to be dark. 3. To be melancholy; to be sullen.

\* **GLOOMILY**, *adv.* [from *gloomy*.] 1. Obscurely; dimly; without perfect light; disinfully. 2. Sullenly; with cloudy aspect; with dark intentions; not cheerfully.—

See, he comes: how gloomily he looks!  
*Dryden.*

Gloomily retir'd the spider lives. *Thomson.*

\* **GLOOMINESS**, *n. f.* [from *gloomy*.] 1. Want of light; obscurity; imperfect light, dismalness. 2. Want of cheerfulness; cloudiness of look; heaviness of mind; melancholy.—Neglect spreads gloominess upon their humour, and makes them grow sullen and unconvertible. *Collier of the Spleen.*—The gloominess, in which sometimes the minds of the best men are involved, very often stands in need of such little incitements to mirth and laughter as are apt to disperse melancholy. *Addison.*

\* **GLOOMY**, *adj.* [from *gloom*.] 1. Obscure; imperfectly illuminated; almost dark; dismal for want of light.—

These were from without

The growing miseries which Adam saw

Already in part, though hid in gloomiest shade,

To sorrow abandon'd. *Milton's Par. Lost.*

Deep in a cavern dwells the drowsy god,

Whose gloomy mansion nor the rising sun,

Nor setting visits, nor the lightsome noon.

*Dryden's Fables.*

—The surface of the earth is clearer or just as the sun is bright or more overcast. *Letters.* 2. Dark of complexion.—

That fair field  
Of Enna, where Proserpine gathering  
Herself a fairer flow'r, by gloomy Dis  
Was gather'd. *Milton's*

3. Sullen; melancholy; cloudy of look of heart.

**GLORIA PATRI.** See **DOXOLOGY.**

\* **GLORIED**, *adj.* [from *glory*.] 1. Honourable; decorated with glory; dignified honours. Not in use.—

Old respect

As I suppose, toward your once glor

My son, now captive, hither hath

Your younger feet, while mine cast

age

Came lagging after. *Milton's*

\* **GLORIFICATION**, *n. f.* [from *glorify*.] The act of giving glory.—ing your eyes, enter upon the day with vigour for the preservation of you the last in the glorification of God for the works of *Taylor.*

\* **To GLORIFY**, *v. a.* [from *glorifier*, Fr. Lat.] 1. To procure honour or praise.

Two such silver currents, when the

Do glorify the banks that bound them

Justice is their virtue; that all

Makes them sit sure, and glorifies the

2. To pay honour or praise in worship,

glorified when such his excellency, above

is with due admiration acknowledged.

This form and manner of glorifying God

at that time first begun; but received to

and attested at that time as an arguement

truth. *Hooker.*—

Good fellow, tell us here the circu

That we for thee may glorify the Lor

—All nations shall glorify thy name. *Pf.*

—Our bodies with which the apostle c

us to glorify God, as well as with our sic

of Man.—This is the perfection of every

attain its true and proper end; and the

these gifts and endowments, which God

ven us, is to glorify the giver. *Tillotson*

praise; to honour; to extol.—Who else

find to be most licentious of life, despair

parts of disobedience and rebellious d

him they set up and glorify. *Spenser on*

No chymist yet the elixir got,

But glorifies his pregnant pot,

If by the way to him befall,

Some odoriferous thing, or medicinal

4. To exalt to glory in heaven; to raise

tial beatitude.—If God be glorified in I

shall also glorify him in himself, and sha

way glorify him. *John*, xiii. 32.—Whom

sted them he also glorified. *Rom.* viii.

members of the church remaining, being

sanctified, shall be eternally glorified;

the whole church be truly and perfe

*Pearson.*—The soul, being immortal, w

time or other, retume its body again in

manner. *Lylyffe.*

**GLORIOSA, SUPERB LILY:** A get

□

a order, belonging to the hexandria class and in the natural method ranking un-  
der the order, *Sarmentaceae*. The corolla is  
tubular, undulated, and reflected; the style  
is but one species, a native of

It has a thick, fleshy, tuberous root,  
from its centre declinated round  
ring 8 or 10 feet long, and garnished  
with long narrow leaves running out into a  
rimmed by a long tendril. From the  
top of the stalks proceed large flame-co-  
lored flowers, consisting of six widely  
reflected petals. It flowers in June and  
July is of admirable beauty, whence its  
name requires the protection of a  
house in this country. The flower-stalks shoot  
forth in March or April; which, being long and  
rusty have tall sticks for their support.  
They are propagated by offsets, which are  
in tolerable plenty, and may be separate  
after the stalks decay, or in spring  
ones arise.

**GLORIOUS.** *adj.* [*gloriosus*, Lat. *gloriosus*,  
ostentatious; proud; haughty; ostentatious.

*Followers*, who make themselves as  
of the commendation of those they fol-  
low for want of secrecy. *Bacon*.—  
are *glorious* must needs be factious; for  
stands upon comparisons. *Bacon*. 2.  
ostentatious; excellent.—It is frequently us-  
ed by logical writers, to express the bright-  
ness of sanctity rewarded in heaven.—  
know that thou art Lord, the only God,  
is over the whole world. *Dan*. iii. 22.—  
in respect of the brightness and splen-  
dour of his body, still made more *glorious*  
by the authority which his Father  
has attributed to him of universal Judge. *Nel-*

tial justice holds her equal scales,  
where virtue does the weight incline;  
where thee thy *glorious* foe prevails,  
he defends the cause that once was thine.

*Prior*.  
remember we are Cato's friends,  
like men who claim that *glorious* title.

*Addison's Cato*.  
stand amongst the first servants of  
the *glorious* amongst those that have  
good fight. *Laus*.—If there be nothing  
as doing good, if there is nothing that  
is like to God, then nothing can be so  
the use of our money, as to use it all  
for love and goodness. *Lucy*.

**GLORIOUSLY.** *adv.* (from *glorious*.) No-  
bly; illustriously.—They inspire with  
heavenly flames which shine so *gloriously* in  
his. *Dryden's Duf*.—

with sometimes may *gloriously* offend,  
to faults true critics dare not mind.

*Pope*.

**GLORY.** *n. s.* [*glorie*, Fr. *gloria*, Lat.]  
old poets it was used sometimes as one  
word.] 1. Praise paid in adoration.—*Glo-*  
ry is the highest. *Luke* ii. 12. 2. The se-  
nate prepared for those that please God.  
Let me guide me with thy counsel, and af-

terwards receive me into thy *glory*. *Psalms* lxxiii.  
24.—

Then enter into *glory* and resume  
His seat at God's right hand, exalted high  
Above all names in heav'n. *Milton*.

—It is hardly possible for you to beseech and in-  
treat God to make any one happy in the highest  
enjoyments of his *glory* to all eternity, and yet be  
troubled to see him enjoy the much smaller gifts  
of God, in this short and low state of human life.  
*Law*. 3. Honour; praise; fame; renown; ce-  
lebrity.—

Think it no *glory* to swell in tyranny. *Sidney*.  
*Glory* is like a circle in the water,  
Which never ceaseth to enlarge itself,  
'Till by broad spreading it disperse to nought.

*Shak*.  
And with that word and warning soon was  
sight,

Each soldier longing for near coming *glory*.  
*Fairfax*.

Israel's bright sceptre far less *glory* brings,  
There have been fewer friends on earth than  
kings. *Cowley*.

—Can we imagine that neither the ambition of  
princes or interest, or gain, in private persons, or  
curiosity and the desire of knowledge, or the *glo-*  
*ry* of discoveries, could ever move them in that  
endless time to try their fortunes upon the sea.  
*Burnet*.—

Your sex's *glory* 'tis to shine unknown,  
Of all applause, be fonder of your own. *Young*.

4. Splendour; magnificence.—Solomon, in all his  
*glory*, was not arrayed like one of these. *Mat*. vi.  
29.—

Treated so ill, chas'd from your throne,  
Returning, you adorn the town;  
And with a brave revenge do shew

Their *glory* went and came with you. *Waller*.

—Aristotle says, that should a man under ground  
converse with works of art, and be afterwards  
brought up into the open day, and see the several  
*glories* of the heaven and earth, he would pro-  
nounce them the works of God. *Spettator*. 5-  
Lustre; brightness.—

Now sleeping flocks on their soft fleeces lie;  
The moon, serene in *glory*, mounts the sky.

*Pope's Winter*.  
From opening skies may streaming *glories* shine,  
And saints embrace thee with a love like mine.

*Pope*.  
6. A circle of rays which surrounds the heads of  
saints in pictures.—It is not a converting but a  
crowning grace; such an one as irradiates, and  
puts a circle of *glory* about the head of him upon  
whom it descends. *South*.—A smile plays with a  
surprising agreeableness in the eye, breaks out  
with the brightest distinction, and sits like a *glory*  
upon the countenance. *Collier*. 7. Pride; boast-  
fulness; arrogance.—By the vain *glory* of men they  
entered into the world, and therefore shall they  
come shortly to an end. *Wisd*. xiv. 14.—

On death-beds some in conscious *glory* lie,  
Since of the doctor in this mode they die.

*Young*.  
8. Generous pride.—The success of those wars  
was too notable to be unknown to your ears, and af-

which

which all worthy fame hath *glory* to come unto.

*Sidney.*

(2.) *GLORY.* See § I. *def.* 3. The desire of fame and reputation appears to be one of the principal springs of action in human society. *Glory*, therefore, is not to be contemned, as some of the ancient philosophers affected to teach; but we should regulate our pursuit after it by the dictates of reason; and if the public approbation will not follow us in that course, we must leave her behind. False ideas of glory have deluged the world with blood in all ages. If the actions of the hero, from the prejudices of mankind, conduct soonest to glory and with the greatest splendor, it is because the service he has done seems to be for *all*; and because we think, without reflecting, that he has saved our habitations, our wealth, our children, and every thing that is dear to us. If the man of science, who in his study has discovered and calculated the motions of the heavenly bodies, who in his alambics has unveiled some of the secrets of nature, or who has exhibited to mankind a new art, rises to fame with less noise; it is because the utility which he procures is more widely diffused, though it is often of less service to the present than to succeeding generations. The consequences, therefore, of these two advantages, are as opposite as the causes are different; and while the benefits procured by the warrior appear to have no more influence, and while his glory becomes obscure, that of a celebrated writer or inventor still increases, and is more and more enlarged. His works bring back his name to that age which uses them, and thus still add to his celebrity and fame. This posthumous fame indeed has been decried by some writers. The author of the *Religion of Nature delineated* has treated it as highly irrational and absurd. "In reality (says he) the man is not known ever the more to posterity, because his name is transmitted to them: He doth not live, because his name does. When it is said, Julius Cæsar subdued Gaul, conquered Pompey, &c. it is the same thing as to say, the conqueror of Pompey was Julius Cæsar; i. e. Cæsar and the conqueror of Pompey is the same thing; Cæsar is as much known by one designation as by the other. The amount then is only this, that the conqueror of Pompey conquered Pompey; or somebody conquered Pompey; or rather, since Pompey is as little known now as Cæsar, somebody conquered somebody. Such a poor business is this boasted immortality! and such is the thing called *glory* among us! To the discerning, this fame is mere air!" But surely it were to consider too curiously (as Horatio says to Hamlet) to consider thus. To be convinced of the great advantage of cherishing this high regard to posterity, this noble desire of an after life in the breath of others, one need only look back upon the history of the ancient Greeks and Romans. For what other principle was it which produced that exalted strain of virtue in those days, that may well serve, in many respects, as a model to these? Was it not the *consentiens laus bonorum*, the *incorrupta vox bene judicantium* (as Tully calls it), "the concurrent approbation of the good, the uncorrupted applause of the wise," that animated their most generous pursuits? In short, can it be reasonable to extinguish a passion which

our Creator has universally lighted up in man's breast. Revelation is so far from eradicating the seed, which the Deity has planted in our nature; that it rather cherishes and forward its growth. To *glory* with honour, and to be *had* in everlasting remembrance, are in the number of those mercies which the Jewish dispensation is so virtuous; and the person from whom the Author of the Christian system receives his commission is herself represented as rejoicing that the nations should call her blessed.

\* *To GLORY.* *v. n.* [*glorior*, Lat.] To be proud of.—With like judgment when he had happened to do a thing which he had performed some notable mischief.—They were wont, in the pride of their proceedings, to *glory*, that whereas Luther had blown away the roof, and Zuinglius had blown away the walls of popish superstition, the last work of all remained, which was to lay the very ground and foundation of popery.

Let them look they *glory* not  
Nor build their evils on the graves of  
For then my guiltless blood must  
them.

—Your *glorifying* is not good. 1 Cor.  
Thou hast seen mount A  
While storms and tempests thunders  
And oceans break their billows at  
It stands unmov'd, and *glories* in it

—This title of Freeholder is what I  
and what most effectually calls to  
happiness of that government under  
*Addison*.—If others may *glory* in the  
may not we, whose parents were call  
attend on him at his altar? *Atterbury*  
out of the reach of misfortune; no  
should *glory* in his prosperity. *Clarke*  
*GLOS*, or *GLOS LA FERRIERE*  
France, in the dep. of Evreux, 9 mi  
gle, and 18 W. of Evreux.

\* *To GLOSE.* *v. a.* To flatter;  
*Hanmer*. See *To GLOZE*.

(1.) \* *GLOSS.* *n. f.* [*γλωσσα*; *gloss*]  
A scholium; a comment.—They need  
tence, which mentioneth the word  
but forthwith their *glosses* upon it  
preached, the scripture explained,  
unto us in sermons. *Hooker*.—

If then all souls, both good and bad  
With gen'ral voice, that souls can  
'Tis not man's flatter'ing *gloss*,  
speech,

Which, like God's oracles, can never  
—Some mutter at certain passages  
putting ill *glosses* upon the text, and  
the left hand what I offer with the right

All this, without a *gloss* or comment  
He could unriddle in a moment.

—In many places he has perverted

 given by Mr Heron to a machine composed of va-  
 rious dented wheels with pinions, for raising great  
 weights.

\* GLOSSOGRAPHER. n. f. [*γλωσσα* and *γραφω*]  
 A scholiast; a commentator.

\* GLOSSOGRAPHY. n. f. [*γλωσσα* and *γραφω*.]  
 The writing of commentaries.

GLOSSOPETRA, or GLOTTOPETRA, [from  
*γλωσσα*, a tongue, and *πετρα*, a stone.] in natural  
 history, a kind of extraneous fossil, somewhat in  
 form of a serpent's tongue; frequently found in  
 the island of Malta and divers other parts. See  
 Plate CLXVII, fig. 4. The vulgar notion is, that  
 they are the tongues of serpents petrified. Hence  
 their extraordinary virtue in curing the bites of  
 serpents. The general opinion of naturalists is,  
 that they are the teeth of fishes, left at land by  
 the waters of the deluge, and since petrified. The  
 several sizes of the teeth of the same species, and  
 those of the several different species of sharks, af-  
 ford a vast variety of these fossil substances. Their  
 usual colours are black, bluish, whitish, yellowish,  
 or brown; and in shape they usually approach to  
 a triangular figure. Some are simple, others tri-  
 cuspidate, having a small point on each side of the  
 large one: many of them are quite straight; but  
 they are frequently found crooked, and bent in all  
 directions; many of them are serrated on their  
 edges, and others plain; some are undulated on  
 their edges, and slightly serrated on their undu-  
 lations. They differ also in size as much as in fi-  
 gure; the larger being 4 or 5 inches long, and the

smaller less than a quarter of an inch. They are most usually found in the strata of blue clay, though sometimes also in other substances, and are common in the clay-pits of Richmond and other places. They are very frequent also in Germany, but nowhere so plentiful as in the island of Malta. The Germans attribute many virtues to these fossil teeth; they call them cordials, sudorifics, and alexipharmics: and the people of Malta, where they are extremely plentiful, hang them about their childrens necks to promote dentition. They may possibly be of as much service this way as an anodyne necklace; and if suspended in such a manner that the child can get them to its mouth, may, by their hardness and smoothness, be of the same use as a piece of coral.

\* GLOSSY. *adj.* [from *gloss.*] Shining; smoothly polished.—There came towards us a person of place: he had on him a gown with wide sleeves, of a kind of water-camblet, of an excellent azure colour, far more *glossy* than ours. *Bacon.*—

The rest entire

Shone with a *glossy* scurf. *Milton.*

His furcoat was a bearskin on his back;  
His hair hung long behind, and *glossy* raven black.

*Dryden.*

Myself will search our planted grounds at home,  
For downy peaches and the *glossy* plum.

*Dryden's Virgil.*

GLOTA. See ARRAN, § 2.

GLOTTIS, in anatomy, the narrow slit at the upper part of the *aspera arteria*, which is covered by the epiglottis when we hold our breath and when we swallow. The glottis, by its dilatation and contraction, modulates the voice. See ANATOMY, *Index.*

GLOTTOPETRA. See GLOSSOPETRA.

(1.) GLOUCESTER, or GLOUCESTERSHIRE, a county of England, bounded on the W. by Monmouthshire, Herefordshire, and the Bristol Channel; on the N. by Worcesterhire; on the E. by Oxfordshire and Warwickshire, and on the S. by Wiltshire and Somersetshire. It is 60 miles long, from NE. to SW. 26 broad, and 160 in circumference; containing 1,100,000 acres, 26,760 houses, 162,560 inhabitants, 290 parishes, 140 impropriations, 1229 villages, 2 cities, and 28 market towns. It sends 8 members to parliament, viz. 2 each for Gloucester, (N° 2.) Tewkesbury, and Cirencester; and 2 for the county. Its manufactures are woollen cloths of various kinds, hats, leather, pens, paper, bar iron, edge-tools, nails, wire, tinned plates, brass, &c.: and its annual exports, cheese 8000 tons; bacon, grain, cyder, 5000 l. worth; perry, fish, 4000 l. worth, &c. It lies in the diocese of Gloucester and circuit of Oxford. The air is very wholesome, but the surface is very various; for the eastern part, called *Cotswold*, is hilly; (see COTESWOLD, N° 2.) the western woody; (see DEAN, § II, N° I, 4.) and the rest is a fruitful valley, through which runs the Severn. See EVESHAM, N° 3, and SEVERN, N° I, 2. This river affords a noble conveyance for goods and merchandise. The county is also watered by the Wye, Avon, Isis, Leyden, Frome, Stroud, and Windrush, besides lesser streams, all abounding with fish. The soil is in general very fertile, though much diversified, yielding plenty of corn, pasture,

fruit, and wood. In *Cotswold*, the air and the soil produces excellent pasture of the 400,000 sheep computed to be kept in the county, the greater part are fed here. The soil is exceeding fine, and hence this shire is eminent for its manufacture of cloth, of which pieces are said to have been made yearly the practice of clandestinely exporting wool became common. In the valley, much warmer, and the soil richer, yield most luxuriant pastures; in consequence of numerous herds of black cattle are kept, in quantities of that excellent cheese, for which is celebrated, made in it. The forest of Dovedale formerly almost entirely over-run with wood, extended 20 miles in length, and 10 in breadth. It was then a nest of robbers, especially the Severn; but now it contains many townships, consisting chiefly of miners, employed in the coal-pits, or in digging for iron ore, with both which it abounds. They have their particular laws, customs, and courts of law; and the king, as in all royal forests, has a swain-mote for the preservation of the venison. This forest was anciently, and is now noted for its oaks, which thrive here very well, but as there is a prodigious consumption in the forges, it is continually diminishing. A navigable canal is made between the Severn and the Thames. See SEVERN, N° I. There are also several springs at St Anthony's well, in a parish; at Barrow and Maredon, in a parish; at Ash church, near Tewkesbury; at Bleton, near Winchcomb; at Easington, near Ley; and at Cheltenham. There are also several antiquities, attributed to the Romans, such as Danes, at Abston, Wick, Dointon, Dixter, Dlethorp, Knole, Over Upton, Hanham, ton, and Bourton.

(2.) GLOUCESTER, the capital of the county, (N° 1.) is seated on the E. side of the Severn. It is an ancient city; and by Antiquaries called *Clevum* or *Glevum*, which *Camden* says was formed from the British *Caer Gleva*, a fair city. It was one of the 28 cities of the Britons before the arrival of the Romans, who made it one of their colonies, and in the 8th century it was esteemed one of the chief cities in the kingdom. In the end of the 10th century it was ravaged by the Danes. It was afterwards considerably ravaged by fire at different periods. It was destroyed during the wars with the barons, and was rebuilt upon a hill; and from the middle of the 14th century where the 4 principal streets meet, there is a descent every way, which makes it not only healthy, but adds to its beauty. For iron was its manufactory so early as the reign of William the Conqueror. Henry VIII. made a gift of a bishopric with a dean and six prebends to the city, which was erected in the time of William I. is very much decayed; part of it is left standing, the crown; and the rest serves for a prison, one of the best in England. In its cathedral, an ancient but magnificent fabric, and has reckoned one of the most curious pieces of architecture in England, are the tombs of Robert of Normandy, and of Edward II: and the whispering place like that of St Paul's at

ster-house lies Strongbow who conquered. There are 12 chapels in Gloucester, and monuments of many great persons and monuments of many great persons. John made it a borough, governed by Henry III., who was crowned here, corporation. By its present charter les I, it is governed by a steward, a recorder, 12 aldermen, out of whom is chosen, a town-clerk, 2 sheriffs, cho- out of 26 common councilmen, a sword 4 serjeants. It has 12 incorporated companies, whose masters attend the all public occasions, &c. Besides the there are 5 parish churches, (formerly hospitals, and an infirmary. There one bridge over the river Severn, with aarf, and customhouse. K. Edward I. liament here in 1272, wherein some were made, now called the *Statutes of* and he erected a gate on the S. side of still called by his name, though almost in the civil wars. Richard II. also ament here; and Richard III, in conf- d his having born the title of *Duke of* the two adjacent hundreds of d King's Barton to it, gave it his sword maintenance, and made it a county of after the restoration, the hundreds away by act of parliament, and the down; because the inhabitants stout gainst Charles I, when he besieged it which, though the siege was raised of Essex, it suffered 20,000 l. damage, houses and 6 churches destroyed, which much that it has scarce yet recover- er size and grandeur. Delaware. It is 62 miles long, and 28 broad; and is divided into 10 townships; containing 13,172 citizens, and 191 slaves, in 1795. It a- bounds with iron ore, which is manufactured. A glass-work has also been erected. Woodbury's the capital.

(5.) GLOUCESTER, a small town in the above county, (N<sup>o</sup> 4.) formerly the capital, on the E. bank of the Delaware, 3 miles below Philadelphia.

(6.) GLOUCESTER, a large township of Rhode Island, in Providence county, containing 4025 citizens, in 1795.

(7.) GLOUCESTER, a fertile and well cultivated county of Virginia, bounded on the N. by the Plankitank, E. by Mathews county and Chesapeake bay, S. and SW. by York river, and NW. by King and Queen counties. It is 55 miles long and 30 broad; and contained 6435 citizens, and 7063 slaves, in 1795.

(8.) GLOUCESTER, a town in the above county, (N<sup>o</sup> 7.) on the N. side of the York, 17 miles from York Town, and 20 SE. of Richmond.

(9.) GLOUCESTER ISLAND, or DUKE OF GLOUCESTER'S ISLAND, an island in the South Sea, 6 miles long and 1 broad. The natives are armed with long pikes. Lon. 140. 4. W. Lat. 19. 15. S.

(10, 11.) GLOUCESTER ISLANDS, two isles in the South Sea, lying the one in Lon. 146. 0. W. and Lat. 20. 38. S.; the other in Lon. 146. 15. W. and Lat. 20. 34. S.

(1.) \* GLOVE. *n. s.* [*glofe*, Saxon, from *the fice*, Danish, to divide.] Cover of the hands.—

They flew about like chaff i' th' wind;

For haste some left their masks behind,

Some could not stay their gloves to find *Drayton*.

White gloves were on his hands, and on his head

A wreath of laurel

*Dryden*.

(2.) GLOVES, in commerce, are distinguished into leathern, silk, thread, cotton, worked, &c. Leathern gloves are made of chamois, kid, lamb, doe, elk, buff, &c. Gloves now pay a duty to the king, which increases according to their value.

(3.) GLOVE, THROWING THE, was a practice or ceremony very usual among our ancestors, being the challenge whereby another was desired to single combat. See BATTLE, § 3. It is still retained at the coronation of our kings; when the king's champion casts his glove in Westminster-hall. See CHAMPION, § 1-3. Favyn supposes the custom to have arisen from the eastern nations, who in all their sales of lands, goods, &c. used to give the purchaser their glove by way of investiture. To this effect he quotes Ruth iv. 7. where the Chaldee paraphrase calls *glove* what the common version renders *flow*. He adds, that the Rab- bins interpret by *glove* that passage in the eighth Psalm, "Over *Eodem* will I cast out my *flow*."— He also says, that the custom of blessing *gloves* in the coronation of the kings of France, was a relic of the eastern practice of giving possession with the *glove*, l. xvi. p. 1017, &c. Anciently the judges were prohibited to wear gloves on the bench. And at present in the stables of some princes, it is not safe to go in without pulling off the gloves.

\* To GLOVE. *v. a.* [from the noun.] To cover as with a glove.—

My limbs,  
Weaken'd with grief, being now enrag'd with  
grief,  
Are thrice themselves: hence therefore, thou  
nice crutch;  
A scaly gauntlet now, with joints of steel,  
Must *glove* this hand. *Shak. Henry IV.*

The next he preys on is her palm,  
That alm'ner of transpiring balm;  
So soft, 'tis air but once remov'd;  
Tender as 'twere a jelly *glov'd*. *Cleveland.*  
(1.) \* GLOVER. *n. f.* [from *glove*.] One  
whose trade is to make or sell gloves.—Does he  
not wear a great round beard like a *glover's* par-  
ing knife? *Shak. Merry Wives.*

(2.) GLOVER, Richard, the author of *Leonidas*  
and several other esteemed works, was the son of  
Richard Glover a Hamburgh merchant in London,  
and was born in St Martin's-lane in 1712. He  
very early showed a strong propensity to poetry;  
and while at school, he wrote, amongst other  
pieces, a poem to the memory of Sir Isaac New-  
ton, prefixed to the view of that incomparable  
author's philosophy, published in 4to, in 1728, by  
Dr Pemberton. But though possessed of talents  
calculated to excel in literature, he devoted his  
attention to commerce, and commenced a Ham-  
burgh merchant. He still, however, cultivated the  
belles lettres, and associated with persons eminent  
in science. One of his earliest friends was Mat-  
thew Green, the author of some admirable poems,  
which in 1737, after his death, were collected  
and published by Mr Glover. In 1737, Mr Glo-  
ver married Miss Nunn, with whom he received  
a handsome fortune; and published *Leonidas, a*  
*poem*, in 4to, which soon passed through 3 editions.  
It was inscribed to Lord Cobham; and on its first  
appearance was received with great approbation.  
Lord Lyttelton, in his *Common Sense*, and in a  
poem addressed to the author, praised it in the  
warmest terms; and Dr Pemberton published,  
*Observations on Poetry*, especially epic, occasioned  
by the late poem upon *Leonidas*, 1738, 12mo,  
merely to point out its beauties. In 1739, Mr  
Glover published *London or the Progress of Com-  
merce*, 4to; and a ballad intitled, *Hester's Ghost*.  
Both these pieces seem to have been written with  
a view to incite the public to resent the misbe-  
haviour of the Spaniards; and the latter had a very  
considerable effect. The political dissensions at  
this period raged with great violence especially in  
the metropolis; and at different meetings of the  
livery, Mr Glover was called to the chair, and  
acquitted himself in a very able manner, his con-  
duct being patriotic and his speeches masterly.  
His talents for public speaking, his knowledge of  
political affairs, and his information concerning  
trade and commerce, soon afterwards pointed  
him out to the merchants of London as a proper  
person to conduct their application to parliament  
on the neglect of their trade. He accepted the  
office; and in summing up the evidence gave  
striking proofs of his oratorical powers. This  
speech was pronounced Jan. 27, 1742. In 1744,  
the Duchess of Marlborough died, and by her will  
left to Mr Glover and Mr Mallet 500l. each, to  
write the History of the Duke of Marlborough's  
*Life*. This bequest, however, never took place.

It is supposed that Mr Glover very ear-  
ly ceded his share of it; and Mallet, though  
long as he lived, never made any pro-  
fit. About this period Mr Glover with-  
drew from public notice. He had been  
with the attention of Frederic Prince  
who once presented him with a com-  
pendium of the Classics, elegantly bound; and,  
sensing himself on account of the em-  
barrassment in his circumstances, sent him 500l.  
Mr Glover produced at Drury-lane his  
*Eoadicea*; which was acted 9 nights.  
Mr Mallet, Mr Mossop, Mrs Cibber, and  
Mr Ward, were among the performers; and  
Mr Pemberton wrote a pamphlet to recom-  
mend it, 1761, Mr Glover published *Medea*,  
written on the Greek model; but it was  
not until 1767, when it appeared at Drury-  
lane, Mrs Yates's benefit. At the accession  
of George the third, having surmounted his  
difficulties, he was chosen M. P. for Weymouth.

At this time, he interested himself about Indi-  
a, one of Mr Sullivan's elections; and  
introduced the fable of the man, horse,  
and wheel, whence he drew this conclusion, that  
merchants made use of armed forces to  
protect their trade, it would end in their destruc-  
tion. In 1770, his poem of *Leonidas* was repub-  
lished, 12mo, corrected and extended to  
12; several new characters being  
added, the old ones placed in new situations,  
and some new incidents arising, in June 1772, from the  
bank of Douglass, Heron, and Co. which  
occasioned Mr Glover's taking a very  
active part in the settling those complicated ac-  
counts. In Feb. 1774, he called the annuitants to-  
gether, at the King's Arms tavern, and  
proposals before them for the security of the  
annuities, with which they were fully sat-  
isfied. He also undertook to manage the inter-  
ests of the merchants and traders of London in  
the trade of Germany and Holland,  
dealers in foreign linens, in their ap-  
plication to parliament in May 1774. Both his speeches  
on these occasions were published that year.

Mr Glover engaged on behalf of the West India  
Company in their application to parliament, as  
witnesses, and summed up the evidence in a  
masterly manner. This speech was a  
very able one. For his exertions in this business, he was  
recom-  
pensed with a service of plate, worth  
1000l. After this he retired to ease and indepen-  
dence. He spent the remainder of his days with di-  
stinction an epic poem of considerable length,  
some tragedies and comedies in MS  
Nov. 25th, 1785; leaving a most estimable  
character as a man, a citizen, and an author.

(3.) GLOVER, a township of Ver-  
mont, in the county, NE. of Craftsborough.

\* To GLOUT: *v. n.* [A low word  
find no etymology.] To pout; to  
puff. It is still used in Scotland.—

She lurks in midst of all her den,  
From out a ghastly whirlpool all her  
Where, *glouting* round her rock,  
falls.

ting with sullen spight, the fury shook  
 sted locks, and blasted with each look.

*Garth.*

DW. *n. f.* [from the verb.] 1. Shining  
 Vehemence of passion. 3. Brightness  
 of colour.—

he pale complexion of true love,  
 e red glow of scorn and proud disdain.

*Spak.*

ring glow his bloomy beds display,  
 g in bright diversities of day.

*Pope.*

suppose that the great pile might hap-  
 pended with the ornamental, that the  
 rave, and majestic dignity of Raffælle  
 te with the glow and outlie of a Paulo,  
 et, are totally mistaken. *Reynolds.*

\* GLOW. *v. a.* [*glōwan*, Saxon; *glōy-*  
 1] To make hot so as to shine. Not

On each side her

pretty dimpled boys, like smiling Cupida,  
 ivers colour'd fans, whose wind did seem  
 to the delicate cheeks which they did  
 ol.

*Shak.*

To GLOW. *v. a.* 1. To be heated so as  
 without flame.—

thence silence lesseneth not my fire,  
 d it flames, and hidden it does glow,  
 reveal what ye so much desire.

*Spenser.*

His goodly eyes,  
 'er the files and musters of the war  
 'ow'd like plated Mars, now bend, now  
 n

ffice upon a tawny front.

*Shak.*

nd, wife to the emperor Henry II. to  
 innocency, did take seven glowing irons,  
 another, in her bare hands, and had  
 o harm.

*Hakewill.*

all parts like, but all alike inform'd  
 adiant light, as glowing iron with fire.

*Milton.*

rn with vehement heat.—  
 would you find it easy to compose

ettled steeds, when from their nostrils  
 ws

rching fire that in their entrails glows.

*Addis. Ovid.*

op'ning heav'n their happy regions show,

 w.

*Smith.*

that glow  
 of woe,  
 l heat of body.—

*Pope.*

Did not his temples glow  
 ame sultry winds and scorching heats?

*Addis. Cato.*

cord slides swiftly through his glowing  
 ids.

*Gay.*

hibit a strong bright colour.—  
 With smile that glow'd.

*Milton.*

l rosy red, love's proper hue.  
 in a gown that glows with Tyrian rays.

*Dryden.*

A malicious joy,  
 red and fiery beams cast through your  
 ge

ng pleasure.  
 the mingled strength of shade and light,

*Dryd. and Lee's Oed.*

A new creation rites to my sight;  
 Such heav'nly figures from his pencil flow,  
 So warm with life his blended colours glow,  
 Amidst the soft variety I'm lost.

*Addison.*

Like th' ethereal glow'd the green expanse.

*Savage.*

Fair ideas flow,

Strike in the sketch, or in the picture glow.

*Pope.*

Not the fair fruit that on yon branches glows,  
 With that ripe red th' autumnal sun bettows,  
 Can move the god.

*Pope.*

Each pleasing Blount shall endless smiles Le-  
 flow,

And fair Belinda's blush for ever glow.

*Pope.*

Here clearer stars glow round the frozen pole

*Pope.*

5. To feel passion of mind, or activity of fancy.—

You strive in vain

To hide your thoughts from him, who knew  
 too well

The inward glowings of a heart in love.

*Cato.*

Forc'd compliments and formal bows  
 Will shew thee just above neglect;

The fire with which thy lover glows,

*Prior.*

Will settle into cold respect.  
 Did Shadrach's zeal my glowing breast inspire

*Prior.*

To weary tortures, and rejoice in fire.  
 Let the gay conscience of a life well spent

Calm ev'ry thought, inspire ev'ry grace,  
 Glow in thy heart, and smile upon thy face.

*Pope.*

With furies surrounded,  
 Despairing, confounded.

He trembles, he glows,

Amidst Rhodope's snows.

*Pope.*

So perish all, whose breasts ne'er learn'd to  
 glow

For others good, or melt at others woe.

*Pope.*

To praise is always hard,

When real virtue fires the glowing bard.

*Lewis.*

6. To rage or burn as a passion.—

A fire which every windy passion blows;

With pride it mounts, and with revenge it glows.

*Dryden.*

When crept into aged veins,

Love slowly burns, and long remains;

It glows, and with a sullen heat,

Like fire in logs, it warms us long.

*Shadwell.*

(1.) \* GLOWWORM. *v. f.* [*glow* and *worm*.] A  
 small creeping insect with a luminous tail.—

The honey bags steal from the humble bees,  
 And for night-tapers crop their waxen thighs,  
 And light them at the fiery glowworm's eyes.

*Shak.*

The glowworm shews the matten to be near,  
 And 'gins to pale his ineffectual fire.

*Shak.*

—A great light drowneth a smaller that it cannot  
 be seen; as the sun that of a glowworm.

*Bacon's Nat. Hist.*—

The man, who first upon the ground

A glowworm spy'd, supposing he had found

A moving diamond, a breathing stone;

For life it had, and like those jewels shone:

He held it dear, 'till by the springing day

Informed, he threw the worthless worm away.

*Waller.*

(2.) GLOW-WORM, in zoology. See LAMPYRIS.

\* GLOZE. *n. f.* [from the verb.] 1. Flattery;  
 insinuation.—

Now to plain dealing; lay these *glozes* by.

*Shak.*

3. Specious show; *glofs*. Not used.—

Precious couches full oft are shaken with a fever;

If then a bodily evil in a bodily *gloze* be not hidden,

Shall such morning dews be an ease to the heat of a love's fire?

*Sidney.*

\* To *GLOZE*. *v. n.* [*glefan*, Saxon.] 1. To flatter; to wheedle; to insinuate; to fawn.—

Man will hearken to his *glozing* lies,

And easily transgress.

*Milt. Par. Lost*

So *glaz'd* the tempter, and his proem tun'd:  
Into the heart of Eve his words made way.

*Milton.*

—A false *glozing* parasite would call his foolhardiness valour, and then he may go on boldly, because blindly, and by mistaking himself for a lion, come to perish like an ass. *Soub.*

Now for a *glozing* speech.

Fair protestations, specious marks of friendship.

*Philips.*

2. To comment. This should be *glofs*.—

Which Salique land the French unjustly *gloze*  
To be the realm of France. *Shak. Henry V.*

\* *GLOZEN*. *n. f.* [from *gloze*.] A flatterer.

\* *GLUBOKAIA*, a town of Russia in Kolivan.

\* *GLUCINA*, [from *γλυκύνω*, to sweeten,] a peculiar earth discovered by Vauquelin in the beryl and emerald, so named from its characteristic property of forming salts of a saccharine taste. Its general properties are these: 1. It is white; 2. impid; 3. adhesive to the tongue; 4. insoluble in water, and 5. in ammoniac; but, 6. soluble in the fixed alkalis, 7. in the carbonate of ammoniac; and, 8. in almost all the acids, except the carbonic and phosphoric, and forming salts of a saccharine taste; 9. infusible; but, 10. fusible with borax into a transparent glass; 11. It absorbs  $\frac{1}{2}$  of its carbonic acid; 12. decomposes the aluminous salts; and, 13. is not precipitable by well saturated hydro-sulphurets. Its specific characters, which are not found united in any of the other known earths, are these: 1. Its salts are saccharine, and slightly astringent; 2. It is soluble in the carbonate of ammoniac; 3. It is very soluble in the sulphuric acid by excess; 4. It decomposes the aluminous salts; 5. It is completely precipitated from its solutions by ammoniac; and, 6. Its affinity for the acids is intermediate between magnesia and alumine. 100 parts of beryl contain 16 of glucina. M. Vauquelin justly remarks, that, "in the sciences, a body, a principle, or a property, formerly unknown, though it may often have been used, or even held in the hands, and referred to other simple species, may, when once discovered, be afterwards found in a great variety of situations, and be applied to many useful purposes. Chemistry affords many recent examples of this truth."

*GLUCKOV*, a town of Russia, in Novgorod.

*GLUCKSBURG*, a town and fort of Denmark, in Sleiswick; 9 miles E. of Flensburg.

*GLUCKSTADT*, a considerable town of Germany, in the duchy of Holstein, with a strong castle, subject to Denmark; seated on the Elbe, near its mouth; 28 miles N.W. of Hamburg. Lon. 9. 25. E. Lat. 53. 54. N.

(1.) \* *GLUE*. *n. f.* [*glu*, Fr. *gluten*, La

Welsh.] A viscous body commonly made from the skins of animals to a jelly; any tenacious matter by which bodies are held together; a cement.—Water, and all liquids readily receive dry and more terrestrial bodies; and dry bodies, on the other hand, drink in waters and liquors; so that, as well said by one of the ancients of earthy substances, one is a *glue* to another. *Nat. Hist.*—The driest and most transparent is the best. *Moxon.*—

To build the earth did chance matter

And through the parts cementing *glue*.

*Bl.*

—The flowers of grains, mixed with water, make a sort of *glue*. *Arbutnot on Aliman*

(2.) *GLUE* is differently denominated according to its preparation and the various uses it is put to; as *common glue*, *glow glue*, and *gum glue*. But the two last are more properly *glues*. The common or strong glue is chiefly made by carpenters, joiners, cabinet-makers, &c. is made of skins of animals, as oxen, cow, sheep, &c.: Whole skins are rarely used for any purpose, but only the shavings, parings, of them, or the feet sinews, &c. That whole skins, however, is undoubtedly the best, as that made of sinews is the very worst.

(3.) *GLUE*, METHOD OF MAKING.—To make glue of parings, they first steep them 24 hours in water; then, washing them well out, they put them to the consistence of a thick jelly; they pass, while hot, through a sieve to separate the impurities; and then let it stand some time to purify it further; when all the filth has subsided to the bottom of the vessel, they melt it a 2d time. They next pour it into flat moulds; whence it is taken out pretty solid, and cut into square pieces or cakes; afterwards dry it in the wind, in a fort net; and at last string it to finish its dryness. *Glue* made of sinews, feet, &c. is made in the same manner; only with this difference, they bone and scour the net, and do not steep. Of this commodity there is a great exportation from England; the English is universally allowed to be the best in Europe, not only from the excellency of the materials, but from the skill of the manufacturers. This is the Flanders glue. In both countries it is made by the tanners from fragment skins dried with much care. In France it is a paratt trade; and the glue-makers pick up materials as they can, from the several skins, and boiling these with cow heels, &c. glue; which as they purchase every thing to render it dear, as well as of an insupportable duty on exportation is sold, and a duty of 3s. 6d. on every cwt. The best glue which is made from the skins of the ox, especially if a bull's hide is used. *Glue* is considerably improved in quality by keeping it in water, and the surest way to try its quality is to lay a piece of it to steep 3 or 4 days in well considerably without melting, and when taken out resumes its former dryness, it is

will hold against fire or water, it is made thus: Mix a handful of quick-oz. of linseed oil; boil them to a good hen spread it on tin plates in the shade, become exceeding hard, but may be red over a fire as glue, and will effect it to admiration. Neumann observes, dissolved in a solution of lapis calaminarius of nitre, and afterwards inspissated, extremely slippery tenacious mass, which I use for entangling flies, caterpillars, insects, if it were not too expensive.

**2. METHOD OF PREPARING AND USING A QUART OF WATER ON THE FIRE;** then put lb. of good glue, and boil them gently till the glue be entirely dissolved and of a fience. When glue is to be used, it is made thoroughly hot; after which, with a pen or brush, besmear the faces of the joints as possible; then clapping them together, lengthwise one upon another, 2 or 3 little them close; and let them stand till dry and firm. Mr Boyle gives the receipt for preparing a fine strong glue thus: Steep the isinglass for 24 hours in brandy. When the menstruum has become softened the isinglass, they must be dissolved together, and kept stirring till they are well mixed, and till a drop thereof, suffers to turn into a strong jelly. Then strain hot, through a clean linen cloth into be kept close stopped. A gentle heat dissolve this glue into a transparent and colourless fluid, but very strong; so that wood glued together with it will break rather than in the place where they are joined together.

**GLUE v. a.** [from the noun.] 1. To join with cement.—

I fear thy overthrow  
From my body's parting with my soul:  
And fear *glue'd* many friends to thee.

*Shak. Henry VI.* teacheth a fool is as one that *glue'd* together. *Ecclus. xxii. 7.*—The custom of the Holy Virgin is so much in vogue among the Italians, that one often sees in their a little tinsel crown or circle of stars, or a canopy over the head of the figure. *n. Italy.*—Most wounds, if kept clean, the air, the flesh will *glue* together with a restorative balm. *Derham.* 2. To hold together parts of all homogeneous hard bodies, by touch one another, stick together very; and for explaining how this may be, some have invented hooked atoms, which is a question; and others tell us their bodies are together by rest; that is, by an occult attraction rather by nothing. *Newton's Opticks.* 3. To unite; to inviscate.—Those wasps and flies are sensual men plunged in their pleasures; and when they are once *glued* it is a very hard matter to work them. *L'Esrange.*—Intemperance, sensuality, and lusts, do debase men's minds and clog the senses; sink us down into sense, and *glue* us to low and inferior things. *Tillotson.*—  
A curb'd a groan that else had come;

And pausing, view'd the present in the tomb:  
Then to the heart ador'd devoutly *glue'd*  
Her lips, and, raising it, her speech renew'd.

*Dryden.*  
I hear thee, view thee, gaze o'er all thy charms,  
And round thy phantom *glue* my clasping arms.

\* **GLUEBOILER.** *n. f.* [*glue* and *boil.*] One whose trade is to make glue.

\* **GLUER.** *n. f.* [from *glue.*] One who cements with glue.

\* **GLUM** *adj.* [A low cant word formed by corrupting *gloom.*] Sullen; stubbornly grave.—Some, when they hear a story, look *glum*, and cry, Well, what then? *Guardian.*

**GLUMA,** } *n. f.* in botany, a species of calyx,  
**GLUME,** } consisting of 2 or 3 membranous valves, which are often pellucid at the edges. See **BOTANY, Index.**

**GLUMMEN,** a town of Prussia, in the prov. of Nantangen, 24 miles S. of Königsberg.

**GLURENTZ,** or } a town of Germany, in the  
**GLURNS,** } Tyrol, on the Adige, 3 miles W. of Tyrol, and 36 W. of Brixen. It was built in 1362, and surrounded with walls in 1530. It was taken by the French, under gen. Desfoles, on the 25th March 1799; but during the battle with the Austrians near it, in which the latter lost 5700 men, and 28 pieces of cannon, this town was accidentally set on fire, and totally burnt down on the 26th.

**GLUSBURN,** a town S. of Skipton, Yorksh.

(1.) \* **GLUT.** *n. f.* [from the verb.] 1. That which is gorged or swallowed.—

Disgorged soul

Their devilish *glut*, chain'd thunderbolts, and hail  
Of iron globes. *Milton's Paradise Lost.*

2. Plenty even to loathing and satiety.—

So death

Shall be receiv'd his *glut*; and with us two

Be forc'd to satisfy his ravenous maw. *Milt.*  
—Let him but set the one in balance against the other, and he shall find himself miserable, even in the very *glut* of his delights. *L'Esrange.*—A *glut* of study and retirement in the first part of my life, cast me into this; and this will throw me again into study and retirement. *Pope to Swift.* 3. More than enough; overmuch.—If you pour a *glut* of water upon a bottle, it receives little of it. *Ben Jonson's Discov.* 4. Any thing that fills up a passage.—The water some suppose to pass from the bottom of the sea to the heads of springs, through certain subterranean conduits or channels, until they were by some *glut*, stop, or other means, arrested in their passage. *Woodward.*

(2.) **GLUT,** among falconers, the slimy substance that lies in a hawk's paunch.

\* **To GLUT.** *v. n.* [*engloutir*, French; *glutia*, Lat. to swallow; *γλυφω*.] 1. To swallow; to devour.—

'Till cram'd and gorg'd, nigh burst

With suck'd and *gluted* offal. *Milt. Par. Lost.*

2. To cloy; to fill beyond sufficiency; to sate; to disgust.—The ambassador, making his oration, did so magnify the king and queen, as was enough to *glut* the hearers. *Bacon.*—

Love breaks friendship, whose delights

Feed, but not *glut* our appetites.

*Denham.*  
*What*

What way remove  
His settled hate, and reconcile his love,  
That he may look propitious on our toils,  
And hungry graves no more be *glutted* with our  
spoils. *Dryden.*

No more, my friend ;  
Here let our *glutted* execution end. *Dryd. Æn.*

I found  
The fickle ear soon *glutted* with the sound,  
Condemn'd eternal changes to pursue,  
Tir'd with the last, and eager of the new. *Prior.*

3. To feast or delight even to satiety.—  
With death's carcass *glut* the grave. *Milt.*  
His faithful heart, a bloody sacrifice,  
Torn from his breast, to *glut* the tyrant's eyes.  
*Dryden.*

A sylvan scene, which, rising by degrees,  
Leads up the eye below, nor *gluts* the sight  
With one full prospect ; but invites by many,  
To view at last the whole. *Dryden.*

4. To overfill ; to load.—He attributes the ill suc-  
cess of either party to their *glutting* the market,  
and retailing too much of a bad commodity at  
once. *Arbutnot's Polite Lying.* 5. To saturate.  
—The menstruum, being already *glutted*, could  
not act powerfully enough to dissolve it. *Boyle.*

GLUTA, in botany ; a genus of the pentandria  
order, belonging to the gynandria class of plants.  
The calyx is campanulated and deciduous ; there  
are 5 petals glued below to the column of the  
germ ; and the filaments inserted on the top of  
the column, on which also the germen sits.

GLUTÆUS. See ANATOMY, § 215.

GLUTEN. See BREAD, § 12, and CHEMIS-  
TRY, *Index.*

\* GLUTINOUS. *adj.* [*glutineus*, French ;  
from *gluten*, Latin.] Gluy ; viscous ; tenacious.  
—The cause of all vivification is a gentle and pro-  
portionable heat, working upon a *glutinous* and  
yielding substance ; for the heat doth bring forth  
spirit in that substance, and the substance being  
*glutinous*, produceth two effects : the one that the  
spirit is detained, and cannot break forth ; the o-  
ther, that the matter, being gentle and yielding, is  
driven forwards by the motion of the spirits, after  
some swelling, into shape and members. *Bacon.*—

Next this marble venomb'd seat,  
Smear'd with gums of *glutinous* heat. *Milton.*

—Nourishment too viscid and *glutinous* to be sub-  
dued by the vital force. *Arbutn. on Alim.*

\* GLUTINOUSNESS. *n. f.* [from *glutinous*.]  
Viscosity ; tenacity.—There is a resistance in fluids,  
which may arise from their elasticity, *glutinousness*,  
and the friction of their parts. *Cheyne.*

(1) \* GLUTTON. *n. f.* [*glutton*, Fr. ; from  
*glutis*, Latin, to swallow.] 1. One who indulges  
his self too much in eating.—The Chinese eat  
horribly at this day, and some *gluttons* have used  
to have cats baked. *Bacon's Nat. Hist.*—

Thro' Mankind's gullet she runs down  
While the vile *glutton* dines alone ;  
And, void of modesty and thought,  
She follows Babel's endless draught. *Prior.*

—If a *glutton* was to say in excuse of his gluttony,  
that he only eats such things as it is lawful to eat,  
he would make as good an excuse for himself as  
the greedy, covetous, ambitious tradesman, that

should say, he only deals in lawful busi-  
ness. 2. One eager of any thing to excess.—

The rest bring home in state the  
To that last scene of bliss, and leave  
All those free joys insatiably to pro-  
With which rich beauty feasts the

*Gluttons* in murder, wanton to de-  
Their fatal arts so impiously employ  
(2.) GLUTTON, in zoology, the Er  
of a species of quadrupeds, ranked  
under the genus MUSTELA, or *Itaq*  
Dr Gmelin, and Mr Kerr, under that  
or *Bear*. There are 2 varieties, viz.  
and reddish brown. See *URSUS*, N°

\* To GLUTTONISE. *v. n.* [fro  
To play the glutton ; to be luxurious.  
\* GLUTTONOUS. *adj.* [from *g*  
ven to excessive feeding ; delighted  
with food.—

When they would smile and sav  
debts,

And take down th' interest in thei  
maws.

—The exceeding luxuriosness of thi  
age, wherein we press nature with c  
burdens, and finding her strength de  
take the work out of her hands, an  
to the artificial help of strong waters.

Well observe

The rule of not too much, by temper  
In what thou eat'st and drink'st ; &  
thence

Due nourishment, no *gluttonous* desi  
\* GLUTTONOUSLY. *adv.* [from  
With the voracity of a glutton.

(1.) \* GLUTTONY. *n. f.* [*gluttony*  
from *glutton*.] Excess of eating ; lux  
table.—*Gluttony*, a vice in a great fort  
in a small. *Holiday*—

Their sumptuous *gluttonies* and gorg  
On citron tables or Atlantic stone.

Well may they fear some miserab  
Whom *gluttony* and want at once

—The inhabitants of cold moist count  
nerally more fat than those of warm  
but the most common cause is too gr  
tity of food, and too small a quantity  
in plain English *gluttony* and laziness.

(2.) GLUTTONY, INSTANCES OF F  
NARY. There is a morbid sort of glut  
*fames canina*, i. e. *dog-like appetite*, w  
times occurs, and renders the person ic  
an object of pity and of cure as in other d.

BULMY.) But habitual *gluttons* may b  
among the monsters of nature, and e  
able for endeavouring to bring a fami  
places where they live. K. James I. w  
was presented to him who could eat a v  
at one meal, asked "What could h  
than another man ? and being answer'd  
not do so much," said "Hang him t  
is unfit a man should live that eats as  
men, and cannot do so much as one."  
peror Clodius Albinus devoured more  
shel of apples at once. He eat 500 figs t

raches, 10 melons, 20 lb. of grapes, appers, and 400 oysters. Hardi-Canute, the Danish kings in England, was so ton, that a historian calls him *Bocca di vine's-mouth*." His tables were sometimes 2-day with the most costly viands the air, sea, or land, could furnish; lived he died; for, revelling at a Lambeth, he fell down dead. One the reign of Aurelianus, at one meal, boar, one hundred loaves of bread, id a pig; and drank above three gallons. Fuller says, that one Nicholasarrison in Kent, eat a whole sheep at aw; at another 30 dozen of pigeons. iam Sidley's, he eat as much victuals as sufficed 30 men. At Lord Wotton's d at one dinner 84 rabbits; which, at a man, would have served 168 men. is breakfast 18 yards of black pudding. ed a whole hog at one sitting; and af- at 3 pecks of damofins. One Mallet, r at law, in the reign of Charles I. eat : a dinner provided in Westminster for his practice not being sufficient to sup- th better meat, he fed generally on of- ers, hearts, &c. He lived to near 60 ge, but during the 7 last years of his moderately as other men.

JS, a town near Penryn, Cornwall.  
*Y. adj.* [from *gluc.*] Viscous; tenacious.—It is called balsamick mixture, is a *gluy* spumous matter. *Harvey*.—*gluy* wax some new foundations lay a combs. *Dryden's Ann. Mirab.*  
 er is the composition of the vapour, let one quality of being very *gluy* or vis- it will mechanically solve all the phæno- e grotto. *Addison*.

S. See GLUCAS.  
 NE, KNOBBED-ROOTED LIQUORICE- genus of the decandria order, belong- diadelphia class of plants; and in the thod ranking under the 32d order, *Pa-*  
 The calyx is bilabiate; the carina ala turning back the vexillum with its

CINE ABRUS is a native of Egypt and . The stalks and roots are very sweet . Herman affirms, that the juice ob- n them by decoction is little inferior to whence its name of *wild liquorice* in of America where it is native.

CINE FRUTECENS, the Carolina kidney- It has shrubby climbing stalks, twining support, 15 or 20 feet high, adorned ted leaves of 3 pair of follicles terminated one, and from the axillas clusters of large ple flowers, succeeded by long pods of the climbing kidney-bean. It flowers id July, but the seeds do not ripen in ry. It is cultivated in our gardens how- casily propagated, either by seeds im- m America, or by layers.

RRHIZA, LIQUORICE, a genus of the order, belonging to the diadelphia class and in the natural method ranking un- 2d order, *Papilionaceæ*. The calyx is

bilabiate; the upper lip tripartite, and the m- der one entire; the legumen ovate and compressed. There are two species.

1. GLYCIRRHIZA ECHINATA, the prickly-podded liquorice, resembling the common sort, only the pods are prickly: and

2. GLYCIRRHIZA GLABRA, the common li- quorice, with long, thick, creeping roots, striking several feet deep into the ground; upright, firm, annual herbaceous stalks, 3 or 4 feet high, gar- nished with winged leaves of four or five pair of oval lobes, terminated by an odd one; and from the axillas erect spikes of pale blue flowers in July, succeeded by short smooth pods. The root is the useful part, which is replete with a sweet, balsa- mic, pectoral juice, much used in all compositions for coughs and disorders of the stomach. Both these species are very hardy perennials; but this last is the sort commonly cultivated for use, its roots being fuller of juice and sweeter than the o- ther. The roots are perennial: but the stalks rise in spring and decay in autumn. They are propa- gated by cuttings of the small roots issuing from the sides of the main ones near the earth, divided into lengths of 6 or 8 inches, each having one or more good buds. The proper season for procu- ring the sets for planting is in open weather from October to March; but from the middle of Fe- bruary till the middle of March is rather the best season for planting. An open situation is to be preferred. The soil ought to be a light loose tem- perature, and 3 or 4 feet deep: for the roots of liquorice will arrive at that depth and more, and the longer the roots the more valuable they are. The ground should be trenched 3 spades deep; then proceed to plant the sets, by line and dibble, a foot distant in each row; putting them perpen- dicular into the ground, with the tops about an inch under the surface; let the rows be a foot or a foot and a half asunder. The London gardeners sow a crop of onions on the same ground the first year; which might be done without detriment to the liquorice or the onions; as the liquorice does not rise above 10 or 12 inches the first summer; keep the ground clean from weeds by hoeing. If there be a crop of onions, use the small hoe, cutting out the onions to 4 or 5 inches distant, clearing away such as grow immediately close to the liquorice plants; and when the onions are gathered, give the ground a thorough hoeing with a large hoe, to loosen the surface and destroy all weeds; and in autumn cut down the decayed stalks of the liquorice, and nothing more is neces- sary to be done till February or March, when it is proper to give a slight digging between the rows. During spring and summer, keep down all weeds by broad hoeing; and in autumn, when the stalks are in a decaying state, cut them down to the surface of the earth. In 3 years after planting, the roots of the liquorice will be fit to take up. The proper season for this is, from the beginning of November till February; for they should nei- ther be taken up before the stalks are fully de- cayed, nor deferred till late in spring, other- wise the roots will be apt to shrivel and diminish in weight. In taking them up, the small side roots are trimmed off, the best divided into lengths for fresh sets; and the main roots tied in bundles

for sale. Sell them as soon as possible after they are taken up, before they lose much of their weight. They are sold to the druggists from about 20s. to 40s. per cwt.; and an acre of ground has produced 3000 and upwards, which have been sold for above 60l.; but the price is commonly in proportion to the goodness of the roots. This plant is cultivated in most countries of Europe for the sake of its root. British liquorice is preferable to foreign; this last being generally mouldy, which this root is very apt to become, unless kept in a dry place. The powder of liquorice usually sold is often mingled with flour, and probably too often with substances not quite so wholesome; the best sort is of a brownish yellow colour (the fine pale yellow being generally sophisticated), and of a very rich sweet taste, much more agreeable than that of the fresh root. Liquorice is almost the only sweet that quenches thirst; whence it was called by the Greeks *αἰθήρα*. See ADIPSON. Galen says, that it was employed in this intention in hydropic cases, to prevent the necessity of drinking. Mr Fuller, in his *Medicina Gymnastica*, recommends it as a very useful pectoral; and says it softens acrimonious humours, and is gently detergent; which is confirmed by experience. An extract is directed to be made from it in the shops. It is chiefly brought from abroad, though the foreign extract is not equal to such as is made with proper care in Britain.

GLYFORD, a town SE. of Bodmin, Cornwall.

(1.) \* GLYN, *n. f.* [Irish; *gleann, glyn*, plur. Erse; *glenn*, Scottish.] A hollow between two mountains.—Though he could not beat out the Irish, yet he did shut them up within those narrow corners and *glyns* under the mountain's foot, *Spenser's Ireland*.

(2.) GLYN, a town of Ireland, in Limerick.

(3.) GLYN OF AGERLOW, a town in Cork.

(4.) GLYN OF THE DOWNS, a narrow romantic valley in Ireland, in Wicklow; 13 miles from Dublin; not much wider than the breadth of the road which leads through it, along the banks of a gurgling rivulet. The sides of the valley are steep and rocky, but ornamented with various trees.

GLYNN, a county of Georgia, in the Lower District, bounded on the W. and N. by the Alamaha and Liberty county; E. by the Ocean, and S. by Camden county. Brunswick is the capital.

GLYPH, *n. f.* in sculpture and architecture, any canal or cavity used as an ornament.

(1.) GMELIN, John George, brother to Dr Gmelin, physician at Tubingen, and uncle to the celebrated Dr S. G. Gmelin, (N<sup>o</sup> 2.) was author of the *Flora Siberica*, and of *Travels in Siberia*, an interesting work in 2 vols. We have met with no memoir of this author.

(2.) GMELIN, Samuel Gottlieb, LL. D. professor at Tubingen, and member of the Imperial Academy of Sciences at St Peterburgh, was born at Tubingen in 1745. He was celebrated for his knowledge in natural history, as well as for his travels, which he commenced in June 1768. Having traversed the provinces of Moscow, Veronetz, New Russia, Azof, Casan, and Astracan, he visited, in 1770 and 1771, the harbours of the Caspi-

an, and examined with attention those the Persian provinces which border on of which he has given a circumstantial account in the 3 first vols of his *Travels*. Anxious to his observations, he attempted to pass the western provinces of Persia, which are infested with numerous banditti; and quitted, in An Einzillee, a small trading place in Gela the southern shore of the Caspian; and count of many difficulties and dangers, until Dec. 2, 1773, reach Sallian, a town at the mouth of the Koor. Thence he proceeded to Baku and Kuba, in Shirvan, where he received a friendly reception from Ali Feth Khan, the sovereign of that district. After he had been 20 Uralian Cossacks, and when he was 10 days journey from the Russian fortress, and his companions were, on the 15th of March, arrested by the order of Usméi Khan, a Tartar prince, through whose territories he was obliged to pass. Usméi urged as a pretext for this arrest, that 30 years ago several families had escaped from his dominions, and had taken refuge in the Russian territories; adding that Gmelin should not be released until they were restored. The professor was removed from prison to prison; and at length, wearied out by continued persecutions, he expired, July 1774, at Achmet-Kent, a village of Mount Caucasus. His death was occasioned partly by vexation and loss of several papers and collections, and partly by disorders contracted from the fatigue of a long journey. Some of his papers had been taken to Kassar during his imprisonment, and were, with great difficulty, rescued from the hands of the barbarian who had detained them. The arrangement of these papers, which form the 4th volume of his travels, was confided to the care of Guildenstäedt, and his death was completed by Dr Pallas.

GMELINA, in botany; a genus of the spermia order, belonging to the didyma order of plants; and in the natural method under the 40th order, *Personate*. The calyx is quadridentate; the corolla campanulate bell-shaped; there are two bipartite and simple anthers; the fruit is a plum, with a large kernel.

GNA, or AGNO, a river of Italy, in the Kingdom of Austria, which rises in the Vicentine Mountains, runs through the ci-devant Venetian dominions, dividing it into nearly two equal parts, and after joining the Bachiglione, falls into the Adriatic.

GNA, a town of Germany, in Stiria, SE. of Graz, and 80 S. of Vienna.

GNADENHUITEN, a town of the United States in the North Western Territory, situated on the banks of the Ohio, and is settled by Moravians. It is seated on the banks of the Ohio, 100 miles from lake St Clair, and 28 N.W. of Cincinnati.

(1.) GNARJALIUM, *convulsa*, L. LOCKS, ETERNAL OR EVERLASTING &c. A genus of the polygamia superflua order, belonging to the syngenechia class of plants in the natural method ranking under the order, *Compositae*. The receptacle is naked, pappus feathered; the calyx imbricated, marginal scales roundish, parched, and

42 species; the most remarkable of

**GNAPHALUM ARBOREUM**, or tree gnaphalium, a woody stem, branching 4 or 5 feet high, with sessile leaves, with revolute borders, their upper side, and roundish bunches of small flowers.

**GNAPHALUM MARGARITACEUM**, the pearly flower, has creeping, very spread-crowned with broad, spear-shaped, dry leaves; herbaceous thick, woolly root and an half high, branching out-furnished with long, acute-pointed white rays, and terminated by a corymbose cluster of flowers, which appear in June and are very ornamental.

**GNAPHALUM ODORATISSIMUM**, the sweet-scented flower, hath shrubby winged stalks, irregularly a yard high, with corymboses of bright yellow flowers, changing yellow.

**GNAPHALUM ORIENTALE**, the oriental gold-rod, 3 varieties, with yellow, gold-colour-hite silvery flowers. They have shrub-rising 2 or 3 feet high.

**GNAPHALUM PLANTAGINIFOLIUM**, has fleshy radical leaves, decumbent running herbaceous simple stalks, rising 6 or 8 inches, terminated by a corymbus of white flowers, July, &c.

**GNAPHALUM STECHAS**, has a shrubby stalk, to slender branches 3 feet long, terminated by corymboses of yellow flowers, April and June.

**GNAPHALUM**, CULTURE OF THE DIFFERENT SPECIES OF. The 2d, 5th, and 6th sorts will thrive in any soil or situation. The 5th increase exceedingly by their slips, the 6th is easily propagated by slips. The 1st and 4th species are somewhat tender; they should be kept in pots, to be sheltered in a greenhouse or garden frame in winter. They may be planted in the full ground, in a warm situation, especially the oriental varieties, and likewise the odorous; for these two species will struggle through an ordinary winter, and make a carriage during summer. All these are propagated by slips or cuttings of their shoots. The roots of all these species will retain their vigour, if carefully gathered in a dry place after they are blown.

**GNARL**. } *v. n.* [*gnyrren*, Saxon; *knorren*, Dutch.] To growl; to snarl.—

He 'gan to rear his bristles strong,  
By gnar, until day's enemy  
appease.

Spenser.  
As the shepherd beaten from thy side,  
Whose eyes are gnarling who shall gnaw thee

Shakespeare.  
Gnawing sorrow hath less power to bite

Than that which mocks at it, and sets it light. *Shak.*  
The warring porter durst not whine for doubt;  
Nor the furies while their sovereign spoke.

*Fairfax.*  
**GNARLED**. *adj.* [*gnar*, *nar*, or *kurr*, is in

PART II.

Staffordshire a hard knot of wood which boys drive with sticks.] Knotty.—

Merciful heav'n!

Thou rather with thy sharp and sulph'rous bolt  
Split'st the unwedgeable and gnarled oak,  
Than the soft myrtle. *Shak. Meas. for Meas.*  
**GNARMACK**, a town of England in Cornwall,  
NW. of Truro.

(1) \* **TO GNASH**. *v. a.* [*knascben*, Dutch.]  
To strike together; to clash.—

The peer, who could not yet his wrath assuage,  
Row'd his green eyes, that sparkl'd with his rage,  
And gnash'd his teeth. *Dryden's Virgil.*

(2) \* **TO GNASH**. *v. n.* 1. To grind or collide  
the teeth.—He shall gnash with his teeth, and  
melt away. *Pf. cxii. 10.*—There shall be weeping  
and gnashing of teeth. *Matth. viii. 2.* To rage even  
to collision of the teeth; to fume; to growl.—

His great iron teeth he still did grind,  
And grimly gnash, threat'ning revenge in vain.

*Spenser.*  
—They gnashed upon me with their teeth. *Psalms*  
*xxxv. 16.*—

They him laid

Gnashing for anguish, and despite and shame,  
To find himself not matchless. *Milton.*

With boiling rage Atrides burn'd,  
And foam betwixt his gnashing grinders churn'd.

*Dryden.*  
(1) \* **GNAT**. *n. f.* [*gnat*, Sax.] 1. A small winged  
stinging insect.—

Her whip of cricket's bone, the lash of film;  
Her waggoner, a small grey-coated gnat. *Shak.*

2. Any thing proverbially small.—Ye blind guides,  
which strain at a gnat and swallow a camel. *Matth.*  
*xxiii. 24.*

(2) **GNAT**, in zoology. See **CULEX**.

(1) \* **GNATFLOWER**. *n. f.* [*gnat* and *flower*.]  
A flower otherwise called the bee-flower.

(2) **GNATFLOWER**. See **OPHRYS**, N° 2.

\* **GNATSNAPPER**. *n. f.* [*gnat* and *snapper*.] A bird  
so called, because he lives by catching gnats.—  
They deny that any bird is to be eaten whole, but  
only the gnat-snapper. *Haweswill on Providence.*

(1) \* **TO GNAW**. *v. a.* [*gnagan*, Sax. *knagben*,  
Dutch.] 1. To eat by degrees; to devour by slow  
corrosion.—

A knowing fellow that would gnaw a man  
Like to a vermine, with his hellish braine,  
And many an honest soul, even quick had slain.

*Chapman.*  
To you such scabb'd harsh fruit is giv'n, as  
raw

Young soldiers at their exercisings gnaw. *Dryd.*

2. To bite in agony or rage.—

Alas, why gnaw you so your nether lip?  
Some bloody passion shakes your very frame.

*Shakespeare. Othello.*  
—They gnawed their tongues for pain. *Rev. xvi.*  
*10.*—

He comely fell, and dying gnaw'd the ground.

*Dryden.*

3. To wear away by biting.—

Gnawing with my teeth my bonds asunder,  
I gain'd my freedom. *Shak. Comedy of Err.*  
Like rotten fruit I fall, worn like a cloth,  
Gnaw'n into rags by the devouring moth. *Sandys.*

—A lion, hampered in a net, called a mousetrap to help him out of the snare: the mouse gnawed the threads to pieces, and set the lion at liberty. *L'Esrange*. 4. To fret; to waste; to corrode. 5. To pick with the teeth —

His bones clean pick'd; his very bones they gnaw. *Dryden*.

(2.) \* *To GNAW*. *v. n.* To exercise the teeth. It is now used actively.—I might well, like the spaniel, gnaw upon the chain that ties me: but I should sooner mar my teeth than procure liberty. *Sidney*.—See the heel of having a false woman: my bed shall be abused, my coffers ransacked, my reputation gnawed at. *Shakesp.*—

I thought I saw a thousand fearful wrecks,

A thousand men that fishes gnaw'd upon. *Shak.*

\* *GNAWER*. *n. f.* [from *gnaw*.] One that gnaws.

*GNESEN*, } or *GNIESNO*, a large, and strong town of Great Poland, of which *GNESNO*, } it is the capital, in the palatinate of Kalish, with an archbishop's see, whose prelate is primate of Poland, and was viceroy when there was a vacancy of the throne, before the late overthrow of that monarchy. It was the first town built in the kingdom, and formerly very considerable. It is seated in that part of Poland, which was seized by Frederick-William II, K. of Prussia. It is 100 miles NE. of Breslaw, and 125 W. of Warsaw. Lon. 17. 40. E. Lat. 52. 28. N.

*GNETUM*, in botany; a genus of the monadelphica order, belonging to the monocia class of plants. The antherium of the male is a single scale; there is no corolla, and but one filament with a pair of anthers. The calyx of the female is of the same form; there is no corolla; the style with the stigma is trifid; the fruit is a monospermous plum.

*GNIAFDA*, a town of Hungary, 7 miles WSW. of Palotza.

*GNIDIA*, in botany; a genus of the monogynia order, belonging to the octandria class of plants. The calyx is funnel-shaped and quadrifid, with 4 petals inserted into it: there is one seed somewhat resembling a berry.

*GNIESNO*. See *GNESNA*.

*GNEW*, or *MEVA*, a town of Polish Prussia, in Pomerelia, on the Vistula; 22 miles S. of Dantzick. It was taken by the Poles in 1463; and by the Swedes, in 1626, and 1655.

*GNOMES*, } imaginary beings, who, according

*GNOMI*, } to the cabbalists, inhabit the inner parts of the earth. They are supposed to be small in stature, and guardians of quarries, mines, &c. See *FAIRY*, § 1, 3, 5.

(1.) \* *GNOMON*. *n. f.* [*γνομων*.] The hand or pin of a dial.—The *gnomon* of every dial is supposed to represent the axis of the world, and therefore the two ends or extremities thereof must directly answer to the North and South pole. *Harris*.—There were from great antiquity sun-dials, by the shadow of a style or *gnomon*, denoting the hours of the day. *Brown*.

(2.) *GNOMON*. See *DIAL* and *DIALLING*. The word *γνομων* literally implies something that makes a thing known; as the style of a dial makes the hour known.

(3.) *GNOMON*, in astronomy, a style erected per-

pendicular to the horizon, to find the altitude of the sun. Thus, in the right-angled triangle (*Plate CLXXVIII.*) are given, AD the perpendicular style, BC the length of its shadow, and the angle ABC. Hence, making CB the radius, we have this analogy for finding the angle A, viz. BC : AB :: radius : the angle C. By a *gnomon*, the sun's altitude, and consequently the latitude place, may be found more exactly than by smaller quadrants. See *QUADRANT*. By this instrument the height of any object GH found: for as DE, the distance of the object from the *gnomon*, is to DE, the height of the style; so is FH, the distance of the object from the object, to GH, its height.—See *TRIGONOMETRY*, *INDEX*; and *GEOGRAPHY*, § 3.

(4.) *GNOMON OF A GLOBE*; the index or hour circle.

(1.) \* *GNOMONICKS*. *n. f.* [*γνομωνικα*] science which makes a part of the mathematics teaches to find the just proportion of the construction of all kinds of sun-dials, and for knowing what o'clock it is at the shadow of a *gnomon* or stile, the shadow for this purpose. *Trevelyan*.

(2.) *GNOMONICK*. See *DIALLING*.

*GNOSSOS*, or } in ancient geograph

*GNOSSUS*, } of Crete. See *CREE*

*GNOSTALL*, a town of Staffordshire, between Knightly and Wil-

(1.) *GNOSTICS*, [from *γνομωνικα*, knowledge heretical, famous from the first century, principally in the east. It appears several passages of scripture, particularly ii. 18. 1 Tim. vi. 20. and Col. ii. 8. the persons were infected with the Gnostic the first century; though the sect did not itself conspicuous, either for numbers or duration, before the time of Adrian, when some erroneously date its rise. The name was by this sect, on the presumption that they were the only persons who had the true *gno* Christianity. Accordingly, they looked their Christians as simple, ignorant, and ignorant persons, who explained and interpreted their writings in a low, literal, and unedifying manner. At first the Gnostics were the philosophers and wits of those times, who formed themselves a peculiar system of theology, able to the philosophy of Pythagoras and to which they accommodated all their interpretations of scripture. But

(2.) *GNOSTICS* afterwards became a name, comprehending divers sects and heretics, who rose in the first centuries, though they differed among themselves in opinions, yet all agreed in some common principles. They corrupted the doctrine of Christ by a profligate mixture of the tenets of oriental philosophy, concerning the origin and the creation of the world, with its truths. Such were the Valentinians, the Carpocratians, Nicolaitans, &c. See § 3.

(3.) *GNOSTICS* sometimes also occurs in sense, in the ancient ecclesiastical writings particularly Clemens Alexandrinus, who, in the title of his Gnostic, describes the characters of

St Christian. This point he labours  
 ok of his *Stromata*, where he shows,  
 t the Gnostic, or learned person, has  
 ion. He affirms, that were it possi-  
 knowledge of God to be separated  
 salvation, the Gnostic would make  
 choose the knowledge; and that if  
 promise him impunity, in doing of any  
 once spoken against, or offer him  
 those terms, he would never alter a  
 courses. In this sense the father uses  
 opposition to the heretics of the same  
 ung, that the true Gnostic is grown  
 ly of the holy scripture; and that he  
 orthodox doctrine of the apostles and  
 th; whereas the false Gnostic aban-  
 apostolical traditions, as imagining  
 than the apostles.

ties was sometimes also more partic-  
 the successors of the Nicolaitans  
 tians, in the 2d century, upon their  
 he names of the first authors. Such  
 thoroughly acquainted with all their  
 verities, and visions, may consult *St*  
*Julian, Clement Alexandrinus, Origen,*  
*vanus*; particularly the first of these  
 relates their sentiments at large, and  
 n. Indeed, he dwells more on the  
 than any other sect of Gnostics; but  
 general principles whereon all their  
 mens were founded, and the method  
 l in explaining scripture. He accuses  
 ducing into religion certain vain and  
 neologies, i. e. a kind of divine pro-  
 nations, which had no other found-  
 n their own wild imagination. The  
 fessed, that these *zōons* or emanations  
 re expressly delivered in the sacred  
 t insinuated, that Jesus Christ had inti-  
 in parables to such as could under-

They built their theology not only  
 s and the epistles of St Paul, but also  
 Moses and the prophets. These last  
 rily serviceable to them, on account  
 ries and allusions with which they  
 are capable of different interpreta-  
 tions; though their doctrine, concerning the cre-  
 world by one or more inferior beings  
 imperfect nature, led them to deny  
 thority of the books of the Old Test-  
 ament contradicted this idle fiction, and  
 with an abhorrence of Moses and the  
 law; alleging, that he was actuated  
 by a malignant author of this world, who con-  
 sidered his own glory and authority, and not the  
 good of men. Their persuasion that  
 matter, as its centre and source,  
 created the body with contempt, dis-  
 regarded, and reject the doctrine of the  
 resurrection of the body and its re-union with  
 the soul. Their notion, that ma-  
 liciously predestined in nature, and occasioned  
 calamities, wars, and desolations, in-  
 duced them to apply themselves to the study of  
 magic, to weaken the powers or suspend  
 the operation of their malignant agents. The  
 considered Jesus Christ as the Son of God,  
 who came into the world to be crucified,  
 and to be buried, and to rise again, and  
 to ascend into heaven, and to sit on the  
 right hand of the Father, and to come  
 again to judge the living and the dead.

world for the rescue and happiness of miserable  
 mortals, oppressed by matter and evil beings; but  
 they rejected our Lord's humanity, on the prin-  
 ciple that every thing corporeal is essentially and  
 intrinsically evil; and therefore the greatest part  
 of the sect denied the reality of his sufferings. They  
 set a great value on the beginning of the gospel of  
 St John, where they fancied they saw a great deal  
 of their gods or emanations under the term, the  
*Word, the Life, the Light, &c.* They divided all  
 nature into three kinds of beings, viz. *hylic*, or ma-  
 terial; *psychic*, or animal; and *pneumatic*, or spi-  
 ritual. On the like principle they also distinguish-  
 ed three sorts of men; *material*, *animal*, and *spi-  
 ritual*. The first, who were material, and incap-  
 able of knowledge, inevitably perished, both soul  
 and body; the third, such as the Gnostics them-  
 selves pretended to be, were all certainly saved;  
 the psychic, or animal, who were the middle be-  
 tween the other two, were capable either of being  
 saved or damned, according to their good or evil  
 actions. With regard to their moral doctrines  
 and conduct, they were much divided. The great-  
 est part of this sect adopted very austere rules of  
 life, recommended rigorous abstinence, and pre-  
 scribed severe bodily mortifications, with a view  
 of purifying and exalting the mind. However,  
 some maintained, that there was no moral differ-  
 ence in human actions; and thus, confounding  
 right with wrong, they gave a loose rein to all the  
 passions, and asserted the innocency of following  
 blindly all their motions, and of living by their  
 tumultuous dictates. They supported their opi-  
 nions and practice by various authorities: some  
 referred to fictitious and apocryphal writings of  
 Adam, Abraham, Zoroaster, Christ, and his ap-  
 ostles; others boasted, that they had deduced  
 their sentiments from secret doctrines of Christ,  
 concealed from the vulgar; others affirmed, that  
 they arrived at superior degrees of wisdom by an  
 innate vigour of mind; and others asserted, that  
 they were instructed in their mysterious parts of  
 theological science by Theudas, a disciple of St  
 Paul, and by Matthias, one of the friends of our  
 Lord. The tenets of the ancient Gnostics were  
 revived in Spain, in the 4th century, by a sect  
 called the PASCILIANISTS. At length the name  
*Gnostic*, which originally was glorious, became in-  
 famous, by the idle opinions and dissolute lives of  
 the persons who bore it.

GNOU, or }  
 GNU, } in zoology. See CAPRA, N° IX.

(1.) \* To GO. *v. n.* pret. *I went; I have gone.*  
 [*gan*, Saxon. This was probably changed to *gone*,  
 or *gang*, then contracted to *go*. *Went* is the pre-  
 terite of the old verb *wend*.] 1. To walk; to  
 move step by step.—

You know that love

Will creep in service where it cannot go. *Shak.*  
 —After some months those muscles become cal-  
 lous; and, having yielded to the extension, the  
 patient makes shift to go upon it, though lamely.  
*Wifeman.* 2. To move; not stand still.—Rise,  
 let us be going. *Matt.* xxvi. 46. 3. To walk so-  
 lemnly.—If there be cause for the church to go  
 forth in solemn procession, his whole family have  
 such business come upon them that no one can be  
 spared. *Hooker.* 4. To walk leisurely, not run.—

And must I go to him?  
—Thou must run to him; for thou hast staid so long, that *going* will scarce serve the turn. *Shak.*

5. To march or walk a-foot.—I will only go through on my feet. *Num. xx. 19.* 6. To travel; to journey.—

From them I go,  
This uncouth errand sole. *Milton.*

7. To proceed; to make a progress.—  
Thus others we with defamation wound,  
While they stab us; and so the jest goes round. *Dryden.*

8. To remove from place to place.—  
I am in blood  
Stept in so far, that, should I wade no more,  
Returning were as tedious as go o'er. *Shak.*

9. To depart from a place; to move from a place; the opposite of *to come*.—  
I hope it be not gone, to tell my lord  
That I kiss aught but him. *Shak. Cymbel.*  
At once, good-night;  
Stand not upon the order of your going,  
But go at once. *Shak. Macbeth.*

—And when she had so said she went her way. *Yo. xi. 28.*—I will let you go, that ye may sacrifice, only you shall not go very far away. *Ex. viii. 28.*—Colchester oysters are put into pits, where the sea goeth and cometh. *Bacon's Nat. Hist.*—  
A young tall squire  
Did from the camp at first before him go. *Cowley.*  
Then I concur to let him go for Greece,  
And with our Egypt fairly rid of him. *Dryden.*  
Go first the master of thy herds to find,  
True to his charge, a loyal swain and kind. *Pope's Odyssey.*

10. To move or pass in any manner, or to any end.—  
Though the vicar be bad, or the parson be evil,  
Go not for thy tything thyself to the devil. *Tuffer.*  
—She may go to bed when she list; all is as she will. *Shak.*—  
You did wish that I would make her turn;  
Sir, she can turn and turn, and yet go on. *Shak.*  
—I am glad to see your lordship abroad: I heard say your lordship was sick: I hope your lordship goes abroad by advice. *Shak. Henry IV.*—The mourners go about the streets. *Ecl. xii. 5.*—The sun shall go down over the prophets, and the day shall be dark over them. *Mac. iii. 6.*—Put every man his sword by his side, and go in and out from gate to gate throughout the camp. *Ex. xxxii. 27.*—  
The sun, which once did shine alone,  
Hung down his head; and wish'd for night,  
When he beheld twelve suns for one  
Going about the world, and giving light. *Herbert.*  
This seen, the rest at awful distance stood,  
As if they had been there as servants set,  
To stay, or to go on, as he thought good,  
And not pursue, but wait on his retreat. *Dryd.*  
—Turn not children going, till you have given them all the satisfaction they are capable of. *Locke.*  
—History only acquaints us that his fleet went up the Elbe, he having carried his arms as far as that river *Arbut.*—The last advice I give you relates to your behaviour when you are going to be hanged, which, either for robbing your master, for

housebreaking, or going upon the highway probably be your lot. *Swift.*—  
come for gold will go off with pewtee rather than return empty. *Swift.*  
in company with others.—Thou shalt adorned with thy tabrets, and shalt go dances of them that make merry. *Je.*  
Away, and with thee go the way  
That seek't my friendship, and the way

—He goeth in company with the wofully, and walketh with wicked men. 8.—Whatever remains in story of a kingdom of old, is so obscured with time that it may go along with those of the islands. *Temple.* 12. To proceed in a life good or bad.—And the Levites I away far from me, when Israel went I went astray away from me after they shall even bear their iniquity. *Ezek.*  
To proceed in mental operations.—I warily too far engaged myself for the lifting it, truly I should have kept I had once again gone over it. *Dryd.*  
have gone through the speculative part of the Divine Providence. *Hale's Orig.*  
I hope, by going over all these parts may receive some tolerable satisfaction great subject. *South.*—If we go over Christianity, we shall find that, especially particulars, they enjoy the same time have made our duty more clear and easier. —In their primary qualities we very little way. *Locke.*—I go over this argument again, and enlarge a little on them. *Locke.*—They are not able time to reckon, or regularly go over rate series of numbers. *Locke.* 14. road.—I will go along by the highway, other turn to the right hand, nor to the left. *ii. 27.*—Who shall bemoan thee? Or aside to ask how thou doest? *Jer. x.*

His horses go about  
Almost a mile. *S.*  
—I have endeavoured to escape into freedom of a private scene, where a his own way and his own pace. *Ten*  
march in a hostile or warlike manner  
You were advis'd his flesh was  
Of wounds and scars, and that his spirit  
Would list where most trade of d  
Yet did you say go forth. *St.*  
—We be not able to go up again for they are stronger than we. *Nic.*  
Let us go down after the Philistines spoil them until the morning light 36.—Thou art not able to go against the fight with him. *1 Sam. xvii. 33.*—  
of Jacob shall be among the Gentile among the beasts of the forest; w through, both treadeth down and tear and none can deliver. *Mic. v. 8.* 1 state or opinion for better or worse—hearken to the king's words to go from *1 Mac. ii. 12.*—The regard of the in so great a danger, made all those which went so to wreck, to be lig

parison of their lives and liberty. *Knolles*.  
 look upon men and matters with an evil  
 eye are best pleased when things go back-  
 wards: which is the worst property of a servant of  
 or state. *Bacon*.—

goes to ruin, they themselves contrive  
 to b the honey, and subvert the hive. *Dryd*.  
 d men, by their providence and good  
 ry, accommodatng their expences to their  
 keep themselves from going backwards  
 world. *Locke*.—Cato, we all go into your

*Addison*. 17. To apply one's self.—See-  
 self confronted by so many, like a resolute  
 ne went not to denial, but to justify his  
 lehood. *Sidney*.—Because this atheist goes  
 cally to work, he will not offer to affirm  
 the parts of the embryo could, accord-  
 ic explication, be formed at a time. *Bentley*.  
 have recourse to.—Dare any of you, hav-  
 itter against another, go to law before the  
 and not before the saints? 1 *Cor*. 19. To

t to do.—So extraordinary an example,  
 generate an age, deserves for the rarity,  
 vas going to say, for the incredibility of it,  
 ration of all that knew him, and consider-  
 ortion. *Locke*. 20. To shift; to pass life not  
 ell.—Every goldsmith, eager to engross to  
 as much as he could, was content to pay  
 r-it, rather than go without. *Locke*.—

they must have; but if they speak for this  
 that colour, they should be sure to go  
 it. *Locke*. 21. To decline; to tend to-  
 death or ruin. This sense is only in the  
 les going and gone.—

is far gone, and, truly, in my youth,  
 I'd much extremity for love,  
 near this. *Shak. Hamlet*.  
 be in party or design.—

ney with the vanquish'd prince and party go,  
 leave their temples empty to the foe. *Dryd*.  
 escape.—Timotheus himself fell into the  
 f Dositheus and Sosipater, whom he be-  
 with much craft to let him go with his life.  
 xii. 24. 24. To tend to any act.—

ere be some women, Silvius, had they  
 mark'd him  
 reels as I did, would have gone near  
 all in love with him. *Shak. As you like it*.  
 be uttered.—His disciples personally ap-  
 among them, and ascertained the report  
 had gone abroad concerning a life so full of  
 s. *Addison*. 26. To be talked of; to be  
 —It has the greatest town in the island  
 s under the name of Ano Caprea, and is  
 al places covered with a very fruitful soil.

27. To pass; to be received.—Because  
 of my acquaintance set forth her praises  
 e, I will only repeat them, and spare my  
 tongue, since she goes for a woman. *Sidney*.  
 the man went among men for an old man  
 says of Saul. 1 *Sam*. xvii. 12.—A kind im-  
 agination makes a bold man have vigour and en-  
 ergy in his air and motion: it stamps value u-  
 pon his face, and tells the people he is to go for  
 h. *Collier*.—Clipping should be finally stop-  
 ped the money which remains should go ac-  
 cording to its true value. *Locke*. 28. To move

by mechanism.—This pope is decrepid, and the  
 bell goes for him. *Bacon*.

Clocks will go as they are set; but man,  
 Irregular man's never constant, never certain.  
*Ottaway*.

'Tis with our judgments as our watches, none  
 Go just alike, yet each believes his own. *Pope*.

29. To be in motion from whatever cause.—  
 The weyward sisters, hand in hand,  
 Posters of the sea and land,  
 Thus do go about, about. *Shak. Macbeth*.

—Clipt and washed money goes about, when the  
 entire and weighty lies hoarded up. *Waller*. 30.  
 To move in any direction.—Doctor, he is a curer  
 of souls, and you a curer of bodies: if you should  
 fight, you go against the hair of your professions.  
*Shak Merry Wives*.—Shall the shadow go forward  
 ten degrees, or go back ten degrees? 2 *Kings* xx.  
 9. 31. To flow; to pass; to have a course.—

The god I am, whose yellow water flows  
 Around these fields, and fattens as it goes,  
 Tyber my name. *Dryden's En*.

32. To have any tendency.—  
 Athenians, know

Against right reason all your counsels go;  
 This is not fair, nor profitable that,  
 Nor t'other question proper for debate. *Perf*.

33. To be in a state of compact or partnership.—  
 As a lion was bestriding an ox that he had newly  
 plucked down, a robber passing by cried out to  
 him, half shares: you should go your snip, says the  
 lion, if you were not so forward to be your own  
 carver. *L'Estrange*.—There was a hunting match  
 agreed upon betwixt a lion, an ass, and a fox,  
 and they were to go equal shares in the booty.  
*L'Estr*. 34. To be regulated by any method: to  
 proceed upon principles—Where the multitude  
 beareth sway, laws that shall tend to the preser-  
 vation of that state must make common smaller  
 offices to go by lot, for fear of strife and divisions  
 likely to arise. *Hosker*.—We are to go by another  
 measure. *Spratt*.—The principles I there went on,  
 I see no reason to alter. *Locke*.—The reasons that  
 they went upon were very specious and probable.

*Bentley*. 35. To be pregnant.—  
 Great bellied women,  
 That had not half a week to go. *Shak. H. VIII*.  
 The fruit she goes with,  
 I pray that it good time and life may find. *Shak*.  
 —Of living creatures some are a longer time in  
 the womb, and some shorter: women go com-  
 monly nine months, the cow and the ewe about  
 six months. *Bacon*.—Some do go with their young  
 the sixth part of a year, or two over or under, that  
 is, about six or nine weeks: and the whelps of  
 these see not till twelve days. *Brown*.—

And now with second hopes she goes,  
 And calls Lucina to her throws. *Milton*.

36. To pass; not to remain.—She began to afflict  
 him, and his strength went from him. *Judg*. xvi.  
 19. When our merchants have brought them, if  
 our commodities will not be enough, our money  
 must go to pay for them. *Locke*. 37. To pass, or  
 be loosed; not to be retained.—

Then he lets me go,  
 And, with his head over his shoulder turn'd,  
 He seem'd to find his way without his eyes. *Shak*.  
 Let

Let go the hand of that arch heretick.

*Shak. K. John.*  
38. To be expended.—Scholars are close and frugal of their words, and not willing to let any go for ornament, if they will not serve for use. *Felton.*  
39. To be in order of time or place.—We must enquire farther what is the connexion of that sentence with those that go before it, and those which follow it. *Watts's Log.* 40. To reach or be extended to any degree.—Can another man perceive that I am conscious of any thing, when I perceive it not my self? No man's knowledge here can go beyond his experience. *Locke.* 41. To extend to consequences.—It is not one matter that either directs or takes notice of these: it goes a great way barely to permit them. *L'Esrange.* 42. To reach by effects.—Considering the cheapness, so much money might go farther than a sum ten times greater could do now. *Wilkins.* 43. To extend in meaning.—His amorous expressions go no further than virtue may allow. *Dryden's Ovid.* 44. To spread; to be dispersed; to reach.

Whose flesh, torn off by lumps, the ravenous foe

In morsels cut, to make it farther go. *Tate's Juu.*  
45. To have influence; to be of weight; to be of value.—I had another reason to decline it, that ever us'd to go far with me upon all new inventions or experiments; which is, that the best trial of them is by time, and observing whether they live or no. *Temple.*—'Tis a rule that goes a great way in the government of a sober man's life, not to put any thing to hazard that may be secured by industry, consideration, or circumspection. *L'Esrange.*—Whatever appears against their prevailing vice goes for nothing, being either not applied, or passing for libel and slander. *Swift.* 46. To be rated one with another; to be considered with regard to greater or less worth.—I think, as the world goes, he was a good sort of man enough. *Arbut.* 47. To contribute; to conduce; to concur; to be an ingredient.—The medicines which go to the ointments are so strong, that, if they were used inwards, they would kill those that use them. *Bacon's Nat. Hist.*—More parts of the greater wheels go to the making one part of their lines. *Glanvill's Scepsis.*—There goes a great many qualifications to the completing this relation: there is no small share of honour and conscience and sufficiency required. *Collier.*—I give the sex their revenge, by laying together the many vicious characters that prevail in the male world, and shewing the different ingredients that go to the making up of such different humours and constitutions. *Addison.*—Something better and greater than high birth and quality must go toward acquiring those demonstrations of publick esteem and love. *Swift to Pope.* 48. To fall out, or terminate; to succeed.—

Your strong possession much more than your right,

Or else it must go wrong with you and me.

*Shak.*

How'er the business goes, you have made fault  
I th' boldness of your speech. *Shak.*

—I will send to thy father, and they shall declare unto him how things go with thee. *Tob. x. 8.*—In many armies, if the matter should be tried by duel

between two champions, the victory shall be the one side; and yet, if it be tried by the other side. *Bacon.*—It is the constant observation of all, that if a man had a cause depending in the court, it was one but it went against him. *South.*—At the time of the prince's landing, the father, enquiring how things would go, went over, like others, to the prince. *Swift.*—Whether it goes for me or against me, you must pay reward. *Watt's Logic.* 49. To be in an imperious sense.—It shall go ill with that is left in his tabernacle. *Job. xx.*—His name Beriah, because it went civil with his house. *1 Chron. vii. 23.* 50. To proceed or consequence.—

How goes the night, boy?

—The moon is down: I have not been clock;

And she goes down at twelve.

I had hope,

When violence was ceased, and war on  
All would have then have gone well.

—Duration in itself is to be considered as in one constant, equal, uniform course. *51. To Go about.* To attempt; to endeavour to set one's self to any business.—

O dear father,

It is thy business that I go about.

I lost him, but so found, as well I say  
He could not lose himself, but went about  
His father's business.

—Which answer exceedingly united the minds to them, who concurred only with as they saw them like to prevail in what went about. *Clarendon.*—Some men, from persuasion that they cannot reform their lives root out their old vicious habits, never set as attempt, endeavour, or go about it.

—Either my book is plainly enough written to be rightly understood by those who peruse with attention and indifferency, or else I have mine so obscurely that it is in vain to go about to mend it. *Locke.*—They never go about, as I said, to hide or palliate their vices; pose them freely to view. *Swift.* 52. To Go To err; to deviate from the right.—If a wife go aside, and commit a trespass against *Numb. v. 12.* 53. To Go between. To interpose to moderate between two.—I did go between as I said; but more than that, he loved her indeed, he was mad for her. *Shak.* 54.

by. To pass away unnoticed.—  
Do not you come my tardiness to chide  
That laps'd in time and passion, lets go  
Th' important acting of your dread cool

So much the more our carver's excel  
Which lets go by some sixteen years, and  
her

As she liv'd now.

What's that to us? The time goes by;

55. To Go by. To find or get in the course.  
In argument with men a woman ever  
Goes by the worse, whatever be her cause

—He's sure to go by the worst that contend

ry? that is too mighty for him. *L'Ess.*  
*o by.* To observe as a rule.—'Tis not  
 posed, that by searching one can possi-  
 ge of the size and form of a stone; and  
 e frequency of the fits, and violence of  
 oms, are a better rule to *go by.* *Sbars.*  
*o down.* To be swallowed; to be re-  
 ot rejected.—Nothing so ridiculous, nor  
 possible, but it *goes down* whole with  
 ith and earnest. *L'Ess.*—Folly will not  
 down in its own natural form with dis-  
 idges. *Dryden.*—If he be hungry, bread  
 own. *Locke.*—Ministers are so wise to  
 r proceedings to be accounted for by  
 at a distance, who often mould them in-  
 ems that do not only *go down* very well  
 out, but are supplies for pamphlets in  
 it age. *Swift.* 58. *To Go in and out.*  
 : business of life.—The Lord shall pre-  
 going out and thy coming in. *Ps.* 57.  
*and out.* To be at liberty.—He shall  
 out, and find pasture. *John.* x. 9. 60.  
 f. To die; to go out of life: to de-

mid the friends we miss were safe arrived:  
 rust *go off*; and yet, by these I see,  
 t a day as this is cheaply bought. *Sbak.*  
 manner he *went off*, not like a man that  
 out of life, but one that returned to his  
 tier. 61. *To Go off.* To depart from

eaders having charge from you to stand,  
 t *go off* until they hear you speak. *Sbak.*  
 on. To make attack.—

Bold Cethegus,  
 valour I have turn'd into his poison,  
 and so to daring, as he would  
 pon the Gods. *Ben Jonson.*  
 62. *To proceed.*—He found it a great  
 p that peace, but was fain to *go on* in his  
 67.—He that desires only that the work  
 id religion shall *go on*, is pleased with it,  
 s the instrument. *Taylor.*—I have esca-  
 threats of ill fits by these motions: if  
 , the only poltice I have dealt with is  
 the belly of a fat sheep. *Temple.*—To  
 the soul as *going on* from strength to  
 to consider that she is to shine for ever  
 acceptions of glory, and bughten to all  
*Addison.*—*Go on* in the glorious course  
 undertaken. *Addison.*—Copious bleeding  
 t effectual remedy in the beginning of  
 ; but when the expectoration *goes on*  
 y, not so proper, because it sometimes  
 t it. *Arbutnot.*—I have already hand-  
 abuses during the late management,  
 venient time shall *go on* with the rest.  
 Then we had found that design imprac-  
 e should not have *gone on* in so expen-  
 sagement of it. *Swift.*—Many clergy-  
 in so diminutive a manner, with such  
 slots and interlineations, that they are  
 : to *go on* without perpetual hesitations,  
 dinary expletives. *Swift.*—I wish you  
 go on with that noble work. *Berkley.*  
 over. To revolt; to betake himself  
 party.—In the change of religion, men  
 understandings don't so much consi-

der the principles as the practice of those to whom  
 they *go over.* *Addison.*—Power, which, accord-  
 ing to the old maxim, was used to follow, is now  
 gone over to money. *Swift.* 65. *To Go out.*  
 To go upon any expedition.—You need not have  
 pricked me: there are other men fitter to *go out*  
 than I. *Sbak.* 66. *To Go out.* To be extinguished.

Think'st thou the fiery fever will *go out*,  
 With titles blown from adulation? *Sbak.*  
 —Spirit of wine burned till it *go out* of itself, will  
 burn no more. *Bacon.*—The care of a state, or an  
 army, ought to be as constant as the chymist's fire,  
 to make any great production; and if it *goes out*  
 for an hour, perhaps the whole operation fails.  
*Temple.*—

The morning, as mistaken, turns about;  
 And all her early fires again *goes out.* *Dryden.*  
 —Let the acquaintance be decently buried, and  
 the flame rather *go out* than be smothered. *Collier*  
*of Friendship.*—

My blood runs cold, my heart forgets to  
 heave,  
 And life itself *goes out* at thy displeasure.

*Addison's Cat.*  
 And at her felt approach and secret might,  
 Art after art *goes out*, and all is night. *Page.*

67. *To Go through.* To perform thoroughly; to  
 execute.—Finding Pyrocles every way able to *go*  
*through* with that kind of life, he was desirous for  
 his sake as for his own to enter into it. *Sidney.*—  
 If you can as well *go through* with the statute laws  
 of that land, I will think you have not lost all your  
 time there. *Spenser.*—Kings ought not to suffer  
 their council to *go through* with the resolution and  
 direction, as if it depended on them, but take the  
 matter back into their own hands. *Bacon.*—He  
 much feared the call of Aurim had not the ardours  
 of mind enough to *go through* with such an under-  
 taking. *Ciarendon.*—The amazing difficulty and  
 greatness of his account will rather terrify than in-  
 form him, and keep him from setting heartily a-  
 bout such a task, as he despairs to *go through* with  
 it. *South.*—The powers in Germany are borrow-  
 ing money, in order to *go through* their part of  
 the expence. *Addison.* 68. *To Go through.* To  
 suffer; to undergo.—I tell thee that it is absolute-  
 ly necessary for the common good that thou  
 shouldst *go through* this operation. *Arbutnot.*  
 69. *To Go upon.* To take as a principle.—This  
 supposition I have *gone upon* through those papers.  
*Addison.* 70. The senses of this word are very  
 indistinct: its general notion is motion or progres-  
 sion. It commonly expresses passage from a place,  
 in opposition to *come*. This is often observable  
 even in figurative expressions. We say, the words  
 that *go* before and that *come* after: to day *goes*  
 away and to-morrow *comes*.

(2.) *To Go.* This verb is one of the many Eng-  
 lish words which are often used without meaning,  
 in the bombastic dialect of modern affectation.  
 That eminent and judicious critic, the late prof.  
 J. Hay Beattie has justly ridiculed the fashionable  
 phrases,—*To go to jury, To go to prove, To go into*  
*a variety of matter, &c.* in his humorous dialogue  
 in the shades between Dean Swift, a London  
 bookseller and Mercury, which we have repeat-  
 edly quoted. See BEATTIE, § 2; BLUEN, § 2;  
 To FEEL, § 3, &c. "Indeed," (says Mercury

to Swift) "the words, *line, meet, marked, feel, go,* and some others, may be used on all occasions, whether they have *meaning* or not.—His arguments *went to prove*, &c. Accounts from Spain *go to say*, that, &c. This because more verbose, is thought more elegant than—Accounts from Spain *say*—His arguments proved, &c."

(3.) \* *Go to. interj.* Come, come, take the right course. A scornful exhortation.—

*Go to*, then, O thou far renowned son  
Of great Apollo; shew thy famous might  
In medicine.

*Spenser.*

*Go to, go to*, thou art a foolish fellow;  
Let me be clear of thee.

*Shak.*

My favour is not bought with words like these:  
*Go to*; you'll teach your tongue another tale.

*Roswe.*

(1.) GOA, an island of the Indian Ocean near the W. and Malabar coast of Indostan, separated from the continent by the Mandova. It is 22 m. long and 6 broad, according to Dr Brookes; but Mr Cruttwell makes it only 24 in circumference. The soil is fertile, and produces excellent fruits, corn, &c. The climate is moderate from Oct. to March; in April and May very sultry, and from June, to Sept. almost constant rain.

(2.) GOA, a strong city of Asia, the capital of the above island. It was taken by the Portuguese in 1508, and is the chief town of all their settlements on this side the Cape of Good Hope. It is built on the N. side of the island, having the conveniency of a fine river, capable of receiving ships of the greatest burden, where they lie within a mile of the town. Its banks are beautified with churches, castles, and gentlemen's houses. The air being unwholesome, it is not so well inhabited as formerly. The viceroy's palace is a noble building; and stands at a small distance from the river, over one of the gates of the city, which leads to a spacious street, terminated by a beautiful church. This city contains a great number of handsome churches, convents, and cloisters, with a stately hospital; all well endowed, and kept in good repair. The market-place takes up an acre of ground; and in the shops may be had the produce of Europe, China, Bengal, and other countries. Every church has a set of bells, some of which are continually ringing. There are many Indian converts; but they generally retain some of their old customs; particularly they cannot be brought to eat beef. The clergy are numerous and illiterate; the churches are finely embellished, and have great numbers of images. In one of these churches, is a magnificent chapel of St Francis Xavier, whose tomb it contains: the tomb is of fine black marble from Lisbon; on the 4 sides of it the principal actions of his life are elegantly carved in basso relievo; the figures are admirably executed: It's form is pyramidal, and terminates with a coronet of mother-of-pearl. Within this chapel are excellent paintings by Italian masters; the subjects chiefly from Scripture. The tomb and chapel, must have cost an immense sum, the Portuguese justly esteem them the greatest rarities in the place. The houses are large and showy, but poorly furnished. Greens, fruits, roots, with a little bread, rice, and fish, are the principal diet of the natives, though they have hogs and fowls in plenty. The

river's mouth is defended by several fortifications, with large cannon on both sides the residence of a captain-general, who commands of all the Portuguese forces in India. They have two regiments of European infantry, 3 legions of sepoy's, 3 troops of horse, and a militia; in all, about 5000 men. Goa is at present in little estimation with the European powers; indeed the bigotry of the natives and their superstitious attachment to the idol of the serpent, so general, that the country formerly so fertile, is now reduced to a few thinly inhabited villages: the chief part of whose inhabitants have been banished: for they will not suffer any Mussulman to live within the precincts of the city, and these few are unable to carry on the trade of dry or manufactures of the country. The king of Portugal is obliged to send annually 1,000,000 of money, to defray the expences of government, which is generally swallowed up by the idleness of the king and his courtiers, and the soldiers. There was formerly an inquisition in Goa, but it is now abolished: the only remains, and its black outside is a fit emblem of the cruel and bloody transactions that pass within its walls. Provisions are to be had in great plenty and perfection. The chief trade of the country is in Arrack. Lon. 73. 46. E. Lat. 15. 28.

(3.) GOA, a town in the island of Celebes, on the S. coast. Lon. 120. 30. E. Lat. 5. 30.

\* GOAD. *n. f.* [*goad*, Saxon.] A sharp instrument with which oxen are driven forward.  
Oft in his harden'd hand a goad he

\* *To GOAD. v. a.* [from the noun.] To drive with the goad. 2. To incite to late; to instigate; to drive forward.—

Most dangerous

Is that temptation, that doth *goad* us  
To sin in loving virtue.

*Goaded* with most sharp occasions  
Which lay nice manners by, I put  
The use of your own virtues.

Of all that breathes the various passions  
Stung with delight, is *goaded* on by

(1.) GOADBY, Robert, an eminent English writer, born at Sherborne in Dorsetshire, who was bred at St John's College in Oxford. He compiled an *Illustration of the Holy Scriptures* in 3 vols fol. and a work entitled, *The Christian's Instructor*, the *life of Bonaventura*, &c. and established a newspaper in the western counties, entitled the *Sherborne Post*, which has a great circulation. He died 1778.

(2, 3.) GOADBY, 2 villages in Leicestershire.

(1.) \* GOAL. *n. f.* [*gaule*, French.] A pole, set up to mark the bounds of a field. The landmark set up to bound a race marked out to which racers run.—

As at the Olympian games, or Pythian  
Part curb their fiery steeds, or show  
With rapid wheels.

And the slope sun his upward beam  
Shoots against the dusky pole,  
Pacing toward the other goal.

2. The starting post.—

Hast thou beheld, when from the start,  
The

rtful charioteers with heaving heart  
the race? *Dryden.*  
al purpose; the end to which a design  
or poet has always the goal in his eye,  
sets him in his race: some beautiful de-  
he first establishes, and then contrives  
, which will naturally conduct him to  
*Hyden.*—  
individual seeks a several goal;  
it's great view is one, and that the  
ole. *Pope.*  
in, who here seems principal alone,  
acts second to some sphere unknown;  
s some wheel, or verges to some goal;  
: a part we see, and not a whole. *Pope.*  
ometimes improperly written for *gaol* or

AL. See GAOL, § 1 and 2.  
AR, James, a learned Dominican, born  
in 1601. In 1618 he was sent on a mis-  
sion to the Levant. On his return he resided at  
Levant. Here he was much esteemed by the Lite-  
rati. In 1647, he published at Paris, *Græcorum*  
*in Gr. and Lat. folio.* He also pub-  
lished translations of some of the Byzantine  
works, and died in 1651.

GOAR. *n. f.* [*goror*, Welsh.] Any edging  
of cloth to strengthen it. *Skinner.*  
AR, ST, ST GEVER, or ST GOWER, a  
German town, now in the French republic,  
on the Rhine and Moselle, lately in the  
possession of Hesse Rheinfeuld; with a strong fort  
on the W. bank of the Rhine, near Rhein-  
felden, was surrendered to the French, Oct.  
1792, with all its military stores. It lies 15  
miles E. of Coblenz, and 15 NW. of Bingen.  
2. E. Lat. 50. 10. N.

SHAUSEN, a town of Germany, in the  
Upper Rhine, on the E. bank of the  
Rhine, 15 miles E. of St Goar.

GOAT. *n. f.* [*gat*, Saxon and Scottish.]  
A kind of animal that seems a middle species  
between a deer and sheep.—

of goat, and slips of yew. *Sba. Macbeth.*  
Cyclops care not for your goat-fed Jove,  
or blest ones; we are better farre. *Chapm.*  
They draw naked boys riding and playing  
paper-mills upon goats, eagles, or dol-  
phins.—

little bear that rock'd the mighty Jove,  
an whole borrow'd shape conceal'd his  
eyes,  
and duty rais'd the pious maid.

AT, in zoology. See CAPRA.

BEARD. See GOAT'S-BEARD.

GOAT-CHAFFER. *n. f.* An insect; a kind  
of chaffer. *Bailey.*

AT-CHAFFER. See SCARABÆUS.

FEEDER. *n. f.* [*gat* and *byrd*, Sax. a feeder.]  
One whose employment is to tend  
the goats.

I think some goat-herd proud,  
as on yonder bank,  
he straying herd themselves doth shroud  
in the bushes rank? *Spenser's Past.*  
It gave the goat-herd good contentment,

. PART. II.

and the marquis and his servant chased the kid a-  
bout the stack. *Wotton.*

\* GOATISH. *adj.* [from *goat*.] Resembling a  
goat in any quality: as, rankness; lust.—An ad-  
mirable evasion of a whoremaster, man, to lay his  
*goatish* disposition on the change of a star. *Sbats,*  
*K. Lear.*—The last is notorious for its *goatish* smell,  
and tufts not unlike the beard of that lecherous a-  
nimal. *More against Aibeism.*

GOAT ISLAND, an isle of the United States, on  
the coast of Rhode Island, opposite Newport.  
Fort Washington is built on it.

\* GOATMARJORAM. *n. f.* The same with  
GOATSBEARD.

\* GOATMILKER. *n. f.* [*goat* and *milker*.] A  
kind of owl so called from sucking goats. *Bailey.*

(1.) \* GOATSBEARD. *n. f.* [*goat* and *beard*;  
*barba capri*.] A plant.

(2.) GOAT'S-BEARD. See TRAGOPOGON.

GOAT'S ISLAND, an island, in the E. Indian  
Ocean, one of the Bashee islands. Lon. 121. 0. E.  
Lat. 30. 6. N.

\* GOATSKIN. *n. f.* [*goat* and *skin*.]—  
Then fill'd two goat-skins, with her hands divine;  
With water one, and one with fable wine. *Pope.*

\* GOATSMILK. *n. f.* [*goat* and *milk*.] This is  
more properly two words.—After the fever and  
such like accidents are diminished, asses and *goat-*  
*milk* may be necessary. *Wigman.*

(1.) \* GOAT'S RUE. *n. f.* [*galega*.] A plant.—  
*Goat's Rue* has the reputation of being a great a-  
lexipharmick and sudorifick: the Italians eat it  
raw and boiled; with us it is of no esteem. *Hill.*

(2.) GOAT'S RUS. See GALEGA.

(1.) GOAT'S STONES, greater. See SATYRIUM.

(2.) GOAT'S STONES, lesser. See ORCHIS.

(1.) \* GOATS-THORN. *n. f.* [*goat* and *thorn*.]  
An herb.

(2.) GOATS-THORN. See ASTRAGALUS, § 2.  
GOATSUCKER. See CAPRIMULGUS.

(1.) GOAVE, GRAND, a town of Hispaniola,  
20 miles SW. of Leogane.

(2.) GOAVE, LITTLE, or } a sea port of Hispa-  
(2.) GOAVE, PETIT, } niola, with a har-  
bour capable of admitting ships of the largest size;  
20 miles WSW. of Leogane. Lon. 55. 5. W. of  
Ferro. Lat. 18. 30. N.

\* GOB. *n. f.* [*gobe*, French.] A small quanti-  
ty. A low word.—Do'st think I have so little wit  
as to part with such a *gob* of money? *L'Estrange.*  
GOBAN, a town of Persia, in Chusistan.

\* GOBBET. *n. f.* [*gobe*, Fr.] a mouthful; as  
much as can be swallowed at once.—

Therewith she spew'd, out of her filthy maw,  
A flood of poison, horrible and black,  
Full of great lumps of flesh and *gobbets* raw. *Spens.*  
By devilish policy art thou grown great,  
And like ambitious Sylla, overgorg'd  
With *gobbets* of thy mother's bleeding heart.

*Shakespeare's Henry VI.*  
—The cooks, slicing it into little *gobbets*, prick it  
on a prong of iron, and hang it in a furnace. *Sar-*  
*day's Travels.*—

The giant gorg'd with flesh, and wine, and  
blood,

Lay stretch'd at length, and snoring in his den,  
Beiching raw *gobbets* from his maw, of cherub's

U u With

With purple wine and cruddled gore confus'd.  
*Addison.*

\* To GOBBET. *v. a.* [from the noun.] To swallow at a mouthful. A low word.—Down comes a kite powdering upon them, and gobbets up both together. *L'Esrange.*

(1.) GOBBI, a province of Loango, in Africa, between CAMMA, and Cape Lopez Gonzalvo.

(2.) GOBBI, the capital of the above prov. lies about a day's journey from the sea. Their rivers abound with a variety of fish; but are infested with sea-horses, which do great mischief both by land and water. The principal commerce with the natives is in logwood, elephants teeth, and tails, the hair of which is highly valued.

\* To GOBBLE. *v. a.* [*gobber*, to swallow, old Fr.] To swallow hastily with tumult and noise.—The sheep were so keen upon the acorns, that they gobbled up now and then a piece of the coat along with them. *L'Esrange.*

Of last year's corn in barn great store;  
Fat turkies gobbling at the door. *Prior.*

The time too precious now to waste,  
And supper gobbled up in haste,  
Again afresh to cards they run. *Swift.*

\* GOBBLER. *n. s.* [from *gobble*.] One that devours in haste; a gormand; a greedy eater.

GOBBO CORTONESE. Peter Paul, a celebrated painter of fruit and landscapes, born at Cortona in 1580. He learned the principles of design from his father; was afterwards the disciple of Crescenzio at Rome, and perfected himself in his profession, by copying after nature, with judgment and accuracy. By his skill in the chiaro-scuro he gave an exact and expressive roundness to his fruits, &c. But he chiefly excelled in colouring. He died in 1640.

GOBCEIN, a town of Germany, in the Palatinate of the Rhine, 18 miles SE. of Philipsburg. Lon. 8. 56. E. Lat. 49. 6. N.

(1.) GOBELIN, Giles, a famous French dyer, in the reign of Francis I. who discovered a method of dying a beautiful scarlet, and his name has been given ever since to the finest French scarlets.

(2.) GOBELIN, a small river of France, in the department of Paris.

(3.) GOBELIN, *n. s.* in commerce, a fine kind of French tapestry, first manufactured at Paris, in 1666.

\* GO-BETWEEN. *n. s.* [*go* and *between*.] One that transacts business by running between two parties. Commonly in an ill sense.—Even as you came in to me, her assistant, or *go between*, parted from me: I say I shall be with her between ten and eleven. *Shak. Merry Wives of Windsor.*

GOBIER, Charles, a French author, born at St Malo, in 1644. He was a Jesuit, and being secretary to the missions of that society, wrote *Lettres curieuses et edifiantes*, containing the natural history, geography, and policy, of the countries explored by the Jesuits; and *Histoire des Isles Mariannes*. He died at Paris in 1708.

GOBIN, ST, a town and castle of France, in the dep. of Aisne, and late prov. of Picardy, near Fere. It has a manufactory of fine plate glass. Lon. 3. 23. E. Lat. 49. 29. N.

GOBIUS, in ichthyology, a genus of fishes belonging to the order of thoracici. They have two

holes between the eyes, 4 rays in the of the gills, and the belly fins are united form. There are 8 species, principally distinguished by the number of rays in their

(1.) \* GOBLET. *n. s.* [*goblet*, Fr.] or cup, that holds a large draught.—

My figur'd goblets for a dish of wine  
We love not loaded boards, as  
crown'd;

But free from surfeits our repose is found  
Crown high the goblets with a cheerful  
Enjoy the present hour, adjourn  
thought.

(2.) GOBLETS are ordinarily of a round and without either foot or handle. Besides the word from the Greek *κωβηλον*, a

(1.) \* GOBLIN. *n. s.* [Fr. *gobeline*, *ver* has once retained; writing it in three This word some derive from the *Gibellin* tion in Italy; so that *esse* and *goblin* is *Gibelline*, because the children of either terrified by their nurses with the name of but it appears that *esse* is Welsh, and more than those factions. *Silff Utton*, are *the night*, and the Germans likewise has spirits among them named *Goboldi*, *Gobelin* might be derived.] 1. An evil walking spirit; a frightful phantom.—

Angels and ministers of grace descend  
Be thou a spirit of health, or *goblin*;  
Bring with thee airs from heav'n, or  
hell!

To whom the *goblin*, full of wrath  
Art thou that traitor angel? *Milt.*  
—Always, whilst he is young, be sure  
his tender mind from all impressions of  
of spirits and *goblins*, or any fearful appa-  
in the dark. *Locke.* 2. A fairy; an elf

His son was Elfinel, who overcame  
The wicked *gobelins* in bloody field  
But Elfant was of most renowned  
Who all of crystal did Panthea build  
Go, charge my *goblins* that they  
joints

With dry convulsions; shorten up  
With aged cramps. *Shakespeare*  
Mean time the village rouses up  
While well attested, and as well be-  
Heard solemn goes the *goblin* story rot  
(2.) GOBLIN. See APPARITION, GHOST,  
GOBLIN, and SPECTRE.

GOBONY. See COMPONE.

GOBRIAS, one of the 7 Persian  
conspired against Smerdis the Magiar  
usurped the throne on the death of  
A. A. C. 521. See PERSIA. He was  
in-law of Darius I, and accompanied the  
expedition against the Scythians.

\* GO-BY. *n. s.* Delusion; artifice;  
tion; over-reach.—Except an apprentice  
ted how to adulterate and varnish, and  
*go-by* upon occasion, his master may  
with neglect. *Colleur.*

\* GO-CART. *n. s.* [*go* and *cart*.]  
in which children are inclosed to tea-  
walk, and which they push forward  
ger of falling.—

ig children, who are try'd in  
to keep their steps from sliding,  
members knit, and legs grow stronger,  
of such machine no longer. *Prior.*  
town of the French republic, in the  
Roer, and ci-devant duchy of Cleves:  
s, 6 miles S. of Cleves. It has three  
id was surrounded with walls in 1291.  
E. Lat. 51. 39. N.  
IEIM, or } a town of Germany, in  
LEN, } the duchy of Wirtemberg,  
leidelberg, and 24 NNW. of Stuttgart.  
LANO, a county of Sardinia.  
ANO, the capital of the above county,  
, seated on the Thurso, 25 miles E.

LENIUS, Conrad, a learned German  
in Westphalia, in 1486. He wrote  
cero De Officiis, a translation of Lu-  
cretius, &c. He died in 1539.

LENIUS, Rodolph, a voluminous Ger-  
born in the county of Wardeck, in  
was about 50 years professor of logic  
and died there in 1628. His works  
historical.

LENIUS, Rodolph, a German physici-  
Wirtemberg, in 1572. He was pro-  
fic and mathematics at Marburg. He  
atije o- the cure of wounds by the Mag-  
d in 1621.

D. n. f. [*God*, Sax. which likewise fig-  
The same word passes in both senses  
cidental variations through all the  
ialects.] 1. The Supreme Being.—*God*  
ad they that worship him must wor-  
spirit and in truth. *John* iv. 24.—

*God* above  
een thee and me. *Shak. Macbeth.*  
urches of *God* are united into one by  
discipline and government, by virtue  
same Christ ruleth in them all. *Pearson.*  
eme Being, whom we call *God*, is ne-  
existent, eternal, immense, omni-  
otent, and best being; and therefore  
who is and ought to be esteemed most  
ly. *Grew's Colins.* 2. A god; an idol.  
ificeth unto any *god*, save unto the  
be shall be utterly destroyed. *Exod.*

to wanton boys are we to the *gods*,  
us for their sport. *Shak. K. Lear.*  
*god* of arms, whose iron sceptre sways  
ing North, and Hyperborean seas,  
san colds, and Thracia's Winter coast,  
nd thy seeds, and thou art honour'd  
*Dryden.*  
n or thing deified or too much ho-  
hose end is destruction, whose *god* is  
*Phil.* iii.—

I am not Licio,  
at scorns to live in this disguise,  
one as leaves a gentleman,  
s a *god* of such a cullion. *Shak.*

§ 1. def. 1. See CHRISTIANITY,  
ICS, MORAL PHILOSOPHY, and THE-

§ 1. def. 2.) is also used in speaking of  
ics of the heathens, many of whom

were only creatures to which divine honours and  
worship were superstitiously paid. The Greeks  
and Latins did not mean by the name *God*, an all-  
perfect being, whereof eternity, infinity, omnipre-  
sence, &c. were essential attributes: with them,  
the word only implied an excellent and superior  
nature; and accordingly they give the appellation  
*gods* to all beings of a rank or class higher and  
more perfect than that of men; and especially to  
those who were inferior agents in the divine admi-  
nistration, all subject to the one Supreme. Thus  
men themselves, according to their system, might  
become gods after death; inasmuch as their souls  
might attain to a degree of excellence superior to  
what they were capable of in life. See MYTHO-  
LOGY.

\* To *GOD*, v. a. [from the noun.] To deify; to  
exalt to divine honours.—

This last old man,  
Lov'd me above the measure of a father;  
Nay, *godded* me, indeed. *Shak. Coriolanus.*  
GODAH, a town of Asia, in Indostan.

(1.) GODALMIN, or } a parish of England, in  
(1.) GODALMING, } *Surry* which is divided  
into 9 tythings. It is agreeably diversified with  
hills and valleys. The *Wye* runs through it, sup-  
plies it with fish, and drives 4 corn and 2 paper  
mills. A bridge was built over it in 1785. This  
parish abounds with a peculiar kind of peats, that  
are reckoned better than pit coals.

(2.) GODALMING, a town in the above parish,  
(N<sup>o</sup> 1.) on the *Wye*, where it divides into several  
streams. It is a corporation, and by its charter  
the chief magistrate is a warden chosen yearly,  
with 8 assistants. It carries on manufactures of  
kerseys and stockings; and is famous for liquorice.  
It has a market on Wed. and fairs Feb. 13, Sept.  
28, and Nov. 28. In 1739, the small-pox carried  
off above 500 persons in three months, which was  
more than a 3d of the inhabitants. It lies 4 miles  
SW. of Guildford and 35 of London. Lon. o. 34-  
W. Lat. 51. 13. N.

GODANNA, a town of Persia, in the prov. of  
Iraq, 105 miles E. of Isfahan.

GODAVERY, GODURY, or GONDA, a river  
of Indostan, which rises about 70 miles NE. of  
Bombay, and whose waters, at least in the upper  
part of its course, are esteemed sacred by the Hin-  
doos; who believe that ablutions performed in  
them have a greater religious efficacy than those  
performed in any other river. After crossing Dow-  
latabad and Golconda, from W. to E. it runs SE.  
and receives the Bain Gongga; about 90 miles from  
the sea, it divides into two large branches at Raja-  
mundry; and these subdividing into inferior bran-  
ches, its waters fall into the Bay of Bengal by  
various mouths; which form harbours at Bandar-  
malanka, Coringa, Ingeram, Narsapour, Yalam,  
&c. between Lon. 81. 40. and 82. 50. E. and be-  
tween Lat. 16. 20. and 16. 50. N.

\* GODCHILD. n. f. [*god* and *child*.] A term of  
spiritual relation; one for whom one became spon-  
sor at baptism, and promised to see educated as a  
Christian.

GODDARD, Jonathan, M. D. an eminent phy-  
sician and chemist, and one of the first promoters  
of the Royal Society. He was born about 1617;  
educated and graduated at Oxford; was elected a

fellow of the college of physicians in 1646, and appointed reader of the anatomical lecture in 1647. Oliver Cromwell appointed him first physician to the army, a member of the council of state, and warden of Merton college. But he lost this office on the restoration. He was elected professor of physic in Gresham college, in 1655. He prepared all his own medicines; and in 1668, published a treatise, recommending that practice to all physicians. He was the inventor of the GUTTÆ ANGLICANÆ. He died of an apoplectic fit in 1674. Bishop Seth Ward says, he was the first Englishman who made a telescope.

\* GODDAUGHTER. *n. f.* [*god* and *daughter*.] A girl for whom one became sponsor in baptism. A term of spiritual relation.

(1.) \* GODDESS. *n. f.* [*from god*.] A female deity.—

Hear, nature, hear; dear *goddess*, hear a father!  
*Shakespeare.*

A woman I forswore; but I will prove,  
Thou being a *goddess*, I forswore not thee:  
My vow was earthly, thou a heav'nly love. *Shak.*

I long have waited in the temple nigh,  
Built to the gracious *goddess*'s Clemency;  
But reverence thou the pow'r. *Dryden's Fob.*

From his seat the *goddess* born arose,  
And thus undaunted spoke. *Dryden's Fob.*  
—When the daughter of Jupiter presented herself  
among a crowd of *goddesses*, she was distinguished  
by her graceful stature and superior beauty. *Addis.*

Modesty with-held the *goddess*'s train. *Pope.*

(2.) GODDESSES. The ancients had almost as many goddesses as gods: such were Juno, Minerva, Diana, &c. The virtues, graces, and principal advantages of life; truth, justice, piety, liberty, fortune, victory, &c. were all represented as goddesses; which was paying no small compliment to the fair sex. But to balance this, the Furies, Harpies, &c. were also represented as goddesses.

\* GODDESS-LIKE. *adj.* [*goddess* and *like*.] Resembling a goddess.—

Then female voices from the shore I heard;  
A maid amidst them *goddess-like* appear'd. *Pope.*

GODDINGTON, two small towns of England, in Kent and Oxfordshire.

GODEAU, Anthony, bishop of Grasse and Vence, in France, was born at Dreux, in 1605. He was a very voluminous writer. His principal works are, 1. *An ecclesiastical history*, in 3 vols. fol. containing the first 8 centuries, as he never finished more. 2. *Translation of the Psalms into French verse*; which was so well approved, that even those of the reformed religion preferred it to that of Marot. He died in 1671.

GODERVILLE, a town of France, in the dep. of the Lower Seine, 9 miles NE. of Montivilliers, and 15 NW. of Gaudebec.

(1.) \* GODFATHER. *n. f.* [*god* and *father*.] The sponsor at the font.—He had a son by her, and the king did him the honour to stand *godfather* to his child. *Bacon's Henry VII.*—Confirmation, a profitable usage of the church, transcribed from the apostles, consists in the child's undertaking in his own name the baptismal vow; and, that he may more solemnly enter this obligation, bringing some

*godfather* with him, not now, as in baptism procurator. *Hammond.*

(2.) GODFATHERS and GODMOTHERS: sons who, at the baptism of infants, promise their future conduct, and solemnly promise they will renounce the devil and all his works, follow a life of piety and virtue; and themselves under an indispensable obligation to instruct them, and watch over their conduct. This custom is of great antiquity in the Christian church, and was probably instituted to prevent idolatry, in case the child died before they arrived at the years of discretion. The number of godfathers and godmothers formerly great, but is reduced to 2, in the church of Rome; and 3, in the church of England.

(1.) GODFREY of Bouillon, or Boulogne, of Lorraine, a most celebrated crusader, and pious general. He was chosen general of the expedition which the Christians undertook for the recovery of the Holy Land, and led his army to prepare for the war. He took Jerusalem from the Turks in 1099; and was made king of Jerusalem. His piety would not permit him to wear gold in the city where his Saviour was crowned with thorns. The sultan of Egypt afterwards sent a terrible army against him; which he defeated, with the slaughter of about 100,000 of the enemy. He died in 1106.

(2.—6.) GODFREY. See GOTMOPREY.

GODHEAB, or GOOD HOPE, a settlement in W. Greenland. Lon. 50. 10. W. Lat. 60. 10. N.

\* GODHEAD. *n. f.* [*from god*.] 1. Deity; divinity; divine nature. It is used to denote the idols and the true God.—

Be content;  
Your low-laid son our *godhead* will upraise.  
At the holy mount

Of heav'n's high-seated top, th'impious  
Of *godhead*, fix'd for ever firm and fast  
The filial pow'r arriv'd. *Milton's*  
So may thy *godhead* be content,  
So the returning year be bliss.

2. A deity in person; a god or goddess. *Shakespeare's Timon.*—

Adoring first the *genius* of the place  
The nymphs and native *godheads* yet  
Dr

GODIVA, a lady of the 11th century, famous for an uncommon act of generosity. She gave her husband's property, and her own, to the people of Coventry. See CANTON.

\* GODLESS. *adj.* [*from god*.] Without duty to God; atheistical; wicked; impious.—Of these two sorts of men, but the one has utterly no knowledge of the other studies how to persuade thee there is no such thing to be known. *H*

That *godless* crew  
Rebellious.

For faults not his, for-guilt and  
Of *godless* men, and of rebellious  
him his ungrateful country sent,  
Their best Camillus, into banishment

\* GODLIKE. *adj.* [*god* and *like*.] Resembling a deity; supremely excellent.

Adam his illustrious guest besought,  
 us the *godlike* angels answer'd mild. *Mil-*  
 ng and much revolving in his breast,  
 est the mighty work he might begin  
 iour to mankind, and which way first  
 his *godlike* office now mature. *Milton.*  
 rince shall be so wise and *godlike*, as, by  
 l laws of liberty, to secure protection  
 ragement to the honest industry of man-  
*ke.*

**GODDING.** *n. f.* [from *god.*] A little divini-  
 mutive god.—  
 puny *godlings* of inferior race,  
 humble statues are content with brass.

*Dryden's Juv.*

**GODLINESS.** *n. f.* [from *godly.*] 1. Piety to  
 General observation of all the duties  
 l by religion.—Virtue and *godliness* of life  
 'ed at the hands of the minister of God.

**GODLY.** *adj.* [from *god.*] 1. Pious towards  
 rant that we may hereafter live a *godly*,  
 , and sober life. *Com. Prayer.* 2. Good;  
 ; religious.—Help, Lord, for the *godly*  
 th, for the faithful fail among the chil-  
 en. *Pf. xii.* 1.—The same church is real-  
 this world, in relation to all *godly* per-  
 ained in it, by a real infused sanctity.

**GODLY.** *adv.* Piously; righteously. By  
 should be *godlily*, but the repetition of  
 le is too harsh.—The apostle St Paul  
 that every one that will live *godly* in  
 us must suffer persecution. *Hooker.*

**GODLYHEAD.** *n. f.* [from *godly.*] Goodness;  
 ous. An old word.—

his, and many more such outrage,  
 your *godlyhead* to a swage  
 vorous rigour of his might. *Spenser.*

**GODLY,** *n. f.* an epithet applied to our Savi-  
 the divine and human natures being u-  
 is person.

**GODMANCHESTER,** a borough of Hunt-  
 re, 16 miles from Cambridge, and 57  
 don. It has a bridge over the Ouse,  
 to Huntingdon; was formerly a Ro-  
 by the name of *Durosponte*, where  
 man coins have been often dug up;  
 ding to old writers, in the time of the  
 was the see of a bishop, and had a castle  
 ne Gorman a Danish king, from which  
 was called GORMANCHESTER. It is  
 a fertile soil, abounding with corn. It is  
 no town in England kept more ploughs  
 an this has done. The inhabitants for-  
 ived their kings with nine score ploughs  
 , finely adorned with trappings, &c.  
 made it a corporation, under 2 bailiffs  
 istsants. Here is a school, called the  
 nmar School of queen Elizabeth. On  
 de of the town is an ancient seat of the  
 ndwich. Near this place, in the Lon-  
 between Huntingdon and Caxton, is a  
 known to travellers by the name of *Beg-*  
*h.*

**GODHAM,** a town in Yorkshire.

**GODINSTON,** a town in Dorsetshire.

**GODMOTHER.** *n. f.* [god and mother.] A

woman who has undertaken sponson in baptism.  
 A term of spiritual relation.

(2.) GODMOTHERS. See GODFATHER, § 2.

(1.) GODOLPHIN, John, an eminent English  
 civilian, born in the island of Sicily, in 1617, and  
 educated at Oxford. In 1642-3, he was created  
 LL. D. in 1653, he was appointed one of the  
 judges of the admiralty; and at the Restoration,  
 he was made one of the king's advocates. He was  
 esteemed as great a master of divinity as of law;  
 and published, 1. The holy limbeck. 2. The holy  
 arbour. 3. A view of the admiral's jurisdiction.  
 4. The orphan's legacy. 5. *Repertorium canonicum*,  
 &c. He died in 1678.

(2.) GODOLPHIN, in geography, a hill of Eng-  
 land, in Cornwall, E. of Mount's Bay, and 4 miles  
 from Market-Jew; famous for its tin mines.

(1.) GODRA, a circar of Indostan, in Guzerat.

(2.) GODRA, the capital of the above circar, 55  
 miles E. of Amedabad. Lon. 73. 40. E. Lat. 22.  
 50. N.

GODSHILL, a hill in the Isle of Wight.

\* GODSHIP. *n. f.* [from *god.*] The rank or cha-  
 racter of a god; deity; divinity.—

Discourfing largely on this theme,

O'er hills and dales their *godships* came. *Prior.*

GOD'S MERCY, ISLANDS OF, four isles at the  
 NW. extremity of Hudson's Straits. Lon. 73. 0.  
 W. Lat. 63. 45. N.

\* GONSON. *n. f.* [god and son.] One for whom  
 one has been sponfor at the font.—

What, did my father's *godson* seek your life?

He whom my father named? your Edgar? *Shak.*

GODSTONE, a village in Surry.

GODSTOW, a place NW. of Oxford, in an  
 island formed by the Isis, after it is joined by the  
 Evenlode. It is famous for fish, but more so for  
 the ruins of that nunnery, which Rosamond quit-  
 ted for the embraces of Henry II. The natives  
 show a great hole in the earth, where, they say,  
 is a subterraneous passage, under the river to  
 Woodstock, by which she used to pass and repass.  
 Little more now remains than ragged walls, scat-  
 tered over a considerable extent of ground. An  
 arched gateway, and another venerable ruin, part  
 of the tower of the conventual church, are still  
 standing. Near the altar in this church Rosamond  
 was buried, but the body was afterwards remo-  
 ved by order of a bishop of Lincoln. The only  
 entire part is small, formerly a private chapel.  
 Not many years ago, a stone coffin, said to have  
 been Rosamond's, was to be seen here. The cha-  
 pel now serves for a stable.

GODURY. See GODAVERY.

\* GODWARD. *adj.* To Godward is toward God.  
 So we read, *Hac Arethusa tenus, for balenus Are-*  
*thusa.*—And such trust have we through Christ to  
 Godward. 2 Cor.

GODWICK, a village in Norfolk.

(1.) GODWIN, earl of Kent. See ENGLAND,  
 §. 18.

(2.) GODWIN, Francis, successively bishop of  
 Landaff and Hereford, was born in 1567. He was  
 the son of Dr Thomas Godwin, bishop of Bath  
 and Wells; and was a good mathematician, an  
 excellent philosopher, a pure Latinist, and an ac-  
 curate historian. He understood the true theory  
 of the moon's motion a century before it was ge-  
 nerally

nerally known. He first started those hints afterwards pursued by Bp. Wilkins, in his *Secret and Swift messenger*; and published *A catalogue of the lives of English bishops*. He has been accused of simony, in disposing of preferments, to provide for his children. He died in 1648.

(3.) GODWIN, Mrs. See WOLLSTONECRAFT.

(4.) GODWIN, Thomas. See GODWYN, N° 2.

(5.) GODWIN SANDS. See GOODWIN, N° 3.

(1.) \* GODWIT. *n. f.* [*god*, and *wita*, an animal.] A bird of particular delicacy.—

Nor ortelans nor *godwits* crown his board.

*Cowley.*

(2.) GODWIT. See SCOLOPAX.

(1.) GODWYN, E. of Kent. See ENGLAND, § 17.

(2.) GODWYN, Thomas, a learned English author born in 1517, master of the free-school at Abington in Berkshire; where he educated many youths, who became eminent in church and state. He was a man of great learning: He wrote *Historia Romanae anthologia*, *Synopsis antiquitatum Hebraicarum*, *Moses & Aaron*, *Florilegium Phrascon*, &c. He died in 1642.

\* GODYELD. } *adv.* [corrupted from *God*

\* GODYELD. } *field* or *protecl.*] A term of thanks. Now not used.—

Herein I teach you,

How you should bid *godyeld* us for your pains,  
And thank us for your trouble. *Shak. Macbeth.*

\* GOEL. *adj.* [*golen*, Saxon.] Yellow. An old word.—

In March at the furthest, dry season or wet,  
Hop roots so well chosen let skilful go set;  
The *goeler* and younger, the better I love;  
Well gutted and pared, the better they prove.

*Tuffer.*

GOELANS, a promontory of N. America on the N. side of Lake Ontario, 33 miles SW. of Fort Frontinac.

GOELL, a town in Holstein, near Oldenburg.

GOELWARA, a circar of Indostan in Guzerat, on the W. coast of the Gulf of Cambaya.

\* GOER. *n. f.* [from *go*.] 1. One that goes; a runner.—

I would they were in Africk both together,  
Myself by with a needle, that I might prick  
The *goer* back. *Shak. Cymbeline.*

Such a man

Might be a copy to these younger times;  
Which follow'd well, would now demonstrate  
them

But *goers* backward. *Shak. All's well.*

—Nothing could hurt either of us so much as the intervening officious impertinence of those *goers* between us, who in England pretend to intimacies with you, and in Ireland to intimacies with me. *Pope to Swift.* 2. A walker; one that has a gait or manner of walking good or bad.—The earl was so far from being a good dancer, that he was no graceful *goer*. *Wotton.* 3. The foot. Obsolete,

A double mantle, cast

A'thwart his shoulders, his faire *goers* grac'ft  
With fitted shoes. *Chapman.*

GOEREE, William, a learned bookseller of Amsterdam, born at Middleburg, in 1635. He was a man of taste, and wrote, 1. A General Introduction to the Art of Painting: 2. A Trea-

tise on the principles of Architecture: Jewish Antiquities; printed at Utrecht in 2 vols. folio. He died at Amsterdam.

(1.) GOES, or TER-GOES, a town of the vian republic, in the dept. of the Meuse, devant prov. of Zealand; seated on the I. of the isle of S. Beveland, of which it is tal, on an arm of the Scheldt, from when a canal. It was nearly destroyed by action of the sea, in 1548: In 1564, great it was burnt: The Dutch took it in 17, Prince Maurice fortified it; so that it has gates and 4 bastions. In 1618, the great was burnt, but was rebuilt in an elegant Its chief trade is in grain and salt. It lies E. of Flushing, and 20 of Middleburg. 50. E. Lat. 51. 30. N.

(2.) GOES, a town of Portugal, in the of Beira, 9 miles E. of Coimbra.

GOESIIUS, William, a learned Dutch born at Leyden, and son-in-law of Danius. Among other critical works, he has notations on Petronius Arbiter; which joined to Burman's edition of that work died in 1618.

GOEZ, Damian DE, a Portuguese of great repute, born at Alanguar, of a noble, and educated at the court of K. I He travelled through the chief countries of and became acquainted with Erasmus, Olaus Magnus, Cardinals Bembo and M. Conrad Gloenius, Peter Nannius, and literati. He married and spent several Louvain; and not only wrote the history siege in 1542, but bravely put himself at of the soldiers, and contributed much to fence. After this K. John III. recalled Portugal, in order to write the history kingdom; but the favours with which march loaded him, procured him so much that he was first falsely accused and cast Lisbon; and afterwards found murder own house. He wrote, 1. *Fides, Religio que Ethioptom*: 20. *De Imperio et rebus orum*: 3. *Hispania*: 4. *Urbs Olisippone*: 5. *Chronica do Rey Dom Emanuel*: 6. *do Principe Dom Joan*: and others which have been often printed, and are esteemed

GOFF, Thomas, B. D. an English born at Essex, in 1592. He was educated at Westminster, studied at Oxford; took or obtained the living of E. Clandon, Surrey but marrying a *Xantippe*, her tongue shortened his days, and he died in 1700 wrote 5 tragedies, published after his death several sermons, besides two Latin funerals printed in 1622 and 1627.

GOFFSTOWN, a town of New Hampshire in Hillborough county, on the W. side of Merrimack, 60 miles W. of Portsmouth

GOG and MAGOG, two names general together in scripture. (Ezek. xxxviii. xxxix. 1, 2, &c. Rev. xx. 8.)

Moses Magog the son of Japhet, but *Satan* in Gen. x. 2. 1. Chr. i. 5.) Gog was prince gog, according to Ezekiel, Magog being of the country or people. The general ancients made Magog the father of the

and several interpreters discovered  
 leys of their name in the provinces of  
 ary. Others supposed that the Persi-  
 ic descendants of Magog. Some have  
 hat the Goths were descended from  
 lagog; and that the wars described by  
 nd undertaken by Gog against the  
 those which the Goths carried on a-  
 Roman empire, in the 5th century.

s placed Gog in the neighbourhood of  
 He derives the name of this celebra-  
 tion from the Hebrew *Gogchasan*, "the  
 Gog." He maintains that Prometheus,  
 chained to Caucasus by Jupiter, is Gog,  
 er. There is a province in Iberia call-  
 garene. Most commentators think,  
 nd Magog, mentioned in Ezekiel and  
 ions, are to be taken in an allegorical  
 uch princes as were enemies to the  
 saints. Thus many by Gog in Eze-  
 and Antiochus Epiphanes, the perse-  
 ose Jews who were firm to their religi-  
 the person of the same name in the Reve-  
 y suppose Antichrist to be meant; the  
 y of the church and faithful. Some  
 ured to prove that Gog, spoken of  
 means Cambyfes king of Persia. Others  
 plausibility think that Gog and Magog  
 relations denote all the enemies of the  
 so should be persecutors of it to the  
 ion of ages. From the present state  
 opinion, and the rapid progress of in-  
 he civilized parts of Europe and Ame-  
 ns not improbable, that Gog and Ma-  
 nt the two last powerful opponents of  
 r, DEISM and ATHEISM.

RD, a town of Sweden, in E. Gothland,  
 NW. of Linköping.

VA, Antony Herman, a German phyfi-  
 or of *Arifoxeni Harmonicorum Elemen-*  
 ls. published at Venice in 1592

OGGLE. *v. n.* To look askint.—

id all over with disgrace,

en by her in such a place,

nade him hang his head, and scowl,

ik and goggle like an owl. *Hudibras.*

ighs, nor groans, nor goggling eyes did

it. *Dryden.*

GLE-EYED. *adj.* [*scagl egen. Sax.*]

d; not looking straight.—They are de-

natural, or lame; and very unseemly

oon, except to men that be goggle-eyed

. *Ascham.*

LES, in surgery, instruments used for

isting, or that distortion of the eyes

asions this disorder. They are short

bes, composed of ivory stained black,

a plate of the same ivory fixed in the

their anterior extremities. Through the

each of these plates is a small circular

t the size of the pupil of the eye, for

iffion of the rays of light. These gog-

be continually worn in the day time,

asicles of the eye are brought to act re-

uniformly, so as to direct the pupil

rwards; and by these means the cure

ner or later effected.

LAND, an island of Russia, in the Gulf

of Finland, 80 miles W. of Petersburg. Lon. 44-  
 48. E. of Ferro. Lat. 60. 10. N.

GOGLIONIS, a town of Naples, in the prov.  
 of Capitanata 7½ miles S. of Termoli.

GOGMAGOG HILLS, hills three miles from  
 Cambridge, remarkable for the intrenchments and  
 other works cast up there: which some suppose  
 were a Roman camp; and others a work of the  
 Danes.

GOGNO, a river of the Piedmontese republic,  
 which runs into the Po, near St Nogaro.

GOGO, a town of Indostan, in Guzerat, near  
 the Gulf of Cambaya, 64 miles NW. of Surat,  
 and 84 SSW. of Amedabad. Lon. 71 53. E. Lat.  
 21. 45. N.

GOGOLEV, a town of Russia, in the province  
 of Kiow, 20 miles E. of Kiow.

GOGRA, or SOONJEW, a large river of Asia,  
 which rises in Thibet, from Lake Lanke-Dhe, in  
 Lat. 33. 17. N. and forcing its way through Mount  
 Himmaleh, runs SE. and joins the Ganges above  
 Chuprah in Bahar.

GOGUET, Antony-Yves, a French writer,  
 author of a celebrated work, intitled, *L'Origine  
 des Loix, des Arts, des Sciences, & de leur Progres  
 chez les anciens Peuples*, 1758, 3 vols. 4to: which  
 has been since translated into English. His father  
 was an advocate, and he was born at Paris in 1706.  
 The reputation he gained by it was great: but he  
 enjoyed it a short time, dying in the same year of  
 the small pox; which he always dreaded. Con-  
 rad Fugere, to whom he left his library and his  
 MSS. was so deeply affected with his death, that  
 he died himself about 3 days after him.

(1.) GOHUD, a circar of Indostan, in Agra,  
 subject to a rajah, who is tributary to the Poonah  
 Mahrattas

(2.) GOHUD, the capital of the above circar;  
 55 miles SSE. of Agra. Lon. 78. 44. E. Lat. 26.  
 24. N.

GOJAM, a province of Abyssinia, remarkable  
 for having in it the sources of the Nile. It is  
 bounded on the N. by the high mountains of A-  
 mid-Amid; on the S. by the Nile, on the W. by  
 the GULT, on the E. by the Temci, and on the  
 NE. by the kingdom of Damot. It is about 75  
 miles long from N. to S. and 42 broad from E.  
 to W. It is very populous, but the men are ac-  
 counted the worst soldiers in Abyssinia. It has  
 great numbers of very beautiful cattle.

GOIGN, the S. extremity of Argyllshire.

GOIN, a town of France, in the department  
 of Moielle, and late province of Lorraine: 9 miles  
 S. of Metz.

\* GOING. *n. f.* [from *go.*] 1. The act of walk-  
 ing.—

When nobles are their taylor's tutors,

No hereticks burnt, but wenches suitors,

Then comes the time, when lives to see't,

That going shall be us'd with sect. *Sbak.*

2. Pregnancy.—The time of death has a far great-  
 er latitude than that of our birth; most women  
 coming, according to their reckoning, within the  
 compass of a fortnight; that is, the twentieth part  
 of their going. *Grecul's Cosm. Sac.* 3. Departure.

Thy going is not lonely; with thee goes

Thy husband; him to follow thou art bound.

*Milton.*

GOY,

GOIT, a river of England, in Cheshire, which runs into the Mersey, 3 miles E. of Stopford.

GOITO, a town of the Cisalpine republic, in the department of Mincio, and late duchy of Mantua; between the lakes of Mantua and Garda; 9 miles NNW. of Mantua. It was taken by the allies in 1701, and by the Prince of Hesse in 1706. Lon. 10. 40. E. Lat. 45. 16. N.

GOKEWELL, a town of Lincolnshire NW. of Brig.

\* GOLA. *n. f.* The same with CYMATIUM. —In a cornice the *gola*, or cymatium of the corona, the coping, the modillions or dentelli, make a noble show. *Spectator.*

GOLAN, a town of Poland, in the palatinate of Posen; 10 miles NE. of Posen.

GOLBORN, 2 English villages; 1. in Cheshire, SW. of Tattenhall; 2. in Lancashire, near Derby.

(1.) GOLCONDA, a province of Indostan, in the Deccan; bounded on the N. by Berar, on the E. by the gulf of Bengal; on the S. by Mysore and the Carnatic, and on the W. by Dowlatabad and Vissapour. It was anciently called TELLINGANA, or *Tilling*, and was an independent kingdom; its monarch had an army of half a million of men; but in 1687 it was conquered by Aurengzebe. It abounds in corn, rice, and cattle; but it is most remarkable for its diamond mines, which are the most considerable in the world; 6000 men being usually employed in them. The diamonds are generally purchased of the black merchants, who buy parcels of ground to search for these precious stones in. They sometimes fail of meeting with any, but in others they find immense riches. It has also mines of salt, fine iron for sword blades, and manufactures of calicoes and chintzes. It is subject to the Great Mogul, and governed by the Nizam of the Deccan. It is very fertile, and abounds with vines, fruits, rice, &c. Its winter begins in June, with furious storms of wind, thunder and rain. HYDRABAD is the capital.

(2.) GOLCONDA, a fortress and town of the above kingdom, (N<sup>o</sup> 1.) which form one of the largest cities in the East Indies; being about 6 miles in circumference; and formerly the residence of the kings. It is now much frequented by European merchants. It is seated round the side and foot of a mountain, which has the form of a sugar loaf. The palace is very large and has a fine view of Hydrabad. The fort has 5 towers, and stone walls 3 feet thick, mounted with cannon. It is 5 miles WNW. of Hydrabad. Lon. 70. 10. E. Lat. 16. 30. N.

(1, 1.) \* GOLD. *n. f.* [*gold*, Sax. *golud*, riches, Welsh. It is called *gold* in our English tongue, either of *geol*, as *Staliger* says, which is in Dutch to shine; or of another Dutch word, which is *gelten*, and signifies in Latin *valere*, in English to be of price or value: hence cometh their ordinary word *gelt*, for money. *Peachment on Drawing.*] 1. *Gold* is the heaviest, the most dense, the most simple, the most ductile, and most fixed of all bodies, not to be injured either by air or fire, and seeming incorruptible. It is soluble by means of sea-salt; but is injured by no other salt. *Gold* is frequently found native, and very rarely in a state of ore. Pure *Gold* is so fixed, that Boerhaave informs us of an ounce of it set in the eye of a glass furnace

for two months, without losing a Hill on Fossils.—*Gold* hath these nature of weight, closeness of parts, fixatiou or softness, immunity from rust, and or tincture of yellow. *Bacon's Natura*

Ah! Buckingham, now do I ply To try if thou be current *gold* indeed —We readily say this is *gold*, and that let, only by the different figures and presented to the eye by the pencil. *L*

The *gold* fraught vessel, which it beat,

He sees now vainly make to his retreat. —

2. Money.— For me the *gold* of France did not Although I did admit it as a motive

The sooner to effect what I intended Thou that so stoutly had resisted

Give me thy *gold*, if thou hast any For I have bought it with an hundred

3. It is used for any thing pleasing So among the ancients *χρυσον εφεδωκεν*; *Animamque moreque aureos educit* is

The king's a bawcock, a heart of A lad of life, an imp of fame. *Sb*

(2.) GOLD, *adj.* golden; made of

(3.) GOLD, the most valuable of all is of a bright yellow colour when pure comes more or less white or high-coloured

portion as it is alloyed with silver or is the heaviest of all known bodies, excepted, its specific gravity being to tilled water at 19.640 to 1000. See *C*

*Index.* It melts in a low white heat according to Mr Wedgwood's calculation

degrees of Fahrenheit's, or 32 of his mometer for its fusion; a heat greatly that which melts silver or copper; th

quiring only 4717, and the latter 4588 heat. Other metallurgists, however,

copper requires for its fusion a greater heat than either gold or silver; and

confirmed by the experience of those who these metals.

(4.) GOLD BROCADE. See BROCADE

(5.) GOLD, COMBINATIONS OF, WITH METALS. See CHEMISTRY, § 990.

metallic state, cannot be combined with ble earth, but its calces may; for which

are often used in enamel painting and where they produce a beautiful view

Glass is tinged by them of a beautiful which we have an account in Neri's

making, though Dr Lewis says he never ceed, in making it diffuse itself equally

the substance of the glass. See GLASS,

(6.) GOLD, DUCTILITY AND EXT OF. *Gold*, is the most ductile, and most malleable, of all metals. Accord

stedt, one grain of it may be stretched cover 98 Swedish ells, equal to 63.66 f

of silver wire; but Wallerius asserts, of gold may be stretched in such a way

cover 500 ells of wire. At any rate, it is prodigious; for according to the calculations, the millionth part of a

may be made visible to the naked eye

ity inferior to its ductility. Boyle, quoted in his *Treatise of Colours*, says, that an half of gold may be beaten into of one inch square, which, if intersected by lines drawn at right angles to each other, distant only the fourth part of an inch, will produce 25 millions of little squares, each very easily discernible by the naked eye. Magellan tells us, that its surface may be struck by the hammer 159,092 times. "I find," (says he) by an intelligent gold-beater, that the finest gold leaf is that of seven skins, and must have an alloy of 3 parts of copper to the ounce of pure gold, or would be too soft to pass over the irregular skins. He affirms that 80 sheets, or leaves of gold, each measuring 3.3 square inches, each leaf containing 10.89 square inches, less than 384 grains. Each sheet, therefore, = 272.23 inches, weighs less than 3 grains; so that each grain of the metal occupies 56.718 square inches." From this calculation it appears, that the thickness of gold leaf is less than one 281,020<sup>th</sup> of an inch; and 16 oz. of gold would be sufficient to cover a wire equal in length to the whole circumference of the globe. Gold is more elastic than lead or tin, but less so than iron, or steel. It grows hard by hammering, but its ductility on being heated. Notices the ductility of gold more than that of brass or tin. The former will render steel of standard gold brittle by only touching it, and a very small quantity of steel with it will destroy its ductility and strength. Dr Lewis says, that even the veins which arise from tin in the fire, make gold that it flies in pieces under the hammer. This notion, however, was controverted by Alchorne, Esq; of the Royal Mint; who, in the course of experiments, which he made, and published in the *Philos. Trans.* for 1784, concludes, though tin, like other inferior metals, imitates gold, in proportion to the quantity mixed with it, yet there does not appear any thing specifically inimical to that precious metal, "that, when brittleness has been occasioned by the addition of tin to gold, the former adulterated with arsenic. M. Tillet, from a new set of experiments, recorded in the *Memoirs of the Academy of Sciences at Paris*, 1790, has drawn a conclusion much more favourable to the experience of all former metallurgists; that, though "gold, when perfectly pure, is a small portion of the finest tin, may, by a proper management, be extended to a certain degree by the hammer, and still better by rollers; as it cannot be annealed without danger, it is by this defect deprived of the advantage of recovering its original softness, and is then strongly hammer-hardened."

**GOLD, ELECTRICAL EXPERIMENTS WITH. See MAGNETICITY, Index.**

**GOLD, EXPERIMENTS RESPECTING THE COLOUR OF.** Gold leaf exhibits a fine green colour, which is produced by the insertion of a thin pellicle of the sun or any other luminous body, and is continued for some time to a strong heat, it becomes ignited, and at last melts, assuming a fine bluish green colour; and, when cold, crystallizes into quadrilateral pyramids. This bluish green colour, according to Mr Magellan, as well as the former, when a thin film of the metal is interposed between the eye and the luminous body, is owing to transmitted light. "The green light (says he) is transmitted in both cases, since all reflected colours are produced by the transmission of light, as the ingenious philosopher Mr Delaval has lately discovered and demonstrated, in his very elaborate treatise on this subject, inserted in the 2d vol. of the *Memoirs of the Philosophical Society of Manchester*." Sir Isaac Newton in his *Optics*, (page 162, edit. 1730,) accounts for that phenomenon, saying, that "gold foliated, and held between the eyes and the light, looks of a greenish blue, and therefore (says he) massy gold lets into its body the blue rays to be reflected to and fro within it, till they be stopped and stifled; while it reflects the yellow outwards, and therefore looks yellow. It is therefore, in the two above cases, that some of the blue rays are transmitted along with the yellow ones; and both together appear of a bluish green. If gold be exposed to the joined rays of light, excepting only the yellow ones, which we suppose stopped after they were separated by a prism, it only looks white like silver; which shows (says Sir Isaac Newton) that its yellowness arises from the excess of intercepted rays, tinged that whiteness with their colour when they are let to pass. It is a pleasing observation to look with a deep magnifier on various pieces of gold, silver, and Dutch (copper) leaves, between the eye and the sun-bine. The particles of silver are seen in the form of oblong dark lumps, with some interstices, like net-work, between them: those of the copper leaf are more numerous and more regularly distributed; but the particles of the gold leaf appear like little green semi-transparent and similar particles, uniting between themselves by nearly diaphanous joints, as if they were forced to flatten on their edges, rather than they would break their mutual cohesion with one another."

(9.) **GOLD; FORMS AND PLACES IN WHICH IT IS FOUND.** Gold is more generally found native than any other metal; (see *CHEMISTRY*, § 581.) though Bergman says, he does not know an instance of its ever being found perfectly free of alloy. Kirwan says it is seldom found so, being generally alloyed with silver, copper, or iron, and sometimes with all the three. According to Wallerius, native gold is found, 1. In solid masses, in Hungary, Transylvania, and Peru. 2. In grains, in the Spanish West Indies. 3. In a vegetable form, like the branches or twigs of plants. 4. In a druse figure, as if composed of groups or clusters of small particles united together, found in Hungary. 5. Composed of thin plates, or thin pellicles, covering other bodies, found in Siberia. 6. In a crystalline form in Hungary. Gold is also found in the form of thick solid pieces. It is in general more frequently imbedded in quartz, and mixed with it, than with any other stone; and the quartz in which the gold is found in the Hungarian mines, Mr Magellan tells us, is of a peculiar mild appearance. Sometimes, however, it is found in limestone, hornblende, &c. Europe

is principally supplied with gold from Chili and Peru in South America. A small quantity is likewise imported from China and the coast of Africa. The principal gold mines of Europe are those of Hungary, Salzburg, and Adefors in Smaland. Some gold is also extracted from the silver mines of Osterfilsarberget, in the province of Dalarna. Native gold has been found in Lapland, above Tornea, and in Westmanland. In Peru it is found mixed with a stony matter not well known, from which it is extracted by amalgamation. Mr Pallas mentions three gold mines in Peru, near the Pyschma, in which 500 men are employed. Sometimes kernels or lumps of a spongy texture, and very light, are met with, which contain a good quantity of gold dust. Gold is also found separate from any matrix, in lumps of visible grains mixed with sands, in the beds of rivers. It is visibly dispersed through masses of sand, of a yellowish red or violet colour. In this state it is so universally diffused through every kind of earth, that Mr Bergman thinks it the most common of all the metals, iron excepted. If 200 lb. of sand contain 24 grains of gold, the separation is said to be worth attending to. In Africa 5 lb. of sand often yield 63 grains of gold, or even more; and the heaviest sand, which is often black or red, contains the most. In Hungary, however, only ten or twelve grains of gold are contained in 10,000 lb. of sand; and even this trifling quantity has been extracted, though with loss. Gold is brought down with most of the large rivers. In Transylvania the Avanyos affords subsistence to upwards of 700 gypsy families, who gather gold from its sands. In Brazil it is found in great abundance in the beds of rivers.

(10.) GOLD, FULMINATING. See AURUM, § 2, 3; and CHEMISTRY, Index. M. Magellan takes notice of its extraordinary fulminating property, and says that its *fragor* is 64 times greater than that of an equal quantity of gun-powder. According to Bergman, the strength of the explosion is 176 times greater; 20 grains of aurum fulminans being equivalent to half a pound of gun-powder. Bergman accounts for the amazing strength of this explosion, by supposing it owing to the quantity of air extricated at the time; but this, according to his own account, cannot be at all sufficient for such a purpose; and Magellan is of opinion, that "this wonderful phenomenon seems not yet completely accounted for, by any hypothesis yet known." See EXPLOSION, § 5.

(11.) GOLD, INDESTRUCTIBILITY OF. The strongest heat of any furnace does not change the metallic properties of gold. Messrs Boyle and Kunckel kept gold for several months in the fire of a glasshouse without producing any change upon it. It appears, however, that, by the violent heat of the sun-beams, collected in the focus of a burning-glass, some alteration may be produced in it. Homberg observed that gold, when exposed to the lens of Teichirnhafen, formed, was volatilized, and even vitrified; and Macquer found, that the metal, when exposed to the lens of Mr Trudaine, exhaled a fume which gilded silver, and was therefore gold in a volatile state: the globule of melted gold was agitated with a rapid circular motion, and became covered with a

dull and as it were calciform pellicle; so that a violet vitrification was formed on the surface of the globule. This vitrification extended, and produced a kind of button or of a larger curvature, than that of the glass, and which stuck upon it as the transpiration appears on the selerotica of the eye-glass increased in size, while the gold gradually diminished: the support always tinged with a purple colour, seemingly by the absorption of part of the glass. I do not permit him to vitrify a quantity of gold. He observes, that it is a necessity, that the violet glass should be red combustible matters, in order to justify that it is the calx of that perfect metal would evidently appear to be the case if revived into gold. But however this Mr Fourcroy is of opinion, that this ought to be considered as a true vitrified calx of gold, with the greater probability, as in experiments with this metal the purple colour is constantly produced, and many preparations are employed to give that colour to earthenware and porcelain. "Gold (says he) is therefore like the other metals; and only requires likewise does silver, a stronger heat, and time to unite with the base of air than metallic substances." Mr Kirwan, on the other hand, tells us, that "gold exposed to the most heat of Mr Parker's lens for four months lost no sensible part of its weight; yet in contact with earthy matters, it contracted a blue or purplish tinge, to which he believes an exceeding small portion of oxygen to be dephlogisticated." This experiment of Mr Parker does not invalidate the former: for either Trudaine's lens may be more powerful than Mr Parker's; or the air being more clear than in England, the sun must be stronger. We are assured, that by means of the electric fire, gold is instantaneously calcined and even melted; whence we must conclude, not only that gold is really calcinable, but that the electric fire is most infinitely more powerful than any other fire by its means we may in a moment do what either cannot be done otherwise: very imperfectly, even by the fiercest fire raised. The flame of a lamp blown by dephlogicated air is also found sufficient to volatilize Gold being thus indestructible by the operations of fire, equally resists its flow through the atmosphere. It is altogether exempt from rusting; and though its surface becomes black by exposure to the air, it is merely in consequence of the deposition of foreign bodies upon it produces no change, says M. F. though, according to the experiments of Lavoisier, it seems capable of dividing it in the same manner as it does iron.

(12.) GOLD LEAF, OR GILT LEAF. &

(13.) GOLD LEAF, OR BEATEN GOLD. Beaten with a hammer into exceeding thinness so that it is computed, that an ounce may be extended into 1600 leaves, each 3 inches square: it takes up more than 159,052 times its former surface. See § 6; and LEAF, GOLD

cutten more or less, according to the kind of the work it is intended for; that for wire drawers to gild their ingots withal, is thicker than that for gilding the frames, &c. See GILDING, § IV, N<sup>o</sup> ii, 1. **GOLD, METHODS OF ASCERTAINING THE OF.** As gold has been reckoned by the consent of mankind, the most valuable in the world, it is of great consequence to discover its degree of purity, to procure equality of value in the different pieces in use. The methods by which this is accomplished will be found related under the articles, **ASSAY-MASTER, CARACT, § I, 3; METALLURGY.**

**GOLD, METHODS OF RECOVERING, FROM ORES.** Some powdered sil ammoniac, dissolved with aquafortis into the consistence of a spread upon the gilt silver, and the piece left till the matter smokes and becomes nearly insensible then thrown into water, it is rubbed with a scratch brush made of fine brass wire, the gold easily comes off. Another way is to dissolve the gilt silver into common aquafortis so hot as nearly to boil, and turning it frequently till it becomes all over black; to be washed with a little water, and then with the scratch brush, to get off what aqua regia may have left. This method is used; as the same aqua regia will serve until it is saturated with the gold. To separate gold from gilt copper, some direct a solution of borax to be applied on the gilt parts, but others use a pencil, and a little powder of borax to be sprinkled on the places thus moistened, the piece being then made red hot, and plunged in water, the gold is so far loosened, as to be scraped off with a brush. Others mix the vitriol with nitre and tartar, and form the mixture into a paste, which is spread upon the gilt parts. Schlutter recommends mercury means, as being generally the least expensive for separating gold from the surface both of silver and copper. If the gilt vessel be round, it may be easily got off by turning it in a lathe, applying a proper tool, a skin being stretched underneath, for receiving the shavings. He may easily collect into 2 oz. of shavings all of a gilt vessel weighing 6 lb. Where the piece does not admit of this method, scrapers fixed, and scrapers applied of different sizes according to its size and figure; some large, and some small, with two handles; others small and pointed for penetrating into depressed parts. If it cannot be got off by either of these ways, it must be used, though it takes off more of the silver underneath than the turning tool or scraper.

The gold scrapings or filings may be separated from the silver or copper they contain, by the methods. See METALLURGY. The method in the French *Encyclopédie* give a method of separating the gold from wood, that has been gilt with silver, extracted from a memoir, presented to the Academy of Sciences by M. de Montigny. The gilt wood, is steeped for a quarter of an hour in a quantity of water sufficient to cover the wood very hot: the silver being thus softened,

the wood is taken out, and scrubbed, piece by piece, in a little warm water, with short stiff bristle brushes of different sizes, some small for penetrating into the carvings, and others large for the greater dispatch in flat pieces. The whole mixture of water, lize, gold, &c. is to be boiled to dryness, the dry matter made red hot in a crucible to burn off the lize, and the remainder ground with mercury, either in a mortar, or, where the quantity is large, in a mill.

(16.) **GOLD, MINERALIZATIONS OF.** Gold is said to be mineralized, when it is mixed with some other substance in such a manner as not to be acted upon by aqua regia. In this manner gold is found mineralized by various minerals: as,

(i.) **GOLD MINERALIZED BY QUICKSILVER, OR Auriferous Cinnabar,** is said to be found in Hungary. M. Sage speaks of a specimen of gold from Hungary, then in the French king's cabinet at Paris, which was crystallized into quadrangular prisms of a grey yellowish colour and a brittle consistency, which he supposes to be the result of a mercurial amalgam of native gold.

(ii.) **GOLD MINERALIZED BY SULPHUR.** Many have insisted, that as gold and sulphur are not found to have any chemical attraction for one another, it is impossible that marcasite can contain any of the metal, or indeed that it can be found in any ore containing sulphur: but since we know by experience, that gold can be melted out of these ores, even after they have been digested in aqua regia, and that gold likewise enters into their sulphurated regulus, there is the greatest reason to believe, that some third substance, probably a metal, has by its admixture enabled the sulphur to unite with a certain quantity of gold. Marcasites, however, contain, at any rate, only a small quantity of gold, and none is to be expected from them in places where no gold is in the neighbourhood. "I am not perfectly clear (says Cronstedt) whether the gold is really dissolved and indurated, or, if I may so express myself, vitrified in the *schirls*; provided, by this mineral body, we mean a garnet substance. But I have seen a piece of what is called *schirl*, whose texture was exactly like the Schemnitz blende; and in this case it might perhaps hold the same contents."

(iii.) **GOLD MINERALIZED BY SULPHUR AND IRON.** Golden pyrites, or mercantile gold ore, is a close and compact substance of a bright yellow colour, in which gold is said to be mineralized by sulphur by means of iron, because it cannot be extracted by aqua regia or by amalgamation. A kind of gold pyrites is found at Adelfors in Smaland, which contains an ounce or less of gold in one cwt. of the ore. The Transylvania gold pyrites, according to Brunnich, in which no gold can be perceived by the naked eye, contain from 50 to 100, and 110 oz. and upwards, in one cwt. Those where the gold appears in the pyrites like brewed Spanish snuff, hold 250 oz. but they are very scarce. The mountain of Faczebaya, near Zalathna, is remarkable for its gold pyrites; and here they seem also to contain semi-metallic parts. M. Magellan thus accounts for the union of gold with this kind of pyrites: "It is well known, that gold may be dissolved by liver of sulphur. The

process given for this purpose by M. Apigny, p. 156 of his *Treatise on Colours*, is as follows: Reduce to powder 4 lb. of vegetable alkali (salt of tartar), and as many of sulphur, with one of the leaves of gold. Melt the mixture in a crucible with its cover; pour the fused matter out on a marble stone; pound it again when cold, and put the whole in a matras with hot water; which being filtrated is of a greenish-yellow colour, containing the gold dissolved. Now, as we know that *hepar sulphuris* has been found in several pyrites, and Mascagni says, that he found it in those lagoons near Sienna in Italy; is it not very natural to conclude, that this noble metal may be really mineralized in the auriferous pyrites?"

(iv.) GOLD MINERALIZED BY ZINC AND IRON, is called *Schemnitz Blende*. Cronstedt informs us, that the ores of zinc at Schemnitz in Hungary contain a great deal of silver, and that this silver is very rich in gold. Professor Brunnich enumerates the following varieties of this ore: 1. Where the metal is mineralized by means of a cubic lead ore, containing silver, found in the mines of Michael and some places in Transylvania. 2. By a copper pyrites with silver. This kind of ore is called *giff* in Hungary: it has a compact surface of a pale yellow colour; but must not for that reason be confounded with the auriferous pyrites. 3. The Cremnitz ores in which the metal is mineralized by means of red gilder ore. 4. By means of antimony, in which it sometimes appears. This kind is found at the foot of the Carpathian mountains. 5. By cubic lead ore, iron, and some unknown volatile parts. This ore, as described by Scopoli, is of a black colour; the richest pieces are lamellated almost like an iron glimmer, with a degree of flexibility. The vein is quartz, which is sometimes loose, and the metal scattered very minutely in it. It is found in Transylvania. 6. Native gold, with black lead (or molybdena), has been found near Rimezemat in Upper Hungary; but our author (Professor Brunnich) has not had any opportunity of examining whether it is mineralized by it or not. In all the above species, the gold is either entirely native, but so minutely divided, and so loosely scattered, that it can only be seen through microscopes, and often cannot be seen at all before it is separated by various processes: or it may not be in the form of native gold, but the metal as it were in embryo; in which case fire is necessary to bring the constituent parts together, and to add those that are wanting; in that case likewise it is never without silver. "To these (says Mr Magellan) may be added the following ores: 1. Gold, with arsenical pyrites, is found also at Saltzberg in Tyrol, in mountains of quartz and schistus. It contains only 25 grains in the quintal; nevertheless it affords a profit of L. 500 per annum. 2. With a white, red, or vitreous silver ore, near Cremnitz and Schemnitz in Hungary. 3. With a sulphurated ore of silver, iron, lead, and manganese, at Nagaya in Transylvania. Its specific gravity is 4.043, and it is said to afford 10 ounces per quintal. 4. With sulphurated iron, copper, and manganese, at Nagaya."

(17.) GOLD, MOSAIC, is gold applied in patches on a proper ground, distributed into squares,

lozenges, and other compartments; parts shaded to raise or heighten the rest. See M

(18.) GOLD ORES. See § 16, N<sup>o</sup> IV.

(19.) GOLD PLATES FOR ENAMELLING generally made of ducats whose fineness 23½ carats to 23¾; as the finest gold is for this purpose, unless where some part gold are left bare and unpolished, as in watch inlaid-boxes, &c. for which purposes a tin alloy is necessary, and silver is preferred per, because the latter disposes the plate white and turn green. See ENAMEL, § 3.

(20.) GOLD, SHELL, is that used by painters and illuminers, and with which gold is written. It is made by grinding gold in gold-beaters fragments, with a little honey afterwards separating the honey from the gold by water. When the honey is washed away, the gold may be put on paper or shells; whence its name. When it is diluted with gum-water or soap-suds. The same gold powder, prepared from the gold leaf in the same manner, is general and when it is well scoured with varnish, the end in japaners gilding as well as the

(21.) GOLD, SOLUTION AND PRECIPITATION. See CHEMISTRY, Index.

(22.) GOLD, SPUN, or } is flattened

(22.) GOLD THREAD, } (See § 27.)

over a thread of silk, by twisting it with and iron bobbins. To dispose the wire on silk, they pass it between two rollers mill; these rollers are of nicely polished about 3 inches in diameter. They are close to each other, and turned by a handle to one of them, which gives motion to the other. The gold wire in passing between is rendered quite flat, but without loosing anything of its gilding; and is rendered exceedingly thin and flexible, that it is used on silk thread, by means of a hand wheel wound on the bobbins. See BROCADE EMBROIDERY, § 2; LACE, &c.

(23.) GOLD, VALUE OF, CONTRASTED WITH ITS BULK. Mr Paucton, in his *Mémoire* 94, says, that one cubic foot (French) of gold is worth 2,153,000 *livres tournois* 89,708 Louis d'Or; or guineas, and 7 and that the respective value of the same foot of gold is equal to 25.6 cubic silver; each of this last metal being worth about 84,000 French livres, or 3,500 and 8 shillings: so that if we suppose the gold specie of France to be but two thirds of French livres, according to the estimate of M. Neckar, in his *Treatise upon the Commerce*, the whole amount should make a cube of gold less than 10 feet on each side, trifling, in a philosophical view, is the subject that excites the activity of 30 millions of human species.

(24.) GOLD, VITRIFICATION OF. See

(25.) GOLD, USES OF, IN THE ARTS applied to the surface of bodies, not only for ornament, but, by its indestructibility, preferred from the injuries of the atmosphere. The applying it in this manner is called GOLD-LEAFING: the immense ductility of gold renders it

applied at much less expence than gilding. It is also used in gilding, &c. of solution by acids, or amalgam-mercury, which are called WATER-; was formerly used in medicine, and were ascribed to it; whence the of golden tinctures, elixirs, &c. of all these are now deservedly exploded practitioners allow that gold, in manner it be prepared, is quite innocuous. If we may believe Dr S. Liverpool, however, the *Essence of* : valuable ingredient in his *Balm of*

WIRE, a cylindrical ingot of silver, ed with gold, and afterwards drawn rough a great number of little round awing iron, each less than the other, sometimes no bigger than a hair. See ING.

WIRE FLATTED, is the above wire ten two rollers of polished steel, to on on a stick, or to be used flat with- as in brocades, laces, embroideries, CADE, § 3, 4.

COAST, in geography, a maritime irica, on the coast of Guinea, abound- ; and extending 180 miles in length (N° V.) to Panni. See GUINEA,

GOLD COAST. See GOLD, N° II, and GUINEA.

GOLD-CRONACH, a town of Franconia, in the principality of Bayreuth, so named from an ex- hausted gold mine. It is 5 miles N. of Bayreuth.

GOLDEGG, a town of Germany in Austria, 4 miles W. of St Polten.

(1.) \* GOLDEN. *adj.* [*from gold.*] 1. Made of gold; consisting of gold.—

O would to God that the inclusive verge  
Of *golden* metal, that must round my brow,  
Were red hot steel to tear me to the brain. *Shak.*  
Nine royal knights in equal rank succeed,  
Each warrior mounted on a fiery steed,  
In *golden* armour glorious to behold;  
The rivets of their arms were nail'd with gold. *Dryden.*

2. Shining; bright; splendid; resplendent.—

So sweet a kiss the *golden* sun gives not  
To those fresh morning drops upon the rose;  
Nor shines the silver moon one half so bright  
Thro' the transparent bosom of the deep. *Shak.*  
'Tis better to be lowly born  
Than wear a *golden* sorrow. *Shak. Hen. VIII.*  
Heaven's *golden* winged herald late he saw  
To a poor Gallean virgin sent. *Craibaw.*  
To her hard yoke you must hereafter bow,  
Howe'er she shines all *golden* to you now. *Dryd.*  
And see the guardian angels of the good,  
Reclining soft on many a *golden* cloud. *Rowe.*

3. Yellow; of the colour of gold.—*Golden* ruffet- ing hath a gold coloured coat under a ruffet hair, and its flesh of a yellow colour. *Mortimer.* 4. Excellent; valuable.—

I have bought  
*Golden* opinions from all sort of people,  
Which would be worn now in their newest glos,  
Not cast aside so soon. *Shak. Macbeth.*

—That verse which they commonly call *golden*, has two substantives and two adjectives, with a verb betwixt them to keep the peace. *Dryden.*—Thence arises that *golden* rule of dealing with others as we would have others deal with us. *Watts's Logick.*  
5. Happy; resembling the age of gold.—Many young gentlemen flock to him every day, and fleet the time carelessly, as they did in the *golden* world. *Shak.*

(2.) GOLDEN, in geography, a town of Ireland, in Tipperary, on the Suir; 8 miles from Dublin.

(3.) GOLDEN, a village of England in Cornwall, between Grampond and Truro.

- (4.) GOLDEN CALF. See CALF, § 3.  
 (5.) GOLDEN CUPS. See RANUNCULUS.  
 (6.) GOLDEN EAGLE. See ABYSSINIA, ETHIOPIA, § 64; and FALCO, N° 4.  
 (7.) GOLDEN FISH. See CYPRINUS, N° 2.  
 (8.) GOLDEN FLEECE, in the ancient mythology, was the skin and fleece of the ram upon which Phryxus and Helle are said to have swam over the sea to Colchis; and which being sacrificed to Jupiter, was hung upon a tree in the grove of Mars, guarded by two brazen-hoof'd bulls, and a monstrous dragon that never slept; but was taken and carried off by Jason and the Argonauts. Some authors have endeavoured to show that this fable is an allegorical representation of some real history, particularly of the philosopher's stone. Others have explained it by the profit of the wool trade to Colchis, or the gold which they commonly gathered there with fleeces in the rivers. See ARGONAUTS, N° I. § 2, 3.  
 (9.) GOLDEN FLEECE, ORDER OF THE, a military order instituted by Philip the Good, duke of Burgundy, 1427; thus named from a representation of the golden fleece, worn by the knights on their collars, which consisted of flints and steels. The king of Spain, as D. of Burgundy, is grand master of the order; the number of knights is fixed to 31. It is said to have been instituted on occasion of an immense profit which that prince made by wool; though others will have a chemical mystery couched under it, as that famous one of the ancients, which the adepts pretend to be the secret of the *elixir vite*, wrote on the skin of a sheep.  
 (10.) GOLDEN ISLAND, an island of S. America, in the Gulf of Darien, and prov. of Terra Firma; where the Scots first attempted to settle, in 1698, before they took possession of the opposite shore, which they were at last obliged to relinquish, in consequence of the villainous combination of the English and Dutch merchants. See DARIEN, N° I, § 1, 1—5. Lon. 77. 10. W. Lat. 9. 0. N.  
 (11.) GOLDEN LAKE, a lake in the island of Borneo. Lon. 115. 45. E. Lat. 3. 55. N.

 (15.) GOLDEN NUMBER. See CHRONOLOGY.  
 (16.) GOLDEN ROD. See SOLIDAGO, N° 14.  
 (17.) GOLDEN ROSE. See ROSA. The pope annually consecrates a golden rose on the 4th Sunday in lent, which is sent to princesses, or to some church, as a mark of his peculiar affection.  
 (18.) GOLDEN RULE. See ARITHMETIC, § 83.  
 (19.) GOLDEN SAMPHIRE. See INULA.  
 (20, i.) \* GOLDEN SAXIFRAGE. *n. f.* [*chrysopterium*.] An herb.  
 (ii.) GOLDEN SAXIFRAGE. See CHRYSOPLENIUM.  
 (21.) GOLDEN THISTLE. See SCOLYMUS,  
 (22.) GOLDEN VALE, a valley of England, in Herefordshire, W. of Hereford, extending along the banks of the Dove; so named from its fertility and numerous yellow flowers. The sheep fed in it have uncommonly fine wool.

\* GOLDENLY. *adv.* [from *gold* fully; splendidly—My brother Jacob school, and report speaks *goldenly* *Shak.* As you like it.

GOLDENSTETT, a town of the circle of Westphalia, and county 11. miles N. of Diepholz.

(1.) \* GOLDFINCH. *n. f.* [*gold* singing bird, so named from his.] This is called in Staffordshire a *pro* singing birds they have linnets, goldocks, Canary birds, blackbirds, the vers others. *Curew.*—

A *goldfinch* there I saw, with g  
 Of painted plumes, that hopp  
 side.

(2.) GOLD-FINCH, in ornithology GILLA, N° 5. These birds are of colours, and were they not commonly esteemed. They are usually Michaelmas, and soon become tame, differ very much in their song. They breed in the upper part of plum their nests of the moss that grows trees, and of wool; quilting the sorts of hair. They breed thrice a-year are to be taken with the nest days old, and fed as follows: Pour feed very fine in a mortar; then sieve, and add to it as much wheat feed; with a little flour of canary with a small stick or quill take up a handful of a white pea, and give times a-day. This ought to be made; for if it is suffered to sour, it stomachs, and cause them to cast up and probably die. These young kept warm till they can feed themselves are very tender. In feeding, be the bird clean his bill and mouth. falls upon his feathers, take it off not thrive. Such as eat hemp feed them, should have the seeds of mung and mercury; or lettuce and plant there is no need of purging, give three times a week a little sugar or loam or at the bottom of the cage; for an oiliness, so that if they have not absorb it, in length of time it fouls and brings on them a flux, which is ous.

\* GOLDFINDER. *n. f.* [*gold* an who finds gold.] A term ludicrous those that empty jakes.—

His empty paunch that he might  
 He suck'd his victuals thro' a quill  
 Untouch'd it pass'd between his  
 Or't had been happy for *goldfish*  
 GOLD-FISH. See CYPRINUS,

ONEY. See SPARUS.

NI, a late celebrated dramatic author,  
 ice in 1707. Having showed an un-  
 arly attachment to dramatic perfor-  
 mance, he got a small theatre  
 in his own house, in which, while a  
 he and his companions amused them-  
 selves with comedies. He even became an  
 actor, and wrote a comedy before he was 8 years  
 of age; finishing his grammatical and rhet-  
 oric at Venice and Prague, he went to  
 study philosophy; but preferring the  
 risotle, he went off with a company  
 to Chioggio. After attempting to  
 act at Venice, he became secretary to  
 the senate of that state at Milan. In this city,  
 he acted the *Venetian Gondolier*, the first of his  
 pieces that was acted and printed; and soon  
 after several other pieces for a Vene-  
 tian theatre at Milan, and whom he ac-  
 quainted with Genoa, where he married. After  
 that, he returned to Florence, and Pisa, he returned  
 and wrote comedies for the theatre of  
 Genoa. These cost him so little trouble, that  
 he wrote 16 new comedies, besides 42  
 for that theatre, within a year; and  
 2, tho' so rapidly executed, are con-  
 sidered the best productions. The first edition  
 was published in 10 vols 8vo in 1753.  
 Afterwards a great number of pieces  
 were published at St Luke, which were published  
 in *The New Comic Theatre*. He  
 wrote other pieces between 1753 and 1761;  
 and in 1761, he took a jaunt  
 from whence he went to Rome. He  
 acted in Paris, on the invitation of M. Ze-  
 nari, chief actor on the Italian theatre there,  
 he engaged for two years. After this,  
 he acted as an Italian teacher to the  
 king of the unfortunate Lewis XVI.;  
 he got only 4000 livres a-year, and a  
 box of 50 louis d'ors in a gold box. As he  
 acted at court, but went when called, in a  
 he lost his eye-sight by reading while  
 he acted. In his 62d year, he wrote a French  
 comedy titled *Bourru Bienfaisant*, which was  
 acted in Louis XVI's marriage; and for which  
 he was rewarded with a pension of 1000  
 livres from the king, besides consider-  
 able sums from the performers and the booksellers.  
 He died in Paris in 1792, aged 85; at a crisis,  
 when the French Convention were intending to  
 execute the king liberally. As a dramatic author,  
 he is considered equal to the best comic poets of  
 France; and in fertility of invention supe-  
 rior to all. His whole works were printed  
 in 1788—91, in 31 vols 8vo. He has  
 written *Moliere of Italy*; and Voltaire, in  
 the *marquis Albergati*, called him *the  
 Moliere of Italy*. His favourite work, generally  
 considered his master-piece, was his *Terence*. His  
 other pieces are his *Volponi*. He greatly reformed

the Italian theatre, by purging it of those scurri-  
 lous and low jests which formerly disgraced it.

(1.) \* GOLDPLEASURE. *s. l.* An herb. *Dist.*

(2.) GOLDPLEASURE. See MYAGRUM.

GOLDSBOROUGH, a town of the United  
 States, in the district of Main, 330 miles NE. of  
 Boston. Lat. 42. 10 N.

(1.) \* GOLDSIZE. *s. l.* A glue of a golden  
 colour; glue used by gilders.—The gum of ivy is  
 very good to put into your *gold size*, and other col-  
 ours. *Perkins.*

(2.) GOLD-SIZE FOR FURNISHED GILDING is  
 prepared of 1½ lb. of tobacco-pipe clay, ¼ oz. of  
 red chalk, ½ oz. of black lead, 40 drops of sweet  
 oil, and 3 drains of pure tallow: grind the clay,  
 chalk, and black lead, separately, very fine in wa-  
 ter; then mix them together, add the oil and tal-  
 low, and grind the mixture to a due consistence.

(3.) GOLD-SIZE FOR JAPANING may be made  
 by pulverising gum animi and asphaltum, of each  
 one ounce; red lead, charge of gold, and umbre,  
 of each one ounce and a half, mixing them with  
 a pound of linseed oil, and boiling them; stir  
 them till the whole be incorporated, and appears  
 when cold of the consistence of tar; strain the  
 mixture through a flannel, and keep it stopp'd  
 up in a bottle for use. When used, it must be  
 ground with as much vermilion as will give it an  
 opake body, and diluted with oil of turpentine,  
 so that it may be worked freely with the pencil.  
 A more simple preparation is made with 1 lb. of  
 linseed oil and 4 oz. of gum animi; powder the  
 gum, and mix it gradually with the boiling oil;  
 let it continue to boil till it becomes of the con-  
 sistence of tar; strain it through a coarse cloth;  
 keep and use it as the other.

(1.) GOLDSMITH, Oliver, a celebrated au-  
 thor, born at Roscommon in Ireland, in 1729.  
 His father, who possessed a small estate in that  
 county, had 9 sons, of whom Oliver was the 3d.  
 After being well instructed in the classics, he was,  
 with his brother the rev. Henry Goldsmith, placed  
 in Trinity college, Dublin, about the end of 1749.  
 In this seminary he took the degree of B. D. but  
 his brother not being able to obtain preferment,  
 Oliver turned to the study of physic; and, after  
 attending some courses of anatomy in Dublin,  
 proceeded to Edinburgh in 1751, where he studied  
 medicine under the professors of that university.  
 His benevolent disposition soon involved him in  
 difficulties; and he was obliged precipitately to  
 leave Scotland, in consequence of engaging to pay  
 a considerable sum for a fellow student. A few  
 days after, about the beginning of 1754, he ar-  
 rived in Sunderland, near Newcastle, where he  
 was arrested at the suit of a tailor in Edinburgh,  
 to whom he had given security for his friend. By  
 the good offices of Lauchlan MacLane, Esq; and  
 Dr Sleigh, then in the college, he was delivered  
 out of the hands of the bailiff; and took his pas-  
 sage on board a Dutch ship to Rotterdam, where,  
 after a short stay, he proceeded to Brussels. He  
 then visited great part of Flanders; and after pas-  
 sing some time at Strasburg and Louvain, where  
 he took the degree of M. B. he accompanied an  
 English gentleman to Berne and Geneva. He  
 travelled on foot most part of his tour, having  
 left England with very little money. Being of a

philoso-

philosophical turn, capable of sustaining fatigue, and not easily terrified at danger, he became enthusiastically fond of seeing different countries. He had some knowledge of French and of music, and played tolerably well on the German flute; which, from an amusement, became at times the means of subsistence. His learning produced him an hospitable reception at most of the religious houses; and his music made him welcome to the peasants of Flanders and other parts of Germany. "Whenever I approached," he used to say, "a peasant's house towards night-fall, I played one of my most merry tunes; and that procured me not only a lodging, but subsistence for the next day: but in truth, I must own, whenever I attempted to entertain persons of a higher rank, they always thought my performance odious, and never made me any return for my endeavours to please them." On his arrival at Geneva, he was recommended as a travelling tutor to a young man who had been left a considerable sum of money by his uncle, a pawnbroker near Holborn. This youth, who had been articled to an attorney, on receipt of his fortune determined to see the world; and, on engaging with his preceptor, made a proviso, that he should be permitted to govern himself; and Goldsmith soon found his pupil understood the art of directing in money concerns extremely well, as avarice was his prevailing passion. Such curiosities on the way as could be seen for nothing, he was ready to look at; but if the sight of them was to be paid for, he usually asserted, that he had been told they were not worth seeing. He never paid a bill without observing how amazingly expensive travelling was; and all this, though he was not yet 21. During Goldsmith's continuance in Switzerland, he assiduously cultivated his poetical talent, of which he gave some proofs while at the college of Edinburgh. It was here he sent the first sketch of his delightful poem called the *Traveller* to his brother the clergyman in Ireland, who lived with an amiable wife on an income of only 40l. a year. From Geneva Mr Goldsmith and his pupil visited the south of France; where the young man, upon some disagreement with his preceptor, paid him the small part of his salary which was due, and embarked at Marseilles for England. Our wanderer was left once more upon the world at large, and passed through various difficulties in traversing the greatest part of France. At length his curiosity being satisfied, he bent his course towards England, and arrived at Dover the beginning of the winter 1778. When he came to London, his cash did not amount to two livres. Being an entire stranger, his mind was filled with the most gloomy reflections. With difficulty he discovered that part of the town in which his old acquaintance Dr Sleigh resided. This gentleman received him with the warmest affection, and liberally invited him to share his purse till some establishment could be procured for him. Goldsmith, unwilling to be a burden to his friend, eagerly embraced an offer which was made him soon after, to assist the late rev. Dr Milner in the academy at Peckham; and acquitted himself greatly to the Doctor's satisfaction: but having obtained some reputation by the criticisms he had written in the *Monthly*

*Review*, Mr Griffith, the proprietor, engaged in the compilation of it; and, resolving the profession of an author, he returned to London, as the mart where abilities of merit meet distinction and reward. As his affairs were not in a good state, he adopted the strictest economy; and took lodgings in an obscure court in the Old Bailey, where he wrote several ingenious pieces. The late Mr Griffith, who gave great encouragement to literary abilities, became a patron to him, and introduced him as one of the writers in the *Ledger*, in which his *Citizen of the World* first appeared, under the title of *Chimney*. His fortune now began to improve. The simplicity of his character, the integrity of his mind, and the merit of his productions, made him very acceptable to a number of families; and he emerged from his obscurity in the Old Bailey to the polite Temple, where he took handsome chambers, and lived in a genteel style. The public noticed him by the performance of his comedy *The Natural Man* at Covent Garden theatre, which placed him in the first rank of the poets of the century. Among many other persons who were desirous to know him, the duke of Northumberland; and a circle that attended his introduction to that nobleman shows a striking trait of his character: "I was invited," said the Doctor, "by my friend, to wait upon the duke, in consequence of the satisfaction he had received from the one of my productions. I dressed myself in the best manner I could; and, after such compliments I thought necessary on this occasion, proceeded to Northumberland House, where I acquainted the servants that I had partaken with his Grace. They showed me into the antichamber; where, after waiting for some time, a gentleman very gently dressed made his appearance. Taking him for the duke, I showed him all the fine things I had composed; and complimented him on the honour he had done me when, to my great astonishment, he had mistaken him for his master, who came immediately. At this instant he entered into the apartment; and I was so confused on this occasion, that I wanted words barely to express the sense I entertained of the neglect, and went away extremely at the blunder I had committed." An anecdote exhibits the strict integrity of his mind. Previous to the publication of his *Deserters*, the bookseller had given him a note for the copy, which the Doctor, a few hours after to one of his friends, served, it was a very great sum for so short a performance: "In truth," replied Goldsmith, "I think so too; I have not been easy since; therefore I will go back and return the note;" which he absolutely did; and he obliged the bookseller to pay him the profits produced by the sale of the piece; however, turned out very considerable. The last rehearsal of his comedy intitled *Conquer*, which Mr Coleman had

ed, on the Dr's objecting to the repetition of Tony Lumpkin's speeches, being it might injure the play, the manager Kennels replied, " Psha, my dear be fearful of squibs, when we have almost these two hours upon a barrel of." The piece, however, was rewarded with common applause by the audience; and the propriety of Coleman's observation put an end to the Dr's regard for him. Notwithstanding the excess of his pieces, by some of which he was rebuked in one year, his circumstances were in a prosperous situation; partly owing to the liberality of his disposition, and partly to the habit of gaming; the arts of which he was very little of, and thus became the prey to the advantage of his simplicity. In 1744 he published the prospectus of a Dictionary of Arts and Sciences; and by the friendship of Sir Joshua Reynolds, Dr Beauclerc, Mr Garrick, and others, he was enabled to furnish him with articles upon several subjects, he entertained the most sanguine hopes from it. The undertaking, however, did not meet with that encouragement from the public, which he had imagined it would; and he lamented this circumstance almost to the end of his life. He had been for some time, at different times, with a violent passion for gaming, which contributed to embitter the latter part of his life; and which, united with the other vices he suffered upon other occasions, formed a kind of habitual despondency. In 1774 his condition he was attacked by a nervous fever, which terminated in his death, on the 17th of June 1774. His character is justly expressed in the following lines:  
 A man, simplicity a child.  
 In pleasure he lov'd to enjoy was often  
 by distresses which arose from the  
 his temper, and which sometimes threw  
 id fits of passion: but this impetuosity  
 ed upon reflection; and his servants  
 down upon these occasions, purposely to  
 selves in his way, that they might pro-  
 nediately after; for he who had the  
 re to be reproved, was certain of being  
 or it. The universal esteem in which  
 were held, and the repeated pleasure  
 the perusal, is a striking test of their  
 was a studious and correct observer of  
 ppy in the selection of his images, in  
 of his subjects, and in the harmony of  
 tion; and, though his embarrassed sit-  
 vented him from putting the last hand  
 his productions, his Hermit, his Tra-  
 his deserted Village, claim a place a-

 OLDSMITH. n. f. [gold and smit, Sax.]  
 o manufactures gold.—  
 :r chain nor goldsmith came to me. *Sba.*  
 PART II.

2. A banker; one who keeps money for others in his hands.—The *goldsmith* or scrivener, who takes all your fortune to dispose of, when he has beforehand resolved to break the following day, does surely deserve the gallows. *Swift.*  
 (3.) A GOLDSMITH, (§ 2. def. 1.) or SILVERSMITH, is an artist who makes vessels, utensils, and ornaments, in gold and silver. There is a vast variety in the works made, and tools used, by goldsmiths, which we cannot here particularize. Works that have raised figures are cast in a mould, and afterwards carved, or polished and finished: plates or vessels of silver or gold, are beat out from thin flat plates; table and tea spoons, &c. are beat out from solid ingots, and their mouths struck up with a punch: tankards, and other vessels of that kind, are formed of plates soldered together, and their mouldings are beat, not cast. The business of the goldsmiths formerly required more labour than it does at present; for they were obliged to hammer the metal from the ingot to the thinness they wanted: but since the invention of flattening mills, the metals are reduced to the thinness required, at a small expence. As the goldsmith often has to make his own moulds, he ought to be a good designer, and have a taste in sculpture: he also ought to know enough of metallurgy to be able to assay and refine gold and silver, and to mix the exact quantity of alloy. The goldsmiths in London, employ different hands under them for the various branches of their trade; such as jewellers, box makers, toy-makers, turners, gilders, burnishers, chasers, refiners, founders, &c. Goldsmiths are superior tradesmen: Their wares must be assayed by the wardens of their own company in London, and marked; and the gold and silver must be of the standard fineness, under a penalty of 10*l.* Any false metal may be seized and forfeited to the king. The cities of Edinburgh, York, Exeter, Bristol, &c. have also places appointed for assaying gold and silver plate. Plate sent to the assay office, when discovered to be coarser than the standard, is broken and defaced; and the fees for assaying are limited. A duty is paid on silver plate of 1*s.* per oz.; and on gold plate of 16*s.* per oz.; besides which every goldsmith must take out a licence annually; for which he pays either 2*l.* or 5*l.* according to the extent of his business, with an addition of 15 per cent, agreeably to the late acts. The 2*l.* or rather 2*l.* 6*s.* licence allows him to make silver plate not exceeding 30 oz. and gold plate not exceeding 2 oz. in one piece. The 5*l.* 15*s.* licence qualifies him to make plate of any weight.  
 (4.) GOLDSMITH. See GOULDSMITH.  
 GOLDWELL, a town in Kent, W. of Ashford.  
 (1.) \* GOLDYLOCKS. n. f. [*roma aurea*, Lat.] A plant.  
 (2.) GOLDYLOCKS. See CHRYSOCOMA.  
 GOLE, a village in Yorkshire, E. of Armin.  
 GOLEITA, or GOLETTA, an island of Africa, at the entrance of the Bay of Tunis; taken by the emperor Charles V, during his siege of that city, and retained for several years after. It is 29 miles N. of Tunis, and 375 E. of Algiers. Lon. 10. 20. E. Lat. 37. 10. N.  
 GOLSEZ, a town of Poland, in the palatinate of Sandomirz, 60 miles SSW. of Sandomirz.  
 Y y y GOLP,

**GOLF**, a game much practised in Scotland, and said to be peculiar to this country. It has been very ancient; for there are statutes prohibiting it as early as 1457, lest it should interfere with the sport of archery. The rev. Mr R. Walker, one of the ministers of Canongate, Edinburgh, derives the name from a Dutch game, called *Kolf*, in some respects similar, being played with clubs, though in others very different. See **KOLF**. Both, he supposes, are originally derived from the Greek word, *κολοφος*. See *Sir J. Sinclair's Stat. Acc.* XVI. 28—30. Golf is commonly played on rugged broken ground, covered with short grass, near the sea-shore. A field of this sort is in Scotland called **LINKS**. The game is generally played in parties of one or two on each side. Each party has an exceeding hard ball, somewhat larger than a hen's egg. This they strike with a slender and elastic club, about 4 feet long, crooked in the head, and having lead run into it, to make it heavy. The ball being struck with this club, will fly to the distance of 200 yards, and the game is gained by the party who puts his ball into the hole with the fewest strokes. But the game does not depend solely upon the striking of the longest ball, but also upon measuring the strength of the stroke, and applying it in such direction as to lay the ball in smooth ground, whence it may be easily moved at the next stroke. To encourage this amusement, the city of Edinburgh, A. D. 1744, gave to the company of golfers a silver club, to be played for annually by the members, the victor to append a gold or silver piece to the prize. It has been played for every year since, except 1746 and 1747. For their better accommodation, 22 of the members subscribed 30*l.* each in 1768, for building a house for their meetings. The spot chosen for this purpose was the SW. corner of Leith links, where an area was feued from the magistrates of Edinburgh, and a commodious house and tavern built upon it.

**GOLGOTHA**, [גולגוטה, Syr. *i. e.* a place of skulls.] See **CALVARY**, N<sup>o</sup> 1.

**GOLHEIM**, a town of Germany, in the palatinate of the Rhine; taken by the French in Oct. 1794.

**GOLI**, or **GOLLI**, a small island of Maritime Austria, in the Quarnaro, and ci-devant Venetian Dalmatia, W. of the isle of Arbe. It feeds 2000 sheep.

**GOLICH**, a town of Russia, in the province of Irkutsch, on the Lena; 2 miles S. of Orlenga.

(1.) **GOLIUS**, James, a celebrated professor of Arabic and the mathematics at Leyden, descended from a very honourable family, and born at the Hague in 1596. He studied at Leyden, under Erpinus; and, having acquired all the learned languages, travelled into Asia and Africa. He was esteemed and honoured by Muley Zidan, emperor of Morocco and the Grand Signior. He brought home many MSS. to Leyden; and in 1624, succeeded Erpinus. As he had been an eye-witness of the wretched state of Christianity in the Mahometan countries, none ever solicited for a place of honour and profit with greater eagerness, than he did to procure a new edition of the New Testament, in the original language, with a translation into the vulgar Greek; by an Archiman-

drite; and as some of these Christians blic tongue in divine service, he also among them an Arabic translation of the of the Protestants, with the Catechism. He was likewise appointed interpreter for the Arabic, Turkish, Persian, and languages. He published, 1. The *lilane*, in Arabic. 2. The history of written by Elmacin. 3. *Alferganus' Astronomy*, with a new version, and mentaries. 4. An excellent Arabic Persian Dictionary. He died in 1666.

(2.) **GOLIUS**, Peter, brother to (N<sup>o</sup> 1.) was born at Leyden; and several works in Greek and Latin. 1. *Monastery of Carmelites on the top of* banns.

\* **GOLL**. *n. f.* [corrupted, as *St* from *swal* or *swol*, whence *swaldan*, manage.] Hands; paws; claws. Used and obsolete.—They set hands, and her golden *golls* among them; and that saw not the colour of them, 1 preheminece, *Sidney*.

**GOLLERSDORF**, a town of Germany, 4 miles SSE. of Sonneberg.

**GOLLI**. See **GOLI**.

**GOLLING**, a town of Bavaria, 14 miles SSE. of Salzburg, and 1 Radstadt.

**GOLLNITZ**, a town of Upper Anhalt Zerbst; 7 miles NW. of Zerbst.

**GOLNAW**. See **GOLNOW**.

**GOLNITZ**, a town and river of 14 miles SE. of Kapisdorf.

**GOLNIZ**, a town of Germany, 13 miles S. of St Andre.

**GOLNOW**, or **GOLNAW**, a town of Saxony, in Pomerania, on the Ibm, of Stargard, and 13 NE. of Old Steff 59. E. Lat. 53. 46. N.

**GOLOGRIZZA**, a town of Maria in the province of Istria; 6 miles S. of

**GOLOMBO PZ**. See **COLOMBO**

**GOLPHINGTON**, a town of Washington county, near the head of 26 miles ESE. of Occonee, 37 SW. and 50 NW. of Louisville.

(1.) **GOLSPY**, a parish of Scotland, of Sutherlandshire, 10 miles long from and 1½ broad. The climate is dry and the soil mostly light and fertile, but is sandy, and in others mossy. Sea-wares the coast, and is partly used as made into kelp. Haddocks, whiting, turbot, and flounders also abound.

(2.) **GOLSPY**, a parish of Scotland, in 1791, stated by the rev. Mr W in his report to Sir J. Sinclair, was 17 increased 398, since 1750; though, or it with Dr Webster's report in 1755 have decreased 90, between these p Mr Keith says it was supposed to have led within the course of the 18th century number of horses, in 1792, was 35 1000, and of black cattle 1700. Also were under oats, barley, pease, turnip and fown grass; besides 400 under 600 of hill-ground in commons.

parish in 1746, between a party of the militia, wherein the former and several persons of rank taken

28, a rivulet in the above parish, which overflowed the globe lands and out, in 1775; and in Nov. 1781, did so in 10 days.

29, a village in the above parish, containing inhabitants in 1792.

INSKOL, } two towns of Russia, in  
VINA, } the gov. of Tobolsk.

, a town of Russia, in Kiev.  
, a town of Saxony, in Brandenburg, of New Angermunde.

ZIUS, Henry, a famous engraver born in 1558, at Mulbreck, in the diocese. He was taught engraving by Jacob Cuereubert, and acquired it perfectly; he had a lame hand. He travelled many into Italy; visited Bologna, Naples, Venice, and Rome. In this he adopted a singular disguise, making his apron for his master, while he himself appeared as a valet, kept by the other merely for amusement. Under this disguise he explored all its variety. On his return he surpassed, where he died in 1617, aged 59. He was equalled, and few have equalled, the command of the graver and freedom of hand.

He copied the style of Albert Dürer, and other old masters, with accuracy. He engraved several of his own wood, in *chiaro-scuro*. Of his works are very numerous, the following are celebrated: 1. Six large upright plates, or *pieces*. These he engraved to show himself capable of imitating the styles of others, and others, whose works were in higher estimation than his own: for he adopted a new manner, which he pursued ought it superior, and not because he was able of following the others. It is the first one of them, the Circumcision, which he intended to give it the more plausible air he actually deceived some of the most masters of that age; by one of whom for an original engraving of Albert Dürer's subjects of these plates are, *The Anne and the Virgin; Her Meeting with Elizabeth; the Circumcision; the Adoration of the Kings; the Holy Family*. 2. *The Midas*; and, 3. *The Venetian Ball*, (lately lengthwise,) from Theodore de Bry and Dog, a middling sized work from a design of his own; an advertisement. 4. *The Necromancer*, a middling sized work in *chiaro scuro*. 5. *Night* the same.

30, Hubert, a learned German, born in Gueldres, in 1526. He travelled into Germany, France, and Italy, to make medals, &c. as well as to draw from nature. He was so accurate, that he had at his own house, under his own hand even engraved the plates with his

own hand. Among these his *Imperatorum fere omnium vivae imagines, à J. Casare ad Carolum V. ex veteribus numismatibus*, is an admirable work. He died at Bruges, in 1583, aged 57.

GOLUB, a town of Prussia, in Culm.

GOLUBENSKA, a town of Russia, in the country of the Cossacks, on the Don, 200 miles ENE. of Azoph.

GOLYDDAN, an ancient British poet, who flourished in the end of the 7th and beginning of the 8th centuries. He was hard to Cadwallader, the last king of the South Britons.

GOMAR, Francis, an eminent author of the 17th century, born at Bruges. He was a man of extensive erudition, and was professor of Divinity and Hebrew, in the university of Groningen. He was a most zealous defender of the Calvinistic doctrines against Arminius. He died at Groningen, in 1641.

(1.) GOMARA. See GOMERA.

(2.) GOMARA, or COMORA. See COMORA, N° 1, 2.

GOMARISTS, a name given to the Calvinists in Holland, occasioned by professor GOMAR's defence of their tenets against Arminius and Episcopius. See ARMINIANS, § 1.

GOMASHTEH, in the commerce of Bengal, signifies one cent.

GOMBAULD, John Ogier DE, one of the best French poets in the 17th century, and one of the first members of the French academy, was born at St Just de Luffac, in 1567. He acquired the esteem of Mary de Medicis, and of the wits of his time. He was a Protestant, and died in 1666, aged 99. He wrote many works in verse and prose. His epigrams and sonnets are particularly esteemed. His posthumous works, entitled *Traitez et Lettres sur la Religion*, were printed at Holland, in 1678.

GOMBIN, GAMBIN, or GARIN. See GABIN.

GOMBRON, or } a city of Persia, in the province of Farsistan, called by the natives Bander. This city owes its wealth and grandeur to the demolition of Ormus, and the downfall of the Portuguese empire in the East Indies. It is now justly accounted one of the greatest marts in the East; was built by the great Shah Abbas, and from him obtained the name of *Bander-Abassi*, or *the court of Abbas*. It stands on a bay about 27 miles N. of the island of Kishmish, and 9 from Ormus. The English began to settle here about 1631, when, in consideration of their services against the Portuguese, Shah Abbas granted them half the customs of that port. The city wants almost every thing that contributes to the happiness and even support of life. Towards the land it is encompassed by a wall; and towards the sea are several small forts, with a platform, and a citadel, mounted with cannon to secure it and the road against an enemy by sea. The houses in most of the streets are so out of repair, some half down, others in a heap of rubbish, that a stranger would imagine the town had been sacked; not a vestige of the wealth really contained in the place appearing in view. The bazars and shops round them are chiefly kept by Banians, whose houses are generally in good order. Most of the houses are built with earth and lime, but the best with stone.

Many of them have ventilators at top, which contribute greatly to the health of the inhabitants in the hot seasons. The most sickly months are April, May, September, and October. With fish and mutton the inhabitants are well supplied. Rice is imported from India; and wheat is so abundant, that the poor subsist chiefly on bread and dates. The country abounds in the most delicious fruits, as apricots, peaches, pomegranates, pears, mangoes, grapes, quavas, plums, quinces, &c. But these advantages are more than overbalanced by the scarcity of fresh water, with which the inhabitants are supplied from Assen, a place 7 miles distant, there not being a spring or well in the town. For this reason people of condition retire into the country, in June, July, and August. Even the sea, during this season, is affected, inasmuch that the stench is as disagreeable as that of putrid carcases; and this is increased by the quantities of shell fish left on the shore, from which an exhalation arises that tarnishes gold and silver. At Assen the English factory have a country house and gardens; where they have whole groves of Seville orange trees, which, though not natural to the country, thrive well. They have likewise ponds of fine fresh water, with every thing else that can moderate the heat of the climate, and render life agreeable and elegant. Gombroon is extremely populous, from the commerce carried on by the Dutch and English as well as the natives. The English factory is close by the sea, at some distance from the Dutch, which is a commodious and fine new building. A great part of the company's profits arises from freights. As the natives have no good ships of their own, and are extremely ignorant of navigation, they freight their goods for Surat, and other Indian marts, in English and Dutch bottoms, at an exorbitant rate. The commodities are, fine wines, raisins, almonds, prunellas, dates, pistachio nuts, ginger, silks, carpets, leather, tully, galbanum, ammoniac, asa-fetida, tragacanth, with other gums, and medicines. These are chiefly the produce of Carimania, which they bring to Gombroon in caravans. The English company had once a small factory in Carimania, chiefly for the sake of a fine wool produced there, and used by the hatters. Although the company pay no customs, yet they usually make a present to the shabander, to avoid the trouble he has it in his power to give them. All private traders with the company's passes enjoy the same privileges, on paying two per cent to the company, one to the agent, and one to the broker. All private trade, either by European or country ships, has long been engrossed by the company's servants. Lon. 36. 35. E. Lat. 27. 30. N.

\* GOME. *n. f.* The black greafe of a cart-wheel. *Bailey.*

GOMEKNIES, a town of France, in the dep. of the North, and ci-devant province of French Hainault; 4 miles E. of Quefnoy.

GOMEIRA, or GOMETEA, a small isle of Scotland near the W. coast of Mull.

(1.) GOMERA, or GOMARA, one of the Canary islands, between Ferro and Teneriffe, subject to the Spaniards, who conquered it in 1485. It is 30 miles long and 10 broad; producing corn and

fruits sufficient for the inhabitants. SW. of Teneriffe.

(2.) GOMERA, a town in the above excellent harbour, where the Spaniards take in refreshments. They work, and plenty of wine. Lon. 128. 6. N.

(1.) GOMERSAL, Robert, an English poet of the 17th century. His best composition is *The Levite's Revenge*; a poem on James II. He died in 1646.

(2.) GOMERSAL, a town W. of W. GOMEZ DE CASTRO, Alvariz, a Portuguese historian, born at St Euladie near Terceira. He wrote *The History of Cardinal de Braganza*. He died in 1580, aged 65.

GOMMERN, a town of Upper Saxony, on the Elbe; 8 miles S. of Magdeburg, and 10 NW. of Dessau.

GOMMERVILLE, a town of France, in the dep. of Eure and Loire, 10½ miles S. of Evreux.

GOMORRAH, in ancient geography, one of the cities of the plain, or vale of Siddon, destroyed together with Sodom, by the Jews, on account of the wickedness of the inhabitants. To determine its particular situation is not possible.

GOMORRO ISLANDS. See COMORRO ISLANDS.

GOMOZIA, in botany: A genus of plants, belonging to the tetradymia order, and the corolla is campanulate above; there is no calyx; in the herbaceous state.

(1.) \* GOMPHOSIS. *n. f.* A particular articulation.—*Gomphosis* is the connection of the tooth to its socket. *Wise.*

(2.) GOMPHOSIS. See ANATOMY.

GOMPHRENA, GLOBE AMARANTH, or EVERLASTING FLOWER, a genus of the digynia order, belonging to the tetradymia class of plants; and in the Linnaean system ranking under the 54th order. The calyx is coloured; the exterior one diphyllous, with two ciliated lobes; the nectarium cylindrical, with a capsule monospermous. There are only one of which is commonly cultivated in gardens, viz. the

GOMPHRENA GLOBOSA. It has a branching all round, 2 or 3 feet high, with oval, lanceolate, opposite leaves, and side-shoots terminated in a globose head of flowers, composed of very small starry florets, closely covered with scaly calices placed *imbricatum*, beautifully coloured purple, white, and variegated. The flowers are so small, and closely covered with that they scarcely appear. The leaves are placed scaly coverings, being of a siliceous, coloured and glittering, compact round head, about the size of a cherry, make a fine appearance. Annual plants, natives of India; and cultivated in gardens to raise and forward the growth, so that they may flower and produce ripe seed. They flower from August to November; and if the flower

ull growth, and placed out of the sun, retain their beauty several months.

GMS, a department of the Helvetic ren the Valais.

MS, a town in the above department, 33 of Sion.

AGRA, [from ग्रा, the knee, and अग्र, the gout in the knee. See MEDICINE,

ONAVES, a sea port town of Hispanio-an excellent harbour. It has a medicinal on which baths were erected in 1772; hospital for soldiers and sailors. Lon. 34. of Ferro. Lat. 19. 36. N.

ONAVE, another island on the W. coast niola, 30 miles long, and 5 broad. Lon. V. Lat. 18. 51. N.

CELIN, a town of France, in the dept. 13½ miles NNW. of Grenoble.

IDA, *n. f.* in the Hindoo language, signifier, and hence sometimes makes part of the of rivers, in the E. Indies.

IDAGAMA, GONDEGAMA, or GONDLA- a river of Indostan, which rises near m, forms the original boundary of the c on the N. and enters the bay of Bengal ipilly.

ONDAR, the capital of Abyssinia, seated top of a hill of considerable height. It s about 10,000 families in times of pea- . W. end of the town is the king's palace; y a structure of considerable consequence.

YSSINIA. The hill on which the town is ses in the middle of a deep valley, through run two rivers: one of which, the KAKHA, ; from the Mountain of the Sun, flanks all th of the town; while the other, called grab, falling from the Mountain Waggora, passes it on the N. and NE. and both rivers t the bottom of the hill about a quarter of south of the town. Upon the bank opposite idar, on the other side of the river, is a large of Mahometans; a great part of whom are yed in taking care of the king's and nobili- quipage both when they take the field, and they return. They are formed into a body proper officers; but never fight on either eing entirely confined to their occupation, ch by their care and dexterity in pitching riking the tents, and in leading and conduc- e baggage waggons, they are of great ser- Lon: 37. 33. E. Lat. 12. 34' 30" N.

GONDAR, VALLEY OF, a valley of Abyssin- which the city (N<sup>o</sup> 1.) is situated. It has

3 outlets; one S. to Dembea, Matsha, and the Agows; another on the NW. towards Sennaar, over the Mountain of the Sun; and the third N. leading to the Waggora over the high moun- tain Lamalman, and through Tigre to the Red Sea.

GONDET, a town of France, in the dep. of the Upper Loire, 10 miles S. of Puy.

GONDI, John Francis Paul, Cardinal de Retz, was the son of Philip Emanuel de Gondi, Count de Joigny, lieutenant general, &c. and was born in 1613. From a doctor of the Sorbonne, he first became co-adjutor to his uncle John Francis de Gondi, whom he succeeded in 1654 as Abp. of Paris; and finally made a cardinal. He has drawn his own character in his *Memoirs* with impartiality. From the greatest degree of debauchery, and still languishing under its consequences, he made him- self adored by the people as a preacher. At the age of 23, he was at the head of a conspiracy against the life of Cardinal Richelieu; he precipi- tated the parliament into cabals, and the people into sedition: he was (says M. Voltaire) the first bilhop who carried on a civil war without the mask of religion. However, he was at last oblig- ed to quit France; and he lived the life of a va- grant exile for 5 or 6 years, till the death of his great enemy Cardinal Mazarin, when he returned on certain conditions. After assisting in the conclave at Rome, which chose Clement IX. he reti- red from the world, and ended his life like a phi- losopher, in 1679; which made Voltaire say, that in his youth he lived like Catiline, and in his old age like Atticus. He wrote his *Memoirs* in his retirement; the best edition of which is that of Amsterdam, 4 vols 12mo, 1719.

(1) \* GONDOLA. *n. f.* [*gondole*, French.] A boat much used in Venice; a small boat.—

He saw did swim

Along the shore, as swift as glance of eye,  
A little gondola, bedecked trim

With boughs and arbours woven cunningly.

*Spenser.*

—In a gondola were seen together Lorenzo and his amorous Jessica. *Shak.*—

As with gondolas an his men, his

Good excellence the duke of Venice  
Sails out, and gives the gulph a ring. *Prior.*

(2.) A GONDOLA is a flat boat, very long and narrow, chiefly used at Venice to row on the canals. The word is Italian. Du Cange derives it from the vulgar Greek *κονδύλας*, a bark, or little ship. The middle sized gondolas are upwards of 30 feet long and 4 broad: they always terminate at each end in a very sharp point, which is raised perpendicularly to the height of a man.

(3.) GONDOLA is also the name of a passage boat of 6 or 8 oars, used in other parts of the coast of Italy.

(1.) \* GONDOLIER. *n. f.* [from *gondola*.] A boatman; one that rows a gondola.—

Your fair daughter,

Transported with no worse nor better guard,  
But with a knave of hire, a gondolier,

To the gross clasps of a lascivious Moor. *Otello.*

(2.) GONDOLIERS. The address of the Veneti- an gondoliers, in passing along their narrow canals, is very remarkable: there are usually two to each gondola,

gondola, and they row by pushing before them. The fore man rests his oar on the left side of the gondola: the hindman is placed on the stern, that he may see the head over the tilt or covering of the gondola, and rests his oar, which is very long, on the right side of the gondola.

GONDON, a town of France, in the department of Upper Pyrenees; 7 miles SE. of Tarbes.

GONDORF, a town of Germany lately in the archbishopric of Treves, now included in the French republic, and department of the Rhine and Moselle: 4 miles ENE. of Munster-Mainfield.

GONDRAIN, a town of France, in the dep. of Gers, 7½ miles SW. of Condom, and 20. NW. of Auch.

GONDRECOURT, a town of France, in the department of the Meuse, and ci-devant province of Bar; seated on the Orney, 20 miles S. of St Michael, 21 SSE. of Bar-le-duc, and 9 SW. of Vauconleufs.

GONDREVILLE, a town of France, in the department of Meurthe, and late province of Lorraine, with a castle, and a magnificent hospital; seated on a hill near the Moselle, 3 miles NE. of Toul, and 8 from Nanci. Lon. 6. 9. E. Lat. 48. 40. N.

\* GONE. *part. preter.* [from *go*. See *To Go*.] 1. Advanced; forward in progress.—I have known sheep cured of the rot, when they have not been far gone with it, only by being put into broomlands. *Mort.*—The observer is much the brisker of the two, and, I think, farther gone of late in lyes and impudence than his Presbyterian brother. *Swift.* 2. Ruined; undone.—He must know 'tis none of your daughter, nor my sister; we are gone else. *Shak. Winter's Tale.* 3. Past.—

I'll tell the story of my life,

And the particular accidents gone by,

Since I came to this isle. *Shak. Tempest.*

4. Lost; departed.—When her masters saw that the hope of their gains was gone, they caught Paul and Silas. *Acts* xvi. 19.—Speech is confined to the living, and imparted to only those that are in presence, and is transient and gone. *Holder.* 5. Dead; departed from life.—

I mourn Adonis dead and gone. *Oldham.*

—A dog, that has his nose held in the vapour, loses all signs of life; but carried into the air, or thrown into a lake, recovers, if not quite gone. *Addison on Italy.*

GONESSE, a town of France, in the department of Seine and Oise, and ci-devant province of the Isle of France, seated on the Crould, 9 miles N. of Paris; famous for fine bread.

GONET, John Baptist, D. D. a Dominican friar, and doctor of the University of Bourdeaux, who flourished in the 17th century. He wrote a system of Theology, in 3 vols, and died in 1681.

GONEZ, or GENESA, an Indian deity. See *ABYDOS*, and *POLYTHEISM*.

\* GONFALON, } *n. s.* [*gonfanon*, Fr. *gunfa-*

\* GONFANON, } *na*, *Islandick*, from *gunn*, a battle, and *fani*, a flag. *Mr Lye.*] An ensign; a standard.—

Ten thousand thousand ensigns high advanc'd,  
Standards and gonfalons, 'twixt van and rear,  
Stream in the air. *Milton.*

GONGA, an ancient town of European Tur-

key, in Romania, near the Sea of Marmara, 37 miles NE. of Gallipoli. Lon. 37. 31. E. Lat. 43. N.

GONGAS, a nation of Ethiopia, with the country on the W. of that of the Abissinians. See GONJAH.

GONGORA, Lewis De, an eminent poet, of the 16th century, descended from a distinguished family, and born at Cordova in Spain; the Spaniards reckon him one of their greatest poets, though none of his works were published during his death. He died in 1627.

GONIA, a town of Asiatic Turkey in the dep. of Aphiom-Karabissar, 16 miles W. of Aphiom-Karabissar.

GONJAH, a kingdom of Africa, lying between the Gulf of Guinea on the N. and the Gulf of Guinea on the S. It is supposed by M. De L'Isle to be the GONGE of M. De L'Isle's *Conche* of M. D'Anville.

(2.) GONJAH, the capital of the above, lies about 400 miles from Tombuctou, W. by S. of Cassina. Lon. 6. 10. W. Lat. 13. N.

GONINS, a town of Poland, in the dep. of Bielsk, 48 miles NW. of Bielsk.

(1.) GONIOMETRICAL, *adj.* [from *gonion*, an angle, and *metron*, to measure.] belonging to the measurement of angles.

(2.) GONIOMETRICAL LINES, in geometry, lines used for determining the quantity of such as sines, tangents, secants, &c. A treatise on this subject is inserted in the *Philos. Trans.* § 26.

GONIOMETRY, *n. s.* the art or method of measuring angles. M. De Lagny presented several papers on this art to the Royal Academy, which are inserted in their *Memoirs* for 1722 and 1729. His method consists in measuring angles with a pair of compasses, without a straight edge, except an undivided semicircle. But as it has not yet been adopted by any succeeding mathematicians, and has been reckoned of little value by some, we shall refer the inquirer for a farther description of it to the *Acad. Memoirs*, or Dr Hutton's *Mathematical Dictionary*.

GONKOFEN, a town of Lower Bavaria, 14 miles S. of Dingelsingen, and 14 E. of Landshut.

GONNELLI, John, an eminent Italian painter and sculptor of the 16th century, born in Bassano. His portraits of Pope Urban VI and Cosimo I, duke of Tuscany, have great merit. But having lost his sight at twenty years of age, he, merely by the sense of feeling, acquired perfection in sculpture. Several of his works are extant in France. He died at Rome in 1608.

GONNESSE. See GONESSE.

GONNEVILLE, a town of France, in the dep. of Lower Seine, 6 miles N. of Montiville.

GONNORD, } a town of France, in the dep. of Maine and Loire; 4 miles NNW. of Vihiers, and 15 S. of Angers.

GONOCARPUS, in botany, a genus of plants, belonging to the tetrandria digynia order, belonging to the tetrandria digynia order, belonging to the tetrandria digynia order.

GONON-BESAR, a mountain on the island of Java, famous for pepper.

(1.) \* GONORRHOEA. *n. s.* [from *gonos*, a mummy or stone mummy grows on the

they powder and boil it in milk, and  
to stop gonorrhoeas. *Woodw. on Fossils.*  
ORHOEA. See MEDICINE, and SUR-  
GES.

TOWN of Hungary, 22 miles SW. of

VT. or GONTAUT, a town of France,  
of Lot and Garonne, 4 miles N. of  
and 6 ESE. of Marmande.

ILT, Armand DE, lord of BIRON,  
France, and a celebrated general in the  
17th century, who signalized himself by his valour  
in several sieges and battles. He was  
master of the artillery in 1569, and  
assaulted him at the massacre of St

Barthelemy. He was the first who declared for  
the king. He brought a part of Normandy un-  
der the king's obedience, and dissuaded him from retiri-  
ng to Rochelle. He was killed by a  
bullet at the siege of Epernay, on the 26th  
of May 1650. He was a very universal scholar, and  
a pocket-book, in which he wrote  
things remarkable; which gave rise to  
court; when a person happened to  
bring uncommon, they told him, *Tou-  
chez à Biron's pocket-book.*

IT. See GONTANT.

ER, a Latin author of the 13th cen-  
tury wrote *A History of Constantinople*, in

ZAGA, a market town of the Cisal-  
pine, in the department of the Mincio,  
duchy of Mantua; with a fine cas-  
tral residence of the ancient dukes,  
of Mantua.

AGA, or } Lucretia, one of the most  
DO, } illustrious ladies of the  
17th century; much celebrated for her wit, learn-  
ed style. Hortensio Lando wrote  
upon her, and dedicated to her his dia-  
logues on the passions. Her letters were  
published at Venice in 1552. She was  
when she was not 14 years of age to  
anfrone, who afterwards engaged in a  
contest with the duke of Ferrara; and was de-  
prived of her freedom, but, though condemned,  
she did all in her power to  
obtain her liberty, but in vain; for he died in pri-  
son such impatience under his mis-  
fortune made it imagined he lost his senses.  
He would listen afterwards to any proposals  
which though several were made to her.  
From her pen was so much esteem-  
and reflection was made even of the notes  
of her servants.

GEN, a town of Germany, in the  
Upper Rhine, and ci-devant county of  
annexed to the French republic, and  
the department of the Rhine and  
Moselle. of Creutznach.

AND, a rich county of Virginia, 40  
miles broad; surrounded by Louisa,  
Richmond, Hanover, and Powhatan coun-  
ties, Rivanna and James rivers. In 1795,  
13,397 citizens, and 4,659 slaves.

OD. *adj.* comp. *better*, *superl. best.*  
*good*, Dutch.] 1. Having, either ge-  
nerally or any particular end, such physical

qualities as are expected or desired. Not bad;  
not ill.—God saw every thing that he had made,  
and behold it was very good. *Gen. i. 31.*—

A universe of death! which God by curse  
Created evil; for evil only good. *Milton.*  
Resolv'd

From an ill cause to draw a good effect. *Dryd.*  
—Notwithstanding this criticism the verses were  
*good.* *Spectator.*—A man is no more to be praised  
on this account, than because he has a regular  
pulse and a good digestion. *Addison.*—

Ah! ne'er so dire a thirst of glory boast,

Nor in the critick let the man be lost:

Good nature and good sense must ever join;

To err is human, to forgive, divine. *Pope.*

2. Proper; fit; convenient; right; not wrong.—  
Amongst a man's peers a man shall be sure of fami-  
liarity, and therefore it is good a little to keep state;  
amongst a man's inferiors one shall be sure of reve-  
rence, and therefore it is good a little to be familiar.

*Bacon.*—If you think good, give Martius leave.

*Bacon.*—It was a good time to comply with the  
importunity of the gentlemen of Sussex. *Clarend.*

3. Conducive to happiness.—It is not good that the  
man should be alone. *Gen. ii. 18.*—We may as  
well pretend to obtain the good which we want  
without God's assistance, as to know what is good  
for us without his direction. *Smalridge.* 4. Un-  
corrupted; undamaged.—He also bartered away  
plumbs, that would have rotted in a week, for  
nuts, that would last good for his eating a whole  
year. *Locke.* 5. Wholesome; salubrious.—

A man first builds a country seat,

Then finds the walls not good to eat. *Prior.*

6. Medicinal; salutary.—The water of Nilus is  
sweeter than other waters in taste, and it is excel-  
lent good for the stone and hypochondriack mel-  
ancholy. *Bacon.* 7. Pleasant to the taste.—Eat  
thou honey, because it is good; and the honey-  
comb, which is sweet. *Prov. xxiv. 13.*—Of herbs  
and plants some are good to eat raw; as lettuce,  
endive, and purslane. *Bacon.* 8. Complete; full.

—The Protestant subjects of the abbey make up  
a good third of its people. *Addison.* 9. Useful;  
valuable.—All quality, that is good for any thing,  
is originally founded upon merit. *Collier.*—We  
discipline betimes those other creatures we would  
make useful and good for somewhat. *Locke.* 10.

Sound; not false; not fallacious.—He is resolved  
not to shew how slight the propositions were  
which Luther let go for good. *Asterbury.* 11. Le-  
gal; valid; rightly claimed or held—According  
to military custom the place was good, and the  
lieutenant of the colonel's company might well  
pretend to the next vacant captainship in the same  
regiment. *Wotton.* 12. Confirmed; attested; va-  
lid.—

Ha! am I sure she's wrong'd? Perhaps 'tis  
malice!

Slave, make it clear, make good your accusation.

*Smitb.*  
13. With *as* preceding. It has a kind of negative  
or inverted sense; *as good as*, no better than.—  
Therefore sprang there even of one, and him *as*  
*good as* dead, so many as the stars of the sky in  
multitude. *Heb. xi.* 14. With *as* preceding. No  
worse.—He sharply reprov'd them as men of no  
courage, which, being many times *as good as* in  
possessive

possession of the victory, had most cowardly turned their backs upon their enemies. *Knolles*.—The master will be *as good as* his word, for his own business. *L'Estr.* 15. Well qualified; not deficient.—If they had held their royalties by that title, either there must have been but one sovereign over them all, or else every father of a family had been *as good as* a prince, and had *as good as* a claim to royalty as these. *Locke*. 16. Skilful; ready; dexterous.—Flatter him it may, I confess; as those are generally *good* at flattering who are *good* for nothing else. *South*.—

I make my way where-e'er I see my foe;  
But you, my lord, are *good* at a retreat. *Dryd.*  
17. Happy; prosperous.—Behold how *good* and how pleasant it is for brethren to dwell together in unity. *Psalms* cxxxiii. 1.—

Many *good* morrows to my noble lord!  
—*Good* morrow, Cateby, you are early stirring.  
*Shak.*

*Good e'en*, neighbours;  
*Good e'en* to you all, *good e'en* to you all. *Shak.*  
At my window bid *good* morrow. *Milton.*  
*Good* morrow, Portius! let us once embrace.  
*Adijon.*

18. Honourable.—  
They cast to get themselves a name,  
Regardless whether *good* or evil fame. *Milton.*  
Silence, the knave's repute, the whore's *good* name,

The only honour of the wishing dame. *Pope.*  
19. Cheerful; gay. Joined with any words expressing temper of mind.—They may be of *good* comfort, and ever go cheerfully about their own affairs. 2 *Mac.* xi. 26.—Quietness improves into cheerfulness, enough to make me just so *good* humoured as to wish that world well. *Pope.* 20.

Considerable; not small though not very great.—A *good* while ago God made choice that the Gentiles by my mouth should hear the word. *Acts* xv. 7.—The plant, having a great stalk and top, doth prey upon the grass a *good* way about, by drawing the juice of the earth from it. *Bacon*.—Mirtle and pomegranate, if they be planted, tho' a *good* space one from the other, they will meet.

*Pencham*.—The king had provided a *good* fleet, and a body of three thousand foot to be embarked. *Clarendon*.—We may suppose a great many degrees of littleness and lightness in these earthy particles, so as many of them might float in the air a *good* while, like exhalations, before they fell down. *Burnes*.—They held a *good* share of civil and military employments during the whole time of the usurpation. *Swift.* 21. Elegant; decent; delicate: with *breeding*.—If the critick has published nothing but rules and observations in criticism, I then consider whether there be a propriety in his thoughts and words, clearness and delicacy in his remarks, wit and *good breeding* in his raillery. *Guardian*.—Mankind has been forced to invent a kind of artificial humanity, which is what we express by the word *good breeding*. *Spectator*.

—Those among them, who return into their several countries, are sure to be followed and imitated as the greatest patterns of wit and *good breeding*. *Swift.* 22. Real; serious; not feigned.—Love not in *good* earnest, nor no farther in sport neither, than with safety and pure blush thou

may'st in honour come off again. *S*  
Rich; of credit; able to fulfil engagements. *nio* is a *good* man: my meaning, in saying a *good* man, is to have you understand it is sufficient. *Shak.* 24. Having moral such as are wished; virtuous; pious; applied both to persons and actions, not evil.—For a *good* man some would to die. *Rom.* v. 7.—The woman hath *good* work upon me. *Matt*.—

All man's works on me,  
*Good* or not *good*, ingraft my merit,  
Shall perfect, and for these my death

What reward  
Awaits the *good*, the rest what punishment

The only Son of light  
In a dark age, against example *good*,  
Against allurements.  
Such follow him, as shall be reprobate  
Part *good*, part bad, of bad the large

Grant the bad what happiness they want,  
One they must want, which is to part

Why drew Marceilles' *good* his  
breath,  
When Nature sicken'd, and each  
death?

Such was Roscommon, not more  
*good*,  
With manners generous as his noble blood,  
No farther intercourse with Heaven  
But left *good* works to men of low

25. Kind; soft; benevolent.—Matter turned in her, that where at first likings were did breed *good* will, now *good* will the chief cause of liking her manners. Glory to God in the highest, and on earth peace and *good* will towards men. *Luke* ii. 14. A *good* nature man is but a better man. *Bacon*.—

Here we are lov'd, and there we  
*Good* nature now and passion strive  
Which of the two should be above  
And laws unto the other give.  
—'Tis no wonder if that which affords  
glory to God, hath no more *good* will  
*Decay of Piety*.—

When you shall see him, sir, to do  
'Twere such a thing, 'twould so offend  
world,

'Twould make the people think you  
natur'd.

—To teach him betimes to love and be  
red to others, is to lay early the true  
of an honest man. *Locke*.—*Good* sense and  
ture are never separated, though the  
world has thought otherwise. *Dryden*.  
ty, mildness, tenderness, and a  
would fain bring back to its original  
of virtue, I mean *good* nature, are  
*Dryden*.—This doctrine of God's *good*  
men, this command of men's proportion  
will to one another, is not this the ver  
substance, this the very spirit and life

sole institution? *Spratt*.—It was his  
 sure to spread his healing wings over  
 ;, and to make every one sensible of  
 ill to mankind. *Calamy*.—  
 could you chide the young good natur'd  
 ce,  
 e him from you with so stern an air.

*Addison*.  
 ble; loving.—But the men were very  
 s, and we were not hurt. 1 *Sam*. xxv.

God is good to Israel, even to such as  
 an spirit. *Pf*. lxxiii. 1.—You have good  
 ce of us always, desiring greatly to see  
 ill to see you. 1 *Tbeff*. iii. 6.—I his in-  
 cessarily be adequate, being referred  
 else but itself, nor made by any other  
 the good liking and will of him that  
 his combination. *Locke*. 27. Compa-  
 sionate; merry. Often used ironical-  
 ly he did not draw the good fellows to  
 eking, yet he eat well. *Clarendon*.—

permitted to drink without eating, will  
 custom of having the cup at his nose;  
 beginning and preparation to good fel-  
 cty.—It was well known, that Sir Ro-  
 t a good fellow, in his youth. *Arbut-*  
*not* sometimes used as an epithet of slight  
 mplying a kind of negative virtue or  
 n from ill.—My good man, as far from  
 I am from giving him cause. *Shak*.—

the good man at home, and brought  
 ant. *SpeBar*. 29. In a numerous lentle.  
 other good women that love to do out  
 how handsome it is to louse themselves  
 ne, they that have been but a while  
 in well witness. *Spenser*. 30. Hearty;  
 dubious.—He, that saw the time fit  
 ery he intended, called unto us to fol-  
 low which we both, bound by oath, and  
 ood will, obeyed. *Sidney*.—The good  
 nation to the present war has been  
 much experienced by the successles  
 tended it. *Temple*.—

ill, she said, my want of strength sup-  
 ;  
 ence shall give what age denies.

*Dryden's Fab*.  
 o time. Not too fast.—In good time,  
 er, you have heard them dispute a-  
 um in the schools. *Collier*. 32. In  
 Really; seriously.—  
 mult I hold a candle to my shames?  
 emselves, good sooth, are too too light.

*Shak*.  
 To make.] To keep; to maintain; not  
 not to abandon.—There died upon  
 the chieftains, all making good the  
 any ground given. *Bacon*.—He forced  
 re in spite of their dragoons, which  
 there to make good their retreat. *Gla-*  
*we* claim a proper interest above others  
 inent rights of the household of faith,  
 e good that claim, we are obliged a-  
 to conform to the proper manners  
 hat belong to this household. *Spratt*.—  
 out fear a dangerous war pursues;  
 made him first the danger chide,  
 makes it good on virtue's score. *Dryd*.

34. GOOD [To make]. To confirm; to establish.—  
 I farther will maintain

Upon his bad life to make all this good. *Shak*.  
 —To make good this explication of the article, it  
 will be necessary to prove that the church, which  
 our Saviour founded and the apostles gathered,  
 was to receive a constant and perpetual accession.  
*Pearson*.—These propositions I shall endeavour to  
 make good. *Smulridge*. 35. GOOD [To make.] To  
 perform.—

While she so far extends her grace,  
 She makes but good the promise of her face.

*Waller*.  
 45. GOOD [To make.] To supply.—Every distinct  
 being has somewhat peculiar to itself, to make  
 good in one circumstance what it wants in another.  
*L'Estr*.

(2.) \* GOOD. adv. 1. Well; not ill; not a-  
 miss. 2. As GOOD. No worse.—

Was I to have never parted from thy side,  
 As good have grown there still a lifeless rib.

*Milton*.  
 —Says the cuckow to the hawk, Had you not as  
 good have been eating worms now as pigeons?  
*L'Estrange*.

(3.) \* GOOD. interjection. Well! aight! It is  
 sometimes used ironically.

(4.) \* GOOD. n. s. 1. That which physically  
 contributes to happiness; benefit; advantage; the  
 contrary to evil or misery. —

I fear the emp'ror means no good to us. *Shak*.  
 —Let me play the lion too: I will roar, that I  
 will do any man's heart good to hear me. *Shak*.  
 —He wav'd indifferently 'twixt them, doing nei-  
 ther good nor harm. *Shak*.—

Love with fear the only God,  
 Merciful over all his works, with good  
 Still overcoming evil. *Milton*.

God is also in sleep, and dreams advise,  
 Which he hath sent propitious, some great good  
 Presaging. *Milton*.

Nature in man's heart her laws doth pen,  
 Prescribing truth to wit, and good to will. *Davies*.

—The lessening or escaping of evil is to be reck-  
 oned under the notion of good: the lessening or  
 loss of good is to be reckoned under the notion of  
 evil. *Wilkins*.—This caution will have also this  
 good in it, that it will put them upon considering,  
 and teach them the necessity of examining more  
 than they do. *Locke*.—Good is what is apt to cause  
 or increase pleasure, or diminish pain in us; or  
 else to procure or preserve us in the possession of  
 any other good, or absence of any evil. *Locke*.—

Refuse to leave thy destin'd charge too soon,  
 And for the church's good defer thy own. *Prior*.  
 Works may have more wit than does them  
 good,

As bodies perish through excess of blood. *Pope*.  
 —A thirst after truth, and a desire of good, are  
 principles which still act with a great and univer-  
 sal force. *Rogers*. 2. Prosperity; advancement.

If he had employ'd  
 Those excellent gifts of fortune and of nature  
 Unto the good, not ruin of the state. *B. Jonf*.

3. Earnest; not jest.—The good woman never  
 died after this, 'till she came to die for good and  
 all. *L'Estrange*. 4. Moral qualities, such as are  
 desirable; virtue; righteousness; piety; the con-  
 trary

*L'Estrange*. 4. Moral qualities, such as are  
 desirable; virtue; righteousness; piety; the con-  
 trary

*L'Estrange*. 4. Moral qualities, such as are  
 desirable; virtue; righteousness; piety; the con-  
 trary

trary to wickedness.—Depart from evil, and do good. *Pf. xxxiv. 14.*—Not only carnal good from evil does not justify; but no good, no not a purposed good, can make evil good. *Holiday.*—

O sons, like one of us is Man become,  
To know both good and evil, since his taste  
Of that defende fruit, but let him boast  
His knowledge of good lost, and evil got.  
Happier had it suffic'd him to have known  
Good by itself, and evil not at all. *Milton.*

Empty of all good, wherein consists  
Woman's domestic honour, and chief praise. *Milton.*

—By good, I question not but good, morally so called, *bonum honestum*, ought, chiefly at least, to be understood; and that the good of profit or pleasure the *bonum utile*, or *juvandum*, hardly come into any account here. *South.*—

Nor holds this earth a more deserving knight  
For virtue, valour, and for noble blood,  
Truth, honour, all that is compriz'd in good. *Dryden.*

5. Good placed after bad, with *as*, seems a substantive; but the expression is, I think, vicious; and good is rather an adjective elliptically used, or it may be considered as adverbial. See GOOD, *adv.*—The pilot must intend some port before he steers his course, or he had *as good* leave his vessel to the direction of the winds, and the government of the waves. *South.*—Without good nature and gratitude, men had *as good* live in a wilderness as in a society. *L'Esrange.*

(5.) GOOD, MORAL, (*§ 4. def. 4.*) denotes the right conduct of the senses and passions, or their just proportion and accommodation to their respective objects and relations. See MORALS.

(6.) GOOD, PHYSICAL. See § 1. *def. 1.*

GOOD BEARING. [*bonus gestus.*] in law. See ABEARING, and GOOD BEHAVIOUR. He that is bound to this, is more strictly bound than to the peace; because where the peace is not broken, the surety *de bono gestu* may be forfeited by the number of a man's company, or by their weapons.

GOODALL, Walter, a learned Scots antiquary and philologist, born in 1689. He was many years keeper of the Advocates Library, which gave him an opportunity of examining the original papers and authentic documents preserved among the records of that learned faculty, which he did not fail to improve. Being a zealous friend to the exiled royal house of Stewart, he was anxious to rescue the character of our unfortunate Q. Mary from the calumnies that had been thrown upon it, for near two centuries; and accordingly after much deep investigation, published a *Vindication* of that princess, which very much attracted the public attention, and exhibits equal proofs of his learning and industry in literary researches. He wrote several other pieces, and died at Edinburgh in 1751, in the 72d year of his age.

GOOD BEHAVIOUR, in law, an exact carriage and behaviour to the king and the people. A justice of the peace may, at the request of another, or where he himself sees cause, demand surety for the good behaviour; and to that end the justice may issue out his warrant against any persons whatsoever, under the degree of nobility; but when it is a nobleman, complaint is to be

made in the court of chancery, or where such nobleman may be bound peace. Infants and femes covert, to find surety by their friends, may be to their good behaviour; also justices sometimes local intervals, and all break the peace, or are suspected affrays, assaults, battery, wounding, quarrelling, threatening, &c. Peril likewise bound to good behaviour for way of living, keeping bawdy-house, houses, &c. and to may common whores, common whores, &c. He who demands surety for any violence offered, must take an oath of justice, that he goes in fear of his bodily harm, &c. and that it is not but from a regard to his own safety.

GOOD BREEDING. See BREEDING MANNERS.

\* GOOD-CONDITIONED, *adj.* Wholesome or symptoms. Used both of the soul, but not elegantly.—No surge affects of any kind by injections, wh good-conditioned. *Sturp's Surgery.*

GOODEROO, a lake of Abyssinia.

GOODERSTON, a town in Northamptonshire.

GOOD FORTUNE, an island in the North Sea, near the W. coast of Shetland, and 6 broad. Lon. 58. 50. E.

GOOD FRIDAY, a fast of the Christian in memory of the sufferings and death of Christ. It is observed on the Friday before Easter week. Among the Saxons it was called *Friday*; probably on account of the day, &c. then used. On Good Friday

on a plain form; and, after service is done, the cardinals wait on him back to the altar; they keep a deep silence, as a token of sorrow. In the night of Good-Friday perform the obsequies of our Saviour on a great crucifix, laid on a bed of state; flowers; these the bishops distribute to the assistants when the office is ended. On this day, set open a holy imitation of that of mount Calvary.

GOOD HENRY. See CHENOPODIUM.

(1.) GOOD HOPE, a Danish colony in Greenland. Lat. 64. 0. N.

(2.) GOOD HOPE, CAPE OF, a point in Africa, where the Dutch built a good fort; which were taken by the British of Aug. 1796. It is situated in the country of the HOTTENTOTS; for an account of the country at large, with its first discovery, see that article. On approaching the cape, a very remarkable eminence may be discovered at a considerable distance, called the TABLE MOUNTAIN, from its appearance, it terminates in a flat horizontal plain, which the face of the rock descends at right angles. In the summer season, mences in September, and continues the TABLE LAND OR MOUNTAIN, suddenly capped with a white cloud called the *spreading of the Table-cloth*; this cloud seems to roll down the face of the mountain; it is a sure indication of

of wind from the SE.; which generally with great violence, and sometimes continues day or more, but commonly is of short duration. On the first appearance of this cloud, the inhabitants of TABLE BAY prepare for it, by striking up their shutters, and making every thing as snug as possible.—A little W. of the Table Bay a round hill, called the *LOAF*; and by many the *LION'S HEAD*; there is a continuation from it contiguous to the sea, called the *Lion's Rump*; and when taken from a general view of the whole, it very much resembles that animal with his head erect. The *Head* and the *Lion's Rump* have each a fort on them, by which the approach of the governor, particularising the *Head*, is separated by a small chafin from the *Table Land*, stands *Charles's Mount*, and is by the appellation of the *Devil's Tower*; and is called so from the winds of wind supposed to issue from it, which are merely owing to the wind acquires in coming through the *Table*, which is by no means so frequent as in the *Table*, (as the *Devil's Tower* is contiguous to the *Table Land*;) that the *Table* is going to *breakfast*; if in the *Table* day, that he has going to *dinner*; if in the *Table* evening, that the cloth is spread for *dinner*. The level of the sea; the *Devil's Tower*, 2,764; and the *Lion's Head*, 2,764. In the *Table* of the latter lies *Constantia*, a town famous for its wines. (See that article.) The described high lands form a kind of *Table* about the *Table* valley, where the *Table* stands. This is situated at the bottom of the middle height, or *TABLE MOUNTAIN*; in the centre of *TABLE BAY*, so called from the *Table* mountain. *FALSE BAY*, on the SE. side of the *Cape*, is more secure than *Table Bay*, from the NW. winds. It is, however, less frequented, being 24 miles of very heavy road from the *Table*, whence almost all necessaries must be brought. The most sheltered part of *False Bay* is on the W. side, called *SIMON'S BAY*, the latest and most particular, and perhaps the most just account of the *Cape Town*, which voyagers have differed very much in that given by Mr White in his *Journal of a Voyage to New South Wales*. From the ship he observes (p. 37.) "the town appears pleasant, but at the same time small; and that arises from its being built in a valley between such stupendous mountains directly before it. On landing, however, you are surprised, and are not only not disappointed, but find it not only excellent, but well built, and in a good style; the houses are spacious, and intersecting each other at right angles with great precision. This exactness in the formation of the streets, when viewed from the *Table Land*, is observed to be very great. The houses in general are built of stone, cemented with a glutinous kind of earth which

serves as mortar, and afterwards neatly plastered and white-washed with lime. As to their height, they do not in common exceed two stories, on account of the violence of the wind, which at some seasons of the year blows with great strength and fury. For the same reason thatch has been usually preferred to tiles or shingles; but the bad effects that have proceeded from this mode when fires happen, has induced the inhabitants in all their new buildings to give the preference to slates and tiles. The lower parts of the houses, according to the custom of the Dutch, are not only uncommonly neat and clean in appearance, but they are really so; and the furniture is rather rich than elegant. But this is by no means the case with the bed-rooms or upper apartments; which are very ill furnished. The streets are rough, uneven, and unpaved: But many of the houses have a space flagged before the door; and others have trees planted before them, which form a pleasant shade, and give an agreeable air to the streets. The only landing place is at the east end of the town, where there is a wooden quay running some paces into the sea, with several cranes on it for the convenience of loading and unloading the goods that come along side. To this place excellent water is conveyed by pipes, which makes the watering of ships both easy and expeditious. Close to the quay, on the left hand, stands the castle and principal fortress; a strong extensive work, having excellent accommodations for the troops, and for many of the civil officers belonging to the company. Within the gates, the company have their principal stores; which are spacious as well as convenient. This fort covers and defends the east part of the town and harbour, as *Amsterdam fort* does the west part. The latter, which has been built since commodore Johnston's expedition, and whereon both French and Dutch judgment have been united to render it effectual and strong, is admirably planned and calculated to annoy and harass ships coming into the bay. Some smaller detached fortifications extend along the coast, both to the east and west, and make landing, which was not the case before the late war, hazardous and difficult. In a word, *Cape Town* is at this time fortified with strength, regularity, and judgment. The governor's house is delightfully situated, nearly in the centre of an extensive garden, formerly the property of the Dutch East India company, usefully planted, and at the same time elegantly laid out. This garden is as public as *St James's park*; and for its handsome, pleasant, and well-shaded walks, is much frequented by persons of every description. At the upper end of the principal walk is a small space walled in for confining some large ostriches and a few deer; and a little to the right of this is a small menagerie, in which the company kept a few wild beasts and curious birds. There are two churches in the town; one large, plain, and unadorned, for the Calvinists, and a smaller one for the Lutherans. The hospital, which is large and extensive, is situated at the upper end of the town, close to the garden; where the convalescents reap the benefit of a wholesome pure air, perfumed with the exhalations of a great variety of rich fruit trees,

trees, aromatic shrubs, and odorous plants and flowers; and likewise have the use of its productions. The Dutch East India company erected several other public buildings, which improve the appearance of the town. The two principal of these are, the stables and a house for the slaves. The former is a handsome range of buildings, capable of containing an incredible number of horses; which are small, spirited, and full of life. The latter is a building of a considerable extent, where the slaves, male and female, have separate apartments, in a very comfortable style, to reside in after their toil. The inhabitants of the Cape, though in their persons large, stout, and athletic, have not the characteristic phlegm of Dutchmen. The physical influence of climate may account for this. The ladies are lively, good-natured, and familiar; and from a peculiar gay turn, they admit of liberties that would be thought reprehensible in England, though perhaps they as seldom overleap the bounds of virtue as the women of other countries. The heavy draft work about the Cape is mostly performed by oxen; which are brought to an uncommon degree of usefulness and docility. It is not uncommon to see 14, 16, and sometimes 18, in one of their teams; when the roads are heavy, they sometimes, though rarely, yoke 20; all which the Hottentots, Malays, and Cape slaves, have in the most perfect subjection and obedience. One of these places himself on the fore part of the waggon, or, when loaded, on the top of the load, and with a tremendous long whip, which from its size he is obliged to hold in both his hands, manages these creatures with inexpressible address. They can make them either trot or gallop (a gait performed or kept up with difficulty by European oxen), with as much ease as if they were driving horses. They likewise manage horses with the same dexterity; and to see one of them driving 3, 4, 5, or, sometimes 6 pair, in hand, with one of these long whips, would astonish the most complete master of the whip in England. Carriages are not very numerous at the Cape, as the inhabitants in general travel in covered waggons, which better suit the roughness of the country. The governor and some of the principal people keep coaches, which are a good deal in the British style, and always drawn by six horses. The Cape lies W. of Cape Lagullas, the most southern extremity of Africa. Lon. 18° 23' E. Lat. 34. 29. S.

**GOODLEIGH**, a village in Devonshire.

\* **GOODLINESS**, *n. f.* [from *goodly*.] Beauty; grace; elegance.—She sung this song with a voice no less beautiful to his ears, than her *goodliness* was full of harmony to his ears. *Sidney*.—The stateliness of houses, the *goodliness* of trees, when we behold them, delighteth the eye. *Hooker*.

(1.) \* **GOODLY**, *adj.* [from *good*.] 1. Beautiful; graceful; fine; splendid. Now little in use.—A prince of a *goodly* aspect, and the more *goodly* by a grave majesty, wherewith his mind did deck his outward graces. *Sidney*.—

A *goodly* city is this Antium. *Shak. Coriol.*  
Patience and sorrow strove

Which should express her *goodliest*: you have seen  
Sunshine and rain at once. Her smiles and tears  
Were like a wetter May. *Shak. King Lear*.

Here from gracious England have  
Of *goodly* thousands. *Shak.*

—Rebekah took *goodly* raiment of Isaac, and put them upon Jacob. *G.*

—There was not among the children  
*goodlier* person than he. *1 Sam. ix. 2*

Both yonger than they were; of  
And all their formes, much *goodlier*

—He had not made them any see  
their *goodly* houses and olive gardens,  
the former wars. *Knolles*.—

The *goodliest* man of men I  
His sons, the fairest of her daughter  
Of the fourth Edward was his  
Fierce, *goodly*, valiant, beautiful,

Not long since walking in the field  
My nurse and I, we there beheld  
A *goodly* fruit, which, tempting me  
I would have pluck'd.

How full of ornament is all I see  
In all its parts! and seems as bees  
O *goodly* order'd work! O power  
Of thee I am, and what I am is thine

His eldest born, a *goodly* youth  
Excell'd the rest in shape and out  
Fair, tall, his limbs with due proportion  
But of a heavy, dull, degenerate

2. Bulky; swelling; affectedly turgid.  
Round as a globe, and liquor'd  
*Goodly* add great he sails behind him

3. Happy; desirable; gay.—Emulating  
peaceable kingdom, and but lately  
mild and *goodly* government of  
*Spenser*.—

We have many *goodly* days to live  
(2.) \* **GOODLY**, *adv.* Excellently

There Alma, like a virgin queen  
Doth flourish in all beauty excell  
And to her guests doth bound  
dight,

Attemper'd *goodly* well for health  
light.

\* **GOODLYHOOD**, *n. f.* [from *goodly* and *goodness*.] Obsolete.—

But more thy *goodlyhood* forgive  
To meet which of the gods I see

\* **GOODMAN**, *n. f.* [from *good* and *man*.] A slight appellation of civility; general

How now, what's the matter? part  
*goodman* boy, if you please excell  
*Shak. K. Lear*. 2. A rustick term of  
gaffer.—Nay, hear you, *goodman*  
*Hamlet*.—

But see the sun-beams bright to  
And gild the thatch of *goodman*!

Old *goodman* Dobson of the gr  
Remembers he the trees has seen  
**GOOD-MANNERS**. See **MANMANNERS**.

\* **GOODNESS**, *n. f.* [from *good* and *quality*.] Qualities either moral or physical; virtue.—If for any thing he loved gr  
because therein he might exercise  
*Sidney*.—There is in all things an

by they incline to something which  
:; all which perfections are contained  
cueral name of *goodness*. *Hooker*.—

All *goodness*  
to thy stomach.  
s, that *goodness*  
ng all the land's wealth unto one,  
own hands, cardinal, by extortion :  
*ness* of your intercepted packets  
to the pope against the king ; your  
*ness*,  
I provoke me, shall be most notorious.

WICH, a village in Herefordshire.  
WINGTON, a town in Devonshire.  
WIS. *n. f.* [from *good*.] 1. Moveables

— That giv'st to such a guest  
nor selfe, of all thy *goods* the best.

or moveable estate.—  
hat a writ be su'd against you,  
t all your *goods*, lands, tenements,  
nd whatsoever. *Shak. Hen. VIII.*  
lets nothing the proceedings of the cl-  
which respect the temporal punishment  
body and *goods*. *Leffes*. 3. Ware ;  
erchandise.—Her majesty, when the  
r English merchant's were attached to  
f Alva, arrested likewise the *goods* of  
utch here in England. *Raleigh's Eff.*—  
that scorn'd all pow'r and laws of men,  
th their owners hurrying to their den.

*Waller*.  
SUCCESS, BAY OF. See COOK, N° III,  
DDWIN, John, an English divine and  
writer of the 17th century. He was  
St Stephen, in Coleman Street, Lon-  
as deprived of his benefice, for refu-  
sister the sacrament indiscriminately.  
lous republican, he wrote a Vindica-  
execution of Charles I. ; which, after  
ion, was burnt by the hangman. He  
1661.

(2.) GOODWIN, Thomas, an English divine,  
born at Rolesby, in Norfolk, A. D. 1600. To  
avoid religious persecution he went to Holland,  
and was chosen pastor of the English church at  
Arnhem. He returned to England during the  
civil war, and was elected a member of the cele-  
brated Assembly of Divines at Westminster. Oli-  
ver Cromwell appointed him president of Magda-  
len College, Oxford ; and he attended him in his  
last illness. Upon the restoration, he was ejected  
from his presidency, and died soon after. He  
wrote a number of tracts, which make 5 vols folio.

(3.) GOODWIN SANDS, or GODWIN SANDS, fa-  
mous sand banks off the coast of Kent, lying be-  
tween the N. and S. Foreland. As they run paral-  
lel with the coast for 3 leagues together, at about  
2½ leagues distant from it, they add to the security  
of that capacious road, the Downs : for while the  
land shelters ships with the wind from SW. to N.  
W. only, these sands break all the force of the sea  
when the wind is at ESE. The most dangerous  
wind, when blowing hard on the Downs, is the  
SSW. These sands occupy the space, that was  
formerly a large tract of low ground, belonging  
to Godwyns earl of Kent, father of K. Harold II. ;  
and which being afterward given to the monastery  
of St Augustin at Canterbury, the abbot neglect-  
ing to keep in repair the wall that defended it  
from the sea, the whole tract was drowned, A. D.  
1100, leaving these sands, upon which so many  
ships have since been wrecked. These sands lie  
E. of the Downs 4½ miles from S. Foreland.

GOODWINSTON, a village in Kent.

\* GOODY. *n. f.* [corrupted from *good wife*.]  
A low term for civility used to mean persequ—

So t, *goody* sheep, then said the fox, not so ;  
Unto the king so rash you may not go.

*Hubberd's Tale.*  
Swarm'd on a rotten sick the bees I spy'd,  
Which erst I saw when *goody* Dobson died. *Gay.*

Plain *goody* would no longer down ;  
'Twas madam in her grogram gown. *Swift.*

\* GOODYSHIP *n. f.* [from *goody*.] The qua-  
lity of *goody*. Ludicrous.—

The more shame for her *goodyship*,  
To give so near a friend the slip. *Hudibras.*

GOOGINGS, in sea language, are clamps of  
iron bolted on the stern-post of a ship, whereon  
to hang the rudder, and keep it steady ; for which  
purpose there is a hole in each of them, to receive  
a correspondent spindle bolted on the back of the  
rudder, which turns thereby as upon hinges.

GOOL, John VAN, an eminent Dutch painter  
and man of letters, born at the Hague, in 1685.  
He wrote a history of the lives and works of the  
Flemish painters.

GOOMPTY, a river of Indostan Proper, which  
rises in Rohilla, runs SE. by Lucknow and Jion-  
pour, and falls into the Ganges below Benares.

GOOSANDER. See MERGUS, N° 4.

(1.) \* GOOSE. *n. f.* plural *geese*. [*gos*, Saxon ;  
*goes*, Dutch ; *gawse*, Erse, sing. *gewey*, plural.]  
1. A large waterfowl proverbially noted, I know  
not why, for foolishness.—

Thou cream-faced lown,  
Where got'st thou that *goose* look ? *Shak. Marb.*  
—Since I pluckt *geese*, play'd truant, and whipt  
top,

top, I knew not what 'twas to be beaten till lately. *Shak.*—Birds most easy to be drawn see water-fowl; as the *goose* and *swan*. *Peacbam.*—

Nor watchful dogs, nor the more wakeful *geese*.

Disturb with nightly noise the sacred peace.

*Dryd. Fables.*

2. A taylor's smoothing iron.—Come in, taylor; here you may roast your *goose*. *Shak.*

(1.) *GOOSE*, in ornithology, (§ 1. def 1.) See *ANAS*, § 4, 8, &c. Geese were held in great esteem amongst the Romans, for having saved the Capital from the invasion of the Gauls, by cackling and clapping their wings. They were kept in the temple of Juno; and the censors, when they entered upon their office provided meat for them. There was also an annual feast at Rome, at which they carried a silver image of a goose in state; and hanged a dog, because these animals did not bark at the arrival of the Gauls.

(2.) *GOOSE*, *EMPER*, a peculiar species of geese, that frequent the coasts of the Orkney and Shetland isles, in the winter, described by the rev. Mr Bremner, in his account of Walls and Flota. See *Sir J. Sinclair's Stat. Acc.* XVII. 321. From his description, they seem to be a species of *MERCUS*. "Though less in size, (he says,) than the common grey goose, it weighs a great deal more. They sometimes weigh 18 lb. It is never seen on land, and, though it has pretty large wings, it is never seen to fly. The feet are so much in a right line with its body, that they can never be brought far enough forward to assist it in rising out of the water. Nor does nature seem to have intended, that it ever should fly; for in whatever manner it is attacked, pursued, or surpris'd, it always has recourse to diving. Being a bird of passage, it differs from all others in preferring the medium of water to that of air. How this bird hatches its young remains a profound secret, both as to the manner and place."

(4.) *GOOSE*, *GOLDEN*. See *ABYSSINIA*.

(1.) \* *GOOSEBERRY*. *n. f.* [*goose* and *berry*, because eaten with young geese as sauce.] A berry and tree. The species are, 1. The common gooseberry. 2. The large manured gooseberry. 3. The red hairy gooseberry. 4. The large white Dutch gooseberry. 5. The large amber gooseberry. 6. The large green gooseberry. 7. The large red gooseberry. 8. The yellow-leaved gooseberry. 9. The striped leaved gooseberry. *Miller.*—August has upon his arm a basket of all manner of ripe fruits; as pears, plums, apples, *gooseberries*. *Peacbam.*—

Upon a *gooseberry* bush a snail I found;

For always snails near sweetest fruit abound.

*Gay.*

(2.) *GOOSEBERRY*, in botany. See *RIBES*.

(3.) *GOOSEBERRY*, *AMERICAN*. See *MELASTOMA*.

(4.) *GOOSEBERRY*, *BARBADOES*. See *CACTUS*.

*GOOSEBERRY HILL*, a hill in Cork, Ireland.

*GOOSEBERRY ISLANDS*, islands near the E. coast of Newfoundland, 24 miles NW. of Cape Bonavista.

*GOOSEBERRY MOUNTAIN*, a mountain of New York, on the W. bank of Hudson's River, 4 miles S. of Fort George.

*GOOSEBERRY ROCKS*, rocks on the Massachusetts, 2 miles N. of Marblehead.

\* *GOOSECAP*, *n. f.* [from *goose* and a silly person.

*GOOSE CREEK*, a river of Virginia, which into the Potomac, 1 mile S. of Thorpe, Fairfax county.

(1.) \* *GOOSEFOOT*. *n. f.* [*chenopodium*] orach. *Miller.*

(2.) *GOOSEFOOT*. See *CHENOPodium*.

(1.) \* *GOOSEGRASS* *n. f.* *Clivers*; an *Goosegrass*, or wild tansy, is a weed the clays are very subject to. *Mort.*

(2.) *GOOSEGRASS*. See *GALIUM*, N°

(3.) *GOOSEGRASS*, *GREAT*, or *wild*. See *ASPERUGO*.

*GOOSEHURST*, a town N. of Soath.

*GOOSE ISLAND*, an isle in the Gulph of rence, near the coast of Labrador. Lon W. Lat. 50. 52. N.

*GOOSE-NECK*, in a ship, a piece of it on the one end of the tiller, to which the of the whip-staff or the wheel-rope co steering the ship.

*GOOSE-TONGUE*, a species of *ACHILL*.

*GOOSE-WING*, in sea language. When sails before, or with a quarter wind on gale, to make the more haste, they launch boom and sail on the lee side; and a sail is called a *goose-wing*.

*GOOSEY*, a town near Stamford, Be

*GOOTY*, or *GUTTI*, a strong fort on an islan, formerly the seat of government of Row, a Mahratta prince, and lately by sultan Tippoo, before his final defeat by tish in 1799. It is seated beyond the Pe miles S. by E. of Adoni. Lon. 77. 35. E. 15. N.

*GOPLO*, a lake of Poland, in the p of Brzesk, 16 miles long and 4 broad, W. of Brzesk.

*GOPPENGEN*, a town of Germany duchy of Wirtemberg, seated on the Vil mineral spring, 22 miles ESE. of Stuttg 20 NNW. of Ulm. It has considerable manufactures. At present (Jan. 1801) th are in possession of it.

*GORANTO*, a town of Asiatic Tartarania, 80 miles SW. of Satalia.

(1.) *The GORBALS OF GLASGOW*, Scotland, in Lanarkshire, disjoined from Govan, in 1771; comprehending abo acres. The soil is partly a strong bla partly rich clay, and partly sand, the air and the ground flat, abounding with coa Govan colliery is supposed to have as n as would serve Glasgow for 100 years. 200 men are employed in it.

(2.) *GORBALS OF GLASGOW*, a villagi rony in the above parish, on the S. in Clyde, anciently called Bridge-end. It contained 3000 inhabitants, and in 179 5000; as stated by the rev. W. Anderst report to Sir J. Sinclair. Within three e. in 1795, it was expected that number doubled. There were then 556 looms i lage. Longevity is not uncommon. Se lived to 100 and 104. Most of the vi

748; and it was much damaged by ice in 1712, and 1782.

ARA, a town of the French republic in and dept. of Corsica, 8 miles NE. of

ATA, a town of Tunis, 20 miles S. of

ATOV, a town of Russia, in Nizgorod.

BELLIED. *adj.* [from *gorbelly*.] Fat; having swelling paunches.—Hang ye, knaves, are you undone? No, ye fat would your store were here. *Henry IV.*

BELLY. *n. f.* [from *gor*, dung, and *rding* to *Skinner* and *Junius*. It may come from *gor*, Welsh, beyond, too; as seems to me more likely, may be from *gormand*, or *gorman's belly*, the glutton.] A big paunch; a swelling term of reproach for a fat man.

E. *n. f.* a pool to keep fish in. *Bailey*.

UM, or GORICHEM, a town of the Baublic, in the dept. of Delft, and late lulland, which carries on a considerable cheese and butter. It is seated at the f the Ligne and Maese, 12 miles E. of 130 S. of Amsterdam. Lon. 4. 59. E. 1. N.

LD. *n. f.* An instrument of gaming, as om *Beaumont* and *Fletcher*. *Warburton*. y bones can reach at nothing now, but *minepins*. *Beaum. and Fletcher*.—Let vulc thy guts; for *gords* and Fulham-holds.

ELIZA, a town of Spain, in the pro-  
copr; 22 miles SSE. of Leon.

ES, a town of France, in the dept. of  
hs of the Rhone, 9 miles W. of Apt,  
of Avignon.

ÆI MOUNTS, or } The name of one  
ÆIUS MOWS, } or more mountains  
2, upon which Noah's ark is said to  
d after the general deluge, and on one  
the Tigris rises.

IAN. See GORDIANUS, I, II, and III.  
IN KNOT, in antiquity a knot made by  
us, in one of the cords of his yoke, or  
we it, in the leathers of his chariot har-  
ch was so very intricately twisted, that it  
ible to discover where it began or ended.  
e of Apollo having declared that, who-  
d untie this knot should be master of all  
y attempted it, but without success;  
Alexander the Great, after likewise at-  
in vain to untie it, cut it asunder with  
and thus either eluded or fulfilled the  
See GORDIUS, N° 1.

IANUS I, Mæcius Antonius, a Roman  
or his virtues chosen emperor by the ar-  
reign of Maximus, A. D. 236. He  
ded on the father's side from the Græc-  
the mother's from Trajan. He had  
e consul, and was proconsul of Africa  
sen emperor; but his son being slain by  
the governor of Mauritania, he killed  
his 80th year. See ROME. He was so  
er of literature that he had collected in-  
try 62,000 books.

IANUS II, Mæcius Antonius, surnamed

*Africains*, the son of the preceding, by Annia  
Orestilla, the grand-daughter of the emperor Mar-  
cus Antoninus, was like his father very learned  
and liberal. He was made consul by the emperor  
Alexander, and afterwards associated with his fa-  
ther in the empire, but slain in fighting against the  
partisans of Maximinus, A. D. 237.

GORDIANUS III. Mæcius Antonius, grandson of  
Gordianus I, by his daughter Faustina, a renown-  
ed warrior, and styled *The guardian of the Roman  
commonwealth*. He was treacherously assassinated  
by Phillip, an Arabian, one of his generals; who  
succeeded him, A. D. 244. See ROME.

GORDIUM, a city of Phrygia Major, where  
Alexander the Great cut the Gordian Knot.

(I.) GORDIUS, in fabulous history, a poor  
husbandman who had two yokes of oxen, where-  
with he ploughed his land and drew his wain.  
An eagle sitting a long while upon one of his ox-  
en, he consulted the soothsayers; a virgin bad  
him sacrifice to Jupiter in the capacity of king.  
He married the virgin, who bore to him MIDAS.  
The Phrygians instructed by the oracle to set the  
first person they met in a wain upon the throne,  
met Gordius, and made him king. Midas for this  
good fortune dedicated to Jupiter his father's cart;  
and Gordius hung up the knot of the yoke in the  
temple. See GORDIAN KNOT.

(II.) GORDIUS, in zoology, the HAIR WORM,  
a genus of animals belonging to the class of *ver-  
mes* and order of *intestina*. There are several spe-  
cies; viz.

1. GORDIUS AQUATICUS, the water hair worm,  
is 10 or 12 inches in length, and of about the  
thickness of a horse hair; its skin is smooth and  
glossy; its colour pale yellowish white all over,  
except the head and tail, which are black. The  
body is rounded, and very slender in proportion  
to its length: the mouth is small, and placed ho-  
rizontally; the jaws are of equal length, and ob-  
tuse at their extremities. This species is common  
in our fresh waters, especially in clay, through  
which it passes as a fish does through the water,  
and thus gives rise to many springs. This is the  
species of worms, that in Guinea and in some o-  
ther hot countries get into the flesh of the natives,  
and occasion great mischief: with us, though fre-  
quent enough in water where people bathe, it ne-  
ver attempts this.

2. GORDIUS ARGILLACEUS, or clay hair-worm,  
only differs from the preceding in colour, being  
yellowish at the extremities, and in being chiefly  
found in clay.

3. GORDIUS MARINUS, the sea hair-worm, is  
filiform, twisted spirally, and lying flat, about  
half an inch in length; of a whitish colour, smooth,  
and scarcely diminishing at the head. It infests  
herrings, bleaks, and various other fish.

4. GORDIUS MEDINENSIS, the muscular hair-  
worm, is all over of a pale yellowish colour. It  
is a native of both Indies; frequent in the morn-  
ing dew, from whence it enters the naked feet of  
the slaves, and occasions a disease common in those  
countries, and to which children are very liable;  
occasioning severe itchings, and often exciting in-  
flammations and fevers. It infests the muscles of  
the arms and legs, whence it may be drawn out  
by a thread, tied round the head, but care must

be taken not to break it, as the remaining part will grow with redoubled vigour. Baths with infusions of bitter plants, and all vermifuges, destroy it.

(1.) GORDON, Alexander, M. A. an eminent Scots antiquary, an excellent draughtsman, and a good Greek scholar, who resided many years in Italy, visited most parts of that country, and travelled into France, Germany, &c. He was secretary to the Society for Encouragement of Learning, and afterwards to the Egyptian Club, composed of gentlemen who had visited Egypt, such as Lord Sandwich, Dr Shaw, Dr Pococke, &c. He succeeded Dr Stukely as secretary to the Antiquarian Society, which office he resigned in 1752 to Mr Joseph Ames. He went to Carolina with governor Glen, where, besides a grant of land, he had several offices, such as register of the province, &c.; and died a justice of the peace, leaving a handsome estate to his family. He published *Itinerarium Septentrionale*, or a Journey through most parts of the Counties of Scotland, in two parts with 66 copperplates, 1726, folio.

2. Supplement to the *Itinerarium*, 1732, folio. 3. The Lives of Pope Alexander VI. and his son Cæsar Borgia. 4. A complete History of the ancient Amphitheatres, 1736, 8vo. afterwards enlarged in a second edition. 5. An Essay towards explaining the hieroglyphical figures on the Coffin of the ancient Mummy belonging to Capt. William Lestocquer, 1737, folio, with cuts. 6. Twenty-six plates of all the Egyptian Mummies and other Egyptian Antiquities in England, 1739, fol.

(2.) GORDON, hon. George, or Lord George Gordon, 3d son of Cosmo George, D. of Gordon, by Catharine daughter of William E. of Aberdeen, was born at London, Dec. 19th. 1750, and K. George II. was his godfather. He early entered into the navy, but quitted it during the American war, in consequence of an altercation with E. Sandwich about promotion. He was elected M. P. for Ludgerthall, Wilts, in 1774; and during several sessions animadverted with great freedom and no small humour, on the speeches and proceedings of both ministry and opposition. An alarm having been excited by the repeal of certain penal statutes against the Roman catholics in 1779, lord George was chosen president of the Protestant Association at London; and on the 2d June 1780, went to the house of Commons, to present their petition against that rescissory act, attended by about 60,000 of the petitioners. The dreadful consequences of this imprudent measure are related under the article ENGLAND, § 101 and 102. Lord George was imprisoned in the tower, on the 9th June 1780; and tried for high treason, but acquitted on the 4th Feb. 1781; on which occasion there was a very general illumination in Scotland, and 4851. were subscribed to reimburse the expences of his trial. On the 4th

he was excommunicated by the Abp. of York for not appearing in court as a witness. In Feb. and June 1787 he was in the court of King's Bench, for publishing the Queen of France, the French and the Empress of Russia; and also a pamphlet entitled, *A Petition to*

*Lord G. Gordon from the Prisoners in praying that he would secure their liberty venting them from being sent to Botany Bay* petition, upon trial, was proved to be written by himself, for the purpose of criminal justice of England. Being on these charges, he, on the 25th June, went to Holland, where he turned Jew, and was circumcised; but, returning to England he was apprehended on the 7th Dec. 1788, and on the 28th Jan. 1788, was committed to imprisonment for 5 years, and to jail till he should find bail for his good in L.10,000. Not being able to find end of that period to the extent required as a sentence of imprisonment till July 1789, he presented a petition to the Assembly of France, and was visited by eminent revolutionists. He died Nov. 1789 a fever attended with delirium, in the 38th year of his age. As an author, his publications and miscellaneous, abounded with his were not destitute of argument; as a pulpit his language was animated, and his didactic. Of his eccentricities we shall say but his conversion from Christianity to the strictest sects of Presbyterian Secedism, was so very *outré* a measure, that indeed it was *real*, it can be accounted upon one supposition. But whatever thought of his *head*, it is but justice to say, that his beneficence to his fellow-men proved, that his *heart* was impregnated with the finest feelings of sensibility and humanity.

(3.) GORDON, James, a learned Jesuit flourished in the end of the 16th and the beginning of the 17th centuries. He was descended of a family of rank, and settling in France, he became a brewer at Bourdeaux and Paris. He died in 1640.

(4.) GORDON, Thomas, a Scots author of Kirkcudbright, famous for his translation of the *Political Writings*. He came young to Oxford in queen Ann's time, but in what time he is not now known. He first distinguished himself in the defence of Dr Hoadley in his *gorian controversy*: which recommended Mr Trenchard, in conjunction with whom he wrote the well known *Cato's Letters*, a series of important public subjects. This was followed by another periodical paper, the title of the *Independent Whig*; which continued some years after Mr Trenchard's death alone, against the hierarchy of the church but with more acrimony than was shown in *Cato's Letters*. At length Sir Robert Walpole retained him to defend his administration which end he wrote several pamphlets till the time of his death, July 28th 1750, he was commissioner of the wine licenses, as of which he had enjoyed many years. He was married. His second wife was the widow of his friend Trenchard, by whom he had children. He published English translations of Suetonius Tacitus, with additional discourses to which contain much useful matter. T

led, 1. *A Cordial for Low-spirits*, in 1 2. *The Pillars of Priedcraft and Or-*  
*ven*; in 2 vols. 8vo. were published at

1791, in geography, a parish of Scot-

wickshire, 7 miles long, and from 2  
 The air is salubrious; the surface is  
 soil partly light and sandy, partly  
 10fs. Above 200 black cattle, and fe-  
 of sheep are fed annually. The po-  
 1791, stated by the rev. Alex. Duncan,  
 t to Sir J. Sinclair was 912, and had  
 5 since 1755. Barley, corn, and tur-  
 chief produce. Agriculture is im-  
 om 10,000 to 12,000 bolls are annual-  
 the mills.

ON, EAST; } 2 villages in the above  
 ON WEST; } parish.

NA, a town of Naples, in the prov.  
 miles SW. of Molise.

NIA, in botany; a genus of the po-  
 er, belonging to the monadelphia class  
 The calyx is simple; the style five-cor-  
 the stigma quinquetid; the capsule  
 lar; the seeds two-fold with a leafy  
 is a tall and very straight tree, with  
 ramidal head. Its leaves are shaped  
 f the common bay, but serrated. It  
 lay, June and July. The flowers grow  
 s about 5 inches long, are monopeta-  
 succeeded by conic capsules with a  
 t. The stamina are headed with yel-  
 This tree retains its leaves all the year,  
 ily in wet places, and usually in water.

RE. *n. f.* [*gore*, Saxon; *gor*, Welsh,  
 et.] 1. Blood effused from the body.

A grilly wound,  
 ch forth gush'd a stream of *gore* blood

er goodly garment stain'd around,  
 deep sanguine dy'd the grassy ground.

*Spenser.*  
 's crimes the youth unhappy bore,  
 is father's eyes with guiltless *gore*.

*Dryden's En.*  
 ted or congealed.—

The bloody fact  
 ng'd; though here thou see him die,  
 dust and *gore*. *Milton's Par. Lost.*  
 id beard and knotted tresses stood,  
 is *gore*, and all his wounds ran blood.

*Denham.*  
 in globe-making. See GLOBE, § 1,

, in heraldry, one of the abatements,  
 ding to Gullim, denotes a coward.  
 consisting of two arch lines drawn  
 : sinister chief, and the other from  
 fe, both meeting in an acute angle  
 of the fess point. See HERALDRY.

ISLAND, an island in the South Pa-  
 discovered by Captain Cook. Lon.  
 at. 64. o. N.

E. v. a. [*geberian*, Saxon.] 1. To  
 e.—

io noble eye profane a tear  
 be *gor'd* with Mowbray's spear. *Shak.*  
 ART. II.

No weaker lion's by a stronger slain;  
 Nor from his larger tusks the forest boar  
 Commission takes his brother swine to *gore*.

*Tate's Jew.*  
 For arms his men long pikes and javans bore,  
 And poles with pointed steel their axes in battle  
*gore*.

2. To pierce with a horn —  
 Some tofs'd, some *gor'd*, some trampling down  
 he kill'd. *Dryden.*

He idly butting, feigns  
 His rival *gor'd* in every knotty trunk. *Thomf.*

(1.) GOREE, a small island of Africa, near  
 Cape de Verd, subject to the French. It is a small  
 spot not exceeding 1 m. in circumference, but im-  
 portant from its situation for trade, near Cape Verd;  
 whence it has been a bone of contention between  
 European nations. It was first possessed by the  
 Dutch, from whom, in 1663, it was taken by the  
 English; but in 1665 it was retaken by the Dutch,  
 and in 1677 by the French, in whose possession it  
 remained till 1759, when it was reduced by com-  
 modore Keppel, but restored to the French in  
 1763. It was retaken by the British in the Ame-  
 rican war, but again restored at the peace of 1783.  
 Lon. 17. 25. E. Lat. 14. 40. N.

(2.) GOREE, an island of the Batavian republic,  
 in the dept. of Delit, near the mouth of the Mucle,  
 15 miles in circumference, and 2 miles N. of  
 Schowen. Lon. 20. 26. E. of Ferro. Lat. 41. 49. N.

(3.) GOREE, the capital of the above island, 6  
 miles S. of Heivoetsfluyt, and 8 S. of Briel. Lon.  
 3. 30. E. Lat. 41. 45. N.

(4.) GOREY, a borough and post town of Ire-  
 land, in Westford, otherwise called *Neashrough*;  
 18 miles N. of Wexford, and 45 S. of Dublin.  
 Lon. 6. 30. W. Lat. 52. 30. N.

(5.) GOREY MOUNTAINS, mountains of Ireland,  
 in the county of Donegal, 14 miles SW. of Derry.  
 GORGAST a town of Germany, in Branden-  
 burg, 4 miles W. of Cultrin.

(1.) \* GORGE. *n. f.* [*gorge*, Fr.] 1. The throat;  
 the swallow.—There were birds also made to fine-  
 ly, that they did not only deceive the sight with  
 their figures, but the hearing with their songs,  
 which the watery instruments did make their *gorge*  
 deliver. *Sidney*.—And now how abhorred in my  
 imagination it is! my *gorge* rises at it. *Shak. Hamlet*.  
 —Her delicate tenderness will find itself abused,  
 begin to heave the *gorge*, disbelieve and abhor the  
 Moor. *Shak. Othello*. 2. That which is gorged or  
 swallowed. Not in use.—

And all the way, most like a brutish beast,  
 He spewed up his *gorge*, that all did him detest.

*Shenker.*  
 (2.) GORGE, in architecture, the narrowest part  
 of the Tuscan and Doric capitals, lying between  
 the astragal, above the shaft of the pillar, and the  
 anulets.

(3.) GORGE, in fortification, the entrance of the  
 platform of any work. See FORTIFICATION.

\* To GORGE. *v. n.* [*gorger*, Fr.] 1. To fill up  
 to the throat; to glut; to satiate.—

Being with his presence gorged, *gor'd*, and  
 full.

He that makes his generation nestle,  
 To *gorge* his appetite. *Shak. K. Lear.*

*Gorge* with my blood thy barbarous appetite.  
*Dryden.*

—I desire that they will not *gorge* the lion either with nonsense or obscenity. *Addison.*—

Nor would his slaughter'd army now have lain  
On Africk's sands, dishonour'd with their wounds,  
To *gorge* the wolves and vultures of Numidia.

*Addison's Gato.*  
The giant, *gorg'd* with flesh, and wine, and blood,

Lay stretch'd at length, and snoring in his den.  
*Addison.*

2. To swallow: as, *the fish has gorged the boat.*  
(1.) \* **GORGED.** *adj.* [from *gorge*.] Having a gorge or throat.—

Look up a height, the shrill *gorg'd* lark so far  
Cannot be seen or heard. *Shakespeare.*

(2.) **GORGED**, in heraldry, the bearing of a crown, coronet, or the like, about the neck of a lion, a swan, &c. The term is also used when the gorge or neck of a peacock, swan, or the like bird, is of a different colour or metal from the rest.

\* **GORGEOUS.** *adj.* [from *gorgias*, old French. *Skinner.*] Fine; splendid; glittering in various colours; showy; magnificent.—

O, that deceit should dwell

In such a *gorgeous* palace! *Shak. Romeo and Jul.*  
As full of spirit as the month of May,

And *gorgeous* as the sun at Midsummer. *Hen. IV.*  
—He bad them look upon themselves and upon their enemies: themselves dreadful, their enemies *gorgeous* and brave. *Hayward.*—

The *gorgeous* East, with richest hand,  
Pours on her kings barbaric pearl and gold.

*Milton.*  
With *gorgeous* wings, the marks of sov'reign sway,

The two contending princes make their way.  
*Dryden's Virgil.*

\* **GORGEOUSLY.** *adv.* [from *gorgeous*.] Splendidly; magnificently; finely.—The duke, one solemn day, *gorgeously* clad in a suit all over spread with diamonds, lost one of them of good value. *Wotton.*

\* **GORGEOUSNESS.** *n. f.* [from *gorgeous*.] Splendour; magnificence; show.

(1.) \* **GORGET.** *n. f.* [from *gorge*.] The piece of armour that defends the throat.—

He with a palsy fumbling on his *gorget*,  
Shakes in and out the rivet. *Shakespeare.*

—He did oftentimes spend the night in the church alone praying, his head piece, *gorget*, and gauntlets lying by him. *Knolles.*—

See how his *gorget* peers above his gown,  
To tell the people in what danger he was.

*Ben Jonson.*  
About his neck a threefold *gorget*,

As rough as trebled leathern target. *Hudibras.*

(2.) A **GORGET** is a kind of breast-plate like a half moon, with the arms of the prince thereon; worn by the officers of foot. They are either gilt or silver, according to the colour of the buttons on the uniforms.

(3.) **GORGET**, or **GORGET**, in surgery, the concave or cannulated conductor, used in lithotomy. See **SURGERY**.

**GORGIAS**, a celebrated orator of Sicily, born at Leontium, about A. A. C. 417. According to

Quintilian, he was the first extemporator, but this is not credible. Men muken extempore, before they studied if statue of gold was erected to him at E

**GORGOGNONE**, a town of Na province of Basilicata; 15 miles E. of

(1.) \* **GORGON.** *n. f.* [20920.] A nsnaky hairs, of which the sight turned it to stone; any thing ugly or horrid.—

*Gorgons* and hydras, and chymera

Why didst thou not encounter m  
And try the virtue of that *gorgon* fi  
To stare me into statue.

(2.) The **GORGONS**, in antiquity and were three sisters, whose names we EURYALE, and MEPUA; the latter o mortal, but the two former were su to age nor death. They are described on their shoulders, with serpents heads, their hands were of brass, an of a prodigious size, so that they we terror to mankind. Pausanias says, t were the daughters of Phorbos, or Ph

whose death Medusa, his daughter, t the Libyans dwelling near the lake

The queen, being fond of hunting at the neighbouring countries quite was Perseus, having made war on them the queen, when he came to take a field of battle, he found the queen's) tremely beautiful, that he ordered he cut off, and carried it with him to those who could not behold it without a

Others represent them as a kind of m men, covered with hair, who lived i forests. Others, again, make them

fembling wild sheep, whose eyes had and fatal influence.

(1.) **GORGONA**, a small island of sea of Tuscany, and near that of Cor miles in circumference; remarkable quantities of anchovies taken near it. E. Lat. 43. 22. N.

(2.) **GORGONA**, a small island of th 18 miles W. of the coast of Peru, a miles in circumference. It has severa rivulets of excellent water, but is f constant rains. Lon. 79. 3. W. Lat. 3.

**GORGONIA**, in natural history, zoophytes, formerly called *ceratopl* English named *sea-fans*, *sea-feathers*, & Linnæus and Pallas consider them a nature in their growth, between ani getables; but Mr Ellis shows them to mals of the polype kind, growing up) form resembling a shrub, and in no p

See CORALLINES.

ORKA, an island of Abyssinia, in the lake  
15 miles NW. of Gondar, which has a  
lt by F. Pays, wherein the emperor re-  
nter.

JE, a town of France, in the dep. of  
13 miles W. of Lille.

WITZ, a town of Upper Saxony, in  
7 of Reus, 1 mile NW. of Tschleitz.

RIAM, a kingdom of Africa, lying be-  
1. 21° and 29° E. and between Lat. 10°  
l.

RHAM, a township of the United States,  
land county and district of Maine, on  
f the Saco; 15 miles from Pepperel-  
d 130 N. by E. of Bolton; containing  
ns in 1795.

HEM. See GORCUM.

RITIA, GORITZ, or GORZ, a county  
ounded on the E., N., and S. by Car-  
on the W. by Maritime Austria. It  
corn, wine, silk, and fruits. The lan-  
clavonian.

RITIA, or } a strong town in the above  
RITZ. } country, with a castle; feat-  
Lifanzo, 20 miles NE. of Aquilcia, and  
ice. It was taken by the French in 1797,  
s military stores. Lon. 13. 43. E. Lat.

ZIA, a village of Maritime Austria, in  
in the isle of Pago.

ORKAI, a country of Asia, between  
d Oude.

РКАН, a town in the NE. part of the  
ntry; near Napaul, 200 m. N. of Benares.

ÆUS, Abraham, an eminent antiquary,  
ntwerp, in 1540. He collected the rings  
of the ancients, and published an ac-  
a prodigious number of them, in 1601,  
title, *Dactylotheca; sive Annulorum Si-*  
*quorum apud priores tum Græcos quam*  
*Ælus ex ferro, ære, argento, et auro, Præp-*

This was the first part of the work: the  
titled, *Variarum Gemmarum, quibus an-*  
*figuando uti solita, sculpturæ.* In 1608,  
hed his collection of medals: which,  
if we may believe the *Scaligerana*, it is  
lways to trust. He resided at Delft, and  
e in 1609. His collections of antiques  
by his heirs to the prince of Wales.

ATE, a town of the Cisalpine republic,  
p. of Montagna; on the W. bank of the  
io, opposite Lecco.

ITZ, a strong town of Germany, in Up-  
tia, subject to the elector of Saxony;  
the Neisse; 50 miles W. of Dresden,  
f. of Prague. Lon. 15. 15. E. Lat. 51.

Loch, a lake of Perthshire, 2½ miles  
Loch Bruiach, abounding with delicious

trouts, about 10 inches long, but very thick in  
proportion.

\* GORMAND. *n. f.* [*gourmand. Fr.*] A greedy  
eater; a ravenous luxurious feeder.

\* To GORMANDIZE. *v. n.* [from *gormand.*]  
To eat greedily; to feed ravenously.

\* GORMANDIZER. *n. f.* [from the verb.] A  
voracious eater.

GORMAZ, or ST ESTEVAN DE GORMAZ, a  
town of Spain in Old Castile, on the Duero, 6  
miles below Borgo d'Olma.

GORMES, a town of Germany in Austria, 5  
miles ENE. of Ibrnsprunn.

GORO, a port of Maritime Austria, seated on  
one of the mouths of the Po.

GORODITSCHÉ, three towns of Russia; 1. in  
the province of Kiow, 112 mile- SE. of Kiow: 2.  
in that of Penza, 32 miles E. of Penza: 3. in that  
of Tobolsk, 20 miles ESE. of Tobolsk.

GORODNIA, a town of Russia, in the pro-  
vince of Tver, 20 miles E. of Tver.

GORODNITSK, a town of Russia, in the  
province of Tchernigov, on the Snov, 32 miles  
NNE. of Tchernigov.

GORODOK, a town of Russia, in the govern-  
ment of Poletsk, 56 miles E. of Poletsk

GORON, a town of France, in the department  
of Mayenne, 9 miles NW. of Mayenne.

GORONTALE, or } a town on the E. coast of  
GORONTANO, } the island of Celebes.

GOROPIUS, John, M. D. a native of Brabant;  
author of a work, entitled, *Origines Antuerpianæ*,  
wherein, among other legendary stories, he at-  
tempts to prove that the Fiemish was the original  
language, spoken by Adam and Eve.

GORREUS, John, M. D. a physician of Paris,  
in the 16th century, who published a translation  
of *Nicander*. He was born in 1500. Being a pro-  
testant, he suffered much from religious persecu-  
tion; and his coach being one day suddenly seized  
by a party of soldiers, he was attacked with a de-  
lirium; and died in 1572.

\* GORSE. *n. f.* [*gorf, Saxon.*] Furz; a thick  
prickly shrub that bears yellow flowers in Winter.

GORT, a town of Ireland in the county of Gal-  
way, 16 m. SSE. of Galway, and 98 from Dublin.

GORTA, or ST MARIA LA GORTA, an island  
in the Pacific Ocean. Lon. 135. 0. W. Lat. 26.  
35. N.

GORTAHURK, a town of Ireland, in Done-  
gal, Ulster.

GORTERIA, in botany; a genus of the poly-  
gamia frustranea order, belonging to the syngen-  
nesia class of plants; and in the natural method  
ranking under the 49th order, *Compositæ*. The re-  
ceptacle is naked; the pappus woolly; the flo-  
rets of the radius ligulated or plane; the calyx  
imbricated with spinous scales.

GORTIN, a village of Ireland in Tyrone.

GORTSCHITZ, a river of Germany, in Car-  
inthia, which runs into the Gurk, 3 miles S. of  
Eberstein.

GORWAY, a river of Wales in Carnarvon.

\* GORY. *adj.* [from *gore.*] 1. Covered with  
congealed blood.—

When two boars with rankling malice met.  
Their gory sides the fresh wounds fiercely fret.

Spenser.  
Wily

Why do'st thou shake thy *gory* locks at me? Thou can'st not say I did it. *Shak.*

2. Bloody; murderous; fatal. Not in use.—

The obligation of our blood forbids A *gory* emulation 'twixt us twain. *Shak.*

GORZ, or GORITZ. See GORITZ.

GORZE, a town of France, in the dept. of Moselle, and ci-devant prov. of Lorraine, 7½ miles SW. of Metz.

GORZEGNO, a town of the Piedmontese republic, in the dep. of Bormida, and late duchy of Montferrat; seated on the Bormida, 13 miles SE. of Alba, and 15 E. of Bene.

GORZKE, a town of Germany, in the duchy of Magdeburg, 34 miles E. of Magdeburg.

GOS, a river of Germany, in Carinthia, which runs into the Malentheim.

GOSBECK, a town of Suffolk, near Needham. GOSCHGOSCHUENK, a town of the United States in Delaware, on the Ohio, much frequented by owls.

GOSCHUTZ, a town of Silesia, in the principality of Oels; 2 miles N. of Pestenbergr.

GOSE, a river of Upper Saxony, which runs into the Oekar, near Goslar.

GOSELBACH, a river of Upper Saxony, which runs into the Saale; near Merzburg.

GOSELBERG, a mountain of Stiria, 10 miles W. of Landsparg.

(1.) GOSFORD, a barony and decayed village of Scotland, in E. Lothian, 5 miles E. of Preston Pans, in Aberlady parish; anciently the property of the Aitchisons of Glencairney, the ancestors of Lord Viscount Gosford in Ireland.

(2.) GOSFORD, a town of England, in Oxfordshire, SE. of Woodstock.

(3.) GOSFORD CASTLE, an elegant seat of Lord V. Gosford, in Armagh, Ireland, 2 miles from Market-hill.

(4.) GOSFORD, NORTH, } two English villages  
(5.) GOSFORD, SOUTH, } in Northumberland, near Newcastle.

(1.) \* GOSHAWK. *n. f.* [*gof*, goose, and *ba-* *oo*; a hawk.] A hawk of a large kind.—

Such tread his awful visage on them cast; So seem poor doves at *goshawks* sight aghast. *Fairfax.*

(2.) GOSHAWK. See FALCO, N° 35.

(1.) GOSHEN, in ancient geography, a district of Egypt, which Joseph procured for his father and brethren. It was the most fruitful part of the country; and its name seems to be derived from the Hebrew, *Geshem*; which signifies "rain;" Calmet thinks that Goshen, which Joshua (x. 41. xi. 16. xv. 51.) makes part of the tribe of Judah, is the same land of Goshen, which was given to Jacob and his sons by Pharaoh. Gen. xlvii. 26. It is certain that this country lay between Palestine and the city of Tanais, and that the allotment of the Hebrews reached southward as far as the Nile. Josh. xiii. 3.

(2.) GOSHEN, a town of Connecticut in Litchfield county, 7 miles NNW. of Litchfield.

(3.) GOSHEN, a township of Massachusetts in Hampshire county, 14 miles N. of Northampton and 112 W. by N. of Boston, containing 681 citizens in 1795.

(4.) GOSHEN, a township of New York, in O-

range county, containing 2442. souls in 1790, whom 316 were electors.

(5.) GOSHEN, a town in the above town (N° 4.) containing about 350 inhabitants with an academy, court house and Presbyterian church. It is 58 miles N. of New York, NNE. of Philadelphia. Lon. 0. 52. E. of N. Y. Lat. 41. 24. N.

(6.) GOSHEN, a township of Pennsylvania in Chester county.

(7.) GOSHEN, a township of Vermont in Windsor county, W. of Salisbury.

GOSHGOSHINK, a Moravian settlement in Pennsylvania, on the Allegany, 15 miles W. of Fort Franklin.

GOSILIA, a river of Bosnia, which runs into the Sretza.

GOSLAR. See GOSSTAR.

(1.) \* GOSLING. *n. f.* [from *goose*, young goose; a goose not yet full grown] do you go nodding and wagging so like a if you were hipshot? says the goose to be *L'Estr.*—Nature hath instructed even a *goslings* to flick together, while the kite is flying over their heads. *Swift.* 2. A katkin tree and pines.

(2.) GOSLING, in geography, a town in Austria, 12 miles S. of Bavarian Waidhoben.

GOSNARTH, a town near Preston.

(1.) \* GOSPEL. *n. f.* [*godes spel*, or good tidings; *godes spel*; *festel*, *festel*, happy tidings, Eccl.] 1. God's word; book of the Christian revelation.—

Thus may the *gospel* to the rising sun Be spread; and flourish where it first begun.

—All the degrees whereof Scripture treat conditionate, receiving Christ as the *gospel* him, as Lord and Saviour; the former, and the latter, being the condition of scripture and the rejecting, or not receiving him; condition of the scripture reprobation. *F*

—How is a good Christian animated and by a steadfast belief of the promises of the *Bentley.* 2. Divinity; theology.

(2.) The GOSPEL, comprehends the life, actions, death, resurrection, after doctrine of Jesus Christ, recorded in the St Matthew. St Mark. St Luke, and St John are thence called EVANGELISTS. The church never acknowledged any more than four gospels as canonical. See BIBLE, §

\* To GOSPEL, *v. n.* [from the noun.] with sentiments of religion. This word *pare*, in whom I alone have found it, though so venerable in itself, with some irony: I suppose from the gospellers who been held in contempt.—

Are you so *gospel'd*?  
To pray for this good man, and for his  
Whose heavy hand hath bow'd you to it

\* GOSPELLER. *n. f.* [from *gospel*.] of the followers of *Wickliffe*, who first effected a reformation from popery, given the name of *gospellers* in reproach, from their professing and preach only the gospel.—

*spellers have had their golden days, den down our holy Roman faith.*

*Rocue.*  
I, a town of Sardinia, 24 miles S. of

PORT, a town of Hampshire, 79 London. It has a ferry over the c harbour to Portsmouth, and, great ally in time of war. Travellers pre- here, as cheaper and more commodi- Portsmouth. The mouth of the har- red by 4 forts, and a platform of a- non level with the water. Gosport ital for sick and wounded sailors, and l.

PORT, a town of New Hampshire, in 12 miles ESE. of Piscataqua.

POSSAMER. *n. f.* [*gossium*, low Lat.] of plants; the long white cobwebs the air in calm sunny weather, espe- the time of Autumn. *Hanner.*—

may bestride the *gossamour*,  
in the wanton Summer air,  
not fall, so light as vanity. *Sbak.*  
able gnats the horses were,  
nasses of *gossamere*. *Drayton.*

ny *gossamer* now flits no more,  
rons bask on the short sunny shore.

*Dryden.*  
SAMER is the name of a fine filmy sub- cobwebs, which is seen to float in the days in autumn, and is more observe- ble fields, and upon turze and other

This is probably formed by the fly- which, in traversing the air for food, hese threads from its arms which are by the dew, &c.

NS, a town of Asia in Thibet, on the he Dewah. Lon. 81. 24. E. of Ferro. N.

IN, Antony, regius professor of his- toric, in the univerity of Cam in and principal of the college of Du uthor of a Latin history of the ancient

INI, Julian, an Italian author, born in 17, he was made secretary to Ferdi- nand, viceroy of Sicily, and retained 20 years. He wrote several works in erse; and died at Milan, in 1527.

HERES, a town of the French republic, of Sambre and Meuse; and late coun- r, 5 miles from Charleroi.

IP. *n. f.* [from *god* and *iph*, relation, xon.] 1. One who answers for the tism.—

a *gossip's* feast and gaude with me, }  
ong and such nativity. *Sbak.*

irritening of George duke of Clarence,  
in the castle of Dublin, he made  
rl of Kildare and the earl of Ormond  
*Davies on Ireland.* 2. A tipling com-

metimes lurk I in a *gossip's* bowl,  
keness of a roasted crab,  
n she drinks against her lips I bob.

3. One that runs about tattling like women at a lying in.—

To do the office of a neighbour,  
And be a *gossip* at his labour. *Hudibras.*

'Tis sung in ev'ry street,  
The common chat of *gossips* when they meet.

*Dryden.*  
\* To GOSSIP. *v. n.* [from the noun.] 1. To chat; to prate; to be merry.—

Go to a *gossip's* feast and gaude with me.  
—With all my heart I'll *gossip* at this feast. *Sbak.*

His mother was a votress of my order,  
And, in the spiced Indian air by night,  
Full often hath the *gossip* by my side. *Sbak.*

—The market and exchange must be left to their own ways of talking; and *gossips* not to be robbed of their ancient privilege. *Locke.*—He gives himself up to an idle *gossiping* conversation. *Law.*

2. To be a pot-companion.—  
Nor met with fortune, other than at feast,  
Full warm of blood, of mirth of *gossiping*. *Sbak.*

\* GOSSIPRED. *n. f.* [*gossipry*, from *gossip*.] —*Gossipred* or compaternity, by the canon law, is a spiritual affinity; and the juror, that was gossip to either of the parties, might, in former times, have been challenged as one not indifferent. *Davies.*

GOSSLAR, a large and ancient town of Lower Saxony, in the territory of Brunswick. It is a free imperial city, and it was here that gun powder was first invented. It is a large place, but the buildings are in the ancient taste. In 1728, St Stephen's fine church and 280 houses were burnt. It is seated on a mountain, near the Gose and near it are rich mines of iron. The inhabitants are famous for brewing excellent beer. Lon. 5. 37. E. Lat. 51. 55. N.

GOSSNITZ, a town of Upper Saxony, in Altenburg, 3 miles E. of Schmollen.

GOSSWEINSTEIN, or GOSSMANSTEIN, a town of Franconia, in Bamberg, 20 miles ESE. of Bamberg, and 23 NNE. of Nuremberg.

(1.) GOSSYPIUM, COTTON, a genus of the polyandra order, belonging to the monadelphia class of plants; and in the natural method ranking under the 37th order, *Cotumniferae*. The calyx is double, the exterior one trisid; the capsule quadrilocular; the seeds wrapt in cotton wool. There are 4 species, all natives of warm climates.

1. GOSSYPIUM ARBOREUM, the *tree cotton*, has an upright woody perennial stalk, branching 6 or 8 feet high; palmated, four or five-lobed smooth leaves; and yellow flowers, succeeded by large pods filled with seeds and cotton

2. GOSSYPIUM BARBADENSE, the *Barbadoes shrubby cotton*, has a shrubby stalk branching 4 or 5 feet high, three-lobed smooth leaves, glandulous underneath; and yellow flowers succeeded by oval pods, containing seeds and cotton.

3. GOSSYPIUM HERBACEUM the common herbaceous cotton, has an herbaceous smooth stalk two feet high, branching upwards; five-lobed smooth leaves; and yellow flowers from the ends of the branches, succeeded by roundish capsules full of seeds and cotton.

4. GOSSYPIUM HIRsutUM, the *hairy American cotton*, has hairy stalks branching laterally 2 or 3 feet high; palmated, three and five lo-  
bed

bed hairy leaves; and yellow flowers, succeeded by large oval pods furnished with seeds and cotton.

(II.) **GOSYPIUM, CULTURE OF THE.** The three last species are annual, but the first is perennial both in root and stalk. In warm countries these plants are cultivated in great quantities in fields for the sake of the cotton; but the **HERBACEUM** species (N<sup>o</sup> 3.) is most generally cultivated. The pods are sometimes as large as middling-sized apples, closely filled with the cotton surrounding the seed. When these plants are raised in this country, they must be continually kept in a warm stove, where they will produce seeds and cotton. They are propagated by seeds. See **COTTON**, N<sup>o</sup> 1, § i—vii. The American Islands produce cotton shrubs of various sizes, which rise and grow up without any culture; especially in low and marshy grounds. Their produce is of a pale red; some paler than others; but so short that it cannot be spun. None of this is brought to Europe, though it might be usefully employed in making hats. The little that is picked up, serves to make mattresses and pillows. The cotton shrubs, that supply our manufactures, require a dry and stony soil, and thrive best in grounds that have been tilled. The plant appears more flourishing in fresh lands than in those which are exhausted; but while it produces more wood, it bears less fruit. A western exposure is fittest for it. The culture begins in March and April, and continues during the first spring rains. Holes are made at 7 or 8 feet distance, and a few seeds thrown in. When they are 5 or 6 inches high, all the stems are pulled up, except 2 or 3 of the strongest. These are cropped twice before the end of August. This precaution is necessary, as the wood bears no fruit till after the second pruning; and, if the shrub was suffered to grow more than 4 feet high, the crop would not be greater, nor the fruit so easily gathered. The same method is pursued for 3 years; for so long the shrub may continue, if it cannot conveniently be renewed oftener with the prospect of an advantage that will compensate the trouble. This useful plant will not thrive if great attention is not paid to pluck up the weeds that grow about it. Frequent rains promote its growth; but they must not be incessant. Dry weather is particularly necessary in March and April, which is the time of gathering the cotton, to prevent it from being discoloured and spotted. When gathered in, the seeds must be picked out from the wool with which they are naturally mixed. This is done by a cotton mill; composed of two rods of hard wood, about 18 feet long, 18 lines in circumference, and fluted two lines deep. They are confined at both ends, so as to leave no more distance between them than is necessary for the seed to slip through. At one end is a little millstone, which, being put in motion by the foot, turns the rods in contrary directions. They separate the cotton, and throw out the seed contained in it. See **COTTON**, N<sup>o</sup> 1, § vii, 2.

**GOSTADT, JOSTADT, or JOSEPHSTADT**, a town of Upper Saxony, in Erzgebürg, 8 miles S. of Wolkenstein.

**GOSTAVIN.** See **GOSTYNNEN**.

(3.) **GOSTING**, in geography, a town of Austria, 2 miles ENE. of Zisterdorff.

**GOSTITZ**, a town of Silesia, in

**GOSTYNNEN, or GOSTAVIN**, a land, in the palatinate of Rawa, 36 miles W. of Rawa. Demetrius Czar of Muscovy in its citadel till his death.

**GOSZITZ**, a town of Upper Saxony, 3 miles W. of Ziegenbrück.

(1.) \* **GOT.** *pret.* [from the verb *got*.] Lartius writes, they fought together as *got* off. *Shak.*—

If you have strength Achilles' aid,  
Though foul Therites *got* thee, I  
Lov'd and esteem'd.

These regions and this realm my  
This mournful empire is the loser  
—When they began to reason about  
how the sea *got* thither, and away  
there they were perfectly in the dark.

(2.) \* **GOT.** *part. pass. of get.*—Suggested them for their valour in the  
a plot so well by them laid, more the  
victory of others *got* by good fortune  
ed upon any good reason. *Knolles.*—  
suasion in reasoning, when the first  
mission to your will is *got*, will n  
*Locke.*—If he behaves himself so well  
on us for his daily bread, can any  
he will do when he is *got* above the  
*but not.*—

Thou wert from Ætna's burning  
*Got* by fierce whirlwinds, and in t

(1.) **GOTHA**, a city of Germany, Upper Saxony, and capital of the duchy of **GOTHA**. This town had its name from who fortified it in their march to Italy only a village till surrounded with a shop of Mentz in 964. It is situated on the Leina, well built and strong. It has 2 handsome churches and a cathedral. Its chief trade is in dyer's wool; they have 3 crops, but the 3d grow cattle or ducal palace was rebuilt in 1574 by duke Ernest the Pious, who that and the town to be encompassed and ramparts; and gave it the name *Hein*, or the *Castle of Peace*, in opposition to the ancient name of *Grimmerstein*, or the *Furies*. It is situated on a neighbourly plain. In one of the apartments the collection of valuable rarities, and a noble library. It is 18 miles W. of Erfurt. *Lon.* 10. 30. N.

(2.) **GOTHA, or SAXE-GOTHA**, Germany in Upper Saxony. See **S**

(3.) **GOTHA**, a river of Sweden, which rises from lake *Wenne* in the North sea at *Gottenburg*.

**GOTHARD, ST.** one of the highest mountains of Switzerland. From the top, wh

or travellers, and a monastery for one of the most pleasing prospects. It is 8 miles from Altorf, and is the canton of Uri, on the confines of the Grisons, and Italy. Its ancient name according to Ptolemy and Strabo, was *ADULA*, (N<sup>o</sup> 1.) Hence the modern name, Despreause, files it *Monte Adula*. The Rufs, the Rhone, the Aar, the and some inferior rivers rise in it. According to M. Micheli, its highest point is 2,750 above the level of the sea, though others say 2000. Considered in its utmost extent, besides St Gothard properly, the mountains of Crispian, Fourche, and Vogelsberg. Its top is covered with snow and ice. It has some mines of fine silver. This tremendous mountain was passed by the French army under general Moncey, consisting of 1000 men; who, pushing their advanced guard, drove the Austrians under general Kollowrat to Lake Maggiore.

**GOTTENBURG.** See **GOTTENBURG.**

**ELBA**, a river of Sweden, which runs into the Baltic at Gottenburg.

**GO**, *adj.* relating to the Goths. See **GO**, *Index*.

**GO**, the most southern province of Sweden, being a peninsula, encompassed on three sides by the Baltic Sea, or the channel at the entrance. It was long in the possession of the Danes, but was ceded to Sweden in 1658. It contains 48 towns, and is divided into 10 parishes.

**GO**, EAST, or **OSTROGOTHIA**, a province of Sweden, bounded on the E. by the Baltic Sea, on the W. by Smaland, W. by the Wetter lake, and on the S. by the Ricia and Sundermanland. It is about 100 miles long and 70 broad, and was formerly governed by its own monarchs. See **GO**. It is rich in grain, fruits, wood, minerals, and iron. Its chief towns are Nordkioping, Soderkioping, and Wadstena.

**GO**, SOUTH, a country of Sweden, divided into 3 provinces, viz. Schonen, Blekingen; which have undergone great vicissitudes; being sometimes subject to the Danes, and at other times recovered by the Swedes; till at last they were finally annexed to Sweden by Charles X, at the treaty of Altranstam in 1658.

**GO**, WEST, or **WESTROGOTHIA**, a province of Sweden, bounded on the E. by the Wetter Lake, and Smaland; S. by Smaland; W. by the Scagerac; and N. by the Baltic. It is about 115 miles long and 15 broad. It was anciently governed by its own monarchs, and is fertile in corn and fruits, and has extensive pastures. The rivers, lakes, and sea coast are very fertile. Iron, alum, &c. are manufactured by the natives. The chief towns are Gottenburg, Lidkioping, and Falkenberg.

**GO**, or **GOTTLAND**, an island of Sweden in the Baltic, 75 miles long, and now only 25 broad. It was formerly an independent kingdom. From its situation it has been called *The Eye of the Baltic*. The soil is fertile, and the hills abound with pastures, wood, and stone quarries. Corals, cornelians, agates, and beautiful petrifications are also found in it. In 1361, this island was ravaged by Valdemar III. king of Denmark. In 1403, Albert surrendered it to queen Margaret. King Eric, her successor, lived 3 years in it after his deposition, but in 1449 gave it up to Christian I. It was restored to Sweden, in 1645, by treaty. Wisby is the capital. Lon. from 18. 6. to 19. 6. E. Lat. from 56. 54. to 57. 56. N.

(1) **GOTHOFRED**, or **GODFREY**, Dionysius or Denis, an eminent lawyer, born of an illustrious family at Paris, in 1549. France being involved in confusion by the leaguers, he accepted of a professor's chair at Geneva, until he was employed by Henry IV.; but being afterwards stripped of his employments as a Huguenot, he retired to Heidelberg, from whence no offers could detach him. The disturbances in the Palatinate obliged him, in 1621, to take refuge in Straßburg, where he died in 1622. He wrote a great number of books; his principal work is the *Corpus Juris Civilis, cum notis*.

(2) **GOTHOFRED**, Theodore or Theodosius, son of Denis, (N<sup>o</sup> 1.) was born at Geneva in 1580. As soon as he had finished his studies, he went to Paris; where he conformed to the Romish religion, and applied with indefatigable industry to the study of history, that of France particularly, wherein he became very eminent. In 1632, Lewis XIII. made him one of his historiographers, with a stipend of 3000 livres; and, in 1636, he was sent to Cologne, to assist at the treaty of peace negotiating there, on the part of France, by the cardinal of Lyons. This treaty being removed to Munster, Gothofred was sent thither, where he drew up Memoirs on the subject; and continued in that city, in the king's service, to his death in 1649. His principal work is his *Account of the Ceremonial of the Kings of France*.

(3) **GOTHOFRED**, James, brother of Theodore, was born at Geneva in 1587. Applying himself to the study of the law, he obtained the professor's chair there, was made counsellor of the city, and was several times employed in France, Germany, Piedmont, and Switzerland, to negotiate their affairs in the name of the republic. He died in 1562; and his chief work is his *Codex Theodosianus, cum perpetuis commentariis, &c.*

(4) **GOTHOFRED**, Denis, son of Theodore, (N<sup>o</sup> 2.) was born at Paris in 1615. He studied history after his father's example; became an eminent in that department of knowledge; and obtained the reversion of his father's place of historiographer royal, from Lewis XIII. when he was but 25 years of age. He published his father's *Ceremonial of France*; finished his *Memoirs of Philip de Commines*; and was preparing a *History of Charles VIII.* when he died in 1631.

(5) **GOTHOFRED**, John, son of Denis, (N<sup>o</sup> 4.) succeeded his father in his office and wrote also on history and antiquities. He completed and published his father's *History of Charles VIII.*; and wrote a *Journal de Henry III.*; *Memoirs de la reine Marguerite*, &c. He died in 1732.

**GOTHS**,

**GOTHS**, a warlike nation, famous in the Roman history, who came originally out of SCANDINAVIA, the name given by the ancients to Sweden, Norway, Lapland, and Finmark. According to the most probable accounts, they were the first inhabitants of those countries; and from thence sent colonies into the islands of the Baltic, the Cimbric Chersonesus, and the adjacent places. The time of their first settling in Scandinavia, and of their first peopling the abovementioned islands and Chersonesus, are equally uncertain; though the Gothic annals state the latter to have happened in the time of Serug the great grandfather of Abraham. This first migration of the Goths is said to have been conducted by their king Eric; in which all the ancient Gothic chronicles, as well as the Danish and Swedish ones agree. Their emigration is said to have happened many ages after; when, being overstocked with people, Berig, then king of the Goths, went out with a fleet in quest of new settlements. He landed in the country of the Ulmerugians, now Pomerania, drove out the ancient inhabitants, and divided their lands among his followers. He fell next upon the Vandals, whose country bordered on that of the Ulmerugians, and overcame them; but instead of forcing them to abandon their country, he only made them share their possessions with the Goths. The Goths, who settled in Pomerania and the adjacent parts of Germany, being greatly increased, they undertook a 2d migration in great numbers under Filimer the Great, their 5th prince after leaving Scandinavia; and taking their route eastward, entered Scythia; advanced to the Cimberian Bosphorus, and driving out the Cimberians, settled near the Palus Mæotis. Thence in process of time, being greatly increased in Scythia, they resolved to seek new settlements; and accordingly taking their route eastward, they traversed several countries, and at length returned into Germany. Their leader in this expedition was the celebrated Woden. See ODIN and WODEN. At what time Woden reigned in this country, is quite uncertain; but all historians agree, that he went in quest of new settlements with incredible numbers of people following him. He first entered Roxolonia, comprehending the countries of Prussia, Livonia, and great part of Muscovy: Thence he went by sea into the N. parts of Germany; and having reduced Saxony and Jutland, he at last settled in Sweden, where he reigned till his death, and became so famous that his name reached all countries, and he was by the northern nations worshipped as a god. He is said to have brought the Runic characters out of Asia, and to have taught the northern nations the art of poetry; whence he is styled the father of the Scaldi or Scalds, their poets, who described in verse the exploits of the great men of their nation, as the bards did among the Gauls and Britons. The Romans distinguished the Goths into two classes; the OSTROGOTHS and VISIGOTHS. Their names they received before they left Scandinavia, the *Visigoths* being softened by the Latins from *Westerogoths*, or those who inhabit the western part of Scandinavia, as the Ostrogoths were those who inhabited the eastern part of that country. Their history affords nothing of importance till

the time of their quarrelling with the Romans, which happened in the reign of Caracalla; that period, it becomes so closely interwoven with that of the Romans, that for the most particulars of it we must refer to the article ROMANS. After the destruction of the Roman Empire, the Heruli, the Ostrogoths, under Theodoric, came masters of the greatest part of Italy, and overcame and put to death Odoacer king of the Heruli in 494. They retained their dominion in this country till A. D. 553; when they were conquered by Narfes, Justinian's general. **LV.** The Visigoths settled in Spain in the reign of Honorius, where they founded a kingdom, which continued till the country was subdued by the Franks. See SPAIN. The Goths were famous for their hospitality and kindness to strangers, even before they embraced Christianity. It is said, that from their being eminently generous, they were called *Goths*, by the neighbouring nations; that name, according to Grotius and many other writers, being derived from the German *guten*, which signifies *good*. They encouraged the study of philosophy above all other sciences, and from among their philosophers, Polygam was only allowed but countenanced among the rest, every one being valued or respected according to the number of his wives. By so many wives, a man had an incredible number of children, but they kept but one at home, sending out the rest in quest of new settlements; and these swarms of people which over-ran so many countries. With them adultery was a capital and irremissibly punished with death. It prevailed among them when they were first known to the Romans only by the name of *Gethi* (the most ancient name); as appears from Menander, who was himself of that nation; from Horace, who greatly commends the modesty of their women. Their laws fell little short of those of the ancient Romans. Their government was monarchical; their religion was the same with that of the ancient Germans; and their dress is described by Apollonius in the following words: "They are clothed with high shoes made of hair, and reach to their ankles; their knees, thighs, and buttocks without any covering; their garments of various colours scarce reaching to the knee; they wear a cloak to cover the top of their arms; they wear a tunic with a red border; their belts are of leather; their shoulders are covered with iron plates; their ears are covered with iron locks; they use hooked lances and maces."

**GOTTELSBRUNN**, a town of Germany, 3 miles N. of Brugg.

\* **GOTTEN**. *part. pass. get.*—Wisdom is *gotten* for gold, *Job xxviii. 15.*—Few men when they are *gotten* into an office, apply their thoughts to the execution of it. *Temple.*

**GOTTENBURG**, or **GOTHENBORG**, a strong town of Sweden, in W. C. with a good harbour, at the mouth of the Göta; which is the best situated for commerce of any in Sweden, as it lies without the city. It occupies the site of an ancient town called *Ladise*, which was built by Gustavus V

lowed with considerable privileges, soon he great emporium for the trade of the provinces. Charles IX, when duke of S, having in 1604 laid the foundations of town in the island of Hisingen at no great from Lodefe, called it *Gotteborg*, (now *g.*) in honour of his duchy. Upon his to the throne, he erected in his new trading company; drew thither many s, particularly the Dutch, to whom he an exemption from all duties of export ort during 30 years; a corps of English ch troops, under the command of Wil- wart; and granted to the Calvinists esta- herein the free exercise of their religion, place in Sweden where this toleration was l. The town, being in 1611 reduced by the Danes, was rebuilt in the reign us Adolphus in its present situation, and a confirmation of its ancient rights, with t of several additional privileges. It is very singular situation. At a small dis- m the sea is a marshy plain, scarcely more a mile broad, watered by the *Gotha* and and almost entirely inclosed with high rocks, so bare and rugged, that they produce a single blade of grass, and ex- barren an appearance as the summits of st Alps. *Gottenburg* stands partly upon s, and partly in the plain; and is divid- these different situations, into the Upper er Town. The latter is entirely level, d by several canals in the manner of the owns; and its houses are all constructed s: the upper part hangs on the declivi- rows of buildings rise above each other ats of an amphitheatre. The whole is fortified; and its circumference is near exclusive of the suburbs, called *HAGA*, : towards the harbour. The streets are mly straight: a few of the houses are of ut most of them are constructed with ted red. The harbour is formed by two rocks, and is about a quarter of a mile h. Its entrance is defended by the fort *Elsborg*, which stands upon a small ad, and contains a garrison of 252 men. rg has a Royal Society of Sciences and s; upon the plan of that of *Uplal*.—Mr informed by a merchant who had re- years at *Gottenbry*, that, during that s population had increased considerably, it now contained about 30,000 inhabi- his flourishing state is attributed to the of its commerce, particularly its East mpany, and the success of the herring A British consul and several British mer- ide at *Gottenburg*: and a chapel, with a splin, is appropriated to their use. Lon. Lat. 57. 44. N.

**GOTTBERG**, a town of Upper Saxony, in s, 4 miles NW. of *Langen Salza*.

**GOTTESBERG**, a town of Silesia, in *Schweid- ules SSW. of Freyburg*, and 12 SW. of itz.

**GOTTINGEN**, a considerable town of cony in the duchy of *Brunswick*; formerly nperial, but now subject to the elector of . PART II.

**Hanover**. Here king *George II.* founded an uni- versity. It is seated on the *Leine*, in *Lon. 10. 5. E. Lat. 51. 32. N.*

(2.) **GOTTINGEN**, a town of Sweden, with a good harbour, on the borders of *W. Gothland*, near the mouth of the *Moludal*. It has 2 citadels, towards the land and sea. Being built of wood, it has often suffered by fire. It is a bishop's see and contains 13,000 inhabitants, who carry on a considerable trade by sea. It lies 28 miles SW. of *Stockholm*, and 164 N. of *Copenhagen*. Lon. 11. 34. E. Lat. 58. 29. N.

**GOTTLEBER**, *John Christopher*, a learned critic, born in 1733. His chief work is *Animad- versions on different portions of Plato*. He died in 1785.

**GOTTLEUVE**, a town of Upper Saxony, in *Meissen*, 6 miles SW. of *Konigstein*, and 8 S. of *Pirna*.

**GOTTLIEBEN**, a town of the Helvetic repub- lic, near the lake of *Constance*, where *John Huf- was confined in 1415*; 3 miles from *Constance*.

**GOTTLSTORF**, a town of Germany in *Auf- tria*, 5 miles SE. of *Altenmarkt*.

(1.) **GOTTOLENGO**, a district of the Cisal- pine republic, in the dep. of *Mela*, containing 1 town, several villages and harbours, and 2500 citizens, in 1797.

(2.) **GOTTOLENGO**, the capital of the above district.

**GOTTON**, 2 small towns of England; 1. in the *Isle of Wight*: 2. near *Taunton*, *Somersetsh.*

**GOTTORP**, a town of Denmark, in the duchy of *Sleswic*, capital of *Holstein Gottorp*, where the duke has a very fine palace. Lon. 9. 56. E. Lat. 54. 36. N.

**GOTTSBERG**. See **GOTTESBERG**.

**GOTTSCHED**, a German poet, born at *Kon- ingsberg*, who by his works contributed to spread a taste for literature in Germany. His dramatic productions, wherein his wife assisted him and shared his fame, banished from the German theatre those buffooneries, which formerly disgraced it. He died at *Leipfic* in 1766, 4 years after his wife.

**GOTTSCHEE**, a town of Germany in *Carni- ola*, 23 miles SSE. of *Laybach*, and 160 SSW. of *Vienna*.

**GOTTZENDORF**, a town of Germany, in *Austria*, 5 miles S. of *Aigen*.

**GOTZEL**, or **GOTSEL**, a town of Lower *Bavaria*, 36 miles E. of *Ratisbon*.

(1.) **GOVAN**, a parish of Scotland chiefly in *Lanarkshire*, with a small part in *Renfrewshire*; 5 miles long, from E. to W. and between 3 and 4 broad. The *Clyde* runs through its whole length, and often overflows its banks, which abound with free-stone. Agriculture is in a state of high im- provement, though the soil is not naturally fertile; being originally clay, till, barren sand, and heath; besides about 100 acres of moor. The usual crops are wheat, oats, barley, beans, pease, potatoes, and grass. The population in 1792, stated by the rev. J. Pollock, in his report to Sir J. Sinclair, was 2518. The parish of *GORBALS* having been joined with this in 1755, when Dr *Webster* made up his lists of the population of Scotland, Mr Pollock states the total number of souls in both parishes at 8318, and the increase of both at 3,929.

The horses are mostly above the common size. There is one sheep farm, of 198 acres; 4 bleach-fields; 1 printing field, 8 mills, 3 for corn, 1 for stuff, 1 for paper, and 3 for other manufactures. On the N. boundary of this parish, the counties of Dunbarton, Lanark and Renfrew, the parishes of New Kirkpatrick and Renfrew, and the properties of 3 heritors, all meet in one point.

(2.) GOVAN, a village in the above parish, (N<sup>o</sup> 1.) about one mile long, containing 224 families, in 1792.

GOVANDORE, a bay on the coast of Chili.

GOUANIA, in botany; a genus of the monœcia order, belonging to the polygamia class of plants. The calyx of the hermaphrodite is quinquefid; there is no corolla; there are 5 antheræ covered with an elastic calyptra or hood; the style trifid; the fruit, inferior to the receptacle of the flower, divisible into three seeds. The male is like the hermaphrodite, but wanting stigma and germen.

GOVARDO. See GAVARDO, N<sup>o</sup> 1 and 2.

\* GOUD *n. f.* Wood; a plant. *Dist.*

GOUDA, or TURGOW, a considerable town of the Batavian republic, in the dep. of Delft, and late prov. of S. Holland, remarkable for its stately church. It is sea ed on the river Yffel, 9 miles NE. of Rotterdam, and 22 S. of Amsterdam. Lon. 4. 37. E. Lat. 52. 2. N.

GOUDELIN, or GOUDOULE, Peter, a Gascon poet, born at Toulouse, in the 16th century, and reckoned the Homer of Gascony. His verses have much sprightliness, with a delicate simplicity, which to those who relish the Gascon language is enchanting. He died in 1629.

GOUDHURST, a town of Kent, 12 miles SW. of Maidstone, and 44 SE. of London. Lon. 0. 31. E. Lat. 51. 8. N.

GOUDIMEL, Claudius, a musician of the 16th century, who was put to death by the bigotted catholics at Lyons, for setting the psalms of Marot and Beza to music.

GOUDOZ, a town of Turkey in Natolia, 72 miles ENE. of Kintaja.

GOUDT, Henry, usually called *Count Goudt*, was born of a noble family at Utrecht, in 1570; and was a knight of the Palatinate. Being fond of painting and engraving, he applied himself diligently to drawing, and made a great proficiency therein. He then went to Rome, where he contracted an intimacy with Adam Elsheimer; studied his manner, and made his works models for imitation. Those pictures which Goudt himself painted were delicately touched, in colour and pencil resembling Elsheimer. On his return to Utrecht, a young woman who was in love with him, and desirous of fixing his affections upon herself, gave him in his drink a love philtre, which terminated in a very melancholy manner, by depriving him of his senses; and in this dreadful state he dragged on a miserable life to the age of 69, his death happening in 1639. It is remarkable, that though lost to every other subject when painting was spoken of he would discourse upon it in a very rational manner. He engraved 7 beautiful prints after the pictures of Elsheimer, which are well known to the curious, and are to be met with in most choice collections. He work-

ed with the graver only, in a very neat style produced a most powerful effect, not by ening the strokes, according to the usual method, but by crossing them with additional lines, equally neat, 5 or 6 times, one over another, the deep shadows. The weeds and other things in the fore ground in his admirable prints are very finely expressed. The 7 prints engraved above, are, 1. Ceres drinking from a cup. An old woman appears holding a key at the door of the cottage, and a boy talking by her laughing and pointing at the key, for which contempt he was metamorphosed into a frog. The powerful and striking of this engraving cannot be properly expressed. This print is also called the *forever*. 2. A flight into Egypt; a night scene, in which the moon and stars are introduced with great effect. 3. The angel with Tobit, who is drawn by his side. The back ground is a landscape with the weeds in the fore ground, and the tops of the trees in front, as well as the flowers and weeds hanging from them, are beautifully expressed. 4. The angel with Tobit, crossing a stream of water; The back ground, a landscape with Baucis and Philemon entertaining Jupiter and Mercury. 6. A landscape, called the *rising sun*, representing the dawn of day. The effect is beautiful. 7. The beheading of St John the Baptist, a very small upright oval print, which is the rarest.

\* GOVE. *n. f.* A mow. *Tuffer.*

\* To GOVE. *v. n.* To mow; to put to grass, or mow. An old word.—

Load safe, carry home, follow time! Gove just in the barn, it is out of despa

(1.) GOVEA, Antony, a Latin poet of the 16th century; author of Latin plays which have been admired. His editions of Terence display great judgment and accuracy. He died in 1613.

(2, 3.) GOVEA, Martial and Andrew, thren of Anthony, were also men of letters; the former was a grammarian and poet: he was employed by John III. king of Portugal to establish a college at Coimbra. He died in 1613.

(1.) \* To GOVERN. *v. a.* [*governer gubernar*, Latin.] 1. To rule as a chief; to manage. —This inconvenience is more hard to bear in the governor than the governed; as in a vital part is more incurable than in a mortal. *Spenser on Ireland.*—

Slaves to our passions we become,  
It grows impossible to govern men.

2. To regulate; to influence; to direct. —I am at present against war, though it puts it into my hands, and though such turbulent spirits as you are, govern all times of peace. *Davenant.*—The chief power he is to carry always in his eye, and by it is to govern all his counsels, designs, and actions. *Atterbury.* 3. To manage; to restrain.

Go after her, she's desp'rate; go  
Sba

4. [In grammar.] To have force with syntax: as, *amo governs* the accusative. Listen, children, unto me,  
And let this your lesson be,

language evermore  
 that govern go:efore. *Mauger's Gram.*  
 lot; to regulate the motions of a ship.  
 To GOVERN v. n. To keep superiority:  
 have with haughtiness.—

By that rule,  
 r wicked atoms may be working now  
 e bad counsel, that you still may govern.

*Dryden.*

VERNABLE. *adj.* [from govern.] Sub-  
 ject to authority; subject to rule; manageable.  
 extension of the former part of a man's  
 yet grown up to be headstrong, makes  
 governable and safe. *Locke.*

VERNANCE. *n. f.* [from govern.] 1. Go-  
 rule; management.—Jonathan took  
 nance upon him at that time, and rose up  
 of his brother Judas. *1 Mac. ix. 31. 2.*  
 as that of a guardian.—

he knew not, neither his own ill,  
 rough wife handling, and fair governance,  
 recurred to a better will. *Spenser.*

u! shall king Henry be a pupil still,  
 the surly Gloster's governance? *Shak.*

our; manners. Obsolete.—

ikeft is to fall into misgovernance

s regardless of his governance. *Spens.*

VERNANT. *n. f.* [gouvernante, Fren.]  
 ho has the care of young girls of quality.

e usual and proper word is governess.

VERNESS. *n. f.* [gouvern-ress, old Fr.  
 e.] 1. A female invested with authority.

The moon, the governess of floods,  
 her anger, washes all the air,  
 heumatick diseases do abound. *Shak.*

orefs; A woman that has the care of  
 tics.—He presented himself unto her, fall-  
 n upon both his knees, and holding up  
 s, as the old governess of Danae is paint-  
 the suddenly saw the golden shower.

s three younger children were taken from  
 net's in whose hands he put them. *Clarend.*

orefs; an instructress; a directress.—

fiction that severe governess of the life of  
 igs upon those souls she seizes on. *Mor-*  
*schelm.*

GOVERNMENT. *n. f.* [gouvernement,

1. Form of a community with respect  
 iposition of the supreme authority.—

m to be but two general kinds of govern-  
 he world: the one exercised according  
 bitrary commands and will of some single

the other according to certain orders  
 ntroduced by agreement or custom, and  
 e changed without the consent of many.

-No government can do any act to  
 lf: the supreme legislative power can-  
 e itself not to be absolute. *Locke. 2.*

ished state of legal authority.—

There they shall found

governments, and their great senate chuse  
 gh the twelve tribes, to rule by laws or-  
 in'd. *Milton.*

le he survives, in concord and content  
 amons live, by no division rent;

e great monarch's death dissolves the  
 verament. *Dryden.*

one knows, who has considered the na-

ture of government; that there must be in each  
 particular form of it an absolute unlimited power.

Adiion.—Where any one person or body of men  
 seize into their hands the power in the last resort,  
 there is properly no longer a government, but  
 what Aristotle and his followers call the abuse or  
 corruption of one. *Swift.* 3. Administration of  
 publick affairs.

Safety and equal government are things  
 Which subjects make as happy as their kings.

Those governments, which curb not evils,  
 cause;

And a rich knave's a libel on our laws. *Young.*

4. Regularity of behaviour. Not in use.—

You needs must learn, lord, to amend this  
 fault;

Though sometimes it shews greatness, courage,  
 blood,

Yet oftentimes it doth present harsh rage,  
 Defect of manners, want of government,

Pride, haughtiness, opinion, and disdain.

'Tis government that makes them seem divine;  
 The want thereof makes thee abominable.

5. Manageableness; compliance; obsequiousness.

Thy eyes windows fall,  
 Like death, when he shuts up the day of life;  
 Each part-depriv'd of supple government,  
 Shall stiff and stark, and cold appear, like death.

6. Management of the limbs or body. Obsolete.

Their god  
 Shot many a dart at me with fierce intent;  
 But I them warded all with wary government.

7. [In grammar.] Influence with regard to con-  
 struction.

(2.) GOVERNMENT is also used for a post or  
 office, which gives a person the power or right  
 to rule over a city, or a province, either supreme-  
 ly or by deputation.

(3.) GOVERNMENT is likewise used for the city,  
 country, or place, to which the power of govern-  
 ing is extended.

(4.) GOVERNMENT, CIVIL, was instituted for  
 the preservation and advancement of mens civil  
 interests, and for the better security of their lives,  
 liberties, and properties. The use and necessity  
 of government is such, that there never was an  
 age or country without some sort of civil authori-  
 ty; but as men are seldom unanimous in the means  
 of attaining their ends, so their differences in  
 opinion as to government has produced various  
 forms of it. According to Montesquieu, and most  
 other writers, they may in general be reduced to  
 three kinds. 1. The republican. 2. The mo-  
 narchical. 3. The despotic.—The first is that, in  
 which the people in a body, or only a part of the  
 people, have the sovereign power; the 2d, where  
 one alone governs, but by fixed established laws;  
 but, 3d. in the despotic government, one person  
 alone, without law and without rule, directs ev-  
 ery thing by his own will and caprice. See LAW.  
 On the subject of government at large, see Mon-  
 tesquieu's Spirit of Laws, l. 2. c. 1.; Locke, ii.  
 129, &c. 4to edit. 1768; Sidney on Government;

Sir Thomas Smith *de Repub. Angl.* and Acherly's *Britannic Constitution*. As to the Gothic government, its original and fruits, &c. see Montefquieu's *L'Esprit des Loix*, l. 11. c. 8.—With respect to the feudal policy, how it limited government, see *FEUDAL SYSTEM*, § 5, 7.

**GOVERNULO**, a town of the Cisalpine republic, in the dept. of Mincio, and ci devant duchy of Mantua, anciently called *Ambuletum*. On the 24th Aug. 1796, the French, under Bonaparte, defeated the Austrians under general Wurmsler, near this town, and took 1100 prisoners according to some accounts; but the rev. Mr Cruttwell states the battle to have happened in the beginning of September, and the loss of the Austrians at no less than "10,000 prisoners." (*New Univ. Gaz. Suppl.*) In April 1799, it was taken by the Austrians; but recovered with the rest of the Cisalpine republic, after the battle of Marengo in 1800. Governolo is seated at the junction of the Mincio and the Po, 12 miles SE. of Mantua, Lon. 10. 56. E. Lat. 45. 4. N.

\* **GOVERNOUR**. *n. f.* [*gouverneur*, French.] 1. One who has the supreme direction.—It must be confessed, that of Christ, working as a creator and a *governour* of the world by providence, all are partakers. *Hooker*.—They beget in us a great idea and veneration of the mighty author and *governour* of such stupendous bodies, and excite and elevate our minds to his adoration and praise. *Beatl.* 2. One who is invested with supreme authority in a state.—For the kingdom is the Lord's, and he is the *governour* among the nations. *Pf. xxii. 28.*—The magistrate cannot urge obedience upon such potent grounds as the minister, if so disposed, can urge disobedience; as, for instance, if my *governour* should command me to do a thing, or I must die, or forfeit my estate; and the minister steps in and tells me, that I offend God, and ruin my soul, if I obey that command, 'tis easy to see a greater force in this persuasion. *South.* 3. One who rules any place with delegated and temporary authority.—

To you, lord *governour*,

Remains the censure of this hellish villain.

*Shak. Othello.*

4. A tutor; one who has care of a young man.—

To Eltham will I, where the young king is,  
Being ordain'd his special *governour*;

And for his safety there I'll best devise. *Hen. VI.*

—The great work of a *governour* is to fashion the carriage, and form the mind; to settle in his pupil good habits, and the principles of virtue and wisdom. *Locke*.—During the minority of kings, the election of bishops, and other affairs of the church, must be left in the hands of their *governours* and courtiers. *Lesley.* 5. Pilot; regulator; manager.—Behold all the ships, which though they be so great, and are driven of fierce winds, yet they are turned about with a very small helm, whithersoever the *governour* listeth. *Ja. iii. 5.*

**GOUZEC**, a town of France, in the dept. of Finisterre, 4½ miles SE. of Chateaulin, and 10½ N. E. of Quimper.

**GOUGANE BARO**, a lake of Ireland, in the county of Cork, 10 miles N. of Bantry.

(1.) \* **GOUGE**. *n. f.* [French.] A chissel having

a round edge, for the cutting of such wood to be rounded or hollowed. *Moxon.*

(2.) A **GOUGE** is a round hollow chissel, to cut holes, channels, grooves, &c. in stone, &c.

(3.) **GOUGE**, Thomas, a dissenting clergyman of the 17th century, minister of St Sepulchre London. He was a man of uncommon piety, and a great promoter of useful knowledge. He bred above 300 schools in Wales. He died in 1687, and though he was a nonconformist, Absalon preached his funeral sermon.

(4.) **GOUGE**, William, the father of T. (Nº 3.) was born at Stratford-le-bow, but the established church. His works make a folio. It is remarked of him, that he was absent from morning and evening prayer years, and that he read 15 chapters in every day. He died in 1653.

\* **GOUJERES**. *n. f.* [from *gouje*, Fr. camp trull.] The French disease. *Hann.*

**GOUJET**, Claude Peter, a French author and compiler, born at Paris, in 1797. He published 1. A supplement to Moreau's Dictionary; 2. A supplement to Dupin's Bibliotheque of Ecclesiastical Writers; 3. An abridgement of the French Dictionary; 4. Bibliotheque Françoise, &c. He died in 1767. He had collected a library of 10,000 volumes.

**GOUJIM**, a town of Portugal, in the province of Beira.

**GOVINDPOUR**. See **CALCUTTA**, § 5.

**GOULART**, Simon, a famous miniature painter, born at Senlis in 1543, and one of the most indefatigable writers of his time. He made considerable additions to the Catalogue of the French Academy, and composed a history of the truth composed by Illyricus; and acquired a great reputation by his works; the principal of which are, 1. A translation of Seneca; 2. A collection of memorable histories; 3. A translation of St Cyprian *De lapsis*; 4. Several devotional and moral treatises. He died at Geneva in 1627.

**GOULDSBOROUGH**, a town of the United States, in the district of Maine and 1 county, with a good harbour, 330 miles from Boston. Lon. 67. 53. W. Lat. 44. 25. N.

**GOULDSMITH**, Francis, an English author who flourished in the reign of Charles I. In other works, he translated *Sophompaneas*, a play of Grotius into English verse.

**GOULVIN**, a town of France, in the Finisterre, 4 miles N. of Lesvevin, and 10 miles from St Pol.

**GOUNONG API**. See **GONAPI**.

**GOUNVILLE**, John Heralde, a French author, born in 1625, originally only a vallet de chambre of Rouchefoucault, who advanced him to several high offices. He wrote *Memoirs*, containing important anecdotes of the French minister Mazarine and Colbert. He died in 1707.

**GOVON**, a town of the Piedmontese, in the dept. of the Sesia, 6 miles N. of Aosta.

**GOURA**, or **GURA**, a town of Poland, on the Vistula, 12 miles from Warsaw.

**GOVRA**, a town of Persia, in the province of Irak, 35 miles E. of Ispahan.

**GOURAINCOURT**, a town of France,

Meuse, 8 miles N. of Estain, and 15 un.

U, a town of France, in the dept. of Oasts, 8 miles S. of Lamballe, and 9 is.

U, a cape on the E. coast of Jersey, 4 lt Helier.

**GOURD.** *n. f.* [*gourde*, Fr.] 1. A fruit of some species are long, of- or bottle-shaped. *Miller.*—

li hañs, and from each bough and brake, t, and juiciest *gourd*, will pluck such e

ain our angel guest. *Milt. Par. Lof.*

is abound so much in oil, that a sweet one may be drawn from thence by they are of the four greater cold seeds, in emulsion. *Hill.* 2. A bottle (from

?) *Skinner.*—The large fruit so called ped hollow, for the purpose of con-

carrying wine, and other liquors: any leathern bottle grew to be called name, and so the word is used by

*inner.*

**GOURD,** in botany. See CUCURBITA.

**GOURD,** BITTER. See CUCUMIS.

**GOURD,** ETHIOPIAN SOUR. See ADANSO-

**GOURD TREE.** See CRESCENTIA.

**GOUT.** *n. f.* [from *gourd*] A swelling leg after a journey. *Ferriar's Dict.*

**GOURDON,** a town of France, in the dept. miles N. of Cahors, and 27 WNW.

Lon. 1. 24. E. Lat. 45. 43. N.

**GOURGUES,** Dominic DE, an illustrious French private gentleman of Gacony. The

ving inhumanly massacred a colony of who had settled in Florida, Gourgues

re revenge on them, an account of en under the article FLORIDA. On

e was received with acclamations by sen, but was forbid to appear at court. a invited him to command an English

the Spaniards, in 1593; but he died his way to England.

U, a town of France in the dept. of 4 miles NNW. of Fauet, and 27 W.

**GOURNAY,** a town of France, in the dept. fine, and late duchy Normandy, cele- s butter market. It is seated on the

les NW. of Paris. Lon. o. 36. W. N.

**GOURNAY,** Mary, Lady of. See JARS.

**GOURNET.** *n. f.* [*gounetus*.] A fish.

**GOURNICK,** a town of Scotland, in Renfrew- creek of the Clyde, near a copper es W. of Greenock.

**GOURNOURT,** a town of France in the of the Meuse, 7 miles E. of Gondre- 8. of Vancouleurs.

**GOURT,** a French protestant minister, born 1635. He left France on the revoca- dict of Nantz, and went to Holland, came professor of Greek and Theolo- ing. He died there, in 1704. He *ventarii Lingua Hebraica*, and several

(1.) \* **GOUT.** *n. f.* [*goutte*, French.] 1. The arthritis; a periodical disease attended with great pain.—The *gout* is a disease which may affect any

membraneous part, but commonly those which are at the greatest distance from the heart or the brain, where the motion of the fluid is the slowest,

the resistance, friction, and stricture of the solid parts the greatest, and the sensation of pain, by the dilaceration of the nervous fibres, extreme. *Arb.*

One that's sick o' th' *gout*, had rather Groan so in perplexity, than be cur'd By th' sure physician death. *Shak. Cymb.*

This very reverend lecher, quite worn out With rheumatism, and crippled with his *gout*, Forgets what he in youthful times has done And swings his own vices in his son. *Juv.*

2. A drop [*goutte*, French; *gutta*, Latin.] *Gut* for *drop* is still used in Scotland by physicians.—

I see thee still, And on the blade o' th' dudgeon *gouts* of blood, Which was not so before. *Shak. Macbeth.*

(2.) **GOUT.** See MEDICINE, *Index.* In the new system of medicine, the *gout* is considered as a

disease not arising from plethora, but from the very opposite cause, viz debility; and therefore to be cured by means the reverse of those formerly

too generally prescribed. The late Dr Brown cured the *gout* repeatedly, both in his own habit and those of his patients, by wine, spirits, op-

pium, and a full diet of animal food. See BRUN- NOLIAN SYSTEM, § 8.

(3.) \* **GOUT.** *n. f.* [French.] A taste. An affected cant word.—Catalogues serve for a direc- tion to any one that has a *gout* for the like studies. *Woodw. on Poss.*

(1.) \* **GOUTWORT.** *n. f.* [*gout* and *wort*, *podagraria*.] An herb. *Alm.*

(2.) **GOUTWORT.** See EGOPodium.

\* **GOUTY.** *adj.* [from *gout*.] 1. Afflicted or diseased with the *gout*.—There dies not above one of a thousand of the *gout*, although I believe that more die *gouty*. *Gravatt*—

Knots upon his *gouty* joints appear, And chalk is in his crippled fingers found. *Dryd. Perf.*

—Most commonly a *gouty* constitution is attended with great acuteness of parts, the nervous fibres, both in the brain and the other extremities being delicate. *Arbuth.* 2. Relating to the *gout*.—There are likewise other causes of blood spitting; one is the settlement of a *gouty* matter in the substance of the lungs. *Blackmore.*

**GOUVEA,** a town of Portugal, in Beira.

**GOUVERNANTE,** in botany, the Spanish name of a plant which the Indians in California use in decoction, as a sudorific drink for curing the venereal disease. It is a new species of *daphne*.

(See DAPHNE, § II.) It is a middle sized shrub, with angular and knotty branches, covered with an adhesive varnish; the lateral ones alternate, and near each other; the leaves small, petiolated,

bilobed, opposite, smooth above; indistinctly veined below; the blossoms axillary, sometimes ter- minating, pedunculated; solitary, but sometimes

in pairs. The calyx is quadrifid, egg shaped, the size of the corolla, placed beneath the fruit, deciduous. Corolla polypetalous; petals 4, small,

entire, egg-shaped, fixed on the receptacle: sta-

mina 8 fixed to the receptacle; the length of the corolla: threads channelled, concave on one side, convex on the other: wings veiled, anthera simple. Pistil, germ oblong, covered with 5 angles and 5 cells; seeds oblong; pericarpium covered with fine hairs. *Peyrouse's Voyage*, vol. 3d.

GOUX, a town of France in the dept. of Doubs, 5 miles NW. of Pontarlier, and 9 SE. of Ornans.

(1.) GOUYE, Thomas, an eminent French mathematician, born at Dieppe, in 1650. He was a member of the society of Jesuits. His chief work is *Mathematical and Philosophical Observations*, in 2 vols 8vo. He died at Paris in 1725.

(2.) GOUYE OF LONGUEMARE, another French author, who wrote various memoirs and dissertations to illustrate the history of France.

GOUZON, a town of France in the dept. of Creuse, 15 miles E. of Gueret.

(1.) GOWER, John, one of the most ancient English poets, was cotemporary with Chaucer, and his intimate friend. He studied the law, and was some time a member of the society of Lincoln's-inn. Some have asserted that he was a judge. In the first year of Henry IV. he became blind, which he laments in one of his Latin poems. He died in 1402; and was buried in St Mary Overie, which church he had rebuilt chiefly at his own expence, so that he must have lived in affluent circumstances. His tomb was magnificent, and curiously ornamented. It still remains, but has been repaired in later times. From the collar of SS round the neck of his effigies, which lies upon the tomb, it is supposed that he had been knighted. With regard to his poetical talents, it is sufficient to say, that he was admired at the time when he wrote. He wrote, 1. *Speculum meditantis*, in French, in ten books. There are two copies of this in the Bodleian library. 2. *Vox clamantis*, in Latin verse, in 7 books. Preserved also in the Bodleian library, and in that of All-souls. It is a chronicle of the insurrection of the commons in the reign of Richard II. 3. *Confessio amantis*; printed at Westminster by Caxton in 1493, Lond. 1532, 1545. It is a sort of poetical system of morality, interspersed with a variety of moral tales. 4. *De rege Henrico IV.*; printed in Chaucer's works. There are likewise several historical tracts, in MS. written by our author, which are to be found in different libraries; also some short poems printed in Chaucer's works.

(2.) GOWER, ST, or ST GOAR. See GOAR, N<sup>o</sup> 3.

GOWER'S ISLAND, an isle in the S. pacific ocean, which has no anchorage near it. Lon. 158. 56. E. Lat. 7. 55. S.

(1.) \* GOWN. *n. f.* [*gonna*, Italian; *gawn*, Welsh and Erle.] 1. A long upper garment.—They make garments either short, as cloaks, or, as gowns, long to the ground. *Abbot's Descript. of the World*.—If ever I laid a loole-bodied gown, sew me up in the skirts of it, and beat me to death with a bottom of brown thread; I laid a gown. *Shak.*—

In length of train descends her sweeping gown,  
And by her graceful walk the queen of love is known.  
*Dryd.*

2. A woman's upper garment.—I despise your new gown, 'till I see you dressed in it. *Pope.* 3.

The long habit of a man dedicated peace, as divinity, medicine, law.—The themselves are so mean in Irish counties, will not yield any competent maintenance honest minister, scarcely to buy him a gown on Ireland.—

Girt in his Gabin gown the hero  
Yet not superior to her sex's cares,  
The mode she fixes by the gown she  
Of silks and china the's the last appe  
In these great points she loads the com

4. The dress of peace.—

Hé Mars depos'd, and arms to gown yield;

Successful councils did him soon appear  
As fit for close intrigues as open field

(2.) *The Gown*, (§ 1. *def.* 1, 3.) is a sort of garment, worn over the ordina hanging down to the feet. It is fashionably for ecclesiastics and for laymen, they gave the name  *toga virilis*, i. e. gown, to a plain kind of gown which assumed when arrived at puberty. Particularly denominated *prætexta*. See *TEXTA*, &c. In some universities, wear a scarlet gown. In the Sorbonnors always are in gowns and caps. E wear gowns of two or more colours.

(3.) Gown is also taken in the general magistracy or the profession opposite arms. In this sense it was that Cicero *arma togæ*.

\* GOWNED, *adj.* [from gown.] I gown.—

A noble crew about them waited  
Of sage and sober peers, all gravely gown'd

In velvet white as snow the troops  
The seams with sparkling emeralds

\* GOWNMAN. *n. f.* [*gown* and *man*] devoted to the arts of peace; one whose habit is a gown.—

Let him with pedants  
Pore out his life amongst the lazy gown  
—Thus will that whole bench, in an  
be composed of mean, fawning gown  
dants upon the court for a morsel of bread

GOWRAN, a borough, and post town, in the county of Kilkenny, 3 Ballinabola castle, 8 E. of Kilkenny, 3 Dublin. It is governed by a portreev and town-clerk. Here are the ruin church, and the handsome seat of t Clifden. Lon. 7. 0. W. Lat. 52. 34.

(1.) GOWRIE, Earl of. See SCO

(2.) GOWRIE, CARSE OF, a fertile Perthshire, lying between Perth and along the north banks of the Tay, producing excellent crops. The great it is comprehended in the parish of ERROL, N<sup>o</sup> 1.

GOXHILL, two small towns; 1. shire, near Barton: 2. near Hornsey,

GOYAVA, a town of Africa, on the coast of the island. Lon. 61. 31. W. L

GOYAVES, a town of Guadaloupe

John VAN, painter of landscapes, pieces, was born at Leyden in 1596; visited by Isaac Nicolai, a good afterwards by Esaias Vanderwilde, rated landscape painter of his time. soon rose into general esteem; and more spread throughout Europe than of any other matter, as he possessed common readiness of hand and freedom. It was his practice to sketch the rivers and towns on the banks of rivers, the sea-ports in the Low Countries; and scenes of inland villages, where the scenes appeared picturesque. Those he affected as subjects for his landscapes; enriched with cattle, boats, and figures in the understood perspective, and the which enabled him to give his pictures an agreeable effect. He died in 1660.—His best pieces are generally his name and the year; and his high price will be for ever estimable. His pictures have a greyish cast, occasioned by a colour called *Haerlem blue*, then used, but now disused, as it is apt to lose that greyish tint. His best works are highly in most parts of Europe, and large prices, being ranked with the works of Teniers. They are not now easily to be had if undamaged, though his slighter works are sufficiently common.

GRABAW, a river in Derby and Lancashire, empties into Mersey.

GRABEN, a town of England, in Monmouthshire, near Abergavenny.

GRABEN, a sea port of Morocco, on the Atlantic, near Mozador.

GRABEN, an island of the Mediterranean, 4½ miles from Malta, and 24 miles from Sicily. It is supposed to be the island of Calpe, celebrated by Homer. It is furnished with high rocks, which render it not easy to be taken; yet it is very fertile in the middle. It had 6000 inhabitants in 1551, when the island was retaken by the Spaniards; but in 1559, it was retaken by the English, grand master of Malta. The possession of it along with Malta, in 1798, it was retaken by the British under Admiral Nelson, of the ship *Alexander*, on the 28th of August 1798.

GRABEN, an island of the Mediterranean, near Candia. Lon. 41. 31. E. of Ferro. N.

GRACIUS, a celebrated physician, born at Groningen, in Holland, in 1641. He studied at Prussia, and was educated in medicine. Here he acquired great honour by publishing *De Succo Pancreatico*. He also wrote pieces upon the organs of generation and female; upon which subject he was in controversy with Swammerdam. He died aged 32; and his works, with his letters, were published at Leyden in 1677,

GRABER, a town of Bohemia, in the circle of Moravia, 17 miles WNW. of Leitmeritz.

GRABOW, a town of Poland, in the palatinate of Lublin, 12 miles S. of Kalisz.

GRABAW, a town of Poland, in the palatinate of Belez, 28 miles NNW. of Belez.

(1.) \* To GRABBLE. *v. a.* To lie prostrate on the ground. *Sinforth.*

(2.) \* To GRABBLE. *v. n.* [probably corrupted from *grapple.*] To grope; to feel eagerly with the hands.—My blood chills about my heart at the thought of these rogues, with their bloody hands *grabbling* in my guts, and pulling out my very entrails. *Arbutnot's John Bull.*

GRABE, John Ernest, a very learned writer in the beginning of the 18th century, born at Königsberg in Prussia. He was educated in the Lutheran religion; but the reading of the fathers led him into doubts. He presented to the electoral consistory at Sambia in Prussia a memorial containing his doubts. The elector ordered 3 eminent divines to answer them. Their answers shook him in his resolution of embracing the Roman Catholic religion; and one of them, Spener, advised him to go to England. He went; and King William III. gave him a pension, which was continued by queen Anne. He was ordained a priest of the church of England, and honoured with the degree of D. D. by the university of Oxford; upon which occasion Dr George Smalridge pronounced two Latin orations, which were afterwards printed. He wrote, 1. *Specilegium S. S. Patrum, ut et Hæreticorum, sæculi post Christum natum*, 8vo. 2. An edition of the Septuagint, from the Alexandrian MS. in St James's library. 3. Notes on Justin, &c.; and other works, which are esteemed.

(1.) GRABEN, a town of Croatia

(2.) GRABEN, a town of Silesia, in Oels.

(1.) GRABERN, a town of Bohemia.

(2.) GRABERN, a town of Germany in Austria, 3 miles N. of Sonneberg.

GRABINETZ, a town of Maritime Austria, in Istria, 14 miles NE. of Pedana.

GRABO, a town of Sweden in E. Gothland, 11 miles SE. of Linköping.

GRABOW, a town of Germany in Mecklenburg, 22 miles S. of Schwerin.

GRACAY, a town of France, in the dept. of Cher, 12 miles NNW. of Issoudun, and 10 SW. of Vierzon.

GRACCHOPOLIS, or the city of Gracchus, the ancient name of Cracow, in Poland.

GRACCHURIS, a city of Castile in Spain, built by Sempronius Gracchus, formerly called Illurcia.

(1.) GRACCHUS, Sempronius, the father of Tiberius and Caius (N<sup>o</sup> 2, 3.) by Cornelia the daughter of Scipio. He was proconsul in Spain, subdued the Celtiberians, and rebuilt or repaired GRACCHURIS.

(2, 3.) GRACCHUS, Tiberius and Caius. Tiberius being tribune of the Roman people, demanded in their name, the execution of the Agrarian law; by which all persons possessing above 200 acres of land were to be deprived of the surplus, for the benefit of the poor citizens, amongst whom an equal distribution of them was to be made. Having carried his plan into execution by violent measures, he fell a victim to his zeal, being assassinated, A. A. C. 133. Caius his brother pursuing the same steps, was killed by the consul Opimius, A. A. C. 121. See ROME.

(1.) \* GRACE.

(1.) \* GRACE. *n. f.* [*grace*, French; *gratia*, Latin; *grace*, Este.] 1. Favour; kindness.—If the highest love in no base person may aspire to *grace*, then may I hope your beauty will not be without pity. *Sidney*.—

O momentary *grace* of mortal men,  
Which we more hunt for than the *grace* of God!  
*Shakespeare*.

Such as were popular,  
And well deserving, were advanc'd by *grace*.  
*Daniel*.

—Is this the reward and thanks I am to have for those many acts of *grace* I have lately pass'd?  
*King Charles*.—

Yet those remov'd,  
Such *grace* shall one just man find in his fight,  
That he relents, not to blot out mankind. *Milt*.  
—He receiv'd all the *graces* and degrees, the proctorship and the doctorship could be obtained there.  
*Clarendon*.—

Or each, or all, may win a lady's *grace*;  
Then either of you knights may well deserve  
A princess born. *Dryden's Fables*.

None of us, who now your *grace* implore,  
But held the rank of sov'reign queen before.  
*Dryden*.

Proffer'd service I repaid the fair,  
That of her *grace* she gave her maid to know  
The secret meaning of this moral show. *Dryden*.

2. Favourable influence of God on the human mind.—The *grace* of God, that passeth understanding, keep your hearts and minds. *Common Prayer*.—The evil of sin is that we are especially to pray against, most earnestly begging of God, that he will, by the power of his *grace*, preserve us from falling into sin. *Duty of Man*.—

Plevent *grace* descending had remov'd  
The stony from their hearts, and made new flesh  
Regenerate grow instead. *Milton*.

3. Virtue; effect of God's influence.—Within the church, in the public profession and external communion thereof, are contained persons truly good and sanctified, and hereafter saved; and together with them other persons void of all saving *grace*, and hereafter to be damned. *Pearson*.—

How Van wants *grace*, who never wanted wit.  
*Pope*.

4. Pardon; mercy.—  
Noble pity held  
His hand a while, and to their choice gave space  
Which they would prove, his valour or his *grace*.  
*Waller*.

Bow and sue for *grace*  
With suppliant knee. *Milton*.

5. Favour conferred.—  
I should therefore esteem it great favour and *grace*,  
Would you be so kind as to goin my place. *Prior*.

6. Privilege.—  
But to return and view the cheerful skies,  
To few great Jupiter imparts this *grace*. *Dryd*.

7. A goddess, by the heathens supposed to bestow beauty.—

This forehead, where your verse has laid  
The loves delighted and the *graces* play'd. *Prior*.

8. Behaviour, considered as decent or unbecoming.—The same words in Philoclea's mouth, as from one woman to another, so as there were no

other body by, might have had a better perchance have found a gentler reception.  
Have I reason or good *grace* in

9. Adventitious or artificial beauty; appearance.—

One lilac only, with a statlier g  
Presum'd to claim the oak's and c  
And, looking round him with a me  
Spread his exalted boughs to wave  
Her purple habit fits with such  
On her smoo shoulders, and so

—To write and speak correctly gives gains a favourable attention to what say. *Locke*. 10. Natural excellence.— me, that things of principal excellen thus bitten at by men whom God with *graces*, both of wit and learning purposes. *Hooker*.—

To some kind of men,  
Their *graces* serve them but as ene  
In his own *grace* he doth exalt h  
More than in your advancement.

The charming Lausus, full of y  
To Turnus only second in the gra  
Of manly mien, and features of th

11. Embellishment; recommendation  
Where justice grows, there grows  
er *grace*,  
The which doth quench the bra  
smart.

Set all things in their own pecul  
And know that order is the greatest  
The flow'r which lasts for little  
A short liv'd good and an uncertain

12. Single beauty.—  
I pass their form and every chan

13. Ornament; flower; highest perfe  
By their hands this *grace* of king  
If hell and treason hold their prom

14. Single or particular virtue.—  
The king becoming *graces*,  
As justice, verity, temp'rance, stat  
Devotion, patience, courage, fortit  
I have no relish of them. *Shakespeare*

—The *graces* of his religion prepare  
most useful discharge of every relation  
gers. 15. Virtue physical.—

O, mickle is the pow'rtul *grace* t  
In plants, herbs, stones, and their tr

16. The title of a duke or archbishop of the king, meaning the same as your clemency.—

Here come I from our princely g  
To know your griefs; to tell you fru  
That he will give you audience. *Sh*  
—High and mighty king, your *grace*  
your nobles here present, may be plea  
your ears. *Bacon's H. VII.*—Accord  
usual proceeding of your *grace*, and o  
with delinquents which are overtaken  
in simplicity, there was yielded unto h  
rate, patient, and full hearing, toget  
satisfactory answer to all his main  
White. 17. A short prayer before and

• soldiers use him as the *grace* before meat, alk at table, and their thanks at end. *Shak.* *grace* is saying after meat, do you and then take the chairs from behind the . *Scuff.*—  
n cheerful healths, your mistress shall  
ire place;  
hat's more rare, a poet shall say *grace*.

*Pope.*

**GRACE**, among divines, (§ 1. *def.* 2, 3.) is For the free love and favour of God, the spring and source of all the benefits re from him. 2. For the work of the lewring the soul after the image of God; usually guiding and strengthening the be- obey his will, to resist and mortify sin, come it.

**GRACE** at meals. See § 1. *def.* 17. The the moral obligation of this ceremony, om different passages of the New Testa- e so well known, that it is needless to em. Others have been drawn from the of different nations, of very remote anti- thenæus tells us, in his *Deipnosoph.* lib. ii he famous regulation made by Amphic- z of Athens, as to the use of wine, both ces and at home, he required that the

*Jupiter the Sustainer* should be decently rately pronounced. The same writer, in . 149. quotes Hermias, an author extant ne, who mentions a people in Egypt, in s of Naucratis, whose custom it was, af- had placed themselves in the usual pos- ating at the table, to rise again and kneel; e priest began to chant a *grace*, according d form amongst them; and when that ; they joined in the meal in a solemn fa- manner. Heliodorus has a passage in his s to the same purpose, that it was the of the Egyptian philosophers, to pour out and put up ejaculations before they sat meals. Porphyry, in his treatise *De ab- iv. p. 408*, gives a great character of the gymnosophists in Egypt for the strictness lives; and observes, that at the founding l before meals, which consisted only of ad, fruits, and herbs, they went to pray- ich being ended, the bell sounded again, fat down to eating. In general this was as usage among the ancient Greeks, de- yet older ages, according to Clement ndria. He mentions, that these people, ey met together to refresh themselves with : of the grape, sung a piece of music, in of the Hebrew psalms, which they call- sion. Livy, lib. xxxix. speaks of it as a ustom among the Romans, that they of- rifice and prayer to the gods at their id computations. But one of the fullest ies is given by Quæntilian, *Declam.* 301. *ensam*, says he, *ad quam cum venire capi- us invocamus*; “We approached the ta- supper together), and then invoked the The Jesuit Trigautius, in his very elegant ictive narrative of the expedition of their ries into China, B. i. p. 69. gives a similar of the Chinese, who “before partaking ntertainment, pour out wine upon the

X. PART II.

ground, as a thankful oblation to the Lord of hea- ven.” The Turks pray for a blessing on their meat; and many more instances might be pro- duced of nations who have constantly observed the like custom, in some way or other. The cele- brated Jewish historian Josephus, giving a detail of the rites and customs of the Essenes, who were confessedly the strictest and most pious professors of the Jewish religion, says “The priest begs a blessing before they presume to take any nourish- ment; and it is looked upon as a great sin to take or taste before; When the meal is over, the priest prays again; and the company with him bless and praise God as their preserver, and the donor of their life and nourishment.” Puffe, in his book *De vita contemplativa*, gives a similar ac- count of a body of men and women stricter than even the Essenes. From the Hebrew ritual it ap- pears, that the Jews had their hymns and psalms of thanksgiving, not only after eating their pass- over, but on a variety of other occasions, at and after meals, and even between their several cour- ses and dishes. Aristæus (as quoted by R. Eleazar,) says “Moses commands, that when the Jews are going to eat or drink, the company should im- mediately join in sacrifice or prayer.”

(4.) **GRACE**, or **GRACEFULNESS**, in the human character, is an agreeable attribute, inseparable from motion as opposed to rest, and as compre- hending speech, looks, gesture, and loco-motion. As some motions are homely, the opposite to graceful, it may be inquired, With what motions is this attribute connected? No man appears graceful in a mask; and therefore, laying aside the expressions of the countenance, the other mo- tions may be genteel, may be elegant, but of them- selves never are graceful. A motion adjusted in the most perfect manner to answer its end, is ele- gant; but still somewhat more is required to com- plete our idea of grace or gracefulnes. What this *more* may be, is the nice point. One thing is clear from what is said, that it must arise from the expressions of the countenance: and from what expressions so naturally as from those which indi- cate mental qualities, such as sweetness, benevo- lence, elevation, dignity? This promises to be a fair analysis; because of all objects mental quali- ties affect us the most; and the impression made by a graceful appearance, upon every spectator of taste, is too deep for any cause purely corporeal. The next step is, to examine what are the mental qualities, that, in conjunction with elegance of motion, produce a graceful appearance. Sweet- ness, cheerfulness, affability, are not separately sufficient, nor even in conjunction. Dignity alone, with elegant motion, produce a graceful appear- ance; but still more graceful with the aid of other qualities, those especially that are the most exalted. See **DIGNITY**, § 3. But this is not all. The most exalted virtues may be the lot of a person whose countenance has little expression; but such a person cannot be graceful. To produce this appearance, must be added, an expressive countenance, display- ing to every spectator of taste, with life and energy, every thing that passes in the mind. Collecting these circumstances together, grace may be de- fined, “that agreeable appearance, which arises from elegance of motion, and from a countenance

C C C

expressive

expressive of dignity." Expressions of other mental qualities are not essential to that appearance, but they heighten it greatly. Dancing affords great opportunity for displaying grace, and haranguing still more. See DANCING, DECLAMATION, and ORATORY. But in vain will a person attempt to be graceful who is deficient in amiable qualities. A man, it is true, may form an idea of qualities he is destitute of; and, by means of that idea, may endeavour to express these qualities by looks and gestures: but such studied expression will be too faint and obscure to be graceful.

(5.) GRACE, ACT OF, the appellation given to the act of parliament, 1696, c. 32, which allows prisoners for civil debts to be set at liberty, upon making oath that they have not wherewithal to support themselves in prison, unless they are allowed by the creditors on whose diligences they were imprisoned, within ten days after intimation made for that purpose.

(6.) GRACE, DAYS OF, three days immediately following the term of payment of a bill, within which the creditor must protest it, if payment is not obtained, in order to entitle him to recourse against the drawer.

(7.) GRACE, HERB OF, a species of RUTA.  
 \* To GRACE, v. a. [from the noun.] 1. To adorn; to dignify; to embellish; to recommend; to decorate.—This they study, this they practise, this they grace with a wanton superfluity of wit.  
*Hooker.*

I do not think a braver gentleman,  
 More dawning, or more bold is now alive,  
 To grace this latter age with noble deeds. *Shak.*  
 Little of this great world can I speak,  
 And therefore little shall I grace my cause,  
 In speaking for myself. *Shak. Othello.*  
 —There is due from the judge to the advocate some commendation and *gracing*, where causes are well handled. *Bacon.*

Rich crowns were on their royal scutcheons  
 plac'd,  
 With saphires, diamonds, and with rubies grac'd.  
*Dryden.*

By both his parents of descent divine;  
 Great Jove and Phœbus grac'd his nobler line.  
*Pope.*  
 Though triumphs were to generals only due,  
 Crowns were reserv'd to grace the soldiers too.  
*Pope.*

2. To dignify or raise by an act of favour.—  
 He writes  
 How happily he lives, how well belov'd,  
 And daily graced by the emperor. *Shak.*  
 —He might at his pleasure grace or disgrace whom  
 he would in court. *Knollys.*

Dispose all honours of the sword and gun,  
 Grace with a nod, and ruin with a frown.  
*Dryden.*

3. To favour.—  
 When the guests withdrew,  
 Their courteous host saluting all the crew,  
 Regardless pass'd her o'er, nor grac'd with kind  
 adieu. *Dryden.*

\* GRACE-CUP, n. f. [*grace* and *cup*.] The cup or health drunk after grace.—

The grace cup serv'd, the cloth away,  
 Jove thought it time to shew his play. *Prior.*

\* GRACED, adj. [from *grace*.] 1. Beautiful;

graceful. Not in use.—He saw this gent  
 of the properest and best graced men  
 saw, being of a middle age and a m  
*Sidney.* 2. Virtuous; regular; chaste.

Epicurism and lust  
 Make it more like a tavern or a bro  
 Than a grac'd palace. *Shak.*

(1.) GRACEDIEU, a town in Le  
 between Ashby de la Zouch and Lou

(2.) GRACEDIEU, a village in Mon  
 on the Trothy, SW. of Moenmouth.

\* GRACEFUL, adj. [from *grace*.]  
 with dignity.—

Amid' the troops, and like the le  
 High o'er the rest in arms the grac  
 rode.

Matchless his pen, victorious was  
 Bold in the lists, and graceful in the d  
 Yet graceful ease, and sweetness w  
 Might hide her faults, if belles bad fa

Graceful to fight, and elegant to  
 The great are vanquish'd, and th  
 taught.

\* GRACEFULLY, adv. [from *grac  
 gently; with pleasing dignity.—*

Through nature and through art  
 And gracefully her subject chang'd.  
 —Walking is the mode or manner of  
 a beast; but walking gracefully imply  
 or mode superadded to that action. *Wi*

(1.) \* GRACEFULNESS, n. f. [from  
 Elegance of manner; dignity with bea  
 His neck, his hands, his shoulde  
 breast,

Did next in gracefulness and beauty  
 To breathing figures. *Dry*

—He executed with so much gracefulli  
 ty, that he alone got money and reput  
*den's Dnfr.*—There is a secret gracefulness  
 which accompanies his writings, thoug  
 nels and sobriety of age be wanting. *Dry*  
*Præface.*

If hearers are amaz'd from whence  
 Proceeds that fund of wit and sense,  
 Which, though her modesty would  
 Breaks like the sun behind a cloud;  
 While gracefulness its art conceals.  
 And yet through ev'ry motion steals

(2.) GRACEFULNESS. See GRACE,  
 GRACE-HILL, a town of Ireland, in  
 settlement of the Moravians; 1½ m. fr

\* GRACELESS, adj. [from *grace*.]  
 grace; wicked; hopelessly corrupt; abu

This graceless man, for furtherance  
 Did court the handmaid of my lady de

Whose hap shall be to have h  
 Will not so graceless be, to be ingr

—In all manner of graceless and hope  
 ters, some are loit for want of advice,  
 for want of heed. *L'Esrange.*

Furnish'd for offence, he cross'd t  
 Betwixt the graceless villain and his g

(1.) \* GRACES, n. f. Good graces li  
 seldom used in the singular —

Den and delivery of her heart,  
 Her goods and chattels, and good g  
 And person, up to his embraces.

**GRACES, GRATIÆ, or CHARITES**, in theology, were fabulous deities, three who attended on Venus. Their names, Thalia, and Euphrosyne; i. e. *Shining*, and *gay*; or, according to some authors, Euphrosyne, and Egiale. They were some to be the daughters of Jupiter, one the daughter of Oceanus; and by Bacchus and Venus.—Some will have to have been four; and make them the three Hours, or rather with the three of the year. A marble in the king of Sicily represents the three Graces in the air, with a fourth seated and covered with a veil, with the words underneath, *Ad*.—But this group we may understand three Graces, and Venus, who was their daughter of Jupiter by Dione. They were always supposed to have hold of each other's hands, and never parted. They were represented to show that the Graces borrow from art, and that they have no other source than those of nature. Yet in the first ages they were represented naked, as appears from Pausanias (lib. vi. and ix.) who describes their statues. They were of wood, all but their feet, and hands, which were white. Their robe or gown was gilt; one of them held a rose, another a dye, and the third a myrtle.

**GRACES**, in geography, a village in Essex, Baddow.

**GRACIA DIOS**, [Span. i. e. *Thanks to God*.] Mexico, in the province of Honduras.

**GRACILE**, *adj.* [*gracilis*, Latin.] Slender;

**GRACILENT**, *adj.* [*gracilentus*, Lat.] Lean.

**GRACIA**, a muscle of the leg, so called from its shape. See **ANATOMY**, § 216.

**GRACILITY**, *n. f.* [*gracilitas*, Lat.] Slenderness.

**GRACIA**, one of the **AZORES**. It has inhabitants; produces wheat, wine, and abounds with black cattle. It exports cheese.

**GRACIOUS**, *adj.* [*gracieux*, Fr.] 1. Merciful.—Common sense and reason could not be pleased, nor consequently worshipped by a thing barbarous or cruel. *South*.—2. and *gracious*, and a lover of knowledge of the most amiable things. *Burton*.—3. Favourable; kind.—And the Lord showed favour unto them, and had compassion on them. *Isa. xlii. 23*.—

Unblam'd Ulysses' house,  
I finde receipt to *gracious*. *Chapman*.  
From now reveal

the beam of light; from now inspire  
me to sing, my hand to touch the lyre.

*Prior*.  
I am favoured.—Doctrine is much more  
valued *graciously* by example than by rule.

made us *gracious* before the kings of  
the earth they gave us food. 1 *Esdr. viii. 80*.  
Who was now general of the horse, was  
*gracious* to prince Rupert than Wilmot

had been. *Clarendon*. 4. Virtuous; good.—Kings  
are no less unhappy, their issue not being *gracious*  
than they are in losing them when they have ap-  
proved their virtues. *Shak. Winter's Tale*. 5. Ex-  
cellent. Obsolete.—The grievous abuse which  
hath been of councils, should rather cause men  
to study how so *graciously* a thing may again be re-  
duced to that first perfection. *Hooker*. 6. Grace-  
ful; becoming. Obsolete.—Our women's names  
are more *gracious* than their Rutilia, that is, red  
head. *Comden*.

\* **GRACIOUSLY**, *adv.* [from *gracious*.] 1.  
Kindly; with kind condescension.—His testimony  
was *graciously* confirmed, that it was the best of all  
my tragedies. *Dryden*.—

He heard my vows, and *graciously* decreed  
My grounds to be restor'd, my former flocks to  
feed.

—If her majesty would but *graciously* be pleased  
to think a hardship of this nature worthy her royal  
consideration. *Swift*. 2. In a pleasing manner.

\* **GRACIOUSNESS**, *n. f.* [from *gracious*.] 1.  
Kind condescension.—The *graciousness* and temper  
of this answer made no impression on them. *Clarendon*. 2. Pleasing manner.

**GRACULA**, the **GRACKLE**, in ornithology, a  
genus belonging to the order of *picæ*. The bill is  
convex, cultrated, and bare at the point; the  
tongue is not cloven, but is fleshy and sharpish;  
it has 3 toes before and one behind. See **PL. CLXIX**.  
*fig. 1*. There are 12 species. The most remark-  
able are the following:

1. **GRACULA BARITA**, the *boat-tailed grackle*, is  
about the size of a cuckoo. The bill is sharp,  
black, and an inch and a half in length; the  
general colour of the plumage is black, with a gloss  
of purple, especially on the upper parts; the legs  
and claws are black, the latter hooked. There is  
a singularity in the folding up of the tail-feathers,  
which, instead of forming a plain surface at top,  
sink into a hollow like a deep gutter. It always  
carries its tail expanded when on the ground, fold-  
ing it up in the above singular manner only when  
perched or flying. It inhabits Jamaica, and feeds  
on maize, beetles, and other insects, as well as  
on the fruit of the banana. It is likewise common  
in North America. They breed in swamps, and  
migrate in September.

2. **GRACULA CRISTATELLA**, the *Chinese star-  
ling*, is a little bigger than a blackbird. The bill  
is yellow or orange: and the general colour of the  
plumage blackish, with a tinge of blue: the legs  
are a dull yellow. These birds talk and whistle  
very well, and are common in China, where they  
are much esteemed; and the figures of them are  
seen frequently in Chinese paintings. Their food  
is rice, insects, worms, and such like.

3. **GRACULA QUISCUA**, the *purple jack-daw*,  
or *Barbadoes blackbird*, is about the size of a black-  
bird, and is black, but most beautifully and richly  
glossed with purple, especially on the head and  
neck. The female is wholly brown, but deepest  
on the wings and tail. This species inhabits Ja-  
maica, Carolina, Mexico, and other parts of North  
America. These birds generally feed on maize,  
whence they are named *maize-thieves*; but this is  
not their only food. In spring, soon after the  
maize seed is put into the ground, they scratch it

up again; and as soon as the leaf comes out, they take it up with their bills, root and all; but when it is ripe they do still more damage, for at that time they come by thousands, and are so bold, that if disturbed in one part of a field they only go to another. In New Jersey and Pennsylvania 3d. per dozen was once given for the dead birds, and by means of this premium they were nearly extirpated in 1750; when the persecution of them was abated on account of the great increase of worms which had taken place in the meadows, and which in the preceding year had left so little hay in New England as to occasion an importation from other parts. The grakles were therefore again tolerated, as it was observed that they fed on these worms till the maize was ripe. These birds build in trees. They pass the winter in swamps, which are quite overgrown with wood, only appearing in mild weather; and after the maize is got in, are content to feed on the aquatic tare-grass, and if pressed by hunger, buck wheat and oats, &c. they are said also to destroy that pernicious insect the BRUCHUS PISI. Their note is pretty agreeable; but their flesh is not good to eat.

4. GRACULA RELIGIOSA, the lesser grackle, or Indian hare, is about the size of a blackbird, the bill an inch and a half long, and of an orange colour. The general colour of the plumage is black, glossed with violet, purple, and green, in different reflections of light: on the quills is a bar of white; the feathers and legs are orange yellow, and the claws of a pale brown. This species, which is found in several parts of the East Indies, in the Isle of Hainan, and almost every isle beyond the Ganges, is remarkable for whistling, singing, and talking well, much better and more distinct than any of the parrot genus. Its food is of the vegetable kind. Those kept in this climate are observed to be very fond of cherries and grapes; if cherries are offered to one, and it does not immediately get them, it cries and whines like a child, till it has obtained them. It is very tame and familiar.

GRACULUS. See CORYUS, § III, N° 10.

GRADACCIO, a hill of Corsica, in the middle of the island; on which there are two lakes, where the chief rivers take their rise.

(1.) \* GRADATION. *n. f.* [*gradation*, French; *gradus*, Lat.] 1. Regular progress from one degree to another.—The desire of more and more rises by a natural *gradation* to most, and after that to all. *L'Esperance*. 2. Regular advance step by step.

From thence,

By cold *gradation*, and well balanc'd form,

We shall proceed with Angelo. *Shake-sp.*

—The psalmist very elegantly expresseth to us the several *gradations* by which men at last come to this horrid degree of impiety. *Tillot.* 3. Order; sequence; series:—

'Tis the curse of service;

Preferment goes by letter and affection,

Not, as of old, *gradation*, where each second Good heir to th' first. *Shak. Othello.*

4. Regular process of argument.—Certain it is, by a direct *gradation* of consequences from this principle of merit, that the obligation to gratitude

flows from, and is enjoined by, the first of nature. *Soub.*

(2.) GRADATION, in logic, (§ 1. *def.*) of reasoning, otherwise called *SORITES*.

(3.) GRADATION, in painting, a gradual sensible change of colour, by the dimming the tints and shades.

(4.) GRADATION, in rhetoric, the CLIMAX.

\* GRADATORY. *n. f.* [*gradus*, Lat.] from the cloisters into the church. *Asy.*

GRADECK, a town of Lithuania, in the province of Troki, 20 miles SSW. of Grodno.

GRADES, or GRADUS, a town of Prussia, 5 miles N. of Gurk, and 5 W. of Friedland.

GRADETZ, a town of the Helvetii, 6 miles E. of Sion.

\* GRADIENT. *adj.* [*gradiens*, Lat.] moving by steps.—Amongst those *gradations*, that iron spider is especially remarkable, which, being but of an ordinary bigness, moves up and down as if it had been alive. *H.*

GRADIGNA, a town of Maritima, in the Kingdom of Naples, 7 miles SSE. of Capo d'Istria.

GRADISCA, a town of Slavonia, on the Danube, 10 miles S. of Sissek.

(1.) GRADISKA, a town of Croatia, it was taken by the Turks in 1691. It is surrounded by mountains, and is seated on the Save, 20 miles W. of Belgrade, and 10 miles S. of Vienna. Lon. 18. 39. E. Lat. 45. 28.

(2.) GRADISKA, or GRADISCA, a town of Germany, in the circle of Austria, in the province of Friuli, and formerly included in the Kingdom of Hungary, but now in that of Goritz; built in 1473, to stop the inroads of the Turks. It was blockaded by the French under Bernadotte and Serrurier, on the 19th of August, and surrendered next day, though there were 5000 Austrians, (filed by Bonaparte) and 10 pieces of cannon, with 8 standards, and 5 miles S. of Goritz, 15 SE. of Udine, and 10 SSW. of Vienna. Lon. 13. 37. E. Lat. 46. 13.

(3.) GRADISKA, or GRADISCA, a town of Austria, formerly a county of Friuli, and now in that of Goritz. *Gradiska*, N° 2.) is the capital of the county.

(4.) GRADISKA, or GRADISCA, a village in Maritime Austria, and late Venetia, 10 miles WSW. of Udine. It was taken by the French, under general Guieux, in March, 1797, after a sharp engagement, in which the Austrians were defeated with the loss of 450 men, one general and 6 pieces of cannon, and the archduke Charles narrowly escaped taken prisoner.

(5.) GRADISKA, or GRADISCHE, a town of Austria, 1 mile from Windisch-Grätz.

GRADISTA, a town of European Bulgaria, near Servia, 40 miles S. of Vidin.

GRADLITZ, a town of Bohemia, in the province of Koniggratz, 12 miles N. of Koniggratz.

(1.) GRADO, a town of Spain, in the province of Asturias, 10 miles NW. of Oviedo.

(2.) GRADO, a podestaria or district of Austria, in the Dogado of Venice, including several lakes and islands.

ADO, an island on the S. coast of Friuli, in the above district. (N<sup>o</sup> 2.) Lon. 13. t. 45. 52. N.

ADO, a strong town in the above island, 6 miles E. by N. of Venice, containing 30 souls. It has an ancient cathedral, seated on the borders of the Dogad.

GRADUAL. *adv.* [*graduel*, Fr.] Pro-  
gress degrees; advancing step by step; from  
to another.—

Nobler birth  
tunes animate with *gradual* life,  
vibrating reason, all summ'd up in man.  
*Milton.*

I suppose a *gradual* natural progress of  
things, from great, things and persons  
downward, till at length, by many steps  
they come to be at greatest. *South.*

GRADUAL. *n. f.* [*gradus*, Latin.] An or-  
ps.—

See the *gradual* prostrate they ador'd,  
venerable kins'd, and thus the saint implor'd.  
*Dryden.*

DUALITY. *n. f.* [from *gradual*.] Re-  
gression.—This some ascribe unto the  
of the elements, others to the *graduality*  
of and light. *Brown.*

DUALITY. *adv.* [from *gradual*.] 1.  
ness; in regular progression.—When the  
eyes over the fixed stars, and eclipses them,  
it vanishes; not *gradually*, like that of the  
out all at once. *Newton's Opticks*.—The  
four being weans us *gradually* from our  
of life the nearer we approach towards  
fit. *Swift*.—Human creatures are able to  
of much greater density in diving, and of  
upon the tops of mountains, provided  
may be made *gradually*. *Arbutnot*. 2. In  
Human reason doth not only *gradually*,  
fically differ from the fantastic reason of  
*Irish*.

GRADUATE. *n. f.* [*gradué*, Fr. from  
Latin.] A man dignified with an acade-  
mic degree.—

*Graduates* I dislike the learned route,  
I use a female doctor for the gout.  
*Bramston.*

GRADUATE. See DEGREE, § 3.

GRADUATE. *v. a.* [*graduér*, French;  
Latin.] 1. To dignify with a degree in  
university.—John Tregonwel, *graduated* a  
and dubbed a knight, did good service.  
*Survey of Cornwall*.—Concerning columns  
adjuncts, architects make such a noise.  
terms of architraves, frizes, and cornices,  
ought to *graduate* a master of this art.

2. To mark with degrees.—The places  
marked where the spirits stood at the severest  
greatest heat, and according to these ob-  
servations he *graduates* his thermometers. *Derham*.  
use to a higher place in the scale of me-  
chanical term.—The tincture was capa-  
ble to smute or *graduate* as much silver as an  
ounce weight that gold. *Boyle*. 4. To heighten  
improve.—Not only vitriol is a cause of  
it, but the salts of natural bodies; and dy-  
e and *graduate* their colours with salts  
*Vulgar Errors*.

GRADUATION. *n. f.* [*graduation*, French;  
from *graduate*.] 1. Regular progression by suc-  
cession of degrees.—The *graduation* of the parts  
of the universe is likewise necessary to the per-  
fection of the whole. *Crew*. 2. Improvement; ex-  
altation of qualities.—Of greater repugnancy un-  
to reason is that which he delivers concerning its  
*graduation*, that heated in fire, and often extin-  
guished in oil of Mars or iron, the loadstone ac-  
quires an ability to extract a nail fastened in a wall.  
*Brown*. 3. The act of conferring academical de-  
grees.

GRADWEIN, a town of Stiria, 6 miles NW.  
of Graz.

(1.) GRÆCIA, Greece. See GREECE.

(2.) GRÆCIA, MAGNA, in ancient geography,  
part of the outermost coast of Italy, originally in-  
habited by Greeks. See ITALY.

GRÆCUS. See GREECE.

(1.) GRÆME, John, a Scottish poet, born at  
Carnwath in Lanarkshire, in 1748, whose posthu-  
mous poems have been much admired. His fa-  
ther was a farmer, and he was taught grammar at  
Lanark, under Mr R. Thomson, brother-in-law  
of the celebrated poet, and his progress was rapid.  
In 1766, he went to the University of Edinburgh,  
where he soon surpassed the most industrious, and  
spoke Latin with elegance and accuracy. He also  
acquired considerable knowledge in mathematics,  
natural philosophy, metaphysics, and the Belles  
Lettres. In 1769, he gave the first specimens of  
his poetical genius. In 1770, he was admitted  
into the theological class; but the fatal disease,  
which cut him off, now began to appear, in the  
form of a gradual decline, and soon ended in a  
deep consumption. He died July 26, 1772. His  
poems, consisting of 50 elegies and other miscella-  
neous pieces, were collected and printed at Edin-  
burgh in 1773, in 8vo, the expence being defrayed  
by his friends.

(2.) GRÆME. See GRAHAM.

GRÆMSAY, a small island and parish of Scot-  
land, in the county of Orkney, 1½ miles long and  
1 broad, united to the parish of Hoy. See HOY.  
The population of this island, in 1794, stated by  
the rev. Robert Sands, in his report to Sir J. Sin-  
clair, consisted of 36 families, and 160 souls.

GRAESATZ, a town of Hungary, in Croatia,  
30 miles S. of Bihacz.

GRÆVIUS, John George, one of the most  
learned writers in the 17th century. In the 24th  
year of his age, the elector of Brandenburg made  
him professor at Duisbourg. In 1658, he was in-  
vited to Deventer to succeed his former master  
Gronovius. In 1661, he was appointed professor  
of eloquence at Utrecht; and in 1673, professor  
of politics and history. He fixed here, and refu-  
sed several advantageous offers. He had the satis-  
faction to be sought after by divers princes, and  
to see several of them come from Germany to study  
under him. He died in 1703, aged 71. His *The-  
saurus antiquitatum et historiarum Italiae*, &c. and  
other works are well known.

GRAFABERG, a town of Austria, 5 miles SW.  
of Scrattenthal.

GRAFENDORF, a town of Austria, on the  
Beilach, 4 miles S. of St Polten.

GRA-

GRAFENHAYNCHEN, a town of Saxony, 11 m. SE. of Dessau, and 11 SW. of Wittenberg.

GRAFENSCHLAG, a town of Austria, 4 m. S. of Zwettl.

GRAFENWORTH, a town of Austria, 11 m. SW. of Sonneberg.

(1.) \* GRAFF. *n. f.* A ditch; a moat. See GRAVE.—Though the fortifications were not regular, yet the walls were good, and the *graff* broad and deep. *Clarendon.*

(2.) \* GRAFF. GRAFT. *n. f.* [*greffe*, French.] A small branch inserted into the stock of another tree, and nourished by its sap, but bearing its own fruit; a young cyon.—God gave unto man all kind of seeds and *graffs* of life; as the vegetative life of plants, the sensual of beasts, the rational of man, and the intellectual of angels. *Raleigh.*—It is likely, that as in fruit-trees the *graff* maketh a greater fruit, so in trees that bear no fruit it will make the greater leaves. *Bacon's Natural History.*—

'Tis usual now an inmate *graff* to see  
With insolence invade a foreign tree. *Dryden.*  
—If you cover the top with clay and horse-dung,  
in the same manner as you do a *graff*; it will help  
to heal the sooner. *Mortimer.*—

Now the cleft rind inserted *graffs* receives,  
And yields an offspring more than nature gives.

(1.) \* To GRAFF. To GRAFT. *v. a.* [*greffer*, French.] 1. To insert a cyon or branch of one tree into the stock of another.—

His growth is but a wild and fruitless plant;  
I'll cut his barren branches to the stock,  
And *graft* you on to bear. *Dryden's Don Seb.*  
With his pruning hook disjoin  
Unbearing branches from their head,  
And *graft* more happy in their stead. *Dryden.*

2. To propagate by insertion or inoculation.—  
Now let me *graft* my pears and prune the vine. *Dryden.*

3. To insert into a place or body to which it did not originally belong.—And they also, if they bide not still in unbelief, shall be *grafted* in; for God is able to *graft* them in again. *Romans.*

These are th' Italian names which fate will join  
With ours, and *graft* upon the Trojan line. *Dryden's Aeneid.*

4. To impregnate with an adscititious branch.—  
We've some old crab-trees here at home, that will not

Be *grafted* to your relish. *Shak. Coriolanus.*  
The noble isle doth want her proper limbs;  
Her royal stock *graft* with ignoble plants. *Shak.*

5. To join one thing so as to receive support from another.—This resolution against any peace with Spain is a new incident *grafted* upon the original quarrel, by the intrigues of a faction among us. *Swift.*—

May one kind grave unite each hapless name,  
And *graft* my love immortal on thy fame. *Pope.*

(2.) \* To GRAFF. *v. n.* To practise infition.—  
In March is good *grafting* the skilful do know,  
So long as the wind in the East do not blow:  
From moon being chang'd, 'till past bethe prime,  
For *grafting* and cropping is very good time.

*Tusser.*  
I have fruit in greater plenty the way is to

*graft*, not only upon young stocks, but upon the boughs of an old tree; for they bear great numbers of fruit; whereas, if you graft upon one stock, the tree can bear but one.

GRAFFENBERG, a town of Upper Carniola, 19 miles SE. of Layb.

GRAFFENDORFF, a town of Styria, 19 miles SW. of Sonneberg.

GRAFFENTHAL, a town of Saxony, 7 miles S. of Saalfeld.

GRAFFEN-TONNA, a town of Saxe-Gotha, 8 miles N. of Gotha.

GRAFFENWARK, a town of Carinthia, 19 miles S. of Layb.

GRAFIGNY, France, a French lady, the authoress of the celebrated *Peruvian Letters*, which have been translated into all the languages. She was born in 1693, and married to the Count of Lorraine's chamberlain; after whose death she retired to Paris with mademoiselle De Guise, where her talents were much admired. She died in 1758, aged 65.

GRAFT. See GRAFF, § 1, 2.

\* GRAFTER. *n. f.* [from *graft* or *grafting*] who propagates fruit by grafting.—I have seen, by the trials of the most skilful gardeners, that a man shall seldom fail to produce cherries born by his *graft* the same year as the infition is made.  *Evelyn.*

(1.) GRAFTING, *n. f.* or ENGRAFTING, in gardening, is the taking a shoot from one tree, and inserting it into another, in such a manner that both may unite closely and become one. The ancient writers on husbandry and agriculture, this operation is called INCISION, to distinguish it from inoculation or budding, which they call *serere oculus*.

(II.) GRAFTING, ACCOUNT OF THE USE, AND THEORY OF. Grafting hath been practised from the most remote antiquity; the origin and invention has been differently accounted for by naturalists. Theophrastus tells us, that he first saw a man who had swallowed a fruit whole, cast it into a cleft or cavity of a rotten tree; where, in some of the putrified parts of the wood, it budded, and when the tree was washed with the rains, it budded, and a shoot issued from within this tree another tree of a different kind. This led the husbandman to certain it, and from which soon afterwards arose the art of grafting. Pliny says, that a countryman, to make a pallisade in his grounds, that would endure the longer, he filled up and finished the bottom of the pallisade, by running it with the trunks of ivy. The effect was, that the stakes of the pallisades, which became engrafted into the trunks, and grew up like large trees; which suggested to him the art of engrafting. The use of grafting is to propagate any curious sorts of fruits so as to unite the kinds; which cannot be done by any other method: for as all the good fruits are accidentally obtained from seeds, so the seeds, when sown, will many of them die, and produce such fruit as is not worth cultivating; but when shoots are taken from trees that produce good fruit, these will never lose their kind, whatever be their stock, or from which they are grafted. The reason of

grafting is somewhat obscure; and had I been given the first hint, all our knowledge would never have led us to it. The effect is ordinarily attributed to the diversity of the ducts of the graft from those of the stock, whence the figure of the particles of the graft passing through them to the rest of the tree. I have, from some observations of Agricola, something new on this head. The stock, he thinks, is only to be considered as vegetable matter, which is to be filtered through the cion, and digested, and brought to maturity, as the time of growth in the vessels of the stock directs. A cion, therefore, of one kind, grafted on a tree of another, may be rather said to be in the tree it is grafted in, than to unite with it: for it is visible that the cion preserves its natural purity, though it be fed and nourished by a mere crab; which is, without doubt, proved by the difference of the vessels in the cion and those of the stock: so that grafting is justly compared to planting. In prosecution of this view of that ingenious author, it may be observed, that the natural juices of the earth, by filtration and comminution in passing through the cion, &c. before they arrive at the cion, are more subtle and arrive there half elaborated and digested; and so disposed for a more easy, plentiful, and perfect assimilation and nutrition; so that the cion must necessarily grow and thrive more rapidly, than if it were put immediately into the ground, there to live on coarser fare and less nourishment: and the fruit produced by the cion, after preparation in the cion, must be finer and more exalted, than if fed immediately from the stock perfectly prepared and altered juices of

**GRAFTING, CHANGES SAID TO BE PRODUCED BY.** Many have talked of changing the nature of the stock, or producing mixed fruits, by engrafting one upon another of the same class; but as the juices from the stock to the pulp of the graft, there is little hope of succeeding in this expectation by ever so many repeated attempts, if, after changing the graft and stock, you set the seed of the fruit produced by the graft in a good mould, it is possible that it may happen, and a new mixed plant may be produced. Thus the almond and peach may be grafted together, and by interchanging the stones of the peaches, and of the shells of the almonds, and by vibrations of the stem of the root here and there, alter their nature so that the coat or pulp of the almond may be changed to the nature of the peach, and the peach may have its kernel enlarged into a kind of almond. And on the same principle, the curious experiments may produce many such mixed kinds of fruits. M. Du Hamel has observed, that, in grafting, there is always found at the insertion of the graft, a change in the direction of the fibres, and a twisting or turning about of the vessels, which exactly imitates that in the formation of glands in animal bodies: and thence he concludes that a new sort of viscus being thus formed, it may be so far influenced by it, as to be directed on the new branch; but that no such

sudden and essential changes can be effected by those means, as many writers on agriculture pretend. He observes, however, that this anatomical observation would not have been sufficient to convince him of the falsity of these relations, had not experiment joined to confirm him in this opinion. He tried many grafts on different trees; and, for fear of error, repeated every experiment of consequence several times: but all served only to convince him of the truth of what he at first suspected. He grafted in the common way the peach upon the almond, the plum upon the apricot, the pear upon the apple, the quince, and the white thorn; one species of plum on other very different species, and upon the peach the apricot and the almond. All these succeeded alike: the species of the fruit was never altered; and in those which would not come to fruit, the leaves, the wood, and the flowers, were all the same with those of the tree from whence the graft was taken. Writers on agriculture have also mentioned a very different sort of grafting; namely, the setting of grafts of one tree upon stocks of a different genus; such as the grafting the pear upon the oak, the elm, the maple, or the plum, &c. M. Du Hamel tried a great number of those experiments carefully, and found every one of them unsuccessful; and the natural conclusion from this was, that there must be some natural alliance between the stocks and their grafts, otherwise the latter will either never grow at all, or very soon perish.

(IV.) **GRAFTING, CIRCUMSTANCES CONTRIBUTING TO PROMOTE OR PREVENT SUCCESS IN.** Notwithstanding the facility with which grafts generally take on good stocks, there are many accidents and uncertainties attending them in their different periods. Some perish immediately; some, after appearing healthy for many months, and some even for years. Of these last some die without the stock suffering any thing; others perish together with the stocks. It is certain, that the greater part of grafted trees do not live so long as they would have done in their natural state; yet this is no invariable rule: for there are some which evidently live the longer for this practice; nay, there are instances of grafts which, being placed on stocks naturally of short duration, live longer than when placed on those which are more robust and lasting. These irregularities have been but little considered, though they might be made productive of considerable advantages. One great requisite for the succeeding of any graft is, that it be in its own nature capable of so close and intimate an union with the substance of the stock, that it becomes as it were a natural branch of it. If all trees resembled one another in their structure and juices, the size and elasticity of their vessels, &c. probably the grafts of all trees would succeed upon one another; but this is not the case. Trees are composed of numerous arrangements of hollow fibres, and these are different and unequal in every species of tree. In order to the succeeding of a graft, it is plain that there must be a conformity in its vessels and juices with those of the stock. The more nearly they agree in this, probably the better they succeed; and the farther they differ, the worse. If there be some difference in the solid

parts of trees, there are evidently many more in the juices. The sap in some trees is white as milk, in others it is reddish, and in some as clear and limpid as water. In some, it is thin and very fluid; in others, thick and viscous. In the taste and smell of these juices there are also no less differences: some are sweet, some insipid, some bitter, some acrid, and some fetid: the quality of the sap thus makes a very great difference in the nature of trees; but its quantity, and derivation to the parts, is scarce less observable. Of this we have familiar instances in the willow and the box; one of which will produce longer shoots in one year than the other in 20. Another difference yet more striking, and indeed more essential in regard to the growth of grafts than all these, is the different season of the year at which trees shoot out their leaves, or ripen their flowers. The almond tree is in flower before other trees in general have opened their earliest buds; and when other trees are in flower, this is full of leaves, and has its fruit set before the mulberry begins to push out its earliest buttons. When we consider all these differences in trees, we are apt to wonder how it is possible for a branch of one to live upon another; and it becomes a much more perplexing question how any graft can succeed, than how such numbers come to miscarry. A graft of one pear upon another shall be seen to succeed presently as if upon its own tree; and in a fortnight will gain six inches in length, and so of some others. This must be owing to the great similarity between the stock and the graft in all respects; and a great contrariety or difference in the structure of parts will make as remarkable a difference on the other hand. An instance of this may be observed in the plum and the elm; which no art can ever make to succeed upon one another, whether the plum be grafted on the elm, or the elm upon the plum stock. These are examples of the extremes of easy growth, and of absolute decay; but there are many conjunctions of trees which seem of a middle nature between the two, and neither immediately perish, nor entirely succeed. Of these, such as were grafted in autumn usually remain green the whole winter without pushing; and those which are grafted in spring remain green a month or longer, but still without shooting. Some have also been known to make a few shoots the first, or even the 2d sap season after the operation; but all perish at the end of these times. Of this kind are the grafts of the pear tree upon the elm, the maple, and the hornbeam, and the mulberry upon the elm and fig, with many others. When we inquire into the cause of this, we find these grafts, though unnatural, have yet had a communication with the stock by means of a few small vessels, which has been sufficient to keep them green, or even to make them shoot a little, during the great ascent of the sap: But the far greater number of the fibres have had all the while no communication, and are found putrified, dried up, or covered with a putrid juice. This has evidently happened by means of the disproportion in size between the vessels of the stock and of the graft, and the great difference between their natural juices, which are obstacles sufficient to prevent either an union of the fibres or the introduc-

tion of new sap. The grafts of the plum, and of the plum on the almond grow very vigorously for the first year every appearance of succeeding entered always perish in the 2d. or 3d. year. A plum graft upon the plum stock also grows out very vigorously at first; but the stock immediately under the graft grows and perishes, the graft absorbing too many juices, and the graft necessarily perishes. The decay of the whole generally happens in the spring, plainly from the difference in the natural shooting of the two trees; the plum pushing very vigorously, and consequently pushing the stock of its juices, at a time when, according to its nature, the juices are but in their infancy in it, and the sap does not begin to rise. The grafts of the plum on the almond, from the same cause, furnished with an abundance of sap which they have at that time no use for, and consequently they as certainly perish by over-pletion, as the other of inanition. A graft of the plum on the plum stock grafted on the plum succeeds excellently, and lives longer than it would have done upon its own stock; the reason seems to be, that the tender tree, shoots with great vivacity, and produces more branches than the root is able to sustain. Thus the peach trees are full of dead wood; and often their large branches and sometimes their whole trunk decay. In the case of the plum, being a slow shooting tree, it communicates its virtue to the graft; and consequently sends out shoots which are robust and strong, and are no more in danger than the root is able to supply with nourishment. Consequently the tree is the more lasting.

(V.) GRAFTING, GENERAL DIRECTING. The grafts, or cions, when the grafting is effected, are young in the summer's growth, for they must be cut in less than one year, and such as grow on the trunk, and robust but moderate branches, such also as are firm and well ripened, may be chosen from healthful trees, and such that the middle part of each shoot is the best graft, cut at the time of grafting to be about 4 or 5 inches in length, or so as to have 4 or 5 joints, but should be preserved at full length till the time, and then prepared as follows: They should be cut from the trees in February, or in March, before the buds begin to swell, and should be much for shooting: in collecting them, they should be such as have not made lateral or side shoots, and if they are used as soon as they are collected, they should be laid in some dry earth in a warm box, or covered with some dry litter, and, if severe weather should prevail, they should be covered with dry litter.

(VI.) GRAFTING, SEASONS PROPER. The best season for performing the operation is February and March. When performed in February, it is generally most successful for cherries, plumbs, and pears; and in March, it is best adapted for apples.

(VII.) GRAFTING, TOOLS AND MANNER. These are, 1. A strong knife, for cutting off the heads of the stocks, pro-

tion of the graft; also a small hand saw for personal use in cutting off the heads of large grafts.

2. A common grafting knife, or strong open-knife, for cutting and shaping the grafts for insertion; also to slope and form the cion for the reception of the grafts.

3. A grafting chisel and small mallet for clefting large stocks in cleft-grafting, for the reception of the grafts.

4. A quantity of new bass strings for bandaging, for tying the grafted parts close, to secure the union, and promote their speedy union with the stock.

5. A quantity of grafting clay, which being closely round the grafts after their insertion and binding, to defend the parts from being scorched by the sun and winds, or too much dried by wet, or pinched by cold; for these reasons it ought to be closely surrounded with a coat of clay, in such a manner as effectually to guard them from all weathers, which would prove injurious to young grafts, and destroy their cement-property, so as to prevent the junction: therefore, a kind of stiff loamy mortar must be made of strong fat loam, or, in default thereof, of a sort of tough binding clay, either of which may be laid in a heap, adding thereto about  $\frac{1}{2}$  of horse dung free from litter, and a portion of great hay, mixing the whole well together, and adding a little water: then let the whole be beaten with a stick upon a floor, or other substance; and as it becomes too dry, apply more water, at every beating turning it over, always continuing to beat it well at top till it be perfectly flat; which must be repeated more or less according to the nature of the clay, but should be several times done the first day: next morning repeat the beating, still moistening it with water; and thus repeating the beating 6 or 8 times the first day for 2 or 3 days, or every other day at least for a week, it will be in proper order for use: observing, it should be prepared a week at least before it is used, but a month is better.

**GRAFTING, VARIOUS METHODS OF.** There are different methods of grafting practised; such as *Whip-grafting*, *Cleft-grafting*, *Crown-grafting*, *Wedge-grafting*, *Side-grafting*, *Root-grafting*, *Grafting by approach*, or *Inarching*: but the most commonly used; and Whip-grafting is the best of all, as being most expeditious and successful.

**Cleft-GRAFTING.** Cut the head of the stock horizontally, and pare the top smooth; cut one side sloping  $1\frac{1}{2}$  or 2 inches deep, and the lower part of the graft sloping the same way, making a sort of shoulder at top of the cion part. Then place it upon the sloped part of the stock, resting the shoulder upon the crown, and bind the parts close together with a string or band, bringing it in a neat manner several times round the stock and graft; then clay the whole near an inch thick on every side, from about an inch or more below the bottom of the cion to an inch over the top of the stock, finishing a whole coat of clay in a kind of oval form, rather longwise, up and down, close effectually about the cion, and every part of it, so no sun, wind, or wet may penetrate, to prevent which is the whole intention of claying. Observe this line it now and then, to see if it any where

cracks or falls off, and if it does, it must be instantly repaired with fresh clay.

2. **Cleft-GRAFTING** is so called, because the stock being large is cleft or slit down the middle for the reception of the graft; and is performed upon stocks from about one to two inches diameter. First, with a strong knife cut off the head of the stock; or if the stock is very large, it may be headed with a saw; and cut one side sloping upwards about  $1\frac{1}{2}$  inches to the top; then proceed with a strong knife or chisel, to cleave the stock at top, cross-way the slope, fixing the knife towards the back of the slope, and strike it with a mallet, so as to cleave the stock about two inches, or long enough to admit the graft, keeping it open with the chisel; this done, prepare the cion, cutting it to such length as to leave 4 or 5 eyes, the lower part of which being sloped on each side, like a wedge,  $1\frac{1}{2}$  or 2 inches long, making one side to a thin edge, the other much thicker, leaving the rind thereon, which side must be placed outward in the stock; the cion being thus formed, and the cleft in the stock being kept open with the chisel, place the graft therein at the back of the stock the thickest side outward, placing the whole cut part down into the cleft of the stock, making the rind of the stock and graft join exactly; then removing the grafting chisel, each side of the cleft will closely squeeze the graft, so as to hold it fast; it is then to be bound with a ligature of bass, and clayed over, as directed above, (see § 1.), leaving 3 or 4 eyes of the cions uncovered. If it be intended to graft any pretty large stocks or branches by this method, two or more grafts may be inserted in each.

1. In this case the head must be cut off horizontally, making no slope on the side, but smooth the top, then cleave it quite across, and place a graft on each side, as the stock may be cleft in two places, and insert two grafts in each cleft; they are thus to be tied and clayed. This method of grafting may be performed upon the branches of bearing trees, when intended either to renew the wood or change the sort of fruit. Towards the end of May, or the beginning of June, the junction of the graft and stock in either method will be effectually formed, and the graft begin to shoot, when the clay may be taken off, and in a fortnight or three weeks after the bandages likewise.

3. **Crown-GRAFTING** is commonly practised upon such stocks as are too large to cleave, and is often performed upon the large branches of apple and pear trees, &c. that already bear fruit, when it is intended to change the sorts, or renew the tree with fresh-bearing wood. It is termed *crown-grafting*, because the stock or branch being headed down, several grafts together are inserted at top all around betwixt the wood and bark, so as to give it a crown-like appearance. This kind of grafting should not be performed until March or early in April; for then the sap being in motion, renders the bark and wood of the stock much easier to be separated for the admission of the graft. The manner of performing it is this: First, cut off the head of the stock or branch with a saw horizontally, and pare the top smooth; then having the grafts, cut one side of each flat, and somewhat sloping, an inch and a half, forming a

sort of shoulder at top of the slope to rest upon the crown of the stock; and then raising the rind of the stock with a wedge, so as to admit the cion between that and the wood two inches down, place the graft with the flat side next the wood, thrusting it down far enough for the shoulder to rest upon the top of the stock; and in this manner may be put 3, 4, 5, or more grafts into one large stock or branch. When the grafts are thus inserted, let the whole be tied tight and well clayed; but leave 2 or 3 eyes of each graft uncovered and raise the clay an inch above the top of the stock, so as to throw the wet quickly off, without lodging about the grafted parts, which would ruin the whole. Crown-grafting may also be performed, by making several clefts in the crown of the stock, and inserting the grafts round the top of the clefts. The grafts will be pretty well united with the stock, and exhibit a state of growth, by the end of May or beginning of June, and the clay may then be taken away. The trees grafted by this method succeed extremely well; but, for the first two or three years, have this inconvenience attending them, that they are liable to be blown out of the stock by violent winds; which must be remedied by tying long sticks to the body of the stock or branch, and tying each graft up to one of the sticks.

4. *Root-GRAFTING* is performed by Whip-grafting cions (See § 6.) upon pieces of the root of any tree of the same genus, and planting the root where it is to remain. It will take root, draw nourishment, and feed the graft.

5. *SIDE-GRAFTING* is by inserting grafts into the sides of the branches without heading them down; and may be practised upon trees to fill up any vacancy, or for the purpose of variety, to have several sorts of apples, pears, plums, &c. upon the same tree. It is performed thus. Fix upon such parts of the branches where wood is wanted to furnish the head or any part of the tree; there slope off the bark and a little of the wood, and cut the lower end of the grafts to fit the part as near as possible; then join them to the branch, and tie them with bass, and clay them over.

6. *Whip-GRAFTING* is always performed upon small stocks, from about the size of a goose quill to half an inch or a little more or less in diameter, but the nearer the stock and graft approach in size the better. It is called *whip-grafting*, because the grafts and stocks being nearly of a size, are sloped on one side, to fit each other, and tied together in the manner of *whips*. The method is as follows: Cut off the head of the stock at some clear smooth part; then cut one side sloping upward, about 1½ or near 2 inches in length, and make a notch or small slit near the upper part of the slope downward about half an inch long, to receive the tongue of the cion; then prepare the cion, cutting it to 5 or 6 inches in length, forming the lower end also in a sloping manner, so as exactly to fit the sloped part of the stock, as if cut from the same place, that the rinds of both may join evenly in every part; and make a slit so as to form a sort of tongue to fit the slit made in the slope of the stock; then place the graft, inserting the tongue of it into the slit of the stock, applying the parts as evenly and close as

possible; and immediately tie the part and cover them with clay, as above directed. This sort of grafting may also be performed, if necessary, upon the young shoots of a tree, if intended to alter the sort; or have more than one sort on the same tree, the middle or end of May, the grafts united with the stock, as will be evident by the shooting of the graft; then the clay wholly taken away; but suffer the graft to remain some time longer, until they seem to swell and be too much constricted by the ligature; then take it wholly off.

7. *GRAFTING BY APPROACH*, or *WEDGED*, is when the stocks designed to be united in the tree from which you intend to take the graft, either grow so near, or can be placed together, that the branch or graft may approach the stock, without separating the tree, till after its union or junction with the stock; so that the graft being bent to the stock, they *approach* and form a sort of *approach* graft, or *wedged* graft, by the names. Being a sure method, it is only practised upon such trees as are made to succeed by any of the other methods. When intended to propagate any tree or shrub by this method of grafting, if the tree or shrub is of the hardy kind, and the full ground, a proper quantity of manure for stocks must be set round it; and of a proper height, the work of manure may be performed; or, if the branches designed to be grafted from is too high, in that case stocks must be planted in a slight stage must be erected around the due height to reach the branches, containing the stocks must be placed in a stage. This method of grafting is formed with the head of the stock, sometimes with the head left on till united with the stock; though by pressing the stock, the work is much easier and having no top, its whole effort is directed to the nourishment of the graft; stocks properly placed, either planted in pots or in pots around the tree to be then make the most convenient branch to the stock, and mark on the body of the parts where they will most easily unite, and in those parts of each branch cut away the bark and part of the wood to the proper length, and in the same way the stock in the proper place for the graft; then make a slit upwards in the stock so as to form a sort of tongue, as above directed, downwards in the stock to admit it; be then joined, slipping the tongue into the slit of the stock, making it in an exact manner, and tie them close with bass, and afterwards cover the joint with due quantity of clay, as in the other methods. After this, let a stout stake be fixed to the side of each graft; to which let the stock and graft be fastened, which will prevent their being disjoined in the operation being performed in spring, and in that position about a month will be united, and the graft may be

the mother tree. In doing this, be-  
erform it with a steady hand, so as not  
r break out the graft, sloping it off  
close to the stock; and if the head  
s was not cut down at the time of  
must now be done close to the graft,  
clay and bandage must also be cleared  
replaced with new, to remain a few  
r. If the grafts are not firmly united  
ock in the period above mentioned,  
emain another year till autumn, before  
e separated from the parent tree. By  
f grafting may be raised almost any  
or shrub, which is often done by way  
s, to ingraft a fruit-bearing branch of  
same any common stock of the same  
reby a new tree bearing fruit is raised  
nthis. This is sometimes practised u-  
and lemon trees, &c. by grafting bea-  
rs of a fruit tree upon any common  
! from the kernels of any of the same  
it, or into branches of each other, so  
oranges, lemons, and citrons, all on  
ec.

**FIG, NEW METHOD OF.** An anony-  
r, in a treatise published at Hamburg,  
*sanitates Hortensius Novae*, recommends  
od of grafting trees, so as to have very  
ramids of fruit upon them, which will  
eauty, flavour, and quantity, all that  
erwise produced. This, he says, he  
perienced, and gives the following men-  
ng it;—The trees are to be transplant-  
n, and all their branches cut off. Ear-  
llowing summer the young shoots are  
d off, and the buds are then to be en-  
d them in an inverted direction. This,  
da not only to the beauty of the pyra-  
also makes the branches more fruitful.  
be closely connected to the trunk, and  
ied in with the common ligature: they  
aced circularly round the tree, three  
h circle, and these circles at six inches  
n one another. The old trees may be  
this manner, the succets having been  
good in those of 20 years standing;  
ost eligible trees are those which are  
orous, and full of juice, and are not a-  
per or two thick. When these young  
ansplanted, they must be fenced round  
to defend them from the violence of  
and there must be no dung put to them  
e thoroughly rooted, for fear of rotting  
e the fibres strike. The buds ingrafted  
all, that the wounds made in the bark  
them, not being very large, may heal  
; and if the buds do not succeed, which  
ceived in a fortnight, there must be o-  
n their place. The wound made to re-  
buds must be a straight cut, parallel to  
n; and the piece of bark taken out must  
ards, that the rain may not get in at  
l. In the autumn of the same year,  
: a green and flourishing pyramid; and  
anner it will flower, and ripen its fruit

**AFTON, Richard,** an English histo-

rian, born at London, in the reign of Henry VIII.  
He published, 1. *An Abridgement of the Chronicles  
of England*; and, 2. *A Cosmick and large History  
of the Affairs of England and Kings of the James,  
abstracted from the Creation of the World.* He died  
in the reign of Q. Elizabeth.

(2.) **GRAFTON**, a town of England, in Gloucest-  
tershire, on the borders of Worcestershire, and near  
Bredon hill; from the side of which, in Feb. 1764,  
16 acres of land slipped down and covered a large  
field at the foot of the hill. This extraordinary  
occurrence is ascribed to the great rain which had  
fallen incessantly for some time before.

(3.) **GRAFTON**, a township of Massachusetts, in  
Worcester county, containing 900 citizens in 1795,  
3 miles E. of Worcester, and 40 SW. of Boston.

(4.) **GRAFTON**, an extensive county of New  
Hampshire, bounded on the E. by Maine District,  
S. by Strafford, Hillsborough and Cheshire coun-  
ties; W. by Vermont, and N. by Canada. It is  
divided into 30 townships and 17 locations; and  
contained 13,451 citizens and 21 slaves in 1797.

(5.) **GRAFTON**, a township of the above coun-  
ty, (N<sup>o</sup> 4.) containing 401 inhabitants in 1797;  
13 miles SE. of Dartmouth, and 19 SW. of Ply-  
mouth.

(6.) **GRAFTON**, or **GRAFTON ISLAND**, one of  
the Bashee islands in the E. Indian Sea. Lon. 139.  
o. W. Lat. 21. 4. N.

(7—15.) **GRAFTON** is also the name of 9 Eng-  
lish villages; viz. 1. in Cheshire, on the Dee NW.  
of Malpas; 2. in Bucks, near Leighton; 3. in  
Northamptonsh. NE. of Kettering; 4. in Oxford-  
sh. on the Isis; 5. in Shrewsbury; 6. and 7. EAST  
and WEST in Wilts; 8. in Worcesterhire near  
Bromsgrove; and 9. in Yorksh. SE. of Borough-  
bridge.

**GRAFUESKOI**, a fort of Russia, in the prov.  
of Kolivan, on the Irtysh.

**GRAGNANO**, a town of Italy, in the repub-  
lic of Lucca, 4 miles NE. of Lucca.

**GRAGNONA**, a town of the Cisalpine repub-  
lic, in the dept. of Crostolo, and late duchy of  
Modena.

(1.) **GRAHAM**, George, clock and watch ma-  
ker, the most ingenious and accurate artist in his  
time, was born in 1675. After his apprentice-  
ship, Mr Tompion received him into his family,  
purely on account of his merit; and treated him  
with a kind of parental affection as long as he lived.  
Beside his universally acknowledged skill in his  
profession, he was a complete mechanic and astro-  
nomer; the great mural arch in the observatory  
at Greenwich was made for Dr Halley, under his  
immediate inspection, and divided by his own hand;  
and from this incomparable original, the best for-  
eign instruments of the kind are copies made by  
English artists. The sector, by which Dr Bradley  
first discovered two new motions in the fixed stars,  
was of his invention and fabric; and when the  
French academicians were sent to the north to  
ascertain the figure of the earth, Mr Graham  
was thought the fittest person in Europe to sup-  
ply them with instruments: those who went to  
the south were not so well furnished. He was  
for many years a member of the Royal Society, to  
which he communicated several ingenious and

important discoveries; and regarded the advancement of science more than the accumulation of wealth. He died in 1751.

(2.) GRAHAM, James, Marquis of MONTROSE, a Scottish nobleman of the 17th century, who, in bravery and fidelity to his sovereign, may be compared to the greatest heroes of antiquity. He undertook, against almost every obstacle that could terrify a less enterprising genius, to reduce Scotland to the obedience of K. Charles I; and in a few months almost effectuated his design; but, for want of supplies, was forced to abandon his conquests. After the death of Charles I. he, with a few men, made a second attempt, but was immediately defeated by a numerous army. As he was leaving the kingdom in disguise, he was betrayed into the hands of his enemy, by Lord Aston his intimate friend. He was carried to his execution with every circumstance of indignity that wanton cruelty could invent; and hanged upon a gibbet 37 feet high, with the book of his exploits appended to his neck. He bore this reverse of fortune with his usual greatness of mind, and expressed a just scorn at the insults of his enemies. We meet with many instances of valour in this active period; but Montrose affords one of the few instances of heroism. He was executed May 21st, 1650. See ENGLAND, § 47, 48.

(3.) GRAHAM, James, M. D. a singular and most eccentric genius, born at Edinburgh, in 1747. He was the son of Mr W. Graham, saddler in Edinburgh. After finishing his studies at that university, he went first to London, and afterwards to America; where he figured with considerable credit, as a philanthropic physician, travelling for the benefit of mankind, to administer relief in the most desperate diseases, to patients whose cases had baffled the utmost exertions of the ordinary practitioners. Having the advantages of a good person, pleasant conversation, polite address, agreeable conversation and engaging manners, he easily got acquainted with many of the principal people in the N. American provinces, particularly in those of New England; where, by putting away in the public papers in a new and uncommon manner, partly by celebrating his medicines and medical skills, and partly by dispersing the products of his brain, in religious, political, medical dissertations, and accounts of extraordinary cures, he certainly made a considerable deal of money. About this time, he married a lady of New England, by whom he had one daughter, and both of whom he brought over to England. Several years after this, he fell acquainted with the celebrated Mrs Catherine Blackley, authoress of the history of England, and of various tracts in favour of British and American liberty. Mr Graham being a great admirer of her talents, had become very intimate with her for some time, when one day, having visited her, he experienced the truth of the proverb, "the more you know, the more you are to learn."

He next set out for the continent, and the lady would have been a great deal surprised, had she known that he had not the least objection to her company; but she was the first to break it, as she said, "I do not possess a perfect knowledge of your country, and I am not qualified to be your companion."

His usual assurance, told her, that the excursion had made him forget that circumstance; added, that he hoped he might still have of a near alliance with her, as he is brother, unmarried, who had a great deal to himself both in features and principles, even of the most delicate and virtues, are easily prevailed upon to be committed in consequence of the power of their own charms. The doctor, by his brother introduced, the match completed, and thus the fair historian began *amity Graham*. See MACAULAY. He might doubtless have settled with the ease in Boston, if he could have settled but whether he was influenced by the causes that broke out in New England, the commencement of the American war, that natural restlessness of disposition, never to have permitted him to settle in one place, certain it is, that, about 1770, he returned to Britain, and after making a circuit through England, (where, in his various publications, he made successful cures,) he visited his native city and was employed by many people of quality, among whom he made some cures, after they had consulted the physicians in vain. His fame at this time, that he might have settled contrary to with both profit and "honour in his life." Instead of this, however, and in spite of the entreaties of several people of high rank, he returned to London; where he soon after the most superb institution, that ever existed for the entertainment and gratification of the votaries of pleasure. Under the patronage of the Duke of Devonshire, who put their lives in danger, were willing to sacrifice to Venus. Dr James, he engaged to teach "the art of being happy, and of propagating a strong, beautiful, active, healthy, virtuous, and of being a being, that pains, indignity, and trouble, never disturb, but that of the pleasures, which bite, do not hurt, and cause no other, but they know not what it is." See also the *Magazine*, and other of his advertisements in the London papers, he allowed, that he had the power of being able of creating the most elegant pleasure that ever was known, and that of the public world, as *Novels*, and *Cyrenaica*. All the elements of the human mind, the elements of the firmament, and the powers of the mind, and were used in to any pleasure, that a man's fancy. It certainly was a great talent, and in the present condition of the world, of the mind, and the art of art, to be able to create, with the ease, that the world, as punishment, the true, and the pleasure, to the touch, and the pleasure, to the touch, and the pleasure, to the touch.

*Mabometan Paradise.* And to crown all, the oratory was called in, and the imagination excited to its highest pitch, by the most lush descriptions, (though in the most chaste language,) delivered by the Doctor himself, in his *Public Lecture on Generation*; which he read in the most elegant and graceful manner to very crowded audiences. It cannot be doubted, that an exhibition, pushed away in all the London towns in the most extravagant terms, must have procured a great deal of money from the votaries of the art; yet instead of making money by his lectures, he only run himself in debt, and incurred the immense expense attending them. This was the more surprising, as the Doctor, from whom living luxuriously, not only abstained from wine and spirits, and all strong liquors, but even from animal food, eating nothing but vegetables, and drinking nothing but cold water. Consistent with this abstinence, he recommended the same to others, in a *Sermon*, which he preached in the Tolbooth of Edinburgh, in 1783, and afterwards printed and sold for the benefit of his fellow-citizens that text, *All Flesh is Grass.* (Isaiah xl. 6.) The occasion of his imprisonment was this.—In the year 1783, while his Temple of Health was in the city, he paid a visit to his native city, and for the first time gave his fellow citizens a specimen of his rhetorical powers, by delivering his *Public Lecture on Generation*, a subject which the magistrates of Edinburgh considered as so improper for public discussion, that they exerted their authority to suppress it. Upon this our Doctor published a fresh advertisement, reflecting the keenest terms upon the city magistrates, and containing such striking personal scurrility against a respectable member of council, that the magistrates incarcerated him in the tolbooth. Upon his applying however to the Lords of Session for a bill of suspension, he got out of jail, and continued to deliver his execrable lecture, as long as public curiosity lasted. But though he doubtless collected money by this exhibition, he never afterwards recovered character in Scotland so as to be employed again in his medical capacity, by the people of rank;—not even by those to whom he had formerly been of signal service. During the winter session of 1784, he took it into his head to read the lectures of all the medical professors in the university of Edinburgh; as well as those of the late celebrated Dr John Brown, (see BROWN, J. A.) to whose erudition and abilities he paid very high compliments, although his system of medicine was diametrically opposite to his own. (See BAUKONIAN SYSTEM.) In 1785 and 1786, Dr Graham visited Newcastle, and various other places in England; but in the end of 1787, he returned to Edinburgh in a new and extraordinary character, viz. that of a teacher sent from God, to announce the MILLENNIUM, the 2d coming of Christ, and the final consummation of all things. The cause of this phrenzy some ascribed to his abominable manner of living; others to his having changed too suddenly to that, from former habits of dissipation; others to distress of circumstances, and others to the large quantities of æther, which is certain, that at this time he daily swallowed.

But whether all of these causes might not cooperate, certain it is, that the most fanatical enthusiasts in the darkest ages could not have published more ridiculous advertisements, than the Doctor at this time issued. He not only styled himself "*the servant of the Lord!*" O! W. L! (*i. e.* as he explained it, "Oh wonderful love!") but commenced a new chronological æra, dating his bills "the 1st, 2d, &c. days of the first month of the 1st year of the *New Jerusalem Church!*" But before the commencement of the 2d month, the servant of the Lord was most profanely confined by order of the magistrates, not indeed in the tolbooth as formerly, but in his own house. At last he was obliged to confess, that "he felt the devil, the world, and the flesh, too strong for him, and therefore he supposed that the Lord must look out for another fore-runner of his second coming." Amidst all the excentricities, however, of this singular character, it is but justice to mention, that on a variety of occasions he has given proofs of a benevolent and charitable disposition; and what is still more to his honour, he has upon all occasions, when he visited Edinburgh, paid the utmost attention and respect to his aged parents. It afforded indeed a singular contrast of character to observe him, at the very time he was giving public lectures, of such a nature, as, in the opinion of the magistrates, tended to excite all the young fellows in the city to those vices which youth are generally but too prone to, daily riding out in his coach with his parents, who were two of the most strict old-fashioned Calvinistic Presbyterians in the metropolis.—Amidst the various vicissitudes of Dr Graham's life, nothing was more fortunate for him, than that one of his medical treatises should have proved beneficial to a gentleman of fortune at Geneva; who, as a mark of his esteem and gratitude, sent him a bond, upon the bank of England, settling on him an annuity of L. 50 a-year for life. What this gentleman's disease was, or what the mode of cure recommended in the treatise, we have not heard; but amongst other excentric methods of cure recommended to his patients by the Doctor, one of the most extraordinary was, his *burying them alive up to the neck in earth* for 10 or 12 hours together. This method he practised himself, as well as recommended to his patients, but we have not heard any authentic accounts of a single cure made by this practice. On the contrary, his sister's husband, who had been afflicted with a kind of dropsical swelling over great part of his body, underwent the operation, but died soon after the experiment. The Dr's method of sleeping and cloathing himself was perhaps as different from the ordinary practice as his regimen of eating and drinking. He made it a point to wear no woollen clothes, nor any thing made of any animal substance: and he slept upon a hair mattress, without feather-bed or blankets, and with his windows open in all weathers and seasons. He alleged, and perhaps with some truth, that most of our diseases are occasioned by too much heat; and he carried his cooling regimen so far, that in 1787, he was in terms with the tack-man of the King's Park, for liberty to build a house

house upon the top of Arthur's Seat, in order to try how far he could bear the utmost degree of cold, that the climate of Edinburgh affords; but, though the tackman was willing, the noble proprietor could not be prevailed upon to give his consent, lest the multitude of the Doctor's patients and visitors should destroy the grass in the park. This singular genius died at Edinburgh, 23d June, 1794.

(3.) GRAHAM, Mrs Catherine M'Aulay. See MACAULAY.

(5.) GRAHAM, Sir John, of Abercorn, or Dundaff, one of the brave patriots who fought along with Wallace, against the English invaders under Edward I. He was killed at the battle of Falkirk, in 1298, where the following inscription (repeatedly renewed) is to be seen on his monument:

"*Mente manique potens, et VALLE fidus Achates,  
Condatur hic GRAMUS, bello interfectus ab Anglis,  
XXII. Julii, 1298.*"

Thus translated by one of our old Scots poets:

"Here lies Sir John the Graham, Wallace's true Achates,

"A hero stout and bold, fell'd by the English  
bawties."

(6.) GRAHAM, Sir Richard, lord viscount Preston, eldest son of Sir George Graham of Netherby, in Cumberland, Bart. was born in 1648. He was sent ambassador by Charles II. to Lewis XIV. and was master of the wardrobe and secretary of state under James II. But when the Revolution took place, he was tried and condemned, on an accusation of attempting the restoration of that prince; though he obtained a pardon by the queen's intercession. He spent the remainder of his days in retirement, and published an elegant translation of *Boetius on the consolation of philosophy*. He died in 1695.

GRAHAM'S DYKE. See ANTONINUS'S WALL.

GRAHAM'S MOOR, a moor of Scotland in Stirlingshire, 3 miles SE. of Falkirk, where the brave Sir John Graham was killed, and the patriotic Sir W. Wallace fought his way through the English army in 1298.

GRAHAMSTON, a village of Scotland, in Lanarkshire, near Glasgow, containing 896 inhabitants in 1791.

GRALE MONTES, in ancient geography, the name given by Pliny to that part of the Alps, which lies between France and Italy, and by which they pass out of Italy into the ci-devant province of Provence.

GRAIGEMANACH, a town of Ireland, in Kilkenny, on the Barrow, over which it has a bridge, 20 miles from the sea. The tide flows up to it.

GRAIGSTOWN, a town of Ireland, in the county of Kilkenny and prov. of Leinster.

\* GRAIL. *n. f.* [from *grele*, Fr.] Small particles of any kind.—

Hereof this gentle knight unweeting was,  
And, lying down upon the sandy *grails*,  
Drank of the stream as clear as crystal *grails*. *Spens.*

(1.) GRAIN, John Baptist LE, counsellor and master of requests to Mary de Medicis queen of France, was born in 1565, and was much esteemed by Henry IV. He wrote a work entitled *De iudeis*, containing *The History of Henry the Great,*

and of *Lewis XIII.* from the beginning of to the death of the marshal d'Ancre. This history is reckoned to be wrote with fidelity, and the spirit of a true patriot; tains many things not to be found elsewhere vigorously defends the edict that had been ed to the reformed. He died at Paris in

(2.) \* GRAIN. *n. f.* [*graine*, Fr. *grano*, Italian, has all the following significations.]

1. A single seed of corn.—  
Look into the seeds of time,  
And say which *grain* will grow, and which  
not.

—His reasons are as two *grains* of wheat  
two bushels of chaff; *Shak. Merch. of Ven.*

Let them pronounce the steep Tarpeian  
Vagabond, exile, flaying, pent to living  
But with a *grain* a day, I would not  
Their mercy at the price of one fair we

—Many of the ears, being six inches long  
by *grains* in them, and none less than fo  
*timer.* 2. Corn.—

As it ebbs, the seedfman  
Upon the slime and ooze scatters his  
And shortly comes to harvest. *Ant.*

Pales no longer swell'd the teeming  
Nor Phœbus fed his oxen on the plow

—'Tis a rich soil, I grant you; but osted  
ed with weeds than *grain*. *Collier on*

The seed of any fruit. 4. Any minute  
any single body.—

Thou exist'st on many thousand grains  
That issue out of dust. *Shak. Meas.*

By intelligence  
And proofs as clear as founts in July.

We see each *grain* of gravel. *Shak. H.*

5. The smallest weight, of which in pl  
make a scruple, and in Troy weight a  
pennyweight, a grain so named becaus  
posed of equal weight with a grain of co  
ty is a precious diamond, whose *grains* as  
ble, twice double in their value. *Hobbs*

began at a known body, a barley-corn, 1  
whereof is therefore called a *grain*; whi  
being multiplied, to scruples, drachms, o  
pounds. *Holder.*—The trial being mad  
lead and lead, weighing severally seven  
in the air; the balance in the water wei  
ly 4 drachms and 41 *grains*, and abate  
weight in the air 2 drachms and 19 *gr*

balance kept the same depth in the wa  
His brain

Outweigh'd his rage but half a *grain*.

6. Any thing proverbially small.—For  
world before thee is as a little *grain* of th  
*Wisd.* xi. 22.—It is a sincerely pitiable  
temper, that neglects not to make use of  
of grace. *Hammond.*—The ungrateful p  
to himself, and subsists by the good nat  
thers, of which he himself has not the h  
*Soub.* 7. GRAIN of Allowance. Som  
dulged or remitted; something above  
the exact weight.—He, whose very be  
must be seen with *grains* of allowance,  
too mild, moderate, and forgiving,  
would always give some *grains* of allow  
sacred science of theology. *Watts on the*

of the fibres of wood, or other fir.—

by the conflux of meeting sap, found pine, and divert his grain and errant from his course of growth.

*Shakepeare.*

of the wood as modified by the fir.

each, the swimming alder, and the plane, and linden of a softer grain. *Dryden.* ly considered with respect to the form of the constituent particles.—The sea-horse, in the midst of the soliders uns a curled grain not to be found own.—Stones of a constitution so com-

grain so fine, that they bear a fine toward. 11. Dyed or stained substance. The red roses flush up in her cheeks, pure snow with goodly vermil stain, tion dy'd in grain. *Spenser.*

Over his lucid arms  
y vest of purple flow'd,  
han melibzean, or the grain  
worn by kings and heroes old. *Milton.*  
pensive nun, devote and pure,  
obe of darkest grain  
with majestic train. *Milton.*

The third, his feet  
l from either heel with feather'd mail,  
ur'd grain! *Milton's Paradise Lost.*  
r; disposition; inclination; humour  
rection of fibres.—

r minds, preoccupied with what  
r must do than with what you should do,  
u against the grain to voice him conful.

*Shakepeare.*

Hudibras, it is in vain,  
argue 'gainst the grain. *Hudibras.*  
ents, weary'd out with fruitless care,  
heir hopes of eating, and despair;  
nuch against the grain, forc'd to retire,  
s for supper, and provide a fire. *Dryd.*  
art; the bottom.—The one being trac-  
uild, the other stiff and impatient of a  
ey lived but in cunning concord, as  
ied together, but not united in grain.

14. The form of the surface with re-  
ghness and smoothness.—The smaller  
s of cutting substances are, the smaller  
scratches by which they continually  
ar away the glass until it be polished;  
never so small, they can wear away  
otherwise than by grating and scratch-  
reaking the protuberances; and there-  
it no otherwise than by breaking its  
o a very fine grain, so that the scratch-  
ings of the surface become too small  
s. *Newton's Opticks.*

15. See BARLEY, CORN, WHEAT, &c.  
IN, OILY. See SESAMUM.

GRAIN, SCARLET. See CACTUS, N° 1,  
N° 6; and QUERCUS, N° 4.

GRAIN WEIGHT (§ 2. def. 5.) of gold  
worth two-pence, and of silver out-  
thing.

GRAPE. See MALAGUETTA.

GRANGE, Andrew, a French physician  
pher of the Epicurean sect, born at

Caen in Normandy, in 1616. Among other works  
he published a curious treatise on fire, light, and  
colours. He died in 1676.

\* GRAINED. *adj.* [from grain.] Rough; made  
less smooth.—

Though now this grained face of mine be hid  
In sap consuming Winter's drizzled snow,  
Yet hath my night of life some memory. *Shak.*

(1.) GRAINGER, James, an English divine of the  
18th century, author of a valuable work entitled  
*The Biographical History of England*: in 4 vols 8vo.  
He was vicar of Shiplake in Oxfordshire, and was  
seized with an apoplectic fit, while administering  
the sacrament, April 14th, 1776, and died next  
morning.

(2.) GRAINGER, a new county of the United  
States in Tennessee, in Hamilton district.

(3.) GRAINGER FORT, a fort in Tennessee, on  
the N. side of the Holston, at its mouth.

(1.) \* GRAINS. *n. s.* [without a singular.] The  
husks of malt exhausted in brewing.—

Give them grains their fill,  
Husks, draft, to drink and swill. *Ben Jonson.*

(2.) \* GRAINS OF PARADISE. *n. s.* [*cardamomum*, Latin.] An Indian spice.

(3.) GRAINS OF PARADISE. See AMONUM, § 2.  
GRAINVILLE, a town of France in the dep.  
of the Lower Seine, 3 miles S. of Caux, and 13½  
N. of Caudebec.

\* GRAINY. *adj.* [from grain.] 1. Full of corn.  
2. Full of grains or kernels.

(1.) GRAITNEY, a parish of Scotland, in Dum-  
fries shire, lying along the Solway Frith, in the  
form of an oblong square, 6 miles long and 3 broad.  
The climate is temperate, the air healthful, and  
many of the natives long-lived; instances occurring  
of people dying at 100, 103, 110, and 111. The  
Eden, Esk, and Sark, uniting form the head of the  
Solway Frith and the S. boundary of the parish.  
The rivers and the coast abound with salmon, stur-  
geons, cod, flounders, trouts, pikes, &c. The  
soil is various, but fertile; mostly dry and sandy;  
with some mosses. The annual produce has been  
greatly increased by the inclosures and other im-  
provements made by the proprietors. Of 10,240  
acres, 2000 are annually under oats, 550 under  
barley, 200 in potatoes, 80 under wheat, pease,  
and beans, 60 in turnips, 15 under flax, 600 in  
meadow and sown grass, 6000 in pasture, and 735  
in moss. The total produce is valued at 18,241 l.

154. The exports are estimated at 7,8:01. The  
live stock, in 1793, was 286 horses, 40 sheep, 528  
swine, and 900 black cattle, valued at 7,342 l.  
Coals, wood, tar, salt, and slates, are imported to  
the amount of 10,190 l. The population, in  
1793, stood along with the above particulars, by  
the rev. J. Morgan, in his report to Sir J. Sinclair,  
was 1810; and the increase, since 1755, 759. In  
autumn 1792, natural tar was found in a hollow  
of a tree-stone quarry. The statute labour being  
commuted, the roads and bridges are good.

(2.) GRAITNEY GREEN, a village in the above  
parish, long famous for the clandestine marriages  
of young persons of fortune from England; per-  
formed according to the rites of the church of  
England, by a blacksmith, who is said to gain  
near 1,000 l. a-year by this encroachment on the  
clerical office.

(3.) **GRAITNEY HILL**, [supposed to have been originally named *Great-Know*,] a hill in the above parish, (N<sup>o</sup> 1.) to which it gives name.

**GRAJUELA**, a town of Spain, in Murcia.

**GRAIUS MONS**, in ancient geography, the name given by Tacitus to the highest of the **GRAIÆ MONTES**; now called *Monte St Bernard*, famous for being passed, notwithstanding its tremendous height, and eternal snow, in May, 1800, by general Bonaparte, with 30,000 troops, and all their heavy artillery, &c. See **BERNARD**, N<sup>o</sup> 7.

**GRÄKLE**. See **GRACULA**.

**GRALLÆ**, in ornithology, an order of birds analogous to the *bruta* in the class of *mammalia*, in the Linnæan system. See **ZOOLOGY** and **ORNITHOLOGY**.

**GRAM**, a river of Denmark, which runs into the North Sea, 2 miles N. of Ripen.

**GRAMAFFETTEN**, a town of Germany, in Austria, 12 miles SW. of Freustadt.

**GRAMAT**, a town of France, in the dep. of Lot; 8 miles SW. of St Cere and 22½ NNE. of Cahors. Lon. 19. 23. E. of Ferro. Lat. 44. 47. N.

**GRAMATA**, a town of Turkey, in Epirus.

**GRAMAYE**, John Baptist, a historian and poet, born at Antwerp, and provost of Arnheim. He travelled over Germany and Italy, but in going to Spain, was carried off by African corsairs to Algiers. He returned to the Netherlands, and died at Lubeck. He published, 1. *Africa illustrata, libri X.* in 1622; 4to. 2. *Diarium Algeriense*: 3. *Peregrinatio Belgica*: a curious work: 4. *Antiquitates Flandriæ*: fol. and, 5. *Historia Namurcensis*.

\* **GRAMERCY**. *interj.* [contracted from *grant me mercy*.] An obsolete expression of surprise.—

*Gramercy, sir, said he; but moté I weet*

*What strange adventure do ye now pursue?*

*Spenser.*

*Gramercy, lovely Lucius, what's the news?*

*Shakespeare.*

(1.) **GRAMINA**, **GRASSES**; one of the seven tribes or natural families, into which all vegetables are distributed by Linnæus in his *Philosophia Botanica*. They are defined to be plants which have very simple leaves, a jointed stem, a husky calyx termed *gluma*, and a single seed. This description includes the several sorts of corn as well as grasses. In Tournefort they constitute a part of the 15th class, termed *apetalæ*; and in Linnæus's sexual method, they are mostly contained in the 2d order of the 3d class, *triandria digynia*. This numerous and natural family of the grasses has engaged the attention and researches of several eminent botanists; particularly Ray, Monti, Micheli, and Linnæus. M. Monti, in his *Catalogus stirpium agri Bononiensis, gramina ac hujus modi affinia complectens*, printed at Bononia in 1719, divides the grasses from the disposition of their flowers, as Theophrastus and Ray had done before him into 3 sections or orders—These are, 1. Grasses having flowers collected in a spike. 2. Grasses having their flowers collected in a panicle or loose spike. 3. Plants that in their habit and external appearance are allied to the grasses. This class would have been natural if the author had not improperly introduced sweet-rush, juncus, and arrow-headed grass, into the 3d section. Monti enumerates

about 306 species of the grasses, w  
duces under Tournefort's genera; added three new genera. Schleichze  
*riflographia*, published like wise in  
the grasses, as Monti, from the disposi  
flowers, into the 5 following sections  
with flowers in a spike, as phalaris, and  
and frumentum. 2. Irregular grasses  
anthus and cornucopia. 3. Grasses  
growing in a simple panicle or loose s  
and millet. 4. Grasses with flowers  
a compound panicle, or diffused spike  
poa. 5. Plants by their habit nearly  
grasses, as cypress grass, scirpus, linu  
and scuchzeria. He has enumerated  
species, which he describes with amazi  
Micheli has divided the grasses into  
which contain in all 44 genera, and  
from the situation and number of the

(2.) **GRAMINA**, the 4th order in Linnæus's  
ments of a Natural Method, consistin  
merous and natural family of the g  
**BOTANY**, *Index*; and **GRASS**.

\* **GRAMINEOUS**. *adj.* [*graminis*]  
Grassy. *Gramineous* plants are such as  
leaf without a footstalk.

\* **GRAMINIVOROUS**. *adj.* [*graminis*  
Lat.] Grass-eating; living upon grass  
cients were versed chiefly in the dietetic  
among which the *graminivorous* kind h  
coloured choroides. *Sharp's Surgery*.

(1.) \* **GRAMMAR**. *n. f.* [*grammos*  
*grammatika*, Latin; *γραμματικὴ*.] 1. Th  
speaking correctly; the art which tea  
lations of words to each other.—To  
in the *grammar* and idioms of the te  
then as a rhetorician to make all their  
his eloquence. *Fell.*—We make a c  
dumb, whom we will not allow to sp  
the rules of *grammar*. *Dryden's Dis*  
speaking language, according to the *gra*  
of that language, do yet speak improper  
*Locke*. 2. Propriety or justness of spee  
according to grammar.—*Varium & m*  
*per femina*, is the sharpest satire tha  
made on woman; for the adjectives  
and *animal* must be understood to  
*grammar*. *Dryden*. 3. The book tha  
the various relations of words to one a

(2.) **GRAMMAR**, **ENGLISH**. See **ENG**  
**GUAGE**.

(3.) **GRAMMAR**, **PHILOSOPHIC**, or **U**  
"Grammar," says the rev. Mr Bruce,  
ed as an *art*, necessarily supposes the p  
istence of language; and as its design  
any language to those who are ignora  
must be adapted to the genius of that  
language of which it treats.—But *gram*  
sidered as a *science*, views language as  
significant of thought. Neglecting part  
arbitrary modifications introduced for  
beauty or elegance, it examines the  
relation between *words* and *ideas*; di  
between those particulars, which are  
language, and those which are *only*  
and thus furnishes a certain *standard*,  
different languages may be compared,  
several excellencies or defects pointed out

led *Philosophic or Universal Grammar.*  
See LANGUAGE.

**GRAMMAR SCHOOL.** *n. f.* A school in which learned languages are grammatically taught; thou hast most traiterously corrupted the realm in erecting a *grammar school.* Henry VI.—The ordinary way of Latin in a *grammar school* I cannot extol.

**GRAMMAR, UNIVERSAL.** See § 3.  
**GRAMMARIAN.** *n. f.* [*grammaticus*, Fr. *mar.*] One who teaches grammar; a man who disputes the ambiguous nature of words created among the *grammarians*. *Elements of Speech.*—They who have called the torture of *grammarians*, might also have called him the plague of translators. Dryden.

**GRAMMARIAN** was anciently a title of honour, and erudition, being given to persons learned in any art or faculty. But soon used as a term of reproach, to signify a meddling person, employed about words, but inattentive to the true beauties and delicacy of sentiment. The anatomists, called also *philologists*, must be confounded with the **GRAMMATISTS**, whose business was to teach children the first principles of language. Varro, Cicero, Meffala, Julius Cæsar, thought it no dishonour to be grammarians, who had many priviledges to them by the Roman emperors.

**GRAMMATICAL.** *adj.* [*grammaticus*, Fr. *is*, Lat.] Belonging to grammar.—A man of virtue still being set before their eyes, he taught them with far more diligent *grammatical* rules. *Silvery.*—I shall take notice of consonants, not from the *grammatical* rules of any language, but from the sounds framed by single articulations. *Helder.* 2 Taught by grammar.—I know more than the *grammatical* rules, unless born with a poetical genius. *Uresnoy.*

**GRAMMATICALLY.** *adv.* [from *grammaticus*] According to the rules or science of grammar; a sentence is distinguished into the subjects, verbs, pronouns, adverbs, and other parts of speech which compose it, then it is analysed *grammatically*. *Watts.*—As we teach them to speak properly, so it is rhetoric to instruct how to do it elegantly and *grammatically* true. *Baker*

**GRAMMATICASTER.** *n. f.* [Lat.] A mean man; a low grammarian.—I have not patience with the doubts, the remarks, and disputes of the French *grammaticasters*.

**GRAMMATIST.** *n. f.* a teacher of the first principles of grammar.

**GRAN.** a town of France, in the department, and ci-devant province of Auvergne, 5 miles SW. of Desse.

**GRANMONT,** a town of France, in the department of Vienne, and ci-devant prov. of Lorraine, famous for its abbey; 15 miles NE. of Vienne. Lon. 1. 30. E. Lat. 46. 1. N.

287. 11.

(1.) **GRAMMONT,** or **GEERSBERGH,** a town of the French republic, in the dep. of the Scheldt, and ci-devant prov. of Austrian Flanders, originally a fort built on a hill by the Gots, and thence called *Gottesberg*. Baldwin earl of Flanders purchased the lordship of one Gerard in 1068, built a town and called it after him *Gerardmont*, which has been since gradually corrupted to *Grammont*. It is seated on the Dender, which divides it into the Higher and Lower town; 10 miles S. of Oudenarde, 17 SE. of Ghent, and 20 W. of Brussels. Lon. 2. 59. E. Lat. 50. 47. N.

**GRAMPIAN HILLS,** a chain of mountains in Scotland, which run from E. to W. across the whole breadth of the kingdom. See ALPS, and SCOTTISH, and SCOTLAND.

**GRAMPIUS MOUNTAINS,** one of the above mountains, mentioned by Tacitus, where Calpurnius waited the approach of Agricola, and where the battle was fought so fatal to the brave Caledonians. It gives name to the whole ridge.

\* **GRAMPLE.** *n. f.* A crab-fish. *Linneus.*

**GRAMPOUND,** a town of England, in Cornwall, seated on the Valle, over which there is a bridge. The inhabitants have a considerable manufacture of gloves; and send 2 members to parliament. This town is supposed to be the *Grammoba* of the ancients, as it stands on the same river; and that on the building of the bridge, the name was changed into *Grandport*. It was made a borough by Edward III, and endowed with large priviledges, particularly freedom from toll through all Cornwall, a market on Saturday, and 3 fairs; which the burghers hold of the duchy of Cornwall in fee farm, at the rent of about 12 guineas. Its priviledges were confirmed by Henry VIII; but it did not send members to parliament till the reign of Edward VI. It is a corporation, and has a mayor, 8 magistrates, a recorder, and town clerk. The mayor is chosen annually the Tuesday before Michaelmas, and the members by the majority of the magistrates and freemen. There is a chapel of ease in the town; the parish church, being at Creed, about a quarter of a mile off. It is 45 N. SW. of Launceston, and 144 W. by S. of London. Lon. 4. 49. W. Lat. 50. 22. N.

(1.) \* **GRAMPUS.** *n. f.* A large fish of the cetaceous kind.

(2.) **GRAMPUS.** See DELPHINUS, N° II, § III, 1.

(1.) **GRAN,** a river of Hungary, which runs into the Danube, opposite the town of Gran.

(2.) **GRAN,** or **ESZTERGAN,** a large and strong town of Hungary, the see of an archbishop. It was taken by the Turks in 1540; but retaken in 1683, by the king of Poland, and prince Charles of Lorraine, after a siege of 5 days. It is seated at the conflux of the Danube and the Gran (N° 1.) 55 miles SE. of Presburg, and 82 ESE. of Vienna. Lon. 4. 49. E. Lat. 47. 46. N.

(1.) **GRANA,** a town of the Piedmontese republic, in the ci-devant duchy of Aosta, 12 miles ESE. of Aosta.

(2.) **GRANA,** a sea port town of Spain, in Galicia, 2 miles W. of Ferrol.

(1.) **GRANADA,** a province of Spain, which was long an independent kingdom. See SPAIN. It made a part of the ancient *Bætica*; and was inhabited by the *Bastuli*, the *Gitanis*, &c. It is

288

10

sometimes called *Upper Andalusia*. It is bounded on the S. and E. by the Mediterranean, on the W. and N. by Lower Andalusia, and on the NE. by Murcia. Its extent from W. to E. is 110 miles; but its greatest breadth exceeds not 30. The air is temperate and healthy; and though there are many mountains in the province, and some of them very high, yet they are almost every where covered with vines and fruit trees, together with laurel, myrtle, sweet basil, thyme, lavender, marjoram, and other aromatic herbs, which give an exquisite taste to the flesh of their sheep and cattle. A great deal of silk and sugar, flax and hemp, honey and wax, is also produced here; besides dates and acorns, superior to the finest nuts; good stone for building; several sorts of gems; sumch, used in dressing goat skins; and galls, of which a dye is made for leather. The valleys, with which the mountains are interspersed, are extremely beautiful and fertile. The inhabitants of some of the highest mountains are descendants of the Moors; and, though they are now Roman catholics, retain, in a great measure, their ancient customs, manners, and language. The principal rivers are the Xenil and Gandaluin. Great quantities of salt are made in this province, which, though neither so populous nor so well cultivated as when subdued to the Moors, yet is as much so as any in Spain. It was the last Spanish kingdom possessed by the Moors, and was not annexed to the crown of Castile until 1492.

(2.) GRANADA, the capital of the above province, (N<sup>o</sup> 1.) is situated at the foot of the Sierra Nevada, or the Snowy Mountain, in a wholesome air and fruitful country, 123 miles S. of Madrid. It stands upon two hills separated by the Darro. The Xenil runs under the walls, and these two rivers are formed from the melting of the snow with which the mountain is constantly covered. The Darro is said to carry with it grains of gold; and its name, derived from *lat aurum*, may be alleged as a proof of this: the Xenil rolls with its stream little pieces of silver. When Charles V. came to Granada, in 1526, with the empress Isabella, the city presented him with a crown made of gold gathered from the Darro. The city is large and magnificent, containing a great number of very handsome public and private buildings. Its walls, which are adorned with many towers at equal distances, are said to be 10 miles in compass. Here are two castles; the one built by the Moors, and the other by Charles V. and Philip II. They both command a very fine prospect; and the first is so large, that it looks like a city by itself, and, it is said, has room to accommodate 40,000 people, exclusive of the royal palace, and the convent of St Francis. Here is also a court of inquisition; a royal tribunal; and an university, founded in 1521; with the see of an archbishop, who has a revenue of 20,000 ducats per annum. Many noblemen, clergymen, and wealthy citizens, reside in this city, of which the silk trade and manufacture is very great, and the arsenal is said to be the best furnished of any in Spain. The inhabitants, who are partly descended of the Moors, are well supplied with water. There are several fine squares, particularly that called the *Bexarambla* or *Plaza Mayor*, where the bull-fights are held;

and without the city is a large plain, full of villages, called *La Vega de Granada*. The Moors are said to regret nothing but to mourn all the losses they have sustained. The last Moorish ambassador who came obtained permission of the king to see G. shed tears on entering the Alhambra, not refrain from exclaiming, that their ancestors had deprived them and their that delightful country. See ALHAMBRA. It had formerly 20 gates; 1st, that which still remains; 2d. Bibalmazar, of conference, because, with the Moor place of resort, where they covered; 3d. Vivarambla, so called from its grand square which still bears that name; 4th. Racha, or the gate of provisions; 5th. or the gate of the hermits, which led to solitude; 6th. Bibmitre, or Biblacha; 7th. The mill gate; 8th. that of the it opened to the east; 9th. Bib Luxa of the Alhambra; 10th. Bib Adam, of the bones of Adam; 11th. Bib Cader of the nobles; the Moors kept this gate a long time, because it had been pressed by the enemies who should take the city, ter by it; 12th. Faxajauza, or of the mond trees; 13th. Bib Elecei, the Moor; Alacabar, the coast gate; 14th. Bib the gate of the Banners, now the Mag; 15th. that of the Darro; 16th. that of fayca; 17th. the gate of *Eccc Homo*; by the side of the Alhambra. There are less more monuments in Granada than other city in Spain. From the great inscriptions in and about the city, and the offices of the Alhambra and Generaliss, it supposed these people intended to make the great depository of their religious customs, and magnificence. There is which does not bear some marks of the but, notwithstanding this abundance of monuments, the reign of the Moors in Spain ried in confusion and obscurity. The of the Spaniards, their superstition; and they bore the Moors, have much contributed to this darkness; they have either destroyed or to be effaced by time, every thing bore the mark of mahometanism, insid preserving the monuments of antiquity, which same time were those of their own glory and the solidity of their constructions, than curiosity or a love of the arts, but those which still exist, although daily go From the hall of *Comices*, mentioned HAMBRA, there is a modern fair-cave one, which corresponded to the beauty, since, having been destroyed. At the gallery, a part of which is inclosed by railing: this is called *the prison of the wife of the last king of Granada* having prisoned there. The Gomels and Zemilias of distinction, bore false witness to virtue. This event happened as follows when Abdali the Little reigned in Granada. The principal families were divided against The Moors had carried their arms against and had been bravely repulsed. Abd

f in one of his pleasure houses for this when the Zegriz and Gomels, who were the secret enemies of the Abencerages, had an opportunity to represent themselves as subjects, who employed their influence in the favour of the people and deposed the sovereign. They secured Albin Hamez rich and powerful among them, of illustrious commerce with the queen, and witnesses who asserted they had a festival seen, at Generalif, under a large tree, Albin Hamez in the arms of the queen. The fury of Abdali may easily be conceived at the destruction of the Abencerages; the Zegriz, too prudent to allow the break forth, advised him not to let it be done by that numerous and powerful family, informed of their perfidy. It will be seen, they can unite and put themselves in the way of defence, revenge upon their heads the death of the crown. This advice was given; Abdali went to the Alhambra, leaving his guards to arm themselves, and order to attend. The Abencerages were by one, and beheaded as soon as they were in the hall of the lions, where there is still a fountain which was quickly filled with heads and blood. Thirty five heads were struck off, and all the Abencerages died in the same manner, had who had followed his master, and received in the hurry of the execution, the opportunity of withdrawing and giving to the rest of the unhappy family of Abdali. These immediately assembled in arms, crying out through the city "Treason! treason! Let the king die! Treason! treason! Let the king die!" and immediately put to death the Abencerages, with whom they were favourites, did in assisting them: 14,000 men were in arms, and proceeded towards the city, shouting all the way, Let the king die! His secret should have been discovered, and severely repenting of having heeded the pernicious counsels he had received, the castle gates to be shut; but they were not on fire. Muley Hacem, who had abdicated the throne in favour of his son, the tumult of the people, had one presented himself to appease the citizens; but he no sooner appeared, he was lifted up by the multitude nearest the castle, and cried out, "Behold our king, we will follow him; long live Muley Hacem;" and leaping down, he was surrounded by a strong guard, the Abencerages and other nobles, entered the castle, accompanied by above 100 soldiers. But they found the queen, with her women, and in the situation at the sudden revolution, of new not the cause. They asked for the queen, being informed he was in the hall, entered it furiously, and found him the Zegriz and the Gomels, and in a few hours killed upwards of 200 of them. The bodies of the beheaded Abencerages were laid upon black cloth, and carried to the Alhambra, where they were

by his great actions had gained the favour of the people, appeared the Abencerages; and having got information that the king had taken refuge in a mosque near the mountains, now called St Helena, went and brought him back to the castle of Alhambra. Abdali shut himself up in the castle, and refused to see the queen. Those who had accused her of adultery, however, persisted in their false accusation, and said, they would maintain, with arms in their hands, against all who should dare to contradict them, that the queen was guilty. She was imprisoned, and the day arising on which she was to be executed, when none among the Moors offering to defend her, some Christian knights presented themselves, and conquered her false accusers, so that she was immediately set at liberty. The taking of Granada soon followed this combat; Muza and the Abencerages having, it is said, facilitated the conquest of it by Ferdinand and Isabella. From the Alhambra we enter the Generalif by the low gate, which favoured the escape of Abdali when Ferdinand took Granada. Generalif signifies, in Arabic, *the bowl of pleasure*. It was built by Omar, who was so fond of music, that he retired to this palace, to enjoy that amusement. It is the most pleasant situation in the environs of Granada. It is built upon a very high mountain whence waters rush from every side, in torrents, and fall in beautiful cascades into the courts, gardens, and halls of that ancient palace. The gardens form an amphitheatre, and are full of trees, venerable from their antiquity. Two cypresses in particular are noted, called the Cypresses of the queen, because it was near them that the perfidious Gomels impeached the virtue of that princess and the honour of the Abencerages. Of this place, travellers observe, that the writers of romances have never imagined a scene equal to it. Granada was formerly called ILLIBERIA, and founded, says tradition, by Liberia, a great-granddaughter of Hercules, daughter of Hispan, and wife to Hesperus, a Grecian prince, and brother to Atalanta. Others maintain that it was founded by IBERUS, grandson of Tubal, and that it took the name of *Granada*, or *Grænata*, from Nata the daughter of Liberia; the word *Gar*, in the language of the time, signifying grotto; i. e. the grotto of Nata, because that princess studied astrology and natural history in this country. It is certain that such a person as Nata, or Nitayde, existed in the first ages of Granada; and that in the place where the Alhambra now stands, there was a temple dedicated to Nativala. Granada is said to have been founded A. A. C. 2300. In the time of the Romans it was a municipal colony. A description of Granada, in Latin, written in 1550, by George Hofschel, a merchant at Antwerp, who travelled into Spain, is to be found in the work, intitled *Civitates orbis terrarum*, printed at Cologne in 1576; with a good plan of the city of Granada. This city is 125 miles SW. of Murcia, and 183 S. of Madrid. Lon. 3. 30. W. Lat. 37. 17. N.

(3.) GRANADA, or GRENADA, one of the Caribbee islands. See GRENADA.

(4.) GRANADA, a town of Mexico, in the province of Nicaragua, seated on the lake Nicaragua, 70 miles from the S. Sea. It was taken twice by

the French buccaniers, and pillaged. The inhabitants carry on a great trade by means of the lake, which communicates with the N. Sea. Lon. 85. 10. W. Lat. 11. 8. N.

(5.) GRANADA, New, a province of S. America, in Terra Firma, about 75 miles in length, and as much in breadth. It is bounded on the N. by Carthage and St Martha, on the E. by Venezuela, on the S. by Popayan, and on the W. by Darien. It contains mines of gold, copper, and iron; horses, mules, good pastures, corn, and fruits. It belongs to the Spaniards, and Santa Fe de Bogota is the capital.

GRANADE. See GRENADE.

GRANADIER. See GRENADE.

GRANADILLOES, or GRENADES, dangerous islands of the Caribbees, in America, having St Vincent on the N. and Granada on the S. They were ceded to Britain by the treaty of peace in 1763, but have been since neglected. Lat. 18. 0. N.

(1.) GRANADO, a town of Spain in Seville, 15 miles N. of Ayamonte.

(2.) GRANADO. See GRANADO.

GRANAL, a town of Spain, in the province of Leon, 28 miles SE. of Leon.

(1.) GRANARD, or GRENARD, [Irish, *Grianard*, i. e. the height of the sun.] a borough and post town of Ireland, in Longford, Leinster; 52 miles from Dublin, 16 S. of Cavan, and 11 NE. of Longford. In this town annual prizes are given to the best performers on the Irish harp. It has a barrack for a company of foot; and before the Union with Great Britain, returned two members to parliament. It was formerly the residence of the chiefs of N. Tessa. It has fairs 3d May and 1st Oct. Lon. 7. 30. W. Lat. 53. 44. N.

(2.) GRANARD, MOAT OF, a remarkable hill thought to be artificial, and the site of a Danish fort; which commands from its summit a most extensive prospect into 6 or 7 different counties.

GRANARUOLO, a small town of the Cisalpine republic, in the dep. of Amonè, and ci-devant papal province of Romagna.

(1.) \* GRANARY. *n. f.* [*granarium*, Lat.] A storehouse for threshed corn.—Ants, by their labour and industry, contrive that corn will keep as dry in their nests as in our granaries. Addison.

The naked nations' cloathe,

And be th' exhaustless granary of a world.

Thomson's Spring.

(2.) A GRANARY, CAUTIONS TO BE OBSERVED IN ERRECTING. Sir Henry Wotton advises to make it look toward the north, because that quarter is the coolest and most temperate. Mr Worlidge observes, that the best granaries are built of brick, with quarters of timber wrought in the inside, to which the boards may be nailed, with which the inside of the granary must be lined so close to the beams, that there may be no room left for vermin. There may be many stories one above another, which should be near each other; because the shallower the corn lies, it is the better, and more easily turned. The two great cautions, to be observed in erecting granaries are, to make them sufficiently strong, and to expose them to the most drying winds.

(3.) A GRANARY, METHOD OF MANAGING

CORN IN. The method of ordering c parts of England, particularly in Kent. To separate it from dust and other in ter it is threshed, they toss it with one end to the other of a long and the lighter substances fall down in the room, and the corn only is carried or end to end of it. After this the corn, and then bringing it into the is spread about half a foot thick, about twice in a week; once it weep the screening it. This management about two months; after which a foot thick for two months more; time they turn it once a week, or two for be damp, and now and then for After about 5 or 6 months they raise feet thickness in the heaps, and then once or twice in a month, and screen then. After a year they lay it 2½ or and turn it once in 3 weeks or 4 screen it proportionably. When it years or more, they turn it once in 1 and screen it once a quarter; and however it is kept, the oftener the turning ing is repeated, the better the grain.

It is proper to leave 200 area of a yard very side of the heap of corn, and spaces, into which they turn and toss ten. In Kent they make two square end of the floor, and one round in the means of which they throw the corn upper into the lower rooms, and to turn and air it the better. Their fires with two partitions, to separate the corn, which falls into a bag, and wholly full this is thrown away, the pure corn remaining behind. Corn has been kept in our granaries 30 years; served, that the longer it is kept the yields in proportion to the corn, so and whiter the bread is, the superfluous only evaporating in the keeping. In Switzerland, they keep corn 80 year by these methods. The public granaries are 7, 8, or 9 stories high, having the midst of every floor to let down one to another. They are built so though every way surrounded with corn contracts no dampness, and the the convenience of coming up to their lading. The Russians preserve subterranean granaries of the figure of wide below and narrow at top; they plastered, and the top covered with take care to have the corn well dried laid into these storehouses, and often means of ovens; the summer dry was too short to effect it sufficiently. At wheat, barley, and rye, of a great part are there laid up in parcels of 20, 30 in a chamber, according to the size and thus they keep turning every day keep it sweet and fit for shipping. Storm has sometimes been of very consequences to these stores; all the corn of former years having been found spoiled by one night's thunder, that though

, fit for shipping or keeping, and properly use, yet in the morning it was found and sticking. In this case there is no re- turning of all such corn 3 or 4 times a month or longer; in which time it will be recovered, though sometimes not. If of thunder and lightning is only observed place in such corn as is not a year old, it sweated thoroughly in the straw before it is threshed out. The latter inconvenience is avoided by a timely care; but as to the latter that can be done is carefully to ex- aminers of the last year's corn after every storm, that if any of it have been so af- fected may be cured in time; for a neglect of it will utterly destroy it. According to Vir- gils, a granary should always be at the south- east, and have its openings only to the south, that the corn may not be exposed to the winds from the S. and W. which are very dangerous to it; whereas the contrary ones are necessary and wholesome to it, serving to dry it from all external humidity, from the sun's heat. There must also be openings in it to be set open in dry weather, partly to let in fresh air, and partly to let out the warm effluvia which are often emitted by the corn. The roofs of the granaries should always be of tiles, be- cause the worst seasons, when the other open- ings are not safe, there will always be a con- stant current for fresh air, and a way out for the bad air by their joinings, which are never close. In any windows to the south, great care should be taken to shut them up in moist weather, and against hot southern winds. There must ne- cessarily be a cellar, or any other damp place under the granary; for if these cases the corn will certainly be injured by the vapours, and be made damp in the end and ill tasted in the other.

**GRANARY, METHODS OF DESTROYING THAT INFEST GRAIN IN.** The pre- sence of grain from the ravages of insects may be prevented by timely and frequent screening, and turning; (See § 5.) as little or no incon- venience will follow corn or malt lodged dry, but the damage results from a neglect of these pre- cautions. For, whether the obvious damage arise from the weevil, the moth, or the beetle, that da- mages the grain at the time the vermin make their appearance under either of these species, they begin in this last state of existence, only pro- ceeding from their respective kinds of vermiculi; while they continue in that form do the

In this last, or insect state, they eat lit- tle; their principal business being to deposit their eggs. Their rich unerring instinct prompts them to do so in large collections of grain furnish food for themselves while in a vermicular state. It is the business of industry to prevent future ravages of these ravagers, by destroying them previous to their hatching; and this is best effected by frequent screening, and exposure to the winds of fresh air. By frequently turning the grain, the cohesion of their eggs is broken, and the nidus of these minute worms is destroyed, which on hatching collect together, and form numerous nests of a cobweb-like sub-

stance for their security. To these nests they at- tach, by an infinity of small threads, many grains of corn together, first for their protection, and then for their food. When their habitations are broken and separated by the screen, they fall thro' their small interstices, and may be easily removed from the granary with the dust. Those that es- cape an early screening will be destroyed by sub- sequent ones, while the grain is but little injured; and the corn will acquire thereby a superior puri- ty. But by inattention to this, and sometimes by receiving grain already infested into the granary, these vermin, particularly the weevil, will soon spread themselves in that state every where upon the surface, and darken the walls by their number. Under such circumstances hens, with new hatch- ed chickens, if turned on the heap, will traverse, without feeding (or very sparingly so) on the corn, wherever they spread; as they seem insatiable in the pursuit of these insects. When the numbers are reduced within reach, a hen will fly up against the walls, and brush them down with her wings, while her chickens seize them with the greatest avidity. This being repeated as often as they want food, the whole species will in a day or two be destroyed. Of the phalæna, or moth, and the small beetle, they seem equally voracious: on which account they may be deemed the most useful instruments in nature for eradicating these noxious and destruc- tive vermin.

(5) **A GRANARY, METHODS OF VENTILATING GRAIN IN.** M. Du Hamel and Dr Hales recom- mend various contrivances for blowing fresh air through corn laid up in granaries or ships, to pre- serve it sweet and dry, and to prevent its being de- voured by weevils or other insects. This may be done by nailing wooden bars or laths on the floor of the granary about an inch distant from each o- ther, when they are covered with hair cloth only; or at the distance of 2 or 3 inches, when coarse wire-work, or basket-work of osier is laid under the hair-cloth, or when an iron plate full of holes is laid upon them. These laths may be laid across other laths, nailed at the distance of 15 inches, and two or more deep, that there may be a free passage for the air under them. The under laths must come about six inches short of the wall of the granary at one end of them; on which end a board should be set edgeways, and sloping against the wall: by this disposition a large air-pipe is formed, which, having an open communication with all the interstices between and under the bars, will admit the passage of air below forcibly through a hole at the extremity of it, into all the corn in the granary, that will consequently carry off the moist exhalations of the corn. The ventilators for supplying fresh air may be fixed against the wall, on the inside or outside of the granary, or under the floor, or in the ceiling; but wherever they are fixed, the handle of the lever that works them must be out of the granary, otherwise the person who works them would be in danger of suffoca- tion, when the corn is fumed with burning brim- stone, as is sometimes done for destroying weevils. Small moveable ventilators will answer the pur- pose for ventilating corn in large bins in granaries, and may be easily moved from one bin to another.

If

If the granary or corn ship be very long, the main air-pipe may pass lengthwise along the middle of it, and convey air, on both sides, under the corn. In large granaries, large double ventilators, laid on each other, may be fixed at the middle and near the top of the granary, that they may be worked by a wind-mill fixed on the roof of the building, or by a water-mill. The air is to be conveyed from the ventilators through a large trunk or trunks, reaching down through the several floors to the bottom of the granary, with branching trunks to each floor, by means of which the air may be made to pass into a large trunk along the adjoining cross walls: from these trunks several lesser trunks, about 4 inches wide, are to branch off, at the distance of 3 or 4 feet from each other, which are to reach through the whole length of the granary, and their farther ends are to be closed: scams of one 10th or one 12th of an inch are to be left open at the four joinings of the boards, where they are nailed together, that the air may pass through them into the corn. In some of these lesser trunks there may be sliding shutters, to stop the passage of the air through those trunks which are not covered with corn; or to ventilate one part of the granary more briskly than others, as there may be occasion. There must also be wooden shutters, hung on hinges at their upper part, so as to shut close of themselves; these must be fixed to the openings in the walls of the granary on their outside; by these means they will readily open to give a free passage for the ventilating air, which ascends through the corn to pass off, but will instantly shut when the ventilation ceases, and thereby prevent any dampness of the external air from entering: to prevent this, the ventilation should be made only in the middle of dry days, unless the corn, when first put in, is cold and damp. In lesser granaries, where the ventilators must be worked by hand, if these granaries stand on saddles, so as to have their lowest floor at some distance from the ground, the ventilators may be fixed under the lowest floor, between the saddles, so as to be worked by men standing on the ground, without or within the granary. A very commodious and cheap ventilator may be made for small granaries, by making a ventilator of the door of the granary; which may be easily done by making a circular screen, of the size of a quarter of a circle, behind the door: but for this purpose, the door must open, not inwards but outwards of the granary, so that as it falls back, it may be worked to and fro in the screen; which must be exactly adapted to it in all parts of the circular side of the screen, as well as at the top and bottom. But there must be a stop at about 8 or 10 inches from the wall, to prevent the door from falling back further; that there may be room for a valve in the screen, to supply it with air; which air will be driven in by the door, through a hole made in the wall near the floor, into the main air-trunk, in which there must be another valve over the hole in the wall, to prevent the return of the air.

GRANATAN, a town of Upper Saxony, in Erzeburg, 12 miles NE. of Freyburg.

(1.) \* GRANATE. *n. f.* [from *granum*, Lat.] A kind of marble so called, because it is marked

with small variegations like grains. C  
GRANITE.

(2.) THE GRANATE, OR GARNET, is of fossils ranking among the siliceous car according to Magellan, analogous to gem them being composed of the siliceous, argill and calcareous earths, with a greater or portion of iron. The opaque and black contain about a fifth part of iron; but phanous ones only a fiftieth, according man. The garnets, properly so called, a greater quantity of siliceous earth than t and both are now justly ranked with the earths. The general properties of the according to Cronstedt, are as follows: 1. fusible as it contains less metallic matte more transparent or glassy in its texture. ed with salt of kelp, it may, on a piece coal, be converted into glass by the bl which cannot be done without flint. 2. transparent garnet may, without any add brought to a black opaque slag by the lam 4. It is never, as far as is hitherto known pure, or without some mixture of metal, ly iron, which may be extracted by the methods. The garnet matter during the lization, has either been formed in small quantities, or else has had the power of into crystals, though closely confined in substances: since garnets are generally fo pered in other solid stones, and sometimes harder ones, such as quartz and chert. informs us, that garnet is easily melted b of borax or the vegetable alkali. Acco Brunich, most of the garnets strike fire w Cronstedt observes, that the metallic calc mixed with other earthy substances, mal alteration in their fusibility; iron, for inst the argillaceous and micaceous earths, them fusible, though otherwise they are Hence there may be some reasons for call the garnet as a quartz impregnated w yet, on the whole, he thinks it will be call the garnet a stone of a different ord we have experiments sufficient to was reduce the number of earths. The garn is never found but in an indurated state divided into the garnet properly so cal shirl or cockle; though this perhaps is ow to the figure of their crystals than any t Wallerius makes the specific gravity of st from 3600 to 3900, and even 4400; Briff it 4100; and Cotes says, that the garnet hemia are 4360, those of Sweden bet Some make it no less than 5000. The steemed is the Syrian garnet; which is red, inclining to purple, very transpar less beautiful than the oriental amethyst according to Magellan, is the amethyst Pliny; and is found in Syria, Calcutta, C Camboya, and Ethiopia. The SORANT ancients was another kind of garnet of : lour inclining to yellow, called *vermeil* French, and *giacinto guarnacino* by the the former having the name of *rubino* a mong the last mentioned people. The *ranus* comes from Sorian or *Surian*, a Pegu, from whence these gems are

garnets have a yellow colour, in  
 they are called *HYACINTHUS*. Like other  
 divided into oriental and occidental  
 means only *more* or *less* valuable;  
 being always called *oriental*, where-  
 from. Some very fine ones are  
 found in India; they are also met with in  
 Pyrrha, in Silesia, S. Sapho, in the  
 Alps, in Switzerland, in Spain, and in  
 their colour is supposed to proceed  
 from, according to M. Saussure, even  
 small garnets attract the magnetic  
 force at a distance. In the focus of a good  
 the garnet melts into a brown mass,  
 acted by the magnet; which shows  
 its composition in a consider-  
 able degree. Some garnets, however, con-  
 tain tin. M. Magellan is of  
 the *lapis abazeticus* of Pliny, and an-  
 other which he mentions of a deep purple,  
 is garnet. 4. The cockle or snail.  
 The garnets abound so much with  
 iron, they are sometimes worked with profit  
 for iron metal; in which case no notice is  
 taken of the natural character of the stone, in the  
 as is done with clays and jaspers that  
 for in these the quantity of metal is  
 wanted, until at last they acquire the  
 of iron itself. The greatest part of  
 however, contain only from 6 to 12  
 per cent, which is too poor to be worked  
 with advantage as an ore of that me-  
 tal. Many of the garnet kind are to be tried  
 they contain, the iron ought to be  
 extracted by the common process; and  
 at the same time contains tin or  
 bismuth likewise be included in the iron.  
 extracted out of it, however, by a  
 process augmented; the lead and tin sweat-  
 from of drops, though always some-  
 what with iron. None of the garnet kind  
 is found in the form of an earth pro-  
 duce; though at Swappawari, in Lap-  
 land, is found a bole which has the same  
 as garnet; and the hornblende of  
 which is somewhat harder than this bole,  
 has the appearance of cockle.

**GRANITE PASTE.** See **GARNET**, § 4.  
**GRANITE**, in lithology, a genus of fossils,  
 which, under its English name **GRA-  
 NITE**. See also **GARNET**, § 1. and 2.  
 3. species, viz.  
**GRANITE CRASSUS**, the coarse grained  
 very hard stone, crystallizing in form  
 of balls, mostly of a reddish brown col-  
 our, and of a reddish brown and whitish  
 colour, in different parts of Sweden.  
**GRANITE CRYSTALLIZATUS**, the crystal-  
 line is reckoned among the precious  
 stones, in its colour and form, of its  
 value than any of them. Sometimes it is  
 of a dark colour; sometimes yellowish  
 sometimes brown, black or opaque.  
 It is both in lustre and hardness to the  
 equal of the sapphire, although it will  
 not scratch steel. The crystals are some-  
 times, but frequently assume rhombi-

dal, tetradecahedrai, and almost all other regular  
 forms.

- GRANBOROUGH**, a town of Warwickshire.
- (1.) **GRANBY**, Marquis of. See **MANNERS**.
- (2.) **GRANBY**, a township of Connecticut, in  
 Hartford county, 18 miles N. of Hartford, bor-  
 dering on Massachusetts.
- (3.) **GRANBY**, a township of Massachusetts, in  
 Hampshire county, 90 miles W. of Boston, con-  
 taining 596 citizens, in 1795.
- (4.) **GRANBY**, a town of S. Carolina, on the  
 Congaree.
- (5.) **GRANBY BAY**, a bay on the N. coast of  
 Hispaniola. Lon. 61. 25. W. Lat. 15. 42. N.
- GRANCEY**, a town of France, in the dept. of  
 Cote d'Or, 10½ miles N.W. of Is sur Tille.

(1.) \* **GRAND**. *adj.* [*grand*, French; *grandis*,  
 Latin.] Great; illustrious; high in power or dig-  
 nity.—God had planted, that is, made to grow  
 the trees of life and knowledge, plants only pro-  
 per and becoming the paradise and garden of so  
 grand a Lord. *Raleigh's Hist.* 2. Great; splen-  
 did; magnificent.—

A voice has flown  
 To re-enslave a grand design. *Young.*  
 3. Principal; chief.—

What cause  
 Mov'd our grand parents, in that happy state,  
 Favcur'd of heav'n to highly, to fall off  
 From their Creator. *Milton.*

4. Eminent; superiour: very frequently in an ill  
 sense.—

Our grand foe, Satan. *Milton.*  
 So climb this first grand thief into God's fold.  
*Milton.*

5. Noble; sublime; lofty; conceived or expressed  
 with great dignity. 6. It is used to signify ascent  
 or descent of consanguinity.

(1.) **GRAND**, in geography, a town of France,  
 in the dept. of Volges, 9 miles W. Neufchateau.

(2.) **GRAND**, Anthony LE, a Cartesian philoso-  
 pher of the 17th century, author of several works,  
 the best of which is entitled, A Sacred History  
 from the Creation to the time of Constantine the  
 Great, 8vo.

(4.) **GRAND**, Joachim LE, a French political  
 author, born in 1653. He was a man of general  
 knowledge, and was much esteemed at the court  
 of Lewis XIV. He died at Paris in 1733.

(5.) **GRAND**, Mark Antony LE, a celebrated  
 French poet and actor. He was author of several  
 comedies, which were published in 4 vols 12mo.  
 He died at Paris in 1723.

(6.) **GRAND ASSIZE.** See **ASSIZE**, § 2.

(7.) **GRAND DISTRESS**, (*distressio magna*) in  
 English law, a writ of distress, so called on ac-  
 count of its extent, which reaches to all the goods  
 and chattels of the party within the county. This  
 writ lies in two cases: either when the tenant or  
 defendant is attached and appears not, but makes  
 default; or where the tenant or defendant hath  
 once appeared, and after makes default. On  
 such occasions, this writ lies by common law, in  
 lieu of a petit cape.

(8.) **GRAND GUSTO**, among painters, a term  
 used to express that there is something in the pic-  
 ture very great and extraordinary, calculated to  
 surprise, please, and instruct. Where this is found,  
 they

they say, the painter was a man of *grand gusto*; and they use the words *sublime* and *marvellous*, when they speak of a picture, in much the same sense.

(9.) GRAND JURY, } &c. See JURY, LAR-  
(10.) GRAND LARCENY, } CENY, &c.

\* GRANDAM. *n. f.* [*grand* and *dam* or *dame*.]

1. Grandmother; my father's or mother's mother.

I meeting him, will tell him that my lady  
Was fairer than his *grandam* and as chaste

As may be in the world. *Spok. Troil. and Cref.*  
—We have our forefathers and great *grandames*

all before us, as they were in Chaucer's days.  
*Dryden.*

Thy tygers heart belies thy angel face:  
Too well thou shew'st thy pedigree from stone:  
Thy *grandame's* was the first by Pyrrha thrown.

2. An old withered woman.—  
The women

Cry'd, one and all, the suppliant should have  
right,

And to the *grandame* hag adjudg'd the knight.  
*Dryden.*

GRAND ANSE, or JEREMIE, a town in the W.  
part of Hispaniola.

\* GRANDAUGHTER. *n. f.* [*grand* and *daughter*.]

The daughter of a son or daughter.

GRAND BAY, a bay on the S. of Newfoundland.

GRANDBY, a town in Nottinghamshire, SE.  
of Bingham. It has a fair Nov. 1.

GRAND-CHAMP, a town of France in the dept.  
of Morbihan, 7 miles NNW. of Vannes.

\* GRANDCHILD. *n. f.* [*grand* and *child*.] The

son or daughter of my son or daughter; one in  
the second degree of descent.—Augustus Cæsar,  
out of indignation against his daughters and Agrippa  
his *grandchild*, would say that they were not his  
seed, but imposthumes broken from him. *Bacon.*

These hymns may work on future wits, and so  
May great *grandchildren* of thy praises grow.

*Donne.*  
—He hoped his majesty did believe, that he would  
never make the least scruple to obey the *grand-*

*child* of K. James. *Clarendon.*—

Fair daughter, and thou son and *grandchild*  
both!

He 'scaping, with his gods and reliques fled,  
And tow'rd's the shore his little *grandchild* led.

*Milton.*  
*Denham.*

GRANDCOUR, a town of the Helvetic republic,  
in Bern, 10 miles W. of Friburg.

GRANDCOURT, a town of France, in the dept.  
of the Lower Seine, 15 miles E. of Dieppe, and

4. N. of Neufchatel.

(1.) GRANDE, a river of Africa, the S. branch  
of the NIGER. It runs into the Western Ocean.

(2, 3.) GRANDE, two rivers of S. America; 1.  
in Peru, near Cayanta, whose sands are rich in  
gold; 2. in Brazil. Both run into the Atlantic.

(4.) GRANDE, a town of Norway, in the diocese  
of Drontheim, 28 miles W. of Drontheim.

(1.) \* GRANDEE. *n. f.* [*grand*, Fr.; *grandis*,  
Lat.] A man of great rank, power, or digni-  
ty.—They had some sharper and some milder dif-  
ferences which might easily happen in such an inter-  
view of *grandees*, both vehement on the parts  
which they swayed. *Wotton.*—When a prince or

*grandee* manifests a liking to such a th-  
nally set about to make themselves

for such things. *South*—Some parts of  
monarchy are rather for ornament th-  
they furnish out viceroalties for 11

and posts of honour for the noble fan-

PART II.

So mimick ancient wits at best,  
As apes our *grandfires* in their doublets dress. *Pope.*

\* **GRANDSON.** *n. f.* [*grand* and *son.*] The son of a son or daughter.—

Almighty Jove augment your wealthy store,  
Give much to you, and to his *grandsons* more. *Dryden.*

—Grandfathers in private families are not much observed to have great influence on their *grandsons*, and, I believe, they have much less among princes. *Swift.*

**GRAND-SONE,** a town of France, in the dept. of Doubs, 4 miles E. of Besançon.

**GRANDS SEAUX,** or GREAT SEALS, a nation of N. American Indians, who inhabit the country S. of the Missouri. They have about 300 warriors.

(1.) **GRANDVILLE,** a town of France in the dept. of the Channel, and ci-devant prov. of Normandy, partly seated on a plain, partly on a rock; forming an oval peninsula and surrounded with walls and 2 gates. It has a harbour capable of containing 60 ships, and contains about 2,500 citizens. It is 12 miles NW. of Avranches, 15 S. by E. of Coutances, and 18½ W. of Paris. Lon. 1. 32. W. Lat. 48. 50. N.

(2.) **GRANDVILLE,** a town of France in the dep. of Meuse, 3 miles SW. of Longwy.

**GRAND VILLIER,** a town of France, in the dep. of Oise, 14 miles NNW. of Beauvais.

**GRANEN,** a town of Spain in Arragon, 13 miles S. of Huesca.

**GRANENA,** a town of Spain, in Catalonia, 10 miles S. of Lerida.

**GRANEVSKIA,** a fort of Russia, on the Volga, in the province of Saratov.

**GRANEWOLDEN,** a town of Norway, 26 miles S. of Christiania.

(1.) \* **GRANGE.** *n. f.* [*grange*, French.] A farm: generally a farm with a house at a distance from neighbours.—One, when he had got the inheritance of an unlucky old *grange*, would needs sell it; and, to draw buyers, proclaimed the virtues of it: nothing ever thrived on it, saith he; the trees were all blasted, the swine died of the measles, the cattle of the murrain, and the sheep of the rot; nothing was ever reared there, not a duckling or a goose. *Ben Jonson's Discov.*—At the moated *grange* resides this dejected Mariana. *Shak.*

The loose unletter'd hinds,  
When for their teeming flocks and *granges* full  
In wanton dance they praise the bounteous Pan.

*Milton.*  
—If the church was of their own foundation, they might chuse, the incumbent being once dead, whether they would put any other therein; unless, perhaps, the said church had people belonging to it; for then they must still maintain a curate: and of this sort were their *granges* and priories. *Ayliffe.*

(2.) **GRANGE** [from *granum*, Lat. grain.] is also an ancient term for a barn, or place wherein to lay up and thresh corn. Hence also **GRANGER**, or *grangier*, a *grange*-keeper or farmer.

(3.) **GRANGE** is also used for an inn.

(4.) **GRANGE**, Joseph Chancel de LA, a French

F F F author

author born in 1703, celebrated for his talents and misfortunes; which last he drew upon himself by publishing a severe philippic against Philip D. of Orleans. He wrote several tragedies of great merit. He died in 1785, aged 82.

(5.) GRANGE, M. DE LA, a learned and judicious French critic, born at Paris in 1738. He published a translation of Lucretius; and his translation of Seneca was published after his death, in 1775.

(6.) GRANGE, a parish of Scotland, in Banffshire, so named from *Grange*, a farm, (See N° 1.) 6 miles long from N. to S. and 5 miles broad. It contains about 16,000 acres, of which little more than 4000 are in tillage. The church is 4 miles E. of Keith, 10 N. of Huntly, 12 S. of Portsoy, and 16 SW. of Banff. The Isla runs along the S. side of it. The parish being hilly, the climate is cold and moist. About  $\frac{1}{2}$  of the soil is fertile; the rest is mostly a poor clay upon till, or moor. The produce is oats, barley, pease, turnips, potatoes and flax. The population, in 1791, stated by the rev. Francis Forbes in his report to Sir J. Sinclair, was 1572, and had decreased 225, since 1755. The number of horses was 452, of sheep 2582, and of black cattle 1843. The roads are bad. Improvements in agriculture had been introduced by the late lord Findlater, but are retarded by high rents, short leases, and severe services; as well as by oppressive mill multures, till of late that they were commuted. Mr Forbes says, the people also complain much of the excise and distillery laws as unequal and oppressive. Notwithstanding all these disadvantages, the parish produces more grain than supplies the inhabitants, except in very bad seasons. In 1768, the crop after it was cut down, was almost entirely swept away by an overflowing of the Isla. Linen yarn and coarse linens are the only manufactures. About 25,000 bolls of lime are also made annually, as the parish abounds in lime-stone.

(7.) GRANGE, a town of France, in the dept. of Vosges, 5 miles ESE. of Bruyeres.

(8.) GRANGE, a town of Sweden, in the province of Dal-carlia, 30 miles S. of Fablun.

(9.—20.) GRANGE is also the name of 12 English villages: viz. 1. in Cheshire, on the Dee; 2. in Cumberland, near Keswick; 3. in Dorsetsh. near Wareham; 4. NE. of Durham; 5. in Gloucestersh. 6. in Hampshire, NE. of Itching-stoke; 7. in Herefordsh. near Brompton-Brian; 8. in Kent, 1 mile from Gillingham; 9. in Lancashire, with a port for small vessels; 10. N. of Lincoln; 11. in Northumberland, SW. of Morpeth; and 12. in ditto, near Pontiland.

(21.—25.) GRANGE, is also the name of 5 small towns in Ireland: viz. 1. in Antrim; 2. and 3. in Meath; 4. in Sligo; and 5. in Tyrone.

(26.) GRANGE, CAPE LA, a cape on the N. side of Hispaniola.

(27.) GRANGES LE BOURG, a town of France, in the dept. of Upper Saone;  $7\frac{1}{2}$  miles SSE. of Joux.

(28.) GRANGER, or GRAINGER, James, M. D. a Scots physician born at Dunfermline, about 1723. He published a translation of Tibullus, several medical tracts, a poem on the Sugar Cané, and other

poetical pieces. He died in the West Indies, where he had chiefly practised, in 1767.

(29.) GRANGER. See GRANGE, N° 2.

GRANGES, a town of France in the Lot and Garonne; 6 miles E. of Tonnes.

GRANGNANO, a town of Naples, in the Stato Citra, 15 miles W. of Salerno.

GRANHULT, a town of Sweden in 35 miles NW. of Calmar.

GRANI, [from *grann*, Irish, a bear] ancient writers, mustaches or whiskers. Roman Catholics give as a reason why they refused to the laity, *Quia barbati, & non*

*beati granos, dum poculum inter epulas sum*

*liquore pilos inficiunt, quam ori infundunt.*

GRANICUS, a small river near the Bosphorus in Lesser Asia, remarkable for the victory gained by Alexander the Great over Darius.

—Authors disagree about the number of the Persians, though all agree that they were vastly more numerous than the Greeks and Orosius tell us, that the Persian army consisted of 800,000 foot and 20,000 horse.

Others tell us, that they were only 100,000 foot and 10,000 horse. The Macedonian army exceeded 30,000 foot and 5000 horse. The

cavalry lined the banks of the Granicus, to oppose Alexander wherever he should attempt a passage; and the foot were posted in

front of the cavalry on an easy ascent. Parmenio was ordered to allow his troops some time to refresh themselves; but he replied, that having crossed the Hellespont, it would be

impossible for him and his troops to be so long in a rivulet. Accordingly a proper place for the river was no sooner found, than he ordered a strong detachment of horse to

follow him, and he himself followed with the right wing, commanded in person; the trumpets in

time sounding, and loud shouts of joy burst through the whole army. The Persians

such showers of arrows against the detachment of Macedonian horse, as caused some confusion, several of their horses being killed or

wounded near the bank a most bloody combat ensued; the Macedonians attacked the Persians pushing them back to the river. Alexander, who observed that

they were in, took the command of the Macedonian cavalry, after an obstinate resistance gave ground. However, Spithrodates, brother of Ionia, and son in law to Darius, still held his ground, and did all that lay in

his power to bring them back to the charge. Alexander advanced full gallop to engage him, and was

slightly wounded at the first encounter. Spithrodates having thrown his javelin with

both hands advanced sword in hand to meet him, who ran him through with his pike

and his arm to discharge a blow with his battle-ax, that he beat off his head with his battle-ax, that he beat off his head and slightly wounded him through the

As he was ready to repeat the blow, C

Roke of his scymitar cut off Rosacea's head, thus in all probability saved the life of his son. The Macedonians then, animated by example of their king, attacked the Persians with new vigour, who soon after betook themselves to flight. Alexander immediately charged enemy's foot with all his forces, who had now led the river. The Persians, disheartened at defeat of their cavalry, made no great resistance. The Greek mercenaries retired in good order to a neighbouring hill, whence they sent messengers to Alexander desiring leave to march off un molested. But he, instead of coming to a parley with them, rushed furiously into the middle of his main body; where his horse was killed under him, and he himself in great danger of being cut in pieces. The Greeks defended themselves with incredible valour for a long time, but were at almost entirely cut off. In this battle the Persians said to have lost 20,000 foot and 2,500 horse, and the Macedonians only 55 foot and 60 horse.

(2.) GRANITE, *n. f.* [*granit*, Fr. from *granus*, Lat. because consisting as it were of grains, small distinct particles.] A stone composed of coarse and very large concretions, rudely connected together; of great hardness, giving fire to steel; not fermenting with acids, and imperfectly calcinable in a great fire. The hard like granite with black spots, commonly called *or-stone*, forms a very firm, and though rude, yet beautifully variegated mass. It is found in immense strata in Ireland, but not used there. Cornwall it is found in prodigious masses, and brought to London, for the steps of public buildings. Hard red granite, variegated with black and white, now called *oriental granite*, is valuable for its extreme hardness and beauty, and capable of a most elegant polish. *Hill on Fossils*.—*Alabaster*, marble of divers colours, both simple and mixed, the opulites, porphyry, and the *mise*. *Woodward*.—There are still great pillars of *granite*, and other fragments of this ancient temple. *Addison on Italy*.

(1.) GRANITE, in natural history, is a distinct genus of stones. See § 1. Of this genus there are three species: 1. The hard white granite, (§ 1.) is a very valuable kind, consisting of a beautiful congeries of very variously constructed and differently coloured particles, not diffused among or running one to another, but each pure and distinct, though firmly adhering to which ever of the others it comes in contact with, and forming a very firm mass. 2. The hard red granite variegated with black and white, is common in Egypt and Arabia. This species is also found in many parts of Europe. There are fine tables, &c. equal to the best oriental granite, at Mount Edgumbe in Devonshire, which are wrought from stone found in that county. It is also found in other counties of England. 3. The pale whitish granite, variegated with black and yellow. This is sometimes found in strata, but more frequently in loose nodules, and is used for paving the streets. Some of these kinds of stones are found in almost every country, and in many places they are found of immense bigness. The largest mass of this kind in the known world, being as an unconnected stone, is found near the Cape of Good Hope in Africa, and of which we

have the following description in the Philosophical Transactions, vol. 68. p. 101, given by Mr Anderson in a letter to Sir John Pringle. "The stone is so remarkable, that it is called by the people here the *Tower of Babel*, and by some the *Pearl Diamond*. It either takes the last name from a place near which it is situated, or it gives name to the tract of cultivated land called the *Pearl*. It lies upon the top of a ridge of low hills, beyond a large plain, about 30 miles from the Cape Town; beyond which, at a little distance, is a range of hills of a much greater height. It is of an oblong shape, and lies N. and S. The South end is highest; the E. and W. sides are steep and high; the top is rounded, and slopes away gradually to the N. end, so that you can ascend it by that way, and enjoy a most extensive prospect of the whole country. I could not precisely determine its circumference, but it took us above half an hour to walk round it; and by making every allowance for the rugged way, and stopping a little, I think the most moderate computation must make it exceed half a mile. The same difficulty occurred with respect to knowing its height; but I think, that, at the S. end, it is nearly equal to half its length.—I am uncertain whether it ought to be considered as the top of the hill, or a detached stone, because there is no positive proof of either, unless we were to dig about its base; but it would certainly impress every beholder, at first sight, with the idea of its being one stone, not only from its figure, but because it is really one solid uniform mass from top to bottom, without any interruption. It has indeed a few fissures, which do not reach deeper than 4 or 5 feet; and near its north end a stratum of a more compact stone runs across, which is not above 12 or 14 inches thick, with its surface divided into little squares, or oblongs, disposed obliquely. This stratum is perpendicular. Its surface is also so smooth, that it does not appear to have formerly been joined to, or separated from, any other part by violence, but enjoys the exact situation where it was originally placed; and has undergone little change from being exposed for so many successive ages to the calcining power of a very hot climate."—A part of this stone being examined by Sir William Hamilton, he determined it to be a granite, and of the same nature with the tops of some of the Alps; and supposes both to have been elevated by volcanic explosions.

(3.) GRANITE, in Lithology, a genus of stones of the order of petrae, belonging to the class of saxa. The principal constituent parts of this stone are felspar or rhombic quartz, mica, and quartz. These ingredients constitute the hardest sort of granite, and that most anciently known. That into which schoerl enters is more subject to decomposition. They never have any particular texture or regular form, but consist of enormous shapeless masses extremely hard. In the finer granites the quartz is transparent; in others generally white or grey, violet or brown. The felspar is generally the most copious ingredient, and of a white, yellow, red, black, or brown colour. The mica is also grey, brown, yellow, green, red, violet, or black; and commonly the least copious. The schoerl is generally black, and

abounds in the granites that contain it. Hence the colour of the granites depends principally on that of the spar or schoerl. The red granites consist commonly of white quartz, red felt-spar, and grey mica; the grey ones of white quartz, grey or violet felt-spar, and black mica. The black granites commonly contain schoerl instead of felt-spar, and the green usually contain green quartz. On exposing granite to the flame of a blow-pipe, the component ingredients separate from one another. Mr Gerhard, having melted some in a crucible, found the felt-spar run into a transparent glass; below it the mica lay in form of a black slag, the quartz remaining unaltered. It melted somewhat better when all the three were powdered, and mixed together; though even then the quartz was still discernible by a magnifying glass. Hence we may explain the reason why grains of a white colour are sometimes found in volcanic lavas. The mixture of mica prevents the flux or quartz from spilling or cracking; and hence its infusibility and use in furnace-building. Granites are seldom slaty or laminated. In those of a close texture, the quartz and schoerl predominate. They take a good polish; for which reason the Egyptians formerly, and the Italians still work them into large pieces of ornamental architecture, for which they are extremely fit, as not being liable to decay in the air. Faber, in his letters from Italy, mentions a kind of stone named GRANITONE, composed of felt-spar and mica: a substance of this kind, which moulders in the air, is found in Finland; which is said to contain salt-petre, and sometimes common salt. In that country it is called *rapakivi*. Wallerius describes 18 species of granites, besides many others akin to this genus. Those described by Cronstedt are, 1. Loose or friable, which comes from France, and is used at the brass-works for casting that metal in. 2. Hard or compact, of which there are two varieties, red and grey. The former is met with of two kinds; viz. fine-grained from Swappari in Lapland, or coarse-grained from the province of Dalarna in Sweden. The grey, with other colours, is met with on the coast round Stockholm and Norland in Sweden.

GRANITELLO, a genus of stones of the order of petra, belonging to the class of saxa. There are 2 species, 1. That composed of distinct particles, found in several of the mountainous parts of Sweden. In some of these there is a predominance of quartzose particles, in others of micaceous; in which last case the stone is slaty, and easily split. 2. That composed of convoluted particles. It is met with of different colours, as whitish, grey, greenish, and reddish. Both these kinds of stone are used in building furnaces, on account of the powerful resistance they make to the fire; but the latter is preferable to the other, on account of its containing a little of a refractory clayish substance. It is likewise of great use in mills, where the fellow is a coarse sand stone.

GRANITONE. See GRANITE, § 3.

\* GRANIVOROUS, *adj.* [*granum* and *voro*, Lat.] Eating grain; living upon grain.—*Granivorous* birds, as a crane, upon the first peck of their bills, can distinguish the qualities of hard bodies, which the sense of men discerns not without mas-

tication. *Brown*.—Panick affords a de-nourishment, both for *granivorous* birds a kind. *Arbutnot*.

GRANNA, a town of Sweden, in Sma miles NNE. of Johnkioping.

\* GRANNAM, *n. f.* [for *grandam*.] mother. Only used in burlesque works.

Of my kind *grannam* told me, T<sup>h</sup> warning.

GRANOLLERS, a town of Spain, in nia, 18 miles NNE. of Barcelona.

GRANSEE, a town of Germany, in Burg, 30 miles NNW. of Berlin.

GRANSKEVITZ, a town of Upper, in Pomerania, 12 miles NW. of Rugen.

GRANSO, an island in the Baltic, on coast of Sweden. Lon. 16. 36. E. of Ferro 57. 46. N.

(1.) GRANSON, a town of the Helvetic in Neuchatel. It was besieged in 1476, by the bold duke of Burgundy; and after a brave defence surrendered at discretion, when Chabroussly massacred the garrison; but he was after defeated with an army of 50,000 only 10,000 Swiss. It lies 16 miles SW. of chatel. Lon. 6. 30. E. Lat. 46. 50. N.

(2.) GRANSON, a ci-devant bailiwick of Switzerland, of which the above town (N<sup>o</sup> 1) is the capital, between Lake Neuchatel and Moudon.

(1.) GRANT, Francis, Lord Culcairn, eminent lawyer and judge in Scotland, descended from a younger branch of the Grants of Culcairn. He was born about 1660, and having entered for the bar, made a distinguished figure at the bar, by opposing the old lawyers, who argued on the inability of the Convention to make any disposition of the crown, which he showed in favour of the revolution, commended him to an extensive practice, which he acquired to much honour, that the union between the two kingdoms was not without application, created a baronet, with a view of securing his rank in that measure; and soon after created lord of session. The same good qualities, commended him to this honourable office, which he discharged with the highest reputation for 20 years with the highest reputation, when after an illness which lasted but three months he expired without agony on March 16th 1731. In the *Biographia Britannica*, it is recorded of him, "That as an advocate he was indefatigable in the management of business; but at the same time that he spared no pains, he would use no violence. He had so high an idea of the dignity of the office, that he held it equally criminal to use any meanest means of coming at justice, or to use of any arts to elude it. In respect to his private character, though he was modest and frugal, and his practice, yet he was far from being austere. His private charities were very considerable, and grew in proportion with his profits. He never suffered a just cause to be lost through a want of money. He was such an enemy to oppression, that he never denied his assistance to any man who laboured under it; and with respect to the study of all professions in Scotland, he served as a pattern without a leg. Whenever he sat as lord of

f causes was remarkably full, for his being equally established for knowledge y, there were none who had a good their own pretensions, but were desling them before him, and not many t sit down satisfied with his decision. sentences were reversed, and when it was commonly owing to himself; mature reflection, or upon new real at the re-hearing, he saw any jult ktering his judgment, he made no scruring it; being persuaded, that it was as well as more just, to follow truth, port opinion: and his conduct in this ead of lessening, raised his reputation. ot, however, with all this great stock lge, experience, and probity, trust matters of blood, or venture to decide cases on the lives of his fellow-crea- ch was the reason that, though often could never be prevailed upon to act in the judiciary court.—In his private was as amiable as he was estimable in He was charitable without ostentation, in his friendships, and beneficent to any thing to do with him. He was etly just, but so free from avarice, that iding him more intent on the business to him by others than on his own, icriels the care of placing out his mo- o prevent his postponing, as he was uel kind of affairs, when securities of- wined the circumstances of them to be form of cases, and to procured his n his own concerns as if they had been lient. He was so true a lover of learn- much addicted to his studies, that, ding the multiplicity of his business : bar, and his great attention to his a judge, he found time to write v- es on very different and important sub- e political, which were remarkably and highly serviceable to the govern- is of a more extensive nature, such as *law, religion, and education*, which ited to George II. when prince of whose command his then secretary, Molyneux, wrote him a letter of which were many gracious expres- ll in relation to the piece as to its ap- posed, besides these, many discour- ry subjects, for the exercise of his own nd for the better discovery of truth; no farther than his own closet, and iple of modesty were not communi- o his most intimate friends.”

MR. Patrick, Lord Prestongrange, a- ent lawyer and judge in Scotland. burgh, in 1698. In 1754, he was : bench. He wrote several tracts a- bellion in 1745, and died at Edinburgh d 64.

GRANT. *n. s.* [from the verb.] 1. The ng or bestowing. 2. The thing grant- a boon.—

Courtiers jussle for a grant,  
they break their friendship plead their  
Dryden.

3. [In law.] A gift in writing of such a thing as cannot aptly be passed or conveyed by word only; as rents, reversions, services, advowsons in gross, commons in gross, tithes, &c. or made by such persons as cannot give but by deed, as the king, and all bodies politick; which differences be often in speech neglected, and then is taken generally for every gift whatsoever, made of any thing by any person; and he that granteth it is named the grantor, and he to whom it is made the grantee. A thing is said to be in *grant* which cannot be assigned without deed. *Cowel.*—All the land is the queen's, unless there be some *grant* of any part thereof, to be shewed from her majesty. *Spenser.*—Not only the laws of this kingdom but of other places, and the Roman laws, provide that the prince should not be deceived in his *grants*. *Davenant.* 4. Concession; admission of something in dispute.—But of this so large a *grant*, we are content not to take advantage. *Hooker.*—

This *grant* destroys all you have urg'd before.  
Dryden.

\* To GRANT. *v. a.* [from *garantir*, Fr. *Janius* and *Skinner*; perhaps, as *Minsheu* thinks, from *gratis*, or rather from *gratia*, or *gratificor*.] 1. To admit that which is not yet proved; to allow; to yield; to concede.—They gather out of Scripture general rules to be followed in making laws; and so, in effect, they plainly *grant*, that we ourselves may lawfully make laws for the church. *Hooker.*—I take it for *granted*, that though the Greek word which we translate *sanct*, be in itself as applicable to things as persons; yet in this article it signifieth not holy things, but holy ones. *Pearson.*—

*Grant* that the fates have firm'd, by their decree,  
The Trojan race to reign in Italy. *Dryden.*  
Suppose, which yet I *grant* not, thy desire  
A moment elder than my rival fire,  
Can chance of seeing first thy title prove?  
Dryden.

—If he be one indifferent as to the present rebellion, they may take it for *granted* his complaint is the rage of a disappointed man. *Addison.* 2. To bestow something which cannot be claimed of right.—The God of Israel *grant* thee thy petition that thou hast asked of him. 1 *Samuel* xvii.—Then hath God also to the gentiles *granted* repentance unto life. *Acts* xiii. 18.—

Didst thou not kill this king?  
—I grant ye.  
—Do'st grant me, hedgehog? then *grant* me too,  
Thou may'st be damned for that wicked deed.  
*Sbak.*

He heard, and *granted* half his prayer;  
The rest the winds dispers'd. *Pope.*

GRANTA, a river of England, which runs into the Cam at Cambridge.

\* GRANTABLE. *adj.* [from *grant*.] That which may be granted.—The office of the bishop's chancellor was *grantable* for life. *Ayliffe.*

\* GRANTEE. *n. s.* [from *grant*.] He to whom any grant is made.—To smooth the way for popery in Mary's time, the *grantees* were confirmed by the pope in the possession of the abby-lands. *Swift.*

**GRANTHAM**, a populous town of Lincolnshire, which has good inns of great resort, on the road, from London to York. It is supposed to have been a Roman town, from the remains of a castle formerly dug up in it. It is governed by an alderman and 12 justices of the peace, a recorder, a coroner, an escheator, and 12 common councillors. It has a fine large church with a stone spire, one of the loftiest in England; being 300 feet high; and, by a deception of the sight, it seems to lean to one side. Granttham has a good free school, where Sir Isaac Newton received his first education, besides two charity schools. It is a borough, and sends 2 members to parliament. It is seated on the Witham, 38 miles S. of Lincoln, and 110 N. of London. Lon.  $\circ$ . 36. W. Lat. 52. 59. N.

**GRANTLEY**, a town in York, SW. of Rippen.  
**\* GRANTOR**. *n. f.* [from *grant*.] He by whom any grant is made.—*A duplex querela* shall not be granted under pain of suspension of the grantor from the execution of his office. *Ayliffe*.

(1.) **GRANVILLE**, George, lord **LANSDOWNE**, was descended from a very ancient family, derived from Rollo the first duke of Normandy. At 11 years of age he was sent to Trinity college in Cambridge, where he remained 5 years; but at the age of 13 was admitted M. A. having, before he was 12, spoken a set of verses of his own composition to the duchess of York at his college, when she visited the University of Cambridge. In 1696, his comedy called *The Gallants* was acted at the theatre royal in Lincoln-inn fields, as his tragedy called *Heroic Love* was in 1638. In 1702 he translated into English the *second Olympian of Demosthenes*. He was M. P. for the county of Cornwall in 1710; afterwards secretary of war, comptroller of the household, then treasurer, and one of the privy council. In 1711; he was created baron Lansdowne. On the accession of K. George I. in 1714, he was removed from his treasurer's place; and in 1715 entered his protest against the bills for attainting lord Bolingbroke and the duke of Ormond. He entered deeply into the scheme for raising an insurrection in the W. of England; and was committed to the Tower, where he continued two years. In 1719, he made a speech in the house of Lords, against the bill to prevent occasional conformity. In 1722, he withdrew to France, and continued abroad near 10 years. At his return in 1732, he published a fine edition of his works in 2 vols quarto. He died in 1735, leaving no male issue.

(2.) **GRANVILLE**. See **GRANDVILLE**, N<sup>o</sup> 1.

(3.) **GRANVILLE**, a fertile county of N. Carolina, in Hillsbury district, bounded on the SE. by Warren county, S. by Wake, SW. and W. by Orange, and N. by Virginia. It contained 6,819 citizens, and 4,163 slaves, in 1795. William-borough is the capital.

(4.) **GRANVILLE**, a town in Kentucky.

(5.) **GRANVILLE**, a township of Massachusetts, in Hampshire county, 14 miles W. of Springfield, containing 1979 inhabitants, in 1795.

(6.) **GRANVILLE**, a township of New York, in Washington county, containing 2240 inhabitants in 1795.

(7.) **GRANVILLE**, a township of New York, in Annapolis county.

**\* GRANULARY**. *adj.* [from *granum* and compact; resembling a small grain. Small coal, with sulphur and nitre, properly mixed, tempered, and formed into granules, do make up that powder which is used in guns. *Brozon's Vulgar Errors*.

(1.) **\* To GRANULATE**. *v. n.* [from *granum*, Latin.] To be formed into grains.—The juice of grapes, inspissated with sugar, is called *granulated sugar*. *Spratt*.

(2.) **\* To GRANULATE**. *v. a.* 1. To reduce into small masses or granules. 2. To raise the asperities.—I have observed, in many cases, before its entrance into the gullet, much dilated, and thick set, or as it were, *granulated* with a multitude of glandules, each of which was provided with its excretory vessel.

**GRANULATED**, *part. pass.* that has undergone granulation. See the next article.

(1.) **\* GRANULATION**. *n. f.* [from *granulate*.] 1. The act of melting metal into cold water, so as it may congeal into small grains: It is done through a colander, or a sieve. Gunpowder and some salts are likewise granulated, from their resemblance to gunpowder. 2. The act of shooting or breaking into small masses.—Tents in wounds, by the growth of the little *granulations* of the process of time harden them, and in this manner produce a fistula. *Sharp's Surgery*.

(2.) **GRANULATION**, in chemistry, is a process by which metallic substances are reduced into small roundish particles, to facilitate their combination with other substances. This consists only in pouring the melted metal into a vessel filled with water, which mean time to be agitated with a broad melted copper, however, which is agitated with great violence on the contact of the metal. Precautions are to be observed. If the metal works at Bristol, copper is granulated with great danger of explosion, by letting it fall into a large cistern of cold water covered with a brass plate. In the middle of the plate is a small vessel, whose capacity does not exceed a spoonful, perforated with many small holes through which the copper passes. As the cold water passes through the cistern, if the metal is allowed to grow hot the copper will fall to the bottom and run into flat plates instead of granules. Lead or tin may be granulated by pouring when melted into a box; the interior of which is rubbed with powdered charcoal. The box strongly shaken till the grains become solid. Metals are granulated, because the brittleness renders them incapable of being drawn out, and because filing is long and tedious, which renders the metal impure by an admixture of iron from the file.

**\* GRANULE**. *n. f.* [from *granum*.] A small compact particle.—With an microscope, where the naked eye did not discern it, the assisted eye could discern it.

e blue, and some yellow. *Boyle on*

LOUS. *adj* [from *granule*.] Full of

a village in Kilkenny, Ireland.

W, a town of Germany in Bran-  
cken SE. of Prenslow.

APPE. *n. f.* [*grappe*, French; *krappe*,  
the fruit of the vine, growing in clus-  
t from which wine is expressed.—  
It not glean thy vineyard, neither  
th'er every *grape* of thy vineyard;  
we them for the poor and stranger.

con for thy sake

the no mention make;

action by thee fell,

at, I lov'd thee well.

*Concky.*

the vines in early flow'r desery'd,

is discolour'd on the sunny side. *Pope.*

E, the fruit of the vine. See VINE,

VINE; also CURRANT and RAISIN.

RAPE HYACINTH, or GRAPE Flow-  
lower.

E HYACINTH. See HYACINTHUS.

E, MANGROVE. } Two species of

E, SEA-SIDE. } POLYGONUM.

*n. f. plur.* in the manege, a term used  
arrests or mangy tumours that hap-  
pen's legs.

LOT, in artillery, is a combination of  
ut into a thick canvas bag, and cord-  
together, so as to form a kind of cy-  
e diameter is equal to that of the ball  
e cannon. The number of shot in a  
according to the service or size of the  
service nine is always the number;  
it is increased to any number or six,  
ce and a quarter in weight to three

nent in any plane (though it is most

ozonal, or nearly so), and to find

egrees it contains.

APNEL. *n. f.* [*grape*, French.] 1.

ior belonging to a little vessel. 2. A

on with which in fight one ship fastens

NELS, or GRAPPLINGS, (§ 1. def. 1.)

are fitted with 4 or 5 flukes or claws, and com-  
monly used to ride a boat or other small vessel.

\* GRAPPLE. *n. f.* [from the verb.] 1. Con-  
test hand to hand, in which the combatants seize  
each other: the wrestlers hold.—

As when earth's son, Antæus strove  
With Jove's Alcides, and, oft foil'd, still rose  
Fresh from his fall, and fiercer *grapple* join'd,  
Throttled at length in th' air, expir'd and fell.

*Milton.*

Or did his genius

Know mine the stronger demon, fear'd the *grap-  
ple*,

And, looking round him, found this nook of fate,

To skulk behind my sword? *Dryd. Don Sebast.*

2. Close fight.—In the *grapple* I boarded them:  
on the instant they got clear of our ship, so I alone  
became their prisoner. *Hamlet.* 3. Iron instru-  
ment by which one ship fastens on another.—

But Cymon soon his crooked *grapples* cast,  
Which with tenacious hold his foes embrac'd.

*Dryden.*

(1.) \* To GRAPPLE. *v. n.* [*grabbelen*, Dutch;  
*krappeln*, German] 1. To contend by seizing each  
other, as wrestlers.—They must be also practis'd  
in all the locks and gripes of wrestling, as need  
may often be in fight to tugg or *grapple*, and to  
close. *Milton.*—

Living virtue, all achievements past,

Meets envy, still to *grapple* with at last. *Waller.*

—Does he think that he can *grapple* with divine  
vengeance, and endure the everlasting burnings?  
*Soub.*—

Antæus here and stern Alcides strive,

And both the *grappling* statues seem to live. *Add.*

2. To contest in close fight.—

I'll in my standard bear the arms of York,

To *grapple* with the house of Lancaster. *Shak.*

Sometimes, from fighting squadrons of each

fleet,

Two *grappling* Ætnas on the ocean meet,

And English fires with Belgian flames contend.

*Dryden.*

(2.) To GRAPPLE. *v. a.* 1. To fasten; to fix;

to join indissolubly. Now obsolete.

*Grapple* your minds to sternage of the navy,

And leave your England as dead midnight still.

*Shakespeare's Henry V.*

That business

*Grapples* you to the heart and love of us. *Shak.*

2. To seize; to lay fast hold of.—For Hippagines,  
vessels for the transporting of horse, we are indebted  
to the Salaminians; for *grappling* hooks to A-  
nacharfis. *Hevln.*

\* GRAPPLEMENT. *n. f.* [from *grapple*.] Close

fight; hostile embrace. Not in use.—

They catching hold of him, as down he lent,

Him backward overthrew, and down him stay'd

With their rude hands and grievously *grapplement*.

*Spenser.*

(1.) GRAPPLING. See GRAPNEL, § 2.

(2.) Fire-GRAPPLING, an instrument nearly re-  
sembling the Grapnel, (See GRAPNEL, § 2.) but

differing in the construction of its flukes, which

are furnished with strong barbs on their points.

These machines are usually fixed on the yard-arms

of a ship, to grapple any adversary whom she in-  
tends

tends

tends to board. They are more particularly useful in FIRE-SHIPS for the purposes described under that article.

GRAS, Antony Le, a French writer, born in 1691. He published translations of Cornelius Nepos, and of the works of the primitive fathers, into French. He died in 1761, aged 70.

GRASHOLM, one of the small Orkney Isles, half a mile S. of Shapinshay.

(1.) \* GRASHOPPER. *n. f.* [*grafs* and *hop*.] A small insect that hops in the summer grafs. The *cicada* of the Latins is often by the poets translated *grasshopper*, but improperly.—

Her waggon spokes made of long spinners legs,

The cover of the wings of grasshoppers. *Shak.*  
—*Grasshoppers* eat up the green of whole countries. *Bacon.*—

Where silver lakes with verdant shadows crown'd,

Disperse a grateful chilness all around ;  
The *grasshopper* avoids th' untainted air,  
Nor in the midst of Summer ventures there. *Addison.*

—The women were of such an enormous stature, that we appeared as *grasshoppers* before them. *Spectator.*

(2.) GRASHOPPER, or more properly GRASSHOPPER, in entomology. See GRYLUS.

\* GRASIER. See GRAZIER.

GRASKA, a town of Poland, in the palatinate of Braclaw, 50 miles SW. of Braclaw.

GRASMARK, a town of Sweden, in the province of Warmeland, 42 miles N. of Carlstadt.

GRASON, an island in the gulf of Bothnia, near the coast of Sweden, 15 miles long and 2 broad. Long. 18. 20. E. Lat. 60. 22. N.

\* GRASP. *n. f.* [from the verb.] 1. The gripe or seizure of the hand.—

Nor wanted in his *grasp*  
What seem'd both spear and shield. *Milton.*

This hand and sword have been acquainted well ;

It would have come before into my *grasp*,  
To kill the ravisher. *Dryd. Don Sebastian.*

—The left arm is a little defaced, though one may see it held something in its *grasp* formerly. *Addison.*

2. Possession ; hold.—

I would not be the villain that thou think'st  
For the whole space that's in the tyrant's *grasp*,  
And the rich East to boot. *Shak. Macbeth.*

3. Power of seizing.—

Within the direful *grasp*  
Of savage hunger, or of savage heat. *Milton.*

—They look'd upon it as their own, and had it even within their *grasp*. *Clarendon.*

(1.) \* To GRASP. *v. a.* [*graspare*, Italian.] 1. To hold in the hand ; to gripe.—O fool that I am, that thought I could *grasp* water and bind the wind. *Sidney.*—

In his right hand

*Grasping* ten thousand thunders which he sent  
Before him, such as in their souls infix'd  
Plagues. *Milton's Par. Lost.*

Kings, by *grasping* more than they can hold,  
First made their subjects, by oppression, bold.

*Denham.*

Doom, as they please, my empire no  
I'll *grasp* my sceptre with my dying  
*Dryd. Indian*

2. To seize ; to catch at.—This *grasp* militia of the kingdom into their own I desired the Summer before. *Clarendon.*

For what are men who *grasp* at praise  
But bubbles on the rapid stream of

(2.) \* To GRASP. *v. n.* 1. To endeavour to seize ; to try at.—So endorbitant are the desires of men, that *grasp* at all, and can form no scheme happiness with less. *Swift.* 2. To strive ; to grapple. Not now in use.—

See, his face is black, and full of  
His hands abroad display'd, as one  
And tugg'd for life. *Shak.*

3. To gripe ; to encroach.—

Like a miser 'midst his  
Who *grasps* and *grasps* 'till he can ho

\* GRASPER. *n. f.* [from *grasp*.] grasps, seizes, or catches at.

(1.) \* GRASS. *n. f.* [*grax*, Saxon.] common herbage of the field on which cattle herb with long narrow leaves.—Ye are as the heifer at *grass*, and bellow as he

11.—The beef being young, and one was thin, light, and moist, and not of to endure the salt. *Temple.*—

You'll be no more your former  
But for a blooming nymph will pass  
Just fifteen, coming Summer's *grass*

(II.) GRASS, in botany, is defined to having simple leaves, a stem generally tubular, a husky calyx, called *GLUM* seed single. Hence wheat, oats, barley properly grasses, while clover and similar plants are not grasses, though so called by that name. Of *grass* the leaf for cattle, the small seeds for birds, and grain chiefly for man. And it is observed nature has so provided, that cattle (seldom eat the flower intended to procure unless compelled by hunger. For the the different sorts of grain and grasses, BANDRY, and the names of the genera der.

(III.) GRASSES, CULMIFEROUS, divided into two general classes for the purpose farmer, that it might be of use for him to, viz. 1st, Those which, like the common kinds of corn, run chiefly to seed leaves gradually decaying as these towards perfection, and becoming total or falling off entirely when the seed Rye-grass belongs to this class in the first To it likewise may be assigned the v dogs-tail grass, and fine bent grass. 2

whose leaves continue to advance even seed-stalks are formed, and retain their and succulence during the whole season case with the fescue and poa tribes whose leaves are as green and succulent seeds are ripe and the flower-stalks for any other time. "It is wonderful,"

rks, to see how long mankind has ne-  
 make a proper advantage of plants of  
 ortance, and which, in almost every  
 e the chief food of cattle. The farmer,  
 of distinguishing and selecting grasses  
 kills his pastures either with weeds, or  
 proper grasses; when by making a right  
 ter some trials, he might be sure of the  
 and in the greatest abundance that his  
 s of. At present, if a farmer wants to  
 his land to grass, what does he do? He  
 es his seeds indiscriminately from his  
 ay-rick, or sends to his next neighbour  
 ly. By these means, besides a certain  
 all sorts of rubbish, which must neces-  
 sarily, if he chances to have a large pro-  
 portion of good seeds, it is not unlikely but that  
 weeds for dry land may come from moist,  
 grow naturally, and the contrary. This  
 lovely method of proceeding, as one  
 man could not possibly prevail univ-  
 ersally: he is as safe to all grasses except the darnel  
 which is known in some few counties by  
 the name of *Suffolk grass*; and this latter in-  
 deed, I believe, more to the soil than  
 to the husbandman. Now, would the  
 pains of separating once in his  
 sowing, or a pint of the different kinds of  
 seeds, and take care to sow them separately,  
 at the time he would have wherewithal to  
 run properly, according to the nature  
 and might at the same time spread  
 separately over the nation, by supply-  
 ing shops. The number of grasses fit for  
 use, I believe, small; perhaps half a do-  
 zenscore are all he need to cultivate;  
 and all the trouble would be of such a talk,  
 that the benefit, must be obvious to every  
 man's sight. Would not any one be  
 as wild who should sow wheat, barley,  
 pease, beans, vetches, buck-wheat,  
 and weeds of all sorts together? yet how  
 absurd to do what is equivalent in  
 grasses? Does it not import the farmer  
 to have hay and grass in plenty? and will  
 he be equally on all sorts of food? We  
 contrary. Horses will scarcely eat hay  
 so well enough for oxen and cows.  
 Linnæus, are particularly fond of one  
 grass, and fatten upon it faster than any  
 other. And may they not do the  
 same? How shall we know till we have  
 made trials relating to *Nat. Hist.* As most  
 men know scarce any of the grasses by name,  
 without such knowledge little improve-  
 ment made in this branch of husbandry,  
 Plate CLXIX. given figures of those  
 which have been recommended as the most  
 useful.

1. ANNUAL MEADOW, *Poa annua*.  
 Linnæus (says Mr Stillingfleet) makes the  
 grass grow every where by way sides,  
 and found common. It is called in some  
 parts of *Suffolk grass*. I have seen whole fields  
 of it in *Suffolk*, without any mixture of o-  
 ther; and, as some of the best salt butter  
 of *London* comes from that county, it  
 is thought to be the best grass for the dairy. I

PART II.

have seen a whole park in *Suffolk* covered with  
 this grass; but whether it affords good venison, I  
 cannot tell, having never tasted of any from it.  
 I should rather think not, and that the best pas-  
 ture for sheep is also the best for deer. However,  
 this wants trial. I remarked on *Malvern hill*  
 something particular in relation to this grass. A  
 walk that was made there, for the convenience of  
 the water-drinkers, in less than a year was cover-  
 ed in many places with it, though I could not  
 find one single plant of it besides in any part of  
 the hill. This was no doubt owing to the fre-  
 quent treading, which above all things makes this  
 grass flourish; and therefore it is evident that roll-  
 ing must be very serviceable to it. It has been  
 objected, that this grass is not free from bents,  
 by which word is meant the flowering stems. I  
 answer, that this is most certainly true, and that  
 there is no grass without them. But the flowers  
 and stems do not grow so soon brown as those of  
 other grasses; and being much shorter, they do not  
 cover the radical leaves so much; and therefore  
 this grass affords a more agreeable turf without  
 mowing, than any other whatever that I know of."  
 The seeds of this species drop off before they are  
 dry, and, to appearance, before they are ripe. The  
 utmost care is therefore necessary in gathering the  
 blades, without which, very few of the seeds will  
 be saved. It ripens from the middle of April, to  
 so late, it is believed, as the end of October; but  
 mostly disappears in the middle of the summer.  
 It grows in any soil and situation, but rather af-  
 fects the shade."

2. GRASS, BULBOUS FOXTAIL, *Alopecurus bul-  
 bosus*, is recommended by Dr Anderson, in his  
*Essay on Agriculture*, &c. as promising on some  
 occasions to afford a valuable pasture grass. It  
 seems chiefly, he observes, to delight in a moist  
 soil, and therefore promises to be only fit for a  
 meadow pasture grass. The quality, that first re-  
 commended it to his notice, was the unusual firm-  
 ness that its matted roots gave to the surface of  
 the ground, naturally soft and moist, in which  
 it grew; which seemed to promise that it might  
 be of use upon such soils, chiefly in preventing  
 them from being much poached by the feet of  
 cattle which might pasture upon them. Moist  
 soils especially are so much hurt by poaching, that  
 any thing that promises to be of use in preventing  
 it deserves to be attended to.

3. GRASS, COCK'S TAIL, OR FEATHER, *Stipa  
 pennata*. See STIPA.

4. GRASS, CREEPING MEADOW, *Poa compressa*,  
 according to Dr Anderson, seems to be the  
 most valuable grass of any of this genus. Its  
 leaves are firm and succulent, of a dark Saxou  
 green colour, and grow so close upon one an-  
 other, as to form the richest pile of pasture grass.  
 The flower stalks, if suffered to grow, appear in  
 sufficient quantities; but the growth of these does  
 not prevent the growth of the leaves, both advan-  
 cing together during the whole summer; and  
 when the stalks fade, the leaves continue as green  
 as before. Its leaves are much larger and more  
 abundant than the common meadow grass, *poa  
 trivialis*; and therefore it better deserves to be  
 cultivated.

5. GRASS,

5. GRASS, CREEPING SOFT, *Holcus lanatus*. See HOLCUS.

6. GRASS, CRESTED DOG'S-TAIL, *Cynofurus cristatus*. Mr Stillingfleet imagines this grass to be proper for parks, from his having known one, where it abounds, that is famous for excellent venison. He recommends it also, from experience, as good for sheep; the best mutton he ever tasted, next to that which comes from hills where the purple and sheep's fescue, the fine bent, and the silver hair grasses abound, having been from sheep fed with it. He adds, that it makes a very fine turf upon dry sandy or chalky soils; but unless swept over with the scyth, its flowering stems will look brown; which is the case of all grasses which are not fed on by variety of animals. For that some animals will eat the flowering stems is evident by commons, where scarcely any parts of grasses appear but the radical leaves. This grass is said to be the easiest of the whole group to collect a quantity of seeds from. It flowers in June, and is ripe in July.

7. GRASS, FINE BENT, *Agrostis canicularis*, is recommended by Mr Stillingfleet, from his having always found it in great plenty on the best sheep pastures, in the different counties of England that are remarkable for good mutton. This grass flowers and ripens its seed the latest of them all. It seems to be lost the former part of the year, but vegetates luxuriantly towards the autumn. It appears to be fond of moist ground. It retains its seed till full ripe; flowers the latter end of July, and is ripe the latter end of August. The same may be said of the MOUNTAIN and SILVER HAIR GRASSES.

8. GRASS, FLOTE, or FLOATING FESCUE, *Festuca fluitans*. See FESTUCA, N° 2. It is surprising that the seeds of this plant, which are used as nutritious food in Sweden, Germany, &c. have hitherto been neglected in Britain, as they are so easily collected and cleaned. There is a clamminess on the ear of the flote fescue, when the seeds are ripe, that tastes like honey; and for this reason perhaps they are called *manna seeds*. Linnæus, in his *Flora Suevica*, (art. 95.) says, that the bran of this grass will cure horses troubled with botts, if kept from drinking for some hours. Concerning this grass we have the following information by Mr Stillingfleet. "Mr Dean, a very sensible farmer at Rulcomb, Berkshire, assured me that a field, always lying under water, of about 4 acres, was covered with a kind of grass, that maintained 5 farm horses in good heart from April to the end of harvest, without giving them any other kind of food, and that it yielded more than they could eat. He, at my desire, brought me some of the grass, which proved to be the flote fescue with a mixture of the marsh bent; whether this last contributes much towards furnishing so good pasture for horses, I cannot say. They both throw out roots at the joints of the stalks, and therefore are likely to grow to a great length. In the index of dubious plants at the end of Ray's Synopsis, there is mention made of a grass under the name of *gramen caninum supinum longissimum*, growing not far from Salisbury, 24 feet long. This must by its length be a grass with a creeping stalk; and that there is a grass in Wiltshire growing in wa-

tery meadows, so valuable, that an acre from 10l. to 12l., I have been informed by persons. These circumstances incline me it must be the flote fescue; but whatever be, it certainly must deserve to be inquired.

9. GRASS, GREAT MEADOW, *Poa* seems to approach in many respects to that of the purple fescue; only that its leaves are, and not near so long; being only about 10 or 16 inches at their greatest length. It produces few seed stalks and many leaves, an abiding plant. It affects chiefly the drier of meadows, though it is to be found in good pastures. It is very retentive of its greenness, and may therefore be suffered to remain till its stalks are quite dry. It blossoms in the latter end of June, and its seeds are ripe in July.

10. GRASS, MEADOW FOXTAIL, *Setaria pratensis*. Linnæus says, this is a proper sown on grounds that have been drained. Mr Stillingfleet was informed, that the best that comes to London is from the meadows where this grass abounds. It is scarce in many parts of land, particularly Herefordshire, Berkshire, and Norfolk. It might be gathered at almost any time of the year from hay ricks, as it does not shed its seeds without rubbing, which is the case with few grasses. It is amongst the most grateful to cattle. It is ripe about the end of July.

11. GRASS, MOUNTAIN HAIR, *Aira*. See N° 7. and AIRA.

12. GRASS, NEW AMERICAN. A grass from America, named *Agrostis esurans*, some time ago much advertised and extolled, possessing the most wonderful qualities, seeds of it were sold at the enormous rate of 10s. the bushel. But we have not heard that it has answered expectation. On the contrary, Mr Anderson in his *Bee*, (Vol. i. p. 38.) says, "it has upon trial been found to be good for nothing. Of the seeds sown, few of them germinated: but enow of plants made their appearance, to ascertain, that the grass, in its quality, is among the poorest of the tribe. That it is an annual plant, and altogether unfitable to the farmer."

13. GRASS, PURPLE FESCUE, *Festuca*. See FESTUCA, N° 3.

14. GRASS, RYE, *Hordeum murinum*. This is properly the SECALE VILLOSUM. The darnel, *Lolium perenne*, is also, in some parts of England, improperly called *rye grass*.

15. GRASS, SILVER HAIR, *Aira*. See N° 7. and AIRA.

16. GRASS, SHEEP'S FESCUE, *Festuca*. See FESTUCA, N° 2. This is perhaps the most valuable grass of all. It is observed to thrive in lands of all qualities and in all parts of meadows. It does not part with its greenness till some time after they are ripe, and is very dry. It makes the thickest and closest sward of them, and sends up but few flower stalks in proportion to its leaves. It flowers in the latter end of July.

17. GRASS, VERNAL, *Antioxanthum*. This grows very commonly on dry hills, and on sound rich meadow land. It is one

GRASSES.

*Ryegrass.*

as we have; and from its being found on  
of pastures as sheep are food of, and  
nce excellent mutton comes, it is most  
e a good grass for sheep pastures. It  
teful odour to hay. In one respect, it  
y to gather, as it sheds its seeds upon  
ubbing. A correspondent of the Bath  
owever, mentions a difficulty that oc-  
illecting them, owing to its being sur-  
with taller grasses at the time of its ripen-  
eing almost hid among them. If it be  
ilily watched when nearly ripe, he ob-  
d gathered within a few days after it  
maturity, great part of the seed will be  
twisted elastic awns, which adhere to  
list them out of their receptacles with  
motion from the wind, even while the  
ear remain quite erect. It is found  
the moist parts of meadows; very little  
y pastures. It flowers about the begin-  
y, and is ripe about the middle of June.

\* GRASS OF PARNASSUS. *n. f.* [*par-*  
*in.*] A plant.—This plant is called *par-*  
*mount Parnassus*, where it was sup-  
row; and because the cattle feed on it,  
l the name of grass, though the plant  
emblance to the grass kind. *Miller.*

ASS OF PARNASSUS. See PARNASSIA.  
LASS, ORCHESTON. See ORCHESTON.  
GRASS VETCH. See LATYHRUS.

GRASS WALKS are made, for the most  
by sowing grass seeds, but by laying  
l indeed the turfs from a fine common  
re much preferable to sown grass; but  
r plats are to be made by sowing, the  
to procure the seed from those pastures  
e is naturally fine and clear; or else  
e of keeping it from spiry or benty grass  
ry great, and it will scarce ever look  
—To sow grass walks, the ground must  
ig; and when it has been dressed and  
it must be carefully raked over, and all  
nd stones taken off, and then covered  
ch thick with good mould. The seed  
wn pretty thick, that it may come up  
short; it must then be raked over again,  
he seed, that if the weather should be  
may not be blown away. Where grass  
gardens, either for lawns or walks,  
ld always be a good quantity of the  
oil or Dutch clover sown with it; for  
ake a fine turf much sooner than any o-  
grass, and will retain a better verdure  
ther of the grass tribe. To keep grass  
home, and in good order, sow in au-  
seed over any places that are not well  
where the grass is dead; but nothing  
grass so much as mowing and constant  
When turf is laid in gardens, it is a ge-  
ice to cover the surface of the ground  
turf, either with sand or very poor earth,  
keep the grass fine, by preventing its  
o rank. This is proper for very rich  
ut not for middling, or poor land; for  
is practised in such places, the grass  
wear out and decay in patches. When  
from a common or down, such ought  
as is free from weeds: and when it

is designed to remain for years without renew-  
ings, a dressing should be laid upon it every other  
year, either of very rotten Jung, athe-, or, where  
it can easily be procured, rotten tan; but these  
dressings should be laid on early in the winter, that  
the rain may wash them into the ground, other-  
wise they occasion the grass to burn, when the  
warmth of the summer begins. When grass is thus  
dressed and well rolled and mowed, it may be kept  
very beautiful for many years; but where it is not  
dressed, or fed with sheep, it will rarely continue  
handsome more than eight or ten years.

(VIII.) GRASS WRACK. See ZOSTERA.

\* To GRASS. *v. n.* [from the noun.] To breed  
grass; to become pasture.—

Land arable, driven, or worn to the proof,  
With oats ye may sow it, the sooner to grass,  
More soon to be pasture, to bring it to pass.

*Tupper.*

(1.) GRASSE, a town of France, in the dept.  
of Aude, and late province of Languedoc, seated  
on the Orbieu, at the foot of Mount Courbiere;  
14 miles SE. of Carcassone, and 18 SW. of Nar-  
bonne.

(2.) GRASSE, a town of France, in the dept.  
of Var, and ci-devant province of Provence. It  
is seated on a hill, 15 miles WSW. of Nice, and  
9 WNW. of Antibes. Lon. 6. 56. E. Lat. 43. 42. N.

GRASSELLA, a town of France, in the dept.  
of Aude, 21 miles SW. of Narbonne, and 24

Lat. 43. 5. N.

GRASSENA, a town of the Piedmontese re-  
public, in the dep. of Sesia, and late duchy of A-  
osta; 18 miles E. of Aosta.

GRASSETORTH, a town of Austria.

GRASSHOPPER. See GRYLUS

\* GRASSINESS. *n. f.* [from *grassy*.] The state  
of abounding in grass.

(1.) GRASSMERE, a lofty mountain of Cum-  
berland, near Buttermere.

(2.) GRASSMERE, a village of Northumberland,  
between Kendal and Newick, seated on a pro-  
montory, that projects far into the lake N<sup>o</sup> 3.

(3.) GRASSMERE WATER, a beautiful lake in  
Westmoreland, near Ambleside and Rydal. Its  
banks are formed into small bays, by bold pro-  
jecting eminences, some of rock and some of turf.

\* GRASS-PLOT. *n. f.* [*grass* and *plot*.] A small  
level covered with short grass.—

Here on this *grass-plot* in this very place,  
Come and sport. *Shak. Tempest.*

—The part of your garden next your house should  
be a parterre for flowers, or *grass-plots* bordered  
with flowers. *Temple.*—They are much valued by  
our modern planters to adorn their walks and  
*grass-plots*. *Mortimer.*

\* GRASS-POLY. *n. f.* A species of WILLOW-  
WORT.

\* GRASSY. *adj.* [from *grass*.] Covered with  
grass; abounding with grass.—

Ne did he leave the mountains bare unseem,  
Nor the rank *grassy* fens delights untry'd. *Spens.*  
Kais'd of *grassy* turf

Their table was, and mossy seats had round.

*Milton.*

The most in fields, like herded beasts, lie down.  
To dews obnoxious, on the *grassy* floor. *Dryd.*

GRASWINCKEL, a learned Dutch civilian, born at Delft, in 1600. He was a man of taste, and published several works, wherein he distinguished himself in the belles lettres, as well as in law. He died at Mechlin, in 1666.

GRATAROLUS, William, a learned physician of the 16th century, born at Bergamo in Italy. He taught medicine with reputation at Padua, but having embraced the Protestant religion, he retired to Switzerland, where he was made professor of physic. He died at Basil in 1568, aged 52. He wrote several curious works in Latin; amongst which are, 1. The manner of preserving and improving the memory. 2. Of preserving in health travellers, men of letters, magistrates, and studious persons, &c.

GRATCHI, a town of Russia, in the country of the Cossacs, 20 miles NW. of Tzaritzin.

(1.) \* GRATE. *n. f.* [*crates*, Lat.] 1. A partition made with bars placed near to one another, or crossing each other: such as in cloysters or prisons.—I have grated upon my friends for three reprieves for you, and your couch fellow Nim: or else you had looked through the *grates*, like a geminy of baboons. *Shak.*—

Out at a little *grate* his eyes he cast  
Upon those bord'ring hills, and open plain.

*Daniel.*

—A fan has on it a nunnery of lively black eyed vestals, who are endeavouring to creep out at the *grates*. *Addison.* 2. The range of bars within which fires are made.—My dear is of opinion that an old fashioned *grate* consumes coals, but gives no heat. *SpeBator.*

(2.) GRATES FOR FIRES. (§ 1. *def.* 2.) are composed of ribs of iron placed at small distances from one another, so that the air may have sufficient access to the fuel, and the accumulation of the ashes, which would choke the fire, may be prevented. Grates seem peculiarly adapted to the use of pit coal, which requires a greater quantity of air to make it burn freely than other kinds of fuel. The hearths of the Britons seem to have been fixed in the centre of their halls, as is yet practised in some parts of Scotland, where the fire is nearly in the middle of the house, and the family sit all around it. Their fire place was perhaps nothing more than a large stone, depressed a little below the level of the ground, and thereby adapted to receive the ashes. About a century ago, it was only the floor of the room, with the addition of a bank of clay. But it was now changed among the gentlemen for a portable fire-pan, raised upon low supporters, and fitted with a circular grating of bars. Such were in use among the Gauls in the first century, and among the Welsh in the tenth.

(1.) \* To GRATE. *v. a.* [*gratter*, Fr.] 1. To rub or wear any thing by the attrition of a rough body.—

Thereat the fiend his gnashing teeth did *grate*.  
*Spenser.*

Blind oblivion swallow'd cities up,  
And mighty states characterlets are *grated*  
To dusty nothing. *Shak Troilus and Cressida.*  
—If the particles of the putty were not made to stick fast in the pitch, they would, by rolling up and down, *grate* and fret the object metal, and

fill it full of little holes. *Newton's Optick.*  
—offend by any thing harsh or vexatious.—

Thereat enraged, soon he gan uplift  
Grinding his teeth, and *grating* his gn

—They have been partial in the gospel and chosen out those softer and more *grates*, which would less *grate* and disturb the *Decay of Piety.*—

Just resentment and hard usage cost  
Th' unwilling word and *grating* as it  
Take it, for 'tis thy due. *Dryden's*

—This habit of writing and discouraging I unfortunately differ from almost the wisdom, and am apt to *grate* the ears of whom I could wish, was acquired during my apprenticeship in London. *Swift.* 3. To form a collision of asperities or hard bodies.—

The *grating* shock of wrathful iron  
*Shak. A*

On a sudden open fly,  
With impetuous recoil and jarring in  
Th' infernal doors, and on their hinges  
Harsh thunder, that the lowest bottom  
Of Erebus. *Milton's Par*

(1.) \* To GRATE. *v. n.* 1. To try as to injure or offend; to offend, as by flattery or importunity.—

Wherein have you been galled by  
What peer hath been suborn'd to *grate*  
That you should seal this lawless blood  
Of forg'd rebellion with a seal divine.

—I have *grated* upon my good friends for reprieves for you, or else you had looked through the *grates*. *Shak.*—Paradoxing is of great use, the faculty must be so tenderly managed as to *grate* upon the truth and reason.

*L'Esrange.*—This *grated* harder upon the ears of men. *South.*—I never heard him make any complaint, in a case that would have *grated* on some men's patience, and have filled them with discontent. *Lacke.* 2. To make a surface as that of a rough body drawn over another, are not so nice as to cast away a sharp edge, because the edge of it may sometimes *grate*.

\* GRATEFUL. *adj.* [*gratus*, Lat.] Having a due sense of benefits; willing to acknowledge and to repay benefits.—

A *grateful* mind  
By owing owes not, but still pays.

—When some degree of health was given, he exerted all his strength in a return of gratitude to the author of it. *Fell.*—

Years of service past,  
From *grateful* souls exact reward at last.

2. Pleasing; acceptable; delightful; and whatsoever is ingrate at first, is made so by custom; but whatsoever is too pleasing grows quickly to satiety. *Bacon's Nat*

—A man will endure the pain of hunger and thirst, and refuse such meats and drinks which are *grateful* to his appetite, if he be persuaded that they will endanger his health. *Wilkins.*—

is the more *grateful* to strangers, in refusing to be a frontier town, and bordering upon several nations, many languages are understood. *Brown's Travels.*—

golden fruits on loaded branches shine,  
*grateful* clusters swell with floods of wine.

*Pope.*

**GRATEFULLY.** *adv.* [from *grateful*.] 1. Ignis to acknowledge and repay benedue sense of obligation.—

2. new wak'd, thus *gratefully* reply'd.

*Milton.*

gh remains for household charge beside,  
 and tender children to sustain,  
*gratefully* to feed his dumb deserving train.

*Dryden's Virgil.*

prus long by men and gods obey'd,  
 era toil she *gratefully* repaid. *Granville.*  
 aising manner.—Study detains the mind  
 etual occurrence of something new,  
 gratefully strike the imagination. *Watts.*

**GRATEFULNESS.** *n. f.* [from *grateful*.]  
 ide; duty to benefactors. Now oblo-  
 aconian knight having sometime served  
 more *gratefulness* than good courage de-  
 n. *Sidney.*—

ngs beforehand, ties of *gratefulness*,  
 ind of glory ringing in our ears. *Herbert.*  
 of being acceptable; pleasantness.

**GLEY,** a town of England, in Hamp-  
 the SE. side of Quarley-hill, between  
 and Salisbury, where, in 926, king A-  
 eld a grand council of the nobles.

**GRATER.** *n. f.* [*gratoir*, Fr. from *grate*.]  
 coarse file with which soft bodies are  
 powder.—

ler handed touch a nettle,  
 stings you for your pains,  
 p it like a man of mettle,  
 soft as silk remains.

is with common natures,

hem gently they rebel,  
 be rough as nutmeg graters,  
 e rogues obey you well.

*A. Hill.*

**GRATES,** a cape on the E. of Newfoundland.

**GRATIAN,** the son of Valentinian I. by  
 wife, was associated in the empire by his  
 Amiens in 365, and succeeded him in  
 rince equally extolled for his wit, elo-  
 modesty, chastity, and zeal against here-  
 associated Theodosius with him in the em-  
 advanced the poet Ausonius to the confu-  
 : made a great slaughter of the Germans  
 urg. (See ARGENTORA,) and hence was  
 l *Alemannicus*. He was the first emperor  
 sed the title of *Pontifex Maximus*, on ac-  
 its being a Pagan dignity. He was assas-  
 y Andragathius in 375, in the 24th year  
 c.

**GRATIAN,** a British soldier in the Roman  
 ho was crowned emperor by the legions  
 1, about A. D. 407, but was murdered  
 within 4 months. See ENGLAND, § 12.

**GRATIAN,** a famous Benedictine monk, in  
 century, born at Chiufi. He was em-  
 cer 24 years in composing a work, entit-  
 rum, or *Concordantia Discordantium Ca-*  
 ecuse he there endeavoured to reconcile  
 ns which seemed contradictory to each o-  
 his work was published in 1151. As he  
 tly mistaken, in taking one canon of one  
 or one passage of one father, for another,

and has often cited false decretals, several authors  
 have endeavoured to correct his faults; and chiefly  
 Anthony Augustine, in his excellent work, intit-  
 led, *De emendatione Gratiani*. To the decretals  
 of Gratian, the popes principally owed the great  
 authority they exercised in the 13th and following  
 centuries.

**GRATIANI,** Jerome, an Italian dramatic writ-  
 ter of the 16th century, who, among other pieces,  
 wrote a tragedy, called *Cromwell*, which was  
 much esteemed.

\* **GRATIFICATION.** *n. f.* [*gratificatio*, Lat.]  
 1. The act of pleasing.—They are incapable of  
 any design above the present *gratification* of their  
 palates. *South.* 2. Pleasure; delight.—How hard-  
 ly is his will brought to change all its desires and  
 aversions, and to renounce those *gratifications* in  
 which he has been long uied to place his happiness.  
*Rogers.* 3. Reward; recompence. A low word.

\* **To GRATIFY.** *v. a.* [*gratificor*, Latin.] 1.  
 To indulge; to grant by compliance.—

You steer between the country and the court,  
 Nor *gratify* whate'er the great desire,  
 Nor grudging give what publick needs require.

*Dryden.*

2. To delight; to please; to humour; to soothe.—

But pride stood ready to prevent the blow;

For who would die to *gratify* : foe? *Dryd. Fab.*

The captive generals to his car are ty'd;

The joyful citizens tumultuous tide

Echoing his glory, *gratify* his pride. *Prior.* }

—A palled appetite is humorous, and must be

*gratified* with sauces rather than food. *Tatler.*—

At once they *gratify* their scent and taste.

While frequent cups prolong the rich repast.

*Pope.*

A thousand little impertinencies are very *grati-*  
*fy*ing to curiosity, though not improving to the  
 understanding. *Addison.*—3. To requite with a  
 gratification: as, I'll *gratify* you for this trouble.

\* **GRATINGLY.** *adv.* [from *grate*.] Harshly;  
 offensively.

**GRATINGS,** in a ship, are small edges of sawed  
 plank, framed one into another like a lattice or  
 prison grate, lying on the upper deck, between  
 the main mast and fore-mast, serving for a defence  
 in a close fight, and also for the coolness, light,  
 and conveniency of the ship's company.

**GRATIOLA,** HEDGE HYSSOP: A genus of the  
 monogynia order, belonging to the diandria class  
 of plants; and ranking according to the natural  
 method in the 40th order, *Personate*. The corolla  
 is irregular; there are two barren stamina; the  
 capsule is bilocular; the calyx has seven leaves,  
 with the two exterior ones patulous. There are  
 four species; the most remarkable of which is the

**GRATIOLA OFFICINALIS,** the common hedge  
 hyssop, grows naturally on the Alps and other  
 mountainous parts of Europe. It has a thick,  
 fleshy, fibrous, creeping root, which propagates  
 very much, when planted in a proper soil and si-  
 tuation. From this arise several upright square  
 stalks, garnished with narrow spear-shaped leaves,  
 placed opposite. The flowers are produced on  
 the side of the stalks at each joint: they are shaped  
 like those of the fox-glove, but are small, and of  
 a pale yellowish colour.—This herb has an emetic  
 and purgative virtue; to answer which intentions,

it was formerly used by the common people in England; but was never much prescribed by the physicians, and at last fell totally into disuse. It is the subject of a dissertation by Dr James Kofrzewski of Warsaw, in Poland; who gives some remarkable accounts of its effects in mania and obstinate venereal cases. It was given in powder, or in extract, to the quantity of half a drachm of the first, and a whole drachm of the second, at each dose. From the cases he relates the author draws the following conclusions: 1. The gratiola may be given with safety both to male and female patients. 2. In all disorders proceeding from a superabundance of serum in the fluids, it appears to be a most effectual remedy. 3. In consequence of this, it is had recourse to with very great advantage in melancholy and mania arising from that state of the system. 4. It powerfully promotes purging, vomiting, sweat, and urine; and is therefore much superior to any of the usual evacuating medicines, most of which prove only active in promoting one of these discharges at once. 5. The most obstinate cases of gonorrhœa, fluor albus, and venereal ulcers, are cured by the powder.—In some instances it has induced salivation; but whether it can always be made to produce that effect, is not yet altogether certain. 6. The powder prepared from the extract, and exhibited with sugar, does not induce vomiting; and, on the contrary, the powder of the root always promotes that evacuation.

(1.) GRATIOSA, one of the AZORES. See GRACIOSA. It is about 10 miles long and 8 broad. It has several towns and forts. La Plata is the capital. Lon. 10. 12. W. of Ferro. Lat. 39. 2. N.

(2.) GRATIOSA, or GRACIOSA, one of the Canary islands. See CANARY, § 9. Lon. 13. 7. W. Lat. 29. 15. N.

\* GRATIS. *adv.* [Latin.] For nothing; without a recompence.—

The people cry you mock'd them; and, of late,  
When horn was given them *gratis*, you repin'd.

*Shakespeare.*

—They sold themselves; but thou, like a kind fellow, gav'st thyself away *gratis*, and I thank thee for thee. *Shak.*—The taking of use, though he judged lawful, yet never approved by practice, but lent still *gratis* both to friends and strangers. *Fell.*—Kindred are no welcome clients, where relation gives them a title to have advice *gratis*. *L'Esrange.*—I scorned to take my degree at Utrecht or Leyden, though offered it *gratis* by those universities. *Arbutnot.*

(1.) \* GRATITUDE. *n. f.* [*gratitudo*, low Latin.] 1. Duty to benefactors.—

Forbid

That our renowned Rome, whose *gratitude*  
Tow'ards her deserving children is enroll'd,

Should now eat up her own! *Shak. Coriol.*

Suspicious thoughts his penive mind employ,  
A fullen *gratitude*, and clouded joy. *Harte.*

2. Desire to return benefits.—

The debt immense of endless *gratitude*. *Milt.*

—*Gratitude* is properly a virtue, disposing the mind to an inward sense and an outward acknowledgment of a benefit received, together with a readiness to return the same, or the like. *Soutb.*

(2.) GRATITUDE, in ethics, is a fixing the mind to an inward sense and acknowledgment of benefits received. Ingratitude, Mr Paley observes, checketh voluntary beneficence; hence that of a grateful temper is a considerable importance. A 2d reason for cultivating this temper is; That the person which is touched with the kindness of a benefactor, is capable of being affected with the sense of that affection, and of becoming, and of being, the source of the most exalted virtue. The love of God is the blindest gratitude: It is a mistake to imagine, that this virtue is omitted in the commandment; for every precept, which commands "to love God, because he first loved us," supposes the principle of gratitude, and its proper object.

(3.) GRATITUDE, INSTANCE OF. Fiescobald, a Florentine merchant, had gained a great fortune, of which he was liberal and generous. One day a young stranger applied to him for charity. Fiescobald asked him his name, and of what country? "I am," said he, "a native of England; my name is Cromwell, and my father-in-law is a great man. I left my country to seek my fortune, and came with the French army that went to Gattilion, where I was a page to a foreigner, who carried his pike and burgonet." Fiescobald, pitying his necessities, clothed him, and took him into his house till he had recovered his strength by better diet; and, at his request, mounted him upon a good horse, with a quantity of gold in his pocket. Cromwell returned to his native land; where he got into the service of a nobleman, Woolsey; and after his death, he was introduced so effectually into the favour of Henry the 8th, that he made him a baron, viscount, E. of Hereford, and last lord high chancellor. Mean time, Cromwell, by repeated losses, was reduced to poverty, some English merchants being indebted to him for the sum of 15,000 ducats, became to London for payment. In pursuit of this affair, he was suddenly met with the lord chancellor as he was going to court; who immediately alighted from his horse, and alighted him, and asked him, "If he was not Sir Thomas Fiescobald?" "Yes, Sir," said he, "I am your most humble servant." "My servant," said the lord chancellor, "No; you are my special favourite, and relieved me in my wants, laid the foundation of my greatness, and, as such, I receive you as my special favourite, and since the affairs of my sovereign will not admit a longer conference, I beg you will sit down with me this day with your company at my house, and dine with me." Fiescobald was astonished at this great man should be that acknowledge his obligations, but, recollecting his own situation, and carriage, he concludes it to be better to go, and therefore went to his house. He came soon after; and taking his hand, the lord high chancellor, turns to the lord high admiral, and says, "This is the gentleman who first contributed to my advancement." He told them the whole story; led him into his dining room, and placed him next to him.

company being gone, the Chancellor : affair had brought him to England? gave him the true state of his circum- : which Cromwell replied, " I am for- : misfortunes, and I will make them as : as I can; but, as men ought to be : they are kind, it is fit I should repay : owe you." Then leading him into his : first took out 16 ducats, and delivering : rescobald, said, " My friend, here is : you lent me at Florence, with ten : laid out for my apparel, and ten more : se; but as you might have made advan- : se money in trade, take these four bags, : which is 400 ducats." He next caused : e him the names of his debtors, and the : owed; which he transmitted to one of : s, with a charge to find out the men, : them to pay him in 15 days under the : his displeasure; and thus in a short : ntre sum was paid. All this time Sig- : bald was entertained in the Chancellor's : o proposed to him to continue in Eng- : offered him the loan of 60,000 ducats : s if he would trade here: but he desired : to Florence, which he did, with extra- : avours from Lord Cromwell. *Hackwell's* : s. c. 10. p. 436.

UUS of Falisci, a Latin poet, cotempo- : Ovid, the author of a poem entitled : s, or the *Manner of hunting with dogs*. : edition is that of Leyden, 12mo, with : d notes of Janus Ulitius: 1645, 8vo.

TUITOUS. *adj.* [*gratuitus*, Latin; *gra-* : 1. Voluntary; granted without claim or : ve mistake the *gratuitous* blessings of hea- : e fruits of our own industry. *L'Esbran.* : d without proof.—The second motive : to introduce this *gratuitous* declination : the same poet gives us. *Ray.*

TUITOUSLY. *adv.* [from *gratuitous*.] : it claim or merit. 2. Without proof.— : now whence came this obliquity of di- : rch they *gratuitously* tack to matter : scribe will and choice to these particles. : *bil. Princ.*

TUITY. *n. s.* [*gratuité*, Fr. from *gra-* : A present or acknowledgment; a free : ey might have pretended to comply with : nd dismissed him with a small *gratuity*. : *the Od.*—He used every year to present : is almanack, upon the score of some lit- : y we gave him. *Swift.*

GRATULATE. *v. a.* [*gratular*, Latin.] : gratulate; to salute with declarations of

to gratify the good Andronicus, : ratulate his safe return to Rome, : ople will accept whom he admires. *Shak.*

Whither away so fast?  
So farther than the Tower,  
To salute the gentle princes there. *Shake-sp.*  
: nature could behold so dire a crime,  
: late at least my native clime,  
: ach a land, which such a monster bore,  
: idistant from our Thracian shore. *Dryd.*  
: dare joy for; to mention with expressions

Yet give thy jealous subjects leave to doubt,  
Who this thy 'scape from rumour gratulate,  
No less than if from peril; and devout,  
Do beg thy care unto thy after state. *Ben Jon.*

\* GRATULATION. *n. s.* [from *gratulatione*, Lat.] Salutations made by expressing joy; expres- : sion of joy.—They are the first *gratulations* where- : with our Lord and Saviour was joyfully received : at his entrance into the world, by such as in their : hearts, arms, and bowels embraced him. *Hooker.*

The earth  
Gave signs of *gratulation*, and each hill. *Milt.*  
—Your enjoyments, according to the standard of : a Christian desire, require no addition: I shall : turn my wishes into *gratulations*, and, congratu- : lating their fulness, only with their continuance. : *South.*

\* GRATULATORY. *adj.* [from *gratulate*.] : Congratulatory; expressing congratulation.

(1.) GRATZ, or GRAZ, a handsome town of : Germany, capital of Stiria, with a castle seated on : a high rock, an university, a great number of pa- : laces, and a fine arsenal. The castle communi- : cates with the river by means of a deep well. : The empress-dowager Mary Theresa, was obliged : to retire hither during the war of 1741 and 1742. : It was taken by the French in March, 1797. It is : seated on the Muer. Lon. 16 5. E. Lat. 47. 4. N.

(2.) GRATZ, a town of Silesia, in the principa- : lity of Troppau, seated on the Mora, 4 miles S. : of Troppau.

GRATZARNITZA, a town of European Tur- : key, in Bosnia, 36 miles ENE. of Serajo.

GRATZEN, a town of Bohemia, in the circle : of Bechin; 17 miles NE. of Rosenberg.

GRAVASELE, a town of Naples, in the pro- : vince of Basilicata; 15 miles E. of Venosa.

GRAUDENTZ, or GRUDZIANDS, a town of : Polish Prussia, in the palatinate of Culm, with a : castle, seated on the Vistula, 14 miles NNE. of : Culm, 30 N. of Thorn, and 110 NW. of Warsaw. : Lon. 18. 51. E. Lat. 53. 36. N.

(1.) \* GRAVE. *adj.* [*grave*, Fr. *gravis*, Latin.] : 1. Solemn; serious; sober; not gay; not light or : trifling.—

To th' more mature,  
A glass that featur'd them; and to the grave,  
A child that guided dotards. *Shak. Cymb.*

We should have else desir'd  
Your good advice, which still hath been both  
*grave*

And prosperous, in this day's council. *Shak.*  
—That *grave* awfulness, as in your best breed of : mastives, or elegancy and prettiness, as in your : lesser dogs, are modes of beauty. *More against A-* : *theism*.—Even the *grave* and serious characters are : distinguished by their several sorts of gravity. *Dry-* : *den's Fables, Preface*.—

Youth on silent wings is flown;  
*Graver* years come rolling on. *Prior*

To laugh, were want of goodness and of grace;  
And to be *grave*, exceeds all power of face. *Pope*

Folly-painting humour, *grave* himself,  
Calls laughter forth. *Thomson.*

—They have as much reason to pretend to, and : as much necessity to aspire after, the highest ac- : complishments of a Christian and solid virtue, as : the *gravest* and wisest among Christian philoso- : phers.

phers. *Law.* 2. Of weight; not futile; credible. Little used.—The Roman state was of all others the most celebrated for their virtue, as the *grave* of their own writers, and of strangers, do bear them witness. *Greav's Cosm.* 3. Not showy; not tawdry: as, a *grave* suit of cloaths. 4. Not sharp of sound; not acute.—Accent, in the Greek names and usage, seems to have regarded the tone of the voice; the acute accent raising the voice, in some syllables, to a higher, *i. e.* more acute pitch or tone, and the *grave* depressing it lower, and both having some emphasis, *i. e.* more vigorous pronunciation. *Holder.*

(2.) GRAVE, in grammar, a species of accent opposite to acute. The grave accent is expressed thus ('); and shows, that the voice is to be depressed, and the syllable over which it is placed pronounced in a low deep tone.

(3.) GRAVE, in music, is applied to a sound which is in a low or deep tone. The thicker the chord or string, the more grave the tone or note, and the smaller the acuter. Notes are supposed to be the more grave, in proportion as the vibrations of the chord are less quick.

(4.) GRAVE, in the Italian music, serves to denote the slowest movement.

(5.) \* GRAVE, a final syllable in the names of places, is from the Saxon *graf*, a grove or cave. *Gibson's Camden.*

(6, i.) GRAVE, in geography, a strong city of the Batavian republic, in the dept. of the Dommel and Scheldt, and ci-devant province of Dutch Brabant; with a fort, seated in a marshy country on the S. side of the Meuse. In 1323, John III, D. of Brabant, obtained it from Otho, lord of Cuyck. It was taken by the French, under Pichegru, Dec. 28, 1794, by capitulation; after a bombardment of 10 weeks, during which hardly one house escaped. It lies 8 miles S. of Nimeguen, 20 E. of Bois-le-duc, and 34 SE. of Utrecht. Lon. 5. 45. E. Lat. 51. 46. N.

(ii.) GRAVE, a town of France, in the dep. of the Upper Alps, 16 miles NW. of Briançon.

(7, i.) \* GRAVE. *n. f.* [*graf*, Sax.] The place in the ground in which the dead are repositd.—

Now it is the time of night,

That the *graves*, all gaping wide,

Every one lets forth his spright,

In the church-way paths to glide. *Shak.*

Thou wilt not leave me in the loathsome *grave*. *Milton.*

To walk upon the *graves* of our dead masters,

Is our own security. *Denham's Sophy.*

—A flood of waters would overwhelm all those fragments which the earth broke into, and bury in one common *grave* all the inhabitants of the earth. *Burnet.*—They were wont once a-year to meet at the *graves* of the martyrs; there solemnly to recite their sufferings and triumphs, to praise their virtues, to bless God for their pious examples, for their holy lives and their happy deaths. *Nelson.*

(ii.) GRAVES, among the Jews were generally out of the city, though there are instances of their interring the dead in towns. Frequent mention is made of graves upon mountains, in highways, in gardens, and private houses; so that nothing on this head seems to have been determined. The

same may be observed with respect to the Thebans had a law that every pe built a house should provide a burial-ground who had distinguished themselves were buried in the public forum. The mo custom was, however, to bury out of chiefly by the highway side. The Ro forbidden by the law of the XII tables burn the dead in the city; but some ha pulchres in Rome, though they paid a indulgence.

(1.) \* To GRAVE. *v. a.* *preter. grav* pass. *graven.* [*graver*, Fr. *grave*.] 1. To carve a figure or inscription in any stance.—

Cornice with bossy sculptures *grav*—Later vows, oaths, or leagues can out those former *gravings* or characters, just and lawful oaths were made upon *K. Charles.*—

Thy sum of duty let two words c O! may they *graven* in that heart Be humble and be just.

2. To carve or form.—What profiteth image, that the maker thereof hath *Hab. ii. 18.* 3. To copy paintings upon metal, in order to be impressed on *grav*ers can and ought to imitate the bo colours by the degrees of the lights and 'tis impossible to give much strength to *grave*, after the works of the schools, imitating in some sort the colour of th *Dryden's Dufres.* 4. [From *grave*.] T Not in use.—

There's more gold:

Do you damn others, and let this dam And ditches *grave* you all! *Shak.*

5. To clean, caulk, and sheath a ship. *A*

(2.) \* To GRAVE. *v. n.* To write or on hard substances.—Thou shalt make pure gold, and *grave* upon it. *Ex. xxxi*

\* GRAVE-CLOATHS. *n. f.* [*grave* and The dress of the dead.—

But of such subtle substance and That like a ghost he seem'd, whose *gr* were unbound.

—And he that was dead came forth, bo and foot with *grave-cloaths.* *John xi. 4*

GRAVEDONA, or } a town of the GRAVEDONO, } republic, in th Lario, and ci-devant duchy of Milan; the W. bank of Lake Como, 42 miles N.

(1.) \* GRAVEL. *n. f.* [*gravier*, Fr. Dutch; *gravel*, Armoric.] 1. Hard s consisting of very small pebble stones, consists of flints of all the usual sizes and of the several sorts of pebbles; sometim few pyritæ, and other mineral bodies, o intermixed, and common sand. *Woodes* armour, all gilt, was so well-handled, th ed like a glittering sand and *gravel*, w with silver rivers. *Sidney.*—

Proofs as clear as suns in July, We see each grain of *gravel.* *Shak. Ha*

—Providence permitted not the earth to self in base *gravels* and pebbles, instead ries of stones. *Morc.*—

ep, and yet so clear, we might behold  
*gravel* bottom, and that bottom gold. *Dryd.*  
 per garden at Kensington was at first no-  
 a *gravel* pit. *Spe&*.—*Gravel* walks are  
 uit-trees. *M&rt. H&sb.* 2. [*Gravelle*, Fr.]  
 iter concreted in the kidneys.—If the  
 rittle it will often crumble, and pass in  
 of *gravel*: if the stone is too big to pass,  
 ethod is to come to a sort of a compo-  
 ruce with it. *Arbutnot.*

RAVEL, (§ 1. *def.* 1.) in natural history  
 ning, a congeries of pebbles, which,  
 h a stiff loam, makes lasting and elegant  
 lks; an ornament peculiar to our gar-  
 which gives them an advantage over  
 ther nations.

AVSL, (§ 1. *def.* 2.) in medicine. See  
 E, *Index*; and ALKALI.

RAVEL WALKS. To make these proper-  
 stom should be laid with lime rubbish,  
 stones, or any other hard matter, for  
 ches thick, to keep weeds from growing  
 and over this the gravel is to be laid 6  
 s thick. This should be laid rounding  
 e middle, by which means the larger  
 e run off to the sides, and may be raked  
 r the gravel should never be screened  
 is laid on. It is an error to lay these  
 round, which not only makes them un-  
 alk upon, but takes off from their appa-  
 lth. One inch in 5 feet is a sufficient rise  
 ddle; so that a walk of 20 feet wide  
 only 4 inches higher at the middle than  
 es, and so in proportion. As soon as  
 is laid, it should be raked, and the large  
 own back again; then the whole should  
 both lengthwise and crosswise; and the  
 ho draws the roller should wear shoes  
 heels, that he may make no holes; be-  
 es made in a new walk are not easily re-  
 The walks should always be rolled 3 or  
 4 very hard showers, after which they  
 more firmly than otherwise they could  
 ade to do. Gravel, with some loam a-  
 inds more firmly than the rawer kinds;  
 gravel is naturally very harsh and sharp,  
 r to add a mixture of loam to it. The  
 il for walks is such as abounds with  
 und pebbles, which, being mixed with  
 im, are bound so firmly together, that  
 ever afterwards injured either by wet or  
 er. These are not so liable to be turn-  
 the feet in walking, as the more irregu-  
 rd pebbles, and remain much more firm-  
 places after rolling.

RAVEL. *v. a.* [from the noun.] 1. To  
 ver with gravel.—Moss groweth upon  
 ecially such as lie cold, and upon the  
 in divers terrasses; and again, if they  
 rodden, or if they were at the first *gra-*  
*icon.* 2. To stick in the sand.—William  
 rror, when he invaded this island, chan-  
 arrival to be *gravelled*; and one of his  
 so fast in the sand, that he fell to the  
*Landen.* 3. To puzzle; to stop; to put  
 to embarrass.—I would kiss before I  
 say, you were better to speak first, and  
 were *gravelled* for lack of matter you  
 C. PART II.

might take occasion to kiss. *Shak.*—The disease it-  
 self will *gravel* him to judge of it; nor can there  
 be any prediction made of it, it is so sharp. *Howel.*  
 —What work do our imaginations make with e-  
 ternity and immensity? And how are we *gravelled*  
 by their cutting dilemmas? *Glanville's Scephts.*—

Mat, who was here a little *gravelled*,  
 Tost up his nose, and would have cavill'd. *Prior.*  
 4. [In horsemanship.] To hurt the foot with gra-  
 vel confined by the shoe.

\* GRAVELESS. *adj.* [from *grave*.] Wanting a  
 tomb; unburied.—

My brave Egyptians all,  
 By the discarding of this pelleted storm,  
 Lie *graveless*. *Shak. Ant. and Cleopatra.*

GRAVELINES, a very strong town of the  
 French republic, in the dep. of the North, and  
 ci-devant French Flanders, with a castle and har-  
 bour. It was ceded to France by the treaty of the  
 Pyrenees, and is seated in a marshy country on the  
 river Aa, near the sea, 12 miles E. of Calais. Lon.  
 2. 13 E. Lat. 50. 59. N.

\* GRAVELLY. *adj.* [*graveleux*, French; from  
*gravel*.] Full of gravel; abounding with gravel;  
 consisting of gravel.—There are some natural  
 spring, waters that will inlapidate wood; so that  
 you shall see one piece of wood, whereof the part  
 above the water shall continue wood, and the part  
 under the water shall be turned into a *gravelly*  
 stone. *Bacon's N. Hist.*—If you live in a consump-  
 tive air, make choice of the more open, high, dry,  
 and *gravelly* part of it. *Harvey on Consumptions.*

GRAVELLY LAND, or SOIL, that abounding  
 with gravel or sand, which easily admits of heat  
 and moisture; and the more stony such lands  
 are, the more barren they prove, in general;  
 though not always; for there are gravelly lands  
 in different places in Scotland pretty fertile, which  
 have proved barren upon removing the stones, and  
 recovered their fertility, when the stones and gra-  
 vel were restored.

GRAVELOT, an eminent French engraver,  
 born at Paris in 1699. He resided 13 years in Eng-  
 land. The finest editions of the French poets were  
 ornamented by his works. He died at Paris in 1773.

GRAVELOTTE, a town of France, in the dep.  
 of Moselle; 4 m. N. of Gorze, and 6 SW. of Metz.

\* GRAVELY. *adv.* [from *grave*.] 1. Solemnly;  
 seriously; soberly; without lightness or mirth.—  
 Thou stand'st

*Gravelly* in doubt when to hold them wise. *Milt.*  
 —A girl longs to tell her confidant that she hopes  
 to be married in a little time, and asks her very  
*gravelly* what she would have her to do. *Spe&*.—

Wisdom's above suspecting wiles;  
 The queen of learning *gravelly* smiles. *Swift.*

—A formal story was very *gravelly* carried to his  
 excellence, by some zealous members. *Swift.*—

Is't not enough the blockhead scarce can read,  
 But must he wisely look, and *gravelly* plead?

*Young.*  
 2. Without gaudiness or show.

GRAVEN, a town of Norway, 24 miles SW.  
 of Bergen.

(1.) GRAVENAC, a county of Suabia.  
 (2.) GRAVENAC, the capital of the county,  
 (N<sup>o</sup> 1.) 30 miles W. of Ulm. Lon. 9. 28. E. Lat.  
 48. 22. N.

H h h h GRAVENAC,

GRAVENAU, a town of Lower Bavaria, 20 miles N. of Passau, and 36 ESE. of Ratibon.

\* GRAVENESS. *n. f.* [from *grave*.] Seriousness; solemnity and sobriety of behaviour.—  
You no less becomes

The light and careless livery that it wears,  
Then settled age his fables, and his weeds  
Importing health and *graveness*. *Hamlet.*

But yet beware of counsels when too full;  
Numbers make long disputes and *graveness* dull.  
*Denham.*

GRAVENHORST, a town of Germany, in the circle of Westphalia, 4 miles NE. of Rheine.

GRAVENMÄCHEREN, a town of the French republic, in the dep. of Forets, and late duchy of Luxemburg. It has an ancient monument about 1500 years old. This town was sacked and burnt by the marquis of Brandenburg, in 1551. It is 25 miles ENE. of Luxemburg, and 12 SW. of Treves.

GRAVENWERT, a town of Lower Bavaria, 25 m. N. of Amberg, and 42 ENE. of Nuremberg.

\* GRAVEOLENT. *adj.* [*graveolens*, Latin.] Strong scented. *DiB.*

(1.) \* GRAVER. *comp.* of *grave*. See GRAVE.

(2.) \* GRAVER. *n. f.* [*graveur*, Fr. from *grave*.] 1. One whose business is to inscribe or carve upon hard substances; one who copies pictures upon wood or metal to be impressed on paper.—If he makes a design to be graved, he is to remember that the *gravers* dispose not their colours as the painters do; and that, by consequence, he must take occasion to find the reason of his design in the natural shadows of the figures, which he has disposed to cause the effect. *Dryden's Duff.* 2. The file or tool used in graving.—With all the care wherewith I tried upon it the known ways of softening *gravers*, I could not soften this. *Boyle.*—

The tollsome hours in different labour slide,  
Some work the *file*, and some the *graver* guide.

*Gay's Fan.*

(3.) GRAVER. See GRAVING, § II, 1, 2.

GRAVEROL, a learned French advocate, born at Nismes, in 1635. He was author of *The Sorberiana*, and several other works. He died in 1694.

(1.) GRAVESANDE, a town of the Batavian republic, in the dept. of Delft, and late province of S. Holland; 6 miles WSW. of Delft, and 4 from the coast. It was anciently the chief residence of the Counts of Holland.

(2.) GRAVESANDE, William James, LL. D. and F. R. S. an eminent mathematician, born of an ancient family at Delft in Holland, in 1688. He studied the civil law at Leyden, but mathematical learning was his favourite amusement. When he had taken his degree in 1707, he settled at the Hague, and practised at the bar, in which situation he cultivated an acquaintance with learned men; with a society of whom, he published a periodical review, intitled *Le Journal Litteraire*, which was continued without interruption from 1713 to 1742, when he died. The most considerable of his works are, 1. *A Treatise on Perspective*: 2. An introduction to the Newtonian philosophy, or a treatise on the elements of physics confirmed by experiments: 3. A treatise on the elements of algebra, for the use of young students: and, 4. A course of logic and metaphysics. The ministers of the republic consulted him on many occasions,

and his skill in calculation was often of use to them; as well as his address in deciphering secret correspondence of their enemies. He was sent by the States to congratulate George I. on his accession; and on his return appointed professor of mathematics and astronomy at Leyden, where he was the first that introduced the Newtonian philosophy. He was intimated with Sir Isaac Newton, as well as his doctrine.

(1.) GRAVESEND, a town of Eng. Kent, situated on the banks of the Thames, 23 miles from London; and has a battery mounted with cannon, to command the river, directly opposite to Tilbury fort. This town was plundered and burnt by the French and Spaniards in the reign of Richard II. penance which, the king vested it and with the sole privilege of carrying passage water to London at 4s. the whole fare, head, which was confirmed by Henry V. now the fare is 9d. a head in the tilt boat in the wherry. The former must not take above 40 passengers, the latter only 8. ply here at the landing of people from London to carry them to Rochester, at 1s. This town and Milton were incorporated by Elizabeth, and granted some peculiar privileges. Great quantities of garden stuffs are brought to London, and other places, where the air of Gravesend is preferred to that of Bath. outward bound ships are obliged to anchor at Gravesend till they have been visited by the ward officers; and for this purpose a block house fires a musket: but the ward bound all pass by without notice, put waiters on board, if they are not sufficient. As those outward bound general provisions here, the place abounds with provisions. The town being burnt down in 1727, was granted by the parliament in 1731, to the corporation of Gravesend, to rebuild a new church. In 1624, one Mr Pinnock gave 1000 l. for building-houses, besides one for a master to employ the poor; and there is a charity school for 24 boys, who are both taught and clothed. The town-house was erected in 1764; and an act was passed for paving and lighting the streets.

(2, 3.) GRAVESEND, a township and parish in the County of New York, in King's County, Long Island, 12 miles N. by E. of the city.

(4.) GRAVESEND, a sea port town of the island of Jersey, situated on the SW. side of the island, seated on a bay.

(5.) GRAVESEND, a village in Hertfordshire, 12 miles N. of St. Albans.

GRAVESON, a town of France in the Mouths of the Rhone, 5 miles NE. of Arles.  
\* GRAVEST. *superl.* of *grave*. See GRAVE.  
\* GRAVE-STONE. *n. f.* [*grave* and *stone*.] A stone that is laid over the grave; the monument.

Timon, presently prepare thy  
Lye where the light foam of the sea  
Thy *grave-stone* daily. *Sbc.*

GRAVID, *adj.* Big with child. *Ab.*  
It is surprising that Dr Johnson should have used this adjective, when he inserts its ab-

\* GRAVIDITY. *n. f.* [*gravidus*, Latin.] Pregnancy; state of being with child.—Women who are not always the forementioned

hose the signs of *gravity* and obstruc-  
ard to be distinguished in the beginning.

**DONA.** See GRAVEDONA.

**METER, n. f.** [from *gravis*, weighty,  
to measure.] an instrument or glass  
by Citizen Guyton Morveau, entirely  
principles of Nicholson's Hydrometer.  
**METER and HYDROSTATICS.**

**AVINA,** a town of Naples, in the  
ari, with a bishop's see, 9 miles W. of  
nd 32 SW. of Br. Lon. 17. o. E.  
N.

**AVINA,** John Vincent, an eminent  
illustrious lawyer of Italy, born at  
1664. He was professor of the canon  
college of Sapienza at Rome; where  
1718. His works are both curious and  
chief of them is, *De otu et progressu*  
*s.* They were printed in 4to at Leip-  
s., with notes by Mascovius.

**AVINA,** Peter, an Italian poet, born at  
nd much esteemed by gen. Gonsalvo,  
s, and Prosper Colonna. He wrote,  
oman style, Discourses on Matters re-  
e Law and to the Belles Lettres, as well  
He died in 1525, aged 75.

**VING. n. f.** [from *grave*.] Carved  
iful to work in gold; also to grave any  
*graving*, and to find out every device  
be put to him. 2 *Coro* ii. 14.

**AVITATE. v. n.** [from *gravis*, Lat.]  
the centre of attraction —  
who have nature's steps with care  
u'd,

ter is with active force endu'd,  
its parts magn-tick pow'r exert,  
ach other *gravitate*, assert. *Blackmore.*  
tle matter must be of the same sub-  
all other matter, and as much as is  
led within a particular body must *gru-*  
y with that body. *Bentley.*

**AVITATION. n. f.** [from *gravitate*.]  
ing to the centre.—The most confide-  
merion belonging to terrestrial bodies  
ral action of *gravitation*, whereby all  
ies, in the vicinity of the earth, do  
efs towards its centre. *Bentley.*—  
the loose mountain trembles from on

*avitation* cease, if you go by? *Pope.*

**VITATION,** in natural philosophy, is  
istinguished from **GRAVITY**. Thus  
his takes *gravity* for that force where-  
ould fall to the earth; but gravitation  
diminished by the centrifugal force.  
**AVIAN PHILOSOPHY.**

**AVITY. n. f.** [from *gravis*, Lat. *gravite*,  
ght; heaviness; tendency to the cen-  
quality by which all heavy bodies tend  
centre, accelerating their motion the  
approach towards it, true philosophy  
o be unsoleable by any hypothesis,  
f it into the immediate will of the  
all bodies, considered within the con-  
fluid, there is a twofold *gravity*, true,  
and vulgar or comparative: abso-  
is the whole force by which any bo-

dy tends downwards; but the relative or vulgar  
is the excess of *gravity* in one body above the speci-  
fic *gravity* of the fluid, whereby it tends downwards  
more than the ambient fluid doth. *Quincy.*—Bodies  
do swim or sink in different liquors, according to  
the tenacity or *gravit* of those liquors which are to  
support them. *Brown's Vulg. Err.*—Though this  
increase of density may at great distances be ex-  
ceeding slow, yet if the elastick tone of this medi-  
um be exceeding great, it may suffice to impel  
bodies fr m the denser parts of the medium to-  
wards the rarer, with all that power which we  
call *gravity*. *New. Opt.* 2. Atrociousness; weight  
of guilt.—No man could ever have thought this  
reasnable, that had intended thereby only to  
punish the injury committed, according to the  
*gravity* of the fact. *Hooker.*—3. Seriousness; solemn-  
nity.—There is not a white hair on your face but  
should have his effect of *gravity*. *Shak. Hen. IV.*

Our youths and wild:ers shall no whit appear,  
But all be buried in his *gravity*. *Shak. Jul. Cesar.*  
—For the advocates and council that plead, pa-  
tience and *gravity* of hearing is an essential part  
of justice. *Bacon.*—

Great Cato there, for *gravity* renown'd.

*Dryden.*

—The emperors often jested on their rivals or  
predecessors, but their mints still maintained their  
*gravity*. *Addison.*—He will tell you with great  
*gravity*, that it is a dangerous thing for a man  
that has been used to get money, ever to leave it  
off. *Law.*

(2.) **GRAVITY, or GRAVITATION,** (for they are  
most commonly used synonymously.) signifies ei-  
ther the force by which bodies are pressed towards  
the surface of the earth, or the manifest effect of  
that force; in which last sense the word has the  
same signification with *weight* or *heaviness*. Con-  
cerning gravity in the first sense of the word, or  
that active power by which all bodies are impelled  
towards the earth, there have been great disputes.  
Many eminent philosophers, and among the rest  
Sir Isaac Newton himself, have considered it as  
the first of all second causes; an *incorporeal* or *spi-*  
*ritual substance*, which never can be perceived any  
other way than by its effects: an universal property  
of matter, &c. Others have attempted to ex-  
plain the phenomena of gravitation by the action  
of a very subtle etherial fluid; and to this expla-  
nation Sir Isaac, in the latter part of his life, seems  
not to have been averse. He has even given a con-  
jecture concerning the matter in which this fluid  
might occasion these phenomena. But for a full  
account of the discoveries of this great philosopher  
concerning the laws of gravitation, the conjectures  
made by him and others concerning its cause; the  
various objections that have been made to his  
doctrine, and the state of the dispute at present,  
see the articles **ASTRONOMY, ATMOSPHERE, AT-**  
**TRACTION, EARTH, ELECTRICITY, FIRE, LIGHT,**  
**NEWTONIAN PHILOSOPHY, REPULSION, PLE-**  
**NUM, VACUUM, &c.**

(3.) **GRAVITY, SPECIFIC,** denotes the weight  
belonging to an equal bulk of every different sub-  
stance. Thus the exact weight of a cubic inch of  
gold, compared with a cubic inch of water, tin,  
lead, &c. is called its *specific gravity*. See **HYDRO-**  
**TATICS,** and **SPECIFIC GRAVITY.**

H h h h GRAULHET.

GRAULHET, a town of France, in the dep. of Tarn, 9 miles NE. of Lavaur, and 25 NW. of Castres.

(1.) GRAUNT, Edward, an eminent English grammarian of the 16th century. He was head master of Westminster school, and published a work entitled, *Græce Linguae Specilegium, et Institutio Græce Grammaticæ*. He died in 1601.

(2.) GRAUNT, John, F. R. S. author of a curious and celebrated book, entitled, *Natural and Political Observations made upon the Bills of Mortality*. He was a haberdasher, but gave up his trade, and all public employments, on account of his religion. He was educated a puritan; afterwards professed himself a Socinian; but at last declared himself a Roman Catholic. He died in 1674.

GRAUSZYSZKI, a town of Poland, in the palatinate of Wilna; 28 miles SE. of Wilna.

\* GRAVY. *n. f.* The ferous juice that runs from flesh not much dried by the fire.—Meat we love half raw, with the blood trickling down from it, delicately terming it the *gravy*, which in truth looks more like an ichorous or raw bloody matter. *Harv. on Consump.*—There may be a stronger broth made of vegetables than of any *gravy* soup. *Arbutnot.*

(1.) \* GRAY. *adj.* [*græg*, Saxon; *grau*, Dan. *grauu*, Dutch.] 1. White with a mixture of black.—

They left me then, when the gray headed even,  
Like a sad votarist in palmer's weed,  
Rose from the hindmost wheels of Phœbus' wain.

*Milton.*

—These gray and dun colours may be also produced by mixing whites and blacks, and by consequence differ from perfect whites, not in species of colours, but only in degree of luminousness. *Newton's Optics.* 2. White or hoary with old age.—Living creatures generally do change their hair with age, turning to be gray; as is seen in men, though some earlier and some later; in horses, that are dappled and turn white; in old squirrels that turn grisly, and many others. *Bacon's Nat. Hist.*—Thou hast neither forsaken me now I am become gray headed, nor suffered me to forsake thee in the late days of temptation. *Walton.*—

Anon

Gray headed men and grave, with warriors  
mix'd,

Assemble.

*Milton's Par. Lost.*

—The restoration of gray hairs to juvenility, and renewing the exhausted marrow, may be effected. *Glanville.*—

Gray headed infant! and in vain grown old!  
Art thou to learn that in another's gold  
Lie charms resistless?

*Dryden's Juv.*

—We most of us are grown gray headed in our dear master's service. *Speltator.*—

Her gray hair'd synods damning books unread,  
And Bacon trembling for his brazen head.

*Pope.*

3. Dark like the opening or close of day; of the colour of ashes.—Our women's names are more gracious than their Cæcilia, that is, gray eyed. *Ganden.*—

The gray ey'd morn smiles on the frowning  
night,

Chequering the eastern clouds with streaks of  
light.

*Shak.*

'Till say yon gray is not the morning  
'Tis but the pale reflex of Cynthia's brow

Soon as the gray ey'd morning breaks  
And in the doubtful day the woodcock

*Gay*

(4.) \* GRAY. *n. f.* A gray colour.—  
Down sunk the sun, the closing hoar  
Came onward, mantled o'er with dust

(3.) GRAY, or GREY. § 1. *def. 1.* See § 3, and DYING, Part III, Sect. II. In age they make several sorts of grays; as dappled or blackened gray, which has spots dispersed here and there. The dappled which has spots of a darker colour than of the body. The light or silver gray there is but a small mixture of black; as lead or iron gray, which has but a small of white. And the brownish or sandy gray, where there are bay-coloured hairs with the black.

(4.) GRAY, in geography, a town in the dep. of Upper Saone, and in Franche Compte. It is a trading place seated on the Saone, 25 miles NE. of Dijon. 5. 41. E. Lat. 47. 30. N.

(5.) GRAY, or GRAY ABBEY, a town in the county of Down, 89 miles from London, famous for its linen manufacture.

(6, 7.) GRAY, a post town and town in the United States, in the district of Maine, in Cumberland county; 15 miles N. by W. of Portland, and 140 from Boston. The population was 577.

(8.) GRAY, Lady Jane. See GREY.

(9.) GRAY, Mary of Lednec. See BELMONT.

(10.) GRAY, Thomas, an admired English lawyer, was the youngest and only surviving son of a reputable citizen of London, and was born in 1716. He was educated at Eton, where he contracted a friendship with Mr Houshold, and with Mr Richard West, son of the chancellor of Ireland. Mr West and Gray were both intended for the bar; but Gray was diverted from that pursuit by an invitation to accompany Mr Walpole in his travels; which he accepted without any determined plan of a future life. During his travels, he wrote a great number of letters to Mr West and to his parents, which are printed with his poems; and when he returned, finding himself in narrow circumstances, with a mind not disposed for active employment, he retired to Cambridge, and devoted himself to study. Soon after his return, his father died; and the melancholy impressed on his mind by this event may be traced in his admirable poem *written in a country church-yard*, which is supposed to have been begun at this time. The pulse of his sorrow for the death of his father, and his birth to a very tender sonnet in English, which is a model of Petrarch; and also to a sublime ode in hexameters, written in genuine majesty, with which he intended to begin his books *De Principiis cogitandi*. From the year 1742, to his death, his principal residence was at Cambridge; from which he was absent any considerable time, except in 1759 and 1762; when, on the opening

useum, he took lodgings in Southamp-  
n order to have recourse to the Harleian  
MSS. there deposited, from which he  
erally curious extracts, amounting in all  
able-sized folio, at present in the hands  
Walpole. About 1747, Mr Mason, the  
Mr Gray's poems, was introduced to  
Mason had written some imitations of  
juvenile poems, *viz.* A Monody on the  
Mr Pope, and two pieces intitled *Il-  
ind Il Pacifico* on the peace of Aix-la-  
; and Mr Gray revised them. This laid  
sation of an intimacy which continued  
interruption till Mr Gray's death. About  
; Gray had put his last hand to his cele-  
*egy written in a country church-yard*, and  
nunicated it to his friend Mr Walpole,  
ood taste was too much charmed with  
er him to withhold the sight of it from  
itance. Accordingly it was shown about  
time in MS. and received with all the  
it to justly merited. At last the publisher  
f the magazines having obtained a sur-  
copy of it, Mr Gray wrote to Mr Wal-  
iring that he would put his own MS. in-  
nds of Mr Doddsley, and order him to  
nmediately. This was the most popular  
r author's publications. It ran through  
sitions in a very short time; and was  
nslated into Latin by Messrs Anky and  
and by Mr Lloyd. From 1759 to 1762,  
ally resided in London. In July 1768,  
; Grafton wrote him, that his majesty had  
sed to offer to him the professorship of Mo-  
ory in the university of Cambridge, then  
This place was valuable, the salary being  
year; and was the more acceptable to  
that it was given him without solicitation.  
indeed remarkably disinterested in all his  
Though his income, before this addi-  
; very small, he never read or wrote with  
of making his labours useful to himself.  
be said to have been one of those few  
s in the annals of literature, who are de-  
self interest, and at the same time atten-  
onomy; and also was one of those very  
omists, who possess that talent, untinct-  
th the slightest stain of avarice. When  
mstances were at the lowest, he gave a  
sums in private charity, as would have  
dit to an ampler purse. He seems early  
have had an intention of publishing an  
f Strabo; for his papers contain a great  
of notes and geographical disquisitions on  
or, particularly with respect to that part  
which comprehends Persia and India.  
fatigable pains which he took with the  
of Plato, and the number of critical and  
ry observations which he has left upon  
very part of his works, plainly indicate,  
nan in Europe was better prepared to re-  
d illustrate that philosopher than Mr Gray.  
work, on which he bestowed uncommon  
as the *Antologia*. In an interleaved copy  
slection of Greek epigrams, he has tran-  
sferred additional ones, which he selected  
enave reading; has inserted a great num-  
critical notes and emendations, and sub-

joined a copious index. But whether he intended  
this performance for the press or not, is uncer-  
tain. The only work, which he meditated upon  
with this direct view from the beginning, was a  
*history of English poetry*, upon a plan sketched out  
by Mr Pope. He has mentioned this himself in  
an advertisement to those three fine imitations  
of Norse and Welch poetry, which he gave the  
world in the last edition of his poems. But after  
he had made some preparations for the execution  
of this design, being informed, that Mr Warton,  
of Trinity College, Oxford, was engaged in a  
work of the same kind, he relinquished the under-  
taking; and soon after, on that gentleman's de-  
siring a sight of his plan, our author readily sent  
him a copy of it. Mr Gray had acquired a great  
knowledge of Gothic architecture. He had seen  
and studied in his youth, while abroad, the Ro-  
man proportions, both in ancient times, and in  
the works of Palladio. In his later years he ap-  
plied himself to consider those stupendous struc-  
tures of more modern date that adorn our own  
country; which, if they have not the same grace,  
have undoubtedly equal dignity. He endeavoured  
to trace this mode of building from the time  
it commenced through its various changes, till it  
arrived at its perfection in the reign of Henry VIII.  
and ended in that of Elizabeth. Thus he arrived  
at so very extraordinary a pitch of sagacity, as to  
be able to pronounce at first sight, on the precise  
time when every particular part of any of our  
cathedrals was erected. But the favourite study  
of Mr Gray for the last ten years of his life was  
natural history, which he then rather resumed  
than began; as by the instructions of his uncle  
Antrobus, he was a considerable botanist at 15.  
The marginal notes which he has left on Linnæus  
and other writers on the vegetable, animal, and  
fossile kingdoms, are very numerous; but the  
most considerable are on Hudson's *Flora Anglica*,  
and the 10th edition of the *Systema Naturæ*.  
While employed on zoology, he read Aristotle's  
treatise on that subject with great care, and ex-  
plained many difficult passages of that obscure an-  
cient, by the lights he had received from modern  
naturalists. He died in 1771; and an edition of  
his poems, with memoirs of his life and writings,  
were published in 4to, in 1775, by Mr Mason.  
Mr Gray's character, has been drawn by the Rev.  
Mr Temple, rector of Mamhead in Devonshire,  
in a letter to Mr Boswell. "Perhaps (says Mr  
Temple) he was the most learned man in Europe.  
He was equally acquainted with the elegant and  
profound parts of science, and that not superfi-  
cially but thoroughly. He knew every branch of  
history, both natural and civil; had read all the  
original historians of England, France, and Italy;  
and was a great antiquarian. Criticism, meta-  
physics, morals, politics, made a principal part  
of his plan of study; voyages and travels of all  
sorts were his favourite amusement; and he had  
a fine taste in painting, prints, architecture, and  
gardening. With such a fund of knowledge, his  
conversation must have been equally instructing  
and entertaining; but he was also a good man, a  
well bred man, a man of virtue and humanity.  
There is no character without some speck, some  
imperfection; and I think the greatest defect in  
his

his was an affectation in delicacy, or rather effeminacy, and a visible fastidiousness, or contempt and disdain of his inferiors in science. He also had, in some degree, that weakness which disgusted Voltaire so much in Mr Congreve." (See CONGREGVE.) "Perhaps it may be said: What signifies so much knowledge, when it produces so little? Is it worth taking so much pains to leave no memorial but a few poems? But let it be considered, that Mr Gray was, to others, at least innocently employed; to himself, certainly beneficially. His time passed agreeably; he was every day making some new acquisition in science; his mind was enlarged, his heart softened, and his virtue strengthened; the world and mankind were shown to him without a mask; and he was taught to consider every thing as trifling, and unworthy the attention of a wise man, except the pursuit of knowledge, and the practice of virtue in that state wherein God hath placed us."

(11.) \* GRAY. *n. f.* A badger. *Ainsworth.*

GRAY ABBEY. See GRAY, N<sup>o</sup> 5.

\* GRAYBEARD. *n. f.* [*gray and beard.*] An old man: in contempt.—

Youngling, thou canst not love so dear as I.  
—*Graybeard*, thy love doth freeze. *Shak.*

Have I in conquest stretch mine arm so far,  
To be afraid to tell *graybeards* the truth?

*Shakespeare.*

(1.) \* GRAYLING. *n. f.* [*thymallus.*] The umber, a fish.—The *grayling* lives in such rivers as the trout does, and is usually taken with the baits, and after the same manner: he is of a fine shape, his flesh white, and his teeth, those little ones that he has, are in his throat. He is not so general a fish as the trout, nor so good to eat. *Walton's Angler.*

(2.) GRAYLING, in ichthyology, a species of SALMO. In angling for this fish your hook must be armed upon the shanks with a very narrow plate of lead, which should be slenderest at the bent of the hook, that the bait (a large grasshopper, with the uppermost wing pulled off) may come over to it the more easily. At the point let there be a cad-bait in a continual motion. The jag-tail, which is a worm of a pale flesh-colour, with a yellow tag on its tail, is an excellent bait for the grayling in March and April.

\* GRAYNESS. *n. f.* [from *gray.*] The quality of being gray.

GRAYS, or GRAYS-THURROCK, a town of England in Essex, on the banks of the Thames, opposite Dartford. It has a market on Thursday, and lies 12½ miles SE. of Rufford, and 24 E. of London. Lon. *o.* 24. E. Lat. 51. 26. N.

GRAY'S TOWN, a town of Ireland, in the county of Tipperary, and province of Munster.

GRAZ, or GRATZ. See GRATZ, N<sup>o</sup> 1.

GRAZALEMA, a town of Spain in Granada, 8 miles W. of Ronda.

(1.) \* To GRAZE. *v. a.* [from *grass.*] 1. To tend grazing cattle; to set cattle to feed on grass.

Jacob *graz'd* his uncle Laban's sheep. *Shak.*

O happy man, faith he, that, lo! I see

*Grazing* his cattle in those pleasant fields,

If he but know his good! *Dan. Civil War.*

2. To feed upon.—

I was at first as other beasts, that  
The trodden herb, of abject thoughts

Their steeds around,  
Free from their harness, *graze* the flower

—Some *graze* their land 'till Christmas  
longer. *Mori.*—

This Neptune gave him, when heg  
His scaly flocks that *graze* the war

The lambs with wolves shall *graze*  
dant mead.

3. To supply with grass.—He hath a  
barn to repair, and a field or two to  
cows, with a garden and orchard. *Shak.*

(2.) \* To GRAZE. *v. n.* 1. To eat  
feed on grass.—The greatest of my pride  
my ewes *graze*, and my lambs suck. *Shak.*  
where you will, you shall not house wit

Leaving in the fields his *grazing* co  
He sought himself some hospitable ho

The more ignoble throug  
Attend their stately steps, and slow

long.

2. To supply grass.—Physicians advise  
tients to remove into airs which are pl  
paigns, but *grazing*, and not overgrown  
*Bacon.*—The sewers must be kept so as

may not stay too long in the Spring: to  
ground continueth the wet, whereby it  
*graze* to purpose that year. *Bacon.*—A

of *grazing* ground is that near the sea,  
commonly very rich land. *Mori. Hist.*  
move on devouring.—As every state is

the other that was oppressed, so the  
tually *grazed.* *Bacon.* 4. [From *razer*  
To touch lightly.—

Mark then a bounding valour in o

That being dead, like to the bullets,

Breaks out into a second course of m

Killing in relapse of mortality. *Shak.*

y quality in a high degree.—There  
1 *great* fear. *Pf. xiv. 5.*

ow'r was *great*. *Milton.*

*Great* triumph and rejoicing was in heav'n.

*Milton.*  
Charms such as thine, inimitably *great*  
He only could express. *Broome.*

3. Having number or bulk, relative or compara-  
tive.—The idea of so much is positive and clear:  
the idea of *greater* is also clear, but it is but a  
comparative idea. *Locke.*—4. Considerable in ex-  
tent or duration.—Thou hast spoken of thy ser-  
vants house for a *great* while to come. 2 *Pa. vii. 19.*  
5. Important; weighty.—

Make sure  
Her favours to thee, and the *great* oath take  
With which the blessed gods assurance make.

*Chapman.*  
Many  
Have broke their backs with laying manors on  
them,

For this great journey. *Sbak. Hen. VIII.*  
What is low raise and support,  
That to the height of this *great* argument  
I may assert eternal Providence,  
And vindicate the ways of God to men. *Milt.*

On some *great* charge employ'd  
He seem'd, or fix'd in cogitation deep. *Milton.*

By experience of this *great* event,  
In arms not worse. *Milton.*

After silence then,  
And summons read, the *great* consult began.

*Milton.*  
—And though this be a *great* truth, if it be impar-  
tially considered, yet it is also a *great* paradox to  
men of corrupt minds and vitious practices. *Tillot.*

6. Chief; principal.—  
Hear the king's pleasure, cardinal, who com-  
mands you  
To render up the *great* seal presently. *Sbak.*

7. Venerable; adorable; awful.—  
Thou first art wort God's *great* authentick  
will,  
Interpreter, through highest heav'n to bring.

*Milton.*  
8. Wonderful; marvellous.—  
*Great* things, and full of wonder. *Milton.*

9. Of high rank; of large power.—  
Such men as he be never at heart's ease,  
Whilst they behold a *greater* than themselves.

*Sbak. Julius Caesar.*  
Worthiest by being good,  
Far more than *great* or high. *Milton.*

Of all the *great*, how few  
Are just to heav'n, and to their promise true!

*Pope's Odyssey.*  
Misfortune made the throne her seat,  
And none could be unhappy but the *great*.

*Rouev.*  
Despise the farce of state.  
The sober follies of the wife and *great*. *Pope.*

The marble tombs that raise on high,  
Whose dead in vaulted arches lie;  
These, all the poor remains of state,  
Adorn the rich, or praise the *great*. *Parnel.*

10. General; extensive in consequence or influ-  
ence.—  
Prolifick humour soft'ning all her globe,  
Fermented the *great* mother to conceive. *Milt.*

11. Illustrions; eminent; noble; excellent.—O  
Lord

Lord, thou art *great*, and thy name is *great* in might. *Jer. x. 6.*—

The *great* Creator thus reply'd, *Milton.*  
The *great* Son return'd

Victorious with his faints. *Milton.*

Fair angel, thy desire that tends to know

The works of God, thereby to glorify

The *great* work-master, tends to no excess

That reaches blame. *Milton.*

*Great* are thy works Jehovah, infinite

Thy pow'r! what thought can measure thee, or tongue

Relate thee! *greater* now in thy return,

Than from the giant angels: thee that day

Thy thunder magnified, but to create

Is *greater* than created to destroy. *Milton.*

The *great* luminary,

Aloof the vulgar constellations thick,

That from his lordly eye keep distance due,

Dispenses light from far. *Milton.*

Here Cæsar grac'd with both Minervas shone,

Cæsar, the world's *great* master, and his own.

*Pope.*

Scipio,

*Great* in triumphs, in retirement *great.* *Pope.*

12. Grand of aspect; of elevated mien.—

Such Dido was; with such becoming state,

Amidst the crowd, she walks serenely *great.*

*Dryd. Virg.*

13. Magnanimous; generous; high minded.—In

her every thing was goodly and stately; yet so,

that it might seem that *great* mindedness was but

the ancient-bearer to the humbleness. *Sidney.*—

14. Opulent; sumptuous; magnificent.—

Not Babylon,

Nor *great* Alcaïro, such magnificence

Equall'd in all their glories. *Milton.*

—He disdain'd not to appear at *great* tables and

festival entertainments. *Atterb.* 15. Intellectually

*great*; sublime.—

This new created world, how good, how fair,

Answering his great idea. *Milton.*

16. Swelling; proud.—Solyman perceived that

Vienna was not to be won with words, nor the

defendants to be discouraged with *great* looks;

wherefore he began to batter the walls. *Knolles.*

17. Familiar; much acquainted. A low word.

—Those that would not censure, or speak ill of a

man immediately, will talk more boldly of those

that are *great* with them, and thereby wound

their honour. *Bacon.* 18. Pregnant; teeming.—

His eyes sometimes even *great* with tears. *Sidney.*

Their bellies *great*

With swelling vanity, bring forth deceit. *Sandys.*

This fly, for most he stings in heat of day,

From cattle *great* with young keep thou away.

*Moy's Virg.*

19. It is added in every step of ascending or descending

consanguinity: as *great* grandson is the

grandson of my grandson.—I dare not yet affirm

for the antiquity of our language, that our *great-*

*great-great* grandfathers tongue came out of Persia.

*Camden's Remains.*—What we call *great great*

grandfather they called forthafader. *Camden's Remains.*—

Their holyday-cloaths go from father to

son, and are seldom worn out till the 2d or 3d

generation; so that is it common enough to see a

countryman in the doublet and breeches of his

*great* grandfather. *Addison.* 20. Har-

grievous. A proverbial expression.—

matter to live lovingly with good meek persons. *Taylor's Devotion.*

(2.) GREAT is also a title appropriate to certain princes, as, the *great* Turk, the

*great* cham of Tartary, the *great* prince, &c.

(3.) GREAT is also a surname bestowed upon several kings and emperors, as, Alexander

Cyrus the *great*; Charles the *great* *great*, &c.

(4.) \* GREAT, *n. f.* [from the adjective] whole; the gross; the whole in a

part. To let out thy harvest by *great*. Let this by experience lead thee that

By *great* will deceive thee with thy

out, By day will dispatch. —It were behoveful, for the strength

that no ships should be builded by thee, by daily experience they are found to

imperfect. *Raleigh.*— He did at length so many slain fight

And lost the tale, and took them to

—Carpenters build an house by the *great* agreed for the sum of money. *Mexon*

one day in a week for lovers, and into *great* for any gentlewoman who is true

*Addison.* (5.) A GREAT MANY, a very un- though common phrase, to be found in

authors. See DICTIONARY, § 4. GREAT BANK OF NEWFOUNDLAND

is a fishing bank on the coast of Newfoundland

tending from N. to S. but nearly of a shape. It is separated from the island

by a broad channel of deep water. It is Lon. 49. 45. and 54. 45. W. and betw

o. and 50. 24. N. GREAT BARRINGTON, a town in Massachusetts in Berkshire county, 150 m

Boston, and 20 E. by S. of Hudson, in GREAT BEAR LAKE, a water in the

of N. America, which runs W. into the River, near the Arctic circle. Its mouth

is 1000 yards wide. \* GREATBELLIED. *adj.* [*great* and *bellied*]

teeming.— *Greatbellied* women, That had not half a week to go. *Bl*

In the old time of war, would shake

—A *greatbellied* woman, walking thrity in the day time, had her child stir

her womb, and carried half a turkie. *Wilkins.*

GREAT BRITAIN. See BRITAIN, and SCOTLAND. The long projected

tween Great Britain and Ireland, was proposed in the last Irish parliament, w

a majority in the parliaments of both in 1800; It took place on new years

day the first meeting of the Imperial parliament on the 22d of January 1801. See GREAT DISMAL SWAMP. See DIS

\* To GREATEN. *v. a.* [from *great*]

to enlarge; to magnify. A word little  
r they fought to *greaten* themselves in  
using strangers for the commanders of  
t, the Turks by degrees beat them out  
goodly countries. *Raleigh*.—A favour-  
:is is to please his king, a minister's to  
exalt him. *Ken*.

ER TONE, in music. See TONE.  
FAMING, a river of New York, which  
mountains near the source of the Onca-  
ns NW. by W. into Lake Ontario, 10  
of Black river.

THEARTED. *adj.* [*great and heart.*]  
ed; undejected.—The earl, as *great-*  
ie, declared that he neither cared for  
ip, nor feared his hatred. *Clarendon*.

EAT ISLAND, an island of Ireland, in  
miles long, and from 1 to 3 broad, 8  
Cork.

EAT ISLAND, an island of New Hamp-  
catagua harbour.

ATLY. *adv.* [from *great.*] 1. In a  
e.—

row I will *greatly* multiply. *Milton*.  
illustriously.—

ondon, empress of the northern clime,  
gh fate thou *greatly* didst expire. *Dryd.*  
imously; generously; bravely.—

: are these bold intrepid sons of war,  
:atly turn their backs upon the foe,  
heir general send a brave defiance?

*Addison's Cato.*

MAN'S BAY, a bay of Ireland, on the  
Galway, 6 miles N. of Arran.

ATNESS. *n. f.* [from *great.*] 1. Large-  
ntity or number. 2. Comparative

We can have no positive idea of any  
iration, which is not made up of and  
ate to repeated numbers of feet or  
lays or years, and whereby we judge  
*tness* of these sort of quantities. *Locke*.  
nt good does not, according to the  
has, or is acknowledged to have, cause  
to that *greatness*, as all pain causes de-  
o itself; because the absence of good is  
a pain, as the presence of pain is. *Locke*.  
gree of any quality.—Zeal, in duties,  
proportioned to the *greatness* of the re-  
the certainty. *Rogers*. 4. High place;  
ower; influence; empire.—The most  
ery is lodged most easily in the groy-  
ty; for their ordinary conceit draw-  
ling to *greatness*, and then have they  
discern the right degrees of duty. *Sid-*

el, a long farewell to all my *greatness*.  
*Shak.*

So many  
o *greatness* dedicate themselves. *Shak.*  
your *greatness* not to give the law  
realms; but beaten, to withdraw.

*Dryden.*

oaching *greatness* met him with her  
rms  
r and future state;  
k her from his arms. *Dryden.*

cles raised the Athenians to their *great-*  
PART. II.

*ness* at sea, which he thought to be the true and  
constant interest of that commonwealth. *Swift*.  
3. Swelling pride; affected state.—My lord would  
have you know, that it is not of pride or *greatness*  
that he cometh not aboard your ships. *Bacon*. 6.  
Merit; magnanimity; nobleness of mind.—

*Greatness* of mind and nobleness their feat  
Build in her loveliest. *Milton*.

7. Grandeur; state; magnificence.—  
*Greatness* with Timon dwells in such draught,  
As brings all Brobdignag before your thought.

*Pope.*

GREAT RIDGE, a ridge of the ALLEGANY  
mountains between the Savannah and the Alata-  
maha.

GREAT SKELIG, an island of Ireland on the  
coast of Kerry, in Munster.

\* GREAVE. *n. f.* [*graf, Saxon.*] A grove.  
*Spenser*.—

Yet when there haps a honey-fall,  
We'll lick the firupt leaves,

And tell the bees that theirs is gall  
To that upon the *greaves*. *M. Drayton.*

(1.) GREAVES, John, an eminent physician  
and antiquary, the eldest son of John Greaves rec-  
tor of Colemore, near Alresford in Hampshire.  
He was born in 1602, and educated at Balliol Col-  
lege in Oxford, from which he removed to Mer-  
ton. He was afterwards chosen professor of geo-  
metry, in Gresham college. His ardent thirst of  
knowledge led him to travel into several parts of  
Europe, where he eagerly seized every opportu-  
nity of improving it. His next voyage was into  
the eastern countries; where nothing remarkable  
in the heavens, earth, or even subterraneous pla-  
ces seems to have escaped his observation. He,  
with indefatigable industry, and even at the peril  
of his life, collected a considerable number of A-  
rabic, Persian, and Greek MSS. for Abp. Laud.  
Of these he well knew the value, as he was a mas-  
ter of the languages in which they were written.  
He also collected for that prelate many oriental  
gems and coins. He took a more accurate sur-  
vey of the pyramids than any traveller who went  
before him. On his return from the East, he vi-  
sited several parts of Italy a second time. During  
his stay at Rome, he made a particular inquiry in-  
to the true state of the ancient weights and mea-  
sures. Soon after he finished his 2d voyage, he  
was chosen Savilian professor of astronomy at Ox-  
ford, for which he was eminently qualified. His  
books relating to oriental learning, his *Pyramido-*  
*graphia*, or a description of the pyramids in E-  
gypt, his *Epochæ Celebriores*, and other curious  
and useful pieces, of which Mr Ward has given  
us a catalogue, shew him to have been a great  
man. Those which he intended to publish would  
have shown him to be a greater; but he was stop-  
ped in his great career by death in 1652.

(2.) \* GREAVES. *n. f.* [from *gréves, Fr.*] Ar-  
mour for the legs; a sort of boots. It wants the  
singular number.—He had *greaves* of brass upon  
his legs. 1 Sam. xvii. 6.—

A shield make for him, and a helm, fair  
*greaves*, and curets such

As may renown thy workmanship, and honour  
him as much. *Chapman.*

GREBE. See COLYMBUS, N<sup>o</sup> 2, 3, and 12.

GREBENSTEIN, a town of Hesse Cassel, 12 m. NW. of Cassel, and 16 NNE. of Naumburg.

GREBIN, a town of Prussia, in Pomerania, 6 miles SE. of Dantzic.

GRECIAN. See GREER.

GRECINUS, Julius, a Roman Senator and a man of letters, born at Prejus, in the reign of Augustus. He was a man of exemplary virtue, and was put to death by Caligula, for refusing to accuse an innocent man who had incurred that tyrant's displeasure.

\* GRECISM. *n. f.* [*gracismus*, Lat.] An idiom of the Greek language.

GREEDINO, a town of Franconia, in the bishopric of Aichstadt, 13 miles NE. of Aichstadt.

\* GREE. *n. f.* [*gré*, French; probably from *gratia*.] Good will; favour; good graces.—

And falling her before on lowly knee,  
To her makes present of his service seen,  
Which she accepts with thank: and goodly gree.

*Spenser.*

(1. 1.) GREECE, in many respects, one of the most deservedly celebrated countries in the world, was anciently bounded on the N. by Macedonia and the river Strymon, on the W. by the Ionian sea; on the S. by the Mediterranean; on the E. by the Egean sea and Archipelago. It extended from the Strymon, by which it was parted from Thraee, to the promontory of Tenarus, the southernmost point of the Peloponnesus, now the Morea, about 6° 20' of latitude, or nearly 440 English miles, and in breadth from E. to W. about 350 miles.

(2.) GREECE, ANCIENT NAMES OF THE INHABITANTS OF. The general names by which the inhabitants of this country were known to the ancients were those of *Graioi*, or *Graicoi*, from whence the name of *Greece* is plainly derived. These names are thought to come from *GRÆCUS*, the father, or (according to some) the son, of Thessalus, who gave name to Thessaly; but some modern critics derive it from *Raga*, the same with *Reu*, the son of Peleg, by the transposition of a letter to soften the sound.—These names were afterwards changed for *ACHÆI* or *ACHIVI*, and *HELLENES*, the first, as is supposed, from *Achæus*, the son of Xuthus, the son of Hellen, and father of Ion; or, according to the fable, the son of Jupiter: the other from Hellen, above-mentioned, the son of Deucalion, and father of Dorus, from whom came the *Dores*, afterwards a famous nation among the Greeks.—Another name by which the Greeks were known in some parts of the country, was that of *PELAGI*, which the Arcadians, the most ancient people in Greece, deduced from their pretended founder *Pelafgus*, who is said to have got such footing in Peloponnesus, that the whole peninsula from him was called *PELAGIA*. But the most ancient name of all is universally allowed to have been that of *IONES*, which the Greeks themselves derived from *Ion* the son of Xuthus; or, as the fable hath it, of *Apollo*, by *Creusa* the daughter of *Erechtheus* the grandson of *Deucalion*. *Josephus*, however, affirms, that their original is of much older date; and that *JAVAN*, the son of *Japhet*, and grandson of *Noah*, was the first who peopled these countries; which *Bochart* has also rendered very pro-

bable. It is true, indeed, that among the themselves, only the Athenians and such as sprung from them, were called *Jones*; is also plain beyond exception, that other gave this name to all the inhabitants of Greece.

(3.) GREECE, ANCIENT SAVAGE STATE. The inhabitants of Greece in the first according to their own historians, appear to have been savages scarce a degree removed from the brute. They lived indifferently on every fruit, and the root that came in their way; and lay either in the open fields, or at best sheltered themselves in caves, and hollow trees: while the country remained one uncultivated desert.—The improvement they made in their way of living, was the exchanging of their old food for the more wholesome acorns, building huts for themselves to sleep in, and covering their bodies with the skins of beasts. For all this, it seems, they were helden to *Pelafgus* above mentioned (6) by some to be *PELEG* spoken of in Scripture who was highly revered by them on that account. This reformation in their way of living, however, it seems wrought none in their manners. On the contrary, they who had nothing to do but a hole to sleep in, began now to rob one another of these slender acquisitions in process of time, put them under a necessity of joining themselves into companies under a head, that they might either more safely defend their neighbours, or preserve what they had. Laws they had none except that of the law of nature, that those only lived in safety who inhabited the most barren and craggy places; and hence for a long time had no settled inhabitants, the weakest being always turned out by the strongest. Their gigantic size and strength, if we believe *Plutarch*, added so much to their pride and cruelty, that they seemed to glory in committing the greatest acts of violence and bloodshed on those that unhappily fell into their hands.

(4.) GREECE, ANCIENT STATES AND DOMS OF. The next advance towards civilization was their forming themselves into regular states, to cultivate the lands, and build towns for their safety. Their original barbarity and mutual violence prevented them from uniting into one nation, or even into any considerable commonwealth, and hence the great number of states into which Greece was originally divided. The most considerable of these small principalities mentioned in the following: In *Peloponnesus* were *Sicyon*, *Argos*, and *Messenia*, *Achaia*, *Arcadia*, and *Laconia*. In *Grecia Propria* part of Greece which lay without *Peloponnesus* were those of *Attica*, *Megara*, *Boeotia*, *Epichnemidia*, *Doris*, *Phocis*, *Locris*, and *Ætolia*. In *Epirus* were the *Molopiloichi*, *Cassiopæi*, *Dryopes*, *Chaocæi*, *protii*, *Almeni*, and *Acarnani*. In *Thessaly* those of *Thessaliotis*, *Estiotis*, *Pelagiotis*, and *Phthia*. All these were at one time or other severally governed by kings of the same name, though we only find the names of many mentioned in the histories of the more considerable kingdoms of *Sparta*, *Attica*, *Thebes*.

(5.) GREECE, GENERAL HISTORY OF THE SIEGE OF TROY. The cretion

however, for some time, did not much suffer; the inhabitants of the new kingdom were not destroyed one another with-

Attica was the only place in any degree secure from these incursions, because it was naturally the seat of every thing that could invite an enemy; but those cities suffered much which were situated on the sea-coasts; they were in continual danger of being plundered by sea or land: for pirates at that time infested all those seas than robbers do. And this was one main cause why the ancient cities of Greece were situated at a considerable distance from the shore; but, as all their safety consisted in the help they could make against an invader, they were under a necessity of going armed, and being ever on their guard. The chief arising from these continual robberies was, that they occasioned a great part of the lands to lie uncultivated; the people only planted and sowed as much as was barely necessary for their support; there was so great a neglect of agriculture, that there could be little room for any discoveries in the liberal arts and trades. Hence, when other nations, such as the Jews, Egyptians, Midianites, Phœnicians, had improved themselves to a very high degree in every useful art, the Greeks seem to have been utter barbarians, the most renowned Grecian heroes, Hercules, Theseus, &c. performed exploits which, however exaggerated by tradition, no doubt had a foundation in truth. The Greeks are of opinion, that the Grecian heroes were entirely fictitious, and their exploits deceptions of the Hebrew worthies, such as Samson, &c. Yet, considering the excess of barbarity which at that time prevailed throughout Greece, it seems not at all improbable that some persons of extraordinary courage might undertake the adventures, and travel about like the rovers of the sea, and fight errant in quest of adventures.

GREECE, GENERAL HISTORY OF, TILL THE DEATH OF ALEXANDER THE GREAT. The history of Greece from the time of the Trojan war, in which we find the Greeks united against Troy, for the particulars of that war, see TROY. Their success in this war, which ended about A. A. C. 1184, cost them vast numbers of their bravest warriors, and great numbers of the survivors being obliged to return; and many of those who returned, either by ill fortune, or being ordered, or driven out of their country, it is probable however, that their having been a long time in Asia, might contrivance the Greeks somewhat sooner than otherwise would have been; and accordingly, we find their history somewhat improved, and as it were beginning to emerge from its infancy. The continual wars, indeed, in which they were engaged among themselves, no long time, prevented them from making considerable progress in those arts in which afterwards made so great improvement. The Greeks, which indeed never ceased to be preserved their liberty, ren-

dered them brave, and skilled in the military art, above all other nations; but at the same time they effectually prevented them from making permanent conquests, and confined them within the bounds of their own country; while the different states were one way or other so equally balanced, that scarce one of them was able perfectly to subdue another. The Spartans, however, having, with great difficulty, reduced the kingdom of Messene, and added its territories to their own, became the leading people in Greece. Their superiority was long disputed by Athens; but the Peloponnesian war at last determined that point in favour of the Spartans, when the city of Athens was taken, and its walls demolished by Lysander the Spartan general. See ATTICA, § 13. By the battle of Leuctra, the Spartans lost that superiority which they had maintained for 500 years, and which now devolved on the Thebans. After the death of Epaminondas, the celebrated Theban general, however, as no person was found possessed of his abilities, the Thebans were again obliged to yield the superiority to the Spartans. But by this time the Greeks had become acquainted with the luxuries and elegancies of life; and all the rigour of their original laws could not prevent them from valuing these as highly as other people. This did not indeed abate their valour, but it heightened their mutual animosities; at the same time that, for the sake of a more easy and comfortable life, they became more disposed to submit to a master. The Persians, whose power they had long dreaded, and who were unable to resist them by force of arms, at last found out, by the advice of Alcibiades, the proper method of reducing the Grecian power; namely, by assisting them by turns, and supplying one state with money to fight against another, till they should all be so much reduced, that they might become an easy prey. Thus the Greeks were weakened, though the Persians did not reap any benefit from their weakness. Philip of Macedon entered into the same political views; and partly by intrigue, partly by force, got himself declared Generalissimo of Greece. His successor Alexander the Great completed their subjection; and by destroying the city of Thebes, and exterminating its inhabitants, struck such a terror throughout Greece, that he was as fully obeyed by all the states as by any of the rest of his subjects.

(7.) GREECE, HISTORY OF, TILL ITS SUBJUGATION BY THE TURKS. During the absence of Alexander in Persia the Greeks attempted to shake off the Macedonian yoke, but were quelled by his general Antipater. The news of Alexander's death was to them a matter of the utmost joy; but their mutual animosities prevented them from joining in any solid plan for the recovery of their liberties, and hence they continued to be oppressed by Alexander's successors, or other tyrants, till Aratus, the Achæan, about 268 B. C. formed a design of setting his country free from these oppressors. He persuaded a number of the small republics to enter into a league for their own defence, which was called the *Achæan league*; and notwithstanding that the republics, taken singly, had very little strength, they not only maintained their independence, but soon became formidable when un-

This association continued to become daily more and more powerful; but received a severe check from Cleomenes III. king of Sparta, which obliged them to call in Antigonus to their assistance. This prince overcame Cleomenes at the battle of Sellasia, and afterwards made himself master of Sparta. Thus he became a more formidable enemy than the one he had conquered, and the recovery of the Grecian liberties was incomplete. Soon after this, the Greeks began to feel the weight of a power more formidable than any which they had yet experienced; namely, that of the Romans. That insidious and haughty republic first inter-meddled with the Grecian affairs, under pretence of setting them at liberty from the oppression of Philip VI. of Macedon. This, by a proper union among themselves, they might have accomplished; but in this they acted as though they had been infatuated; receiving with the utmost joy the decree of the Roman consul, who declared them free; without considering, that he who had thus given them liberty, might take it away at his pleasure. This lesson, however, they were soon taught, by the total reduction of their country to a Roman province; yet this can scarce be called a misfortune, when we look back to their history, and consider their outrages upon one another; nor can we sympathize with them for the loss of that liberty, which they only made use of to fill their country with slaughter and bloodshed. After their conquest by the Romans, they made no united effort to recover their liberty. They continued in quiet subjection till the beginning of the 15th century. About that time, they began to suffer under the tyranny of the Turks, and their sufferings were completed by the taking of Constantinople in 1453. Since that time, they have groaned under the yoke of a most despotic government; so that all traces of their former valour, ingenuity, and learning, are now in a manner totally extinct. Whether the exertions of Passwan Oglou, or those of the French shall tend to revive their ancient spirit, time must determine.

(8.) GREECE, PRESENT STATE OF. Modern Greece, now called EUROPEAN TURKEY, and by the Turks RUMELIA, comprehends Macedonia; Albania, now called ARNAUT; Epirus; Thessaly, now JANA; Achaia, now LIVADIA; the Peloponnesus, now MOREA; together with the islands on its coast, and in the Archipelago. The continent of Greece is seated betwixt 36° and 43° lat. N. and between 19° and 26° lon. E. of London. On the N. it is bounded by Bulgaria and Servia, from which it is divided by a ridge of mountains; on the S. by the Mediterranean sea; on the E. by Romania and the Archipelago; and on the W. by the Adriatic. Its length is above 400 miles, and its utmost breadth about 350. The air is extremely temperate and healthy; and the soil fruitful, though badly cultivated; yielding corn, wine, delicious fruits, and abounding with cattle, fowls, and venison. See GREEKS, § 5, 8, and 10.

(11.) \* GREECE. *n. f.* [corrupted from *degrees*. It is written likewise *greece* or *gizee*.] A slight of steps. Obsolete.—

Ev'ry *greece* of fortune  
Is smother'd by that below. *Shak.*  
—After the procession, the king himself remaining

seated in the quire, the lord archbishop, *greece* of the quire, made a long oration. *Henry VII.*

GREECESTER, a small town of En Northumberland, N. o. Otterburn.

\* GREEDILY. *adv.* [from *greedy*.] Ravenously; voraciously; with keen desire.—

*Greedy* she engorg'd without restraint.

He swallow'd it as *greedy*

As parched earth drinks rain.

Ev'n deadly plants, and herbs of poison  
Wild hunger seeks; and to prolong our  
We *greedy* devour our certain death.

\* GREEDINESS. *n. f.* [from *greedy*.] Greediness; voracity; hunger; eagerness of desire.—

Fox in stealth, wolf in *greediness*.

—Thither with all *greediness* of ambition  
gone, and there they intend to sup. *Shak.*  
*ter's Tale.*—

If thou wert the wolf, thy *greediness*  
sift thee. *Shakespeare*

I with the same *greediness* did seek.

As water when I thirst, to swallow *Greedy*

\* GREEDY. *adj.* [*gradig*, Sax. *greotig*, Dutch.] 1. Ravenous; voracious

—As a lion that is *greedy* of his prey. *Ph.*  
—Be not unsatiable in any dainty thing  
*greedy* upon meats. *Ecclesiast.* xxxvii. 29.—  
the *greedy* ravens to be Elias's caterers,  
him food. *King Charles.* 2. Eager; voracious.  
It is now commonly taken  
sense.—

*Greedy* to know, as is the mind of

Their cause of death, swift to the first

—The ways of every one that is *greedy* of

Stern look'd the fiend, as frustrated

Not half suffic'd, and *greedy* yet to kill

While the reaper fills his *greedy* barn

And binds the golden sheaves in brit

—How fearful would he be of all *greedy*

just ways of raising their fortune? *Low*

(1.) GREEK, or GRECIAN, *adj.* Be

Greece.

(2.) GREEK BIBLES. See BIBLE, § V

(3.) GREEK CHURCH, is that part of  
an church which is established in Greece  
likewise to some other parts of Turkey.  
It is so called, in contradistinction from  
Romish church; also the *Eastern church*  
tion from the *Western*. The Roman  
Greek church the *Greek schism*; because  
do not allow the authority of the pope  
pend wholly, as to matters of religio  
own patriarchs. They have treated th  
matics ever since the *revolt*, as they ca  
patriarch Photius.

(4.) The GREEK LANGUAGE, as pres  
writings of the celebrated authors of  
Homer, Hesiod, Demosthenes, Arist  
Xenophon, &c. has a great variety of  
expressions, suitable to the genius an  
of a polite and learned people, who  
for arts and sciences. In it, proper na  
nificative; which is the reason that t

borrow so many terms from it. When invention, instrument, machine, or the discovered, recourse is generally had to for a name to it; the facility where-  
 by are there compounded, affording such expressive of its use; such are, barometer, er, microscope, telescope, &c. But of es, medicine most abounds with such a diaphoretic, diagnosis, diarrhœa, hæ-, hydrophobia, phthisis, atrophy, &c. he copiousness and significance of the herein it excels most, if not all, other; it has also 3 numbers, viz. a singular, plural; a number of tenses in its verbs, takes a variety in discourse, prevents a ynefs that always accompanies too great unity, and renders that language peculiar for all kinds of verse. The use of the s, of the aorists and preterite, together compound words already mentioned, peculiar force and brevity, without ab- from its peripicuity. It is difficult to precise difference between the modern nt Greek; which consists in the term- of the nouns, pronouns, verbs, &c. not hat obtains between some of the dialects alian or Spanish. There are also in the Greek many new words, not to be met re ancient. We may therefore distinguish of the Greek tongue: the first of which he time when Constantinople became the of the Roman empire; the second lasted t period to the taking of Constantinople urks; and the third from that time to

**GREEK MONKS and NUNS**, of whatever or- sider St Basil as their founder and common ind esteem it the highest crime to deviate aft from his constitutions. There are fe- atiful convents with churches, in which ks perform divine serv. e day and night. the monks are *Cenobites*, or live together, e same habit, eat at the same table, e the same exercises and employments.

**GREEK ORDERS**, in architecture, are the onic, and Corinthian; in contradistinction wo Latin orders, the Tuscan and Compo- e ARCHITECTURE, *Index*.

**GREEKS**, the people of Greece.

**GREEKS, CHARACTER OF THE MODERN.** dern Greeks are said to be very covetous, tical, treacherous, great pederasts, and at e time revengeful to the highest degree; r superstitious. They are so much despised urks, that these do not value even a Greek ns Mahometan. Yet Baron De Tott says, enty Greeks, who were natives of Mace- lefated eighty Turkish soldiers; and that ling of the exploits of Alexander, the Troy, &c. See his *Memoirs*, volume 2d. urks are remarkable for their taciturney never use any unnecessary words: but eks, on the contrary, are very talkative ly. The Turks generally practise what igion enjoins, but the Greeks do not; and usery puts them upon a thousand mean d scandalous practices, authorised by bad ; and perpetuated from father to son. The

Greek women have fine features and beautiful complexions: their countenances still very much resemble those of the ancient Greek statues.

(9.) **GREEKS, HISTORY OF THE.** See ATTICA, CONSTANTINOPLE, GREECE, § 5—7, SPARTA, THEBES, &c.

(10.) **GREEKS, RELIGION AND CLERGY OF THE.** Christianity was planted in Greece soon after the death of our Saviour, and flourished there for many ages in great purity; but since the Greeks became subject to the Turkish yoke, they have sunk into the most deplorable ignorance, in consequence of the slavery and thraldom under which they groan, and their religion is now greatly corrupted. It is indeed little better than a heap of ridiculous ceremonies and absurdities. The head of the Greek church is the patriarch of Constantinople; who is chosen by the neighbouring archbishops and metropolitans, and confirmed by the emperor or grand visir. He is a person of dignity, being the head and director of the eastern church. The other patriarchs are those of Jerusalem, Antioch, and Alexandria. Mr Tournefort tells us, that the patriarchates are now generally set to sale, and bestowed upon those who are the highest bidders. The patriarchs, metropolitans, archbishops, and bishops, are always chosen from among the Caloyers or Greek monks. Before the patriarchs receive their patents and the castan, which is a vest of linsy-woolsey, or some other stuff, presented by the grand signior to ambassadors and other persons newly invested with some considerable dignity, they are obliged to make large presents to the vizir, &c. The income of the patriarch of Constantinople is said to amount to no less than 120,000 guilders, of which he pays the one half by way of annual tribute to the Ottoman Porte, adding 6000 guilders as a present at the feast of Bairam. The next person to a bishop among the clergy is an archimandrite, who is the director of one or more convents, which are called *mandren*; then come the abbot, the arch-priest, the priest, the deacon, the under deacon, the chanter, and the lecturer. The secular clergy are subjected to no rules, and never rise higher than high priest. They are allowed to marry once; but it must be with a virgin, and before they are ordained. They have neither glebe nor tythes, but depend on the perquisites that arise from their office; and they seldom preach but in Lent. The Greeks have few nunneries; but many convents of monks, who are all priests, and, students excepted, obliged to follow some handicraft employment, and lead a very austere life. The Greeks deny the supremacy of the pope, and abhor the worship of images; but have many pictures of saints in their churches, whom they pray to as mediators. Their fasts are very severe. They believe also in the doctrine of transubstantiation, and that the Holy Ghost does not proceed from the Son. They admit not of purgatory, says Mr Thevenot: but yet they allow a third place, where they say the blessed remain, in expectation of the day of judgment. At mass they consecrate with leavened bread; and both priests and laymen communicate under both kinds, and women and children as well as men. When they carry the sacrament to the sick, they do not prostrate themselves before it, nor expose it

it to be adored: nor do they carry it in procession, or have any particular feast in honour of it. Baptism is performed among them by plunging the whole body of the child thrice into water. Immediately after baptism, they give it confirmation and the communion; and seven days after that, it undergoes the ceremony of ablution. When a priest is married, among other ceremonies, the bridegroom and bride drink each two glasses of wine; then the glass is given to the priest, who merrily drinks off the rest of the wine, and breaking the glass, says, So may the bridegroom break the virginity of the bride.

(1, i.) \* GREEN. *adj.* [*grun*, German; *groen*, Dutch.] 1. Having a colour formed commonly by compounding blue and yellow; of the colour of the leaves of trees or herbs. The green colour is said to be most favourable to the sight.—The general colour of plants is *green*, which is a colour that no flower is of: there is a greenish primrose, but it is pale, and scarce a *green*. *Bacon's N. Hist.*  
Groves for ever *green*. *Pope.*

2. Pale; sickly: from whence we call the maid's disease the *green sickness*, or *chlorosis*. Like it is *Sappho's*  $\chi\lambda\alpha\sigma\gamma\omicron\tau\omicron\upsilon\sigma\epsilon\upsilon\sigma$ .—

Was the hope drunk  
Wherein you dress'd yourself? Hath it slept since?  
And wakes it now to look so *green* and pale  
And what it did so freely? *Shak. Macbeth.*  
—There's never any of these demure boys come to any proof: they fall into a kind of male *green sickness*. *Shak. Henry IV.*—

'Till the *green sickness* and love's force betray'd  
To death's remorseless arms th' unhappy maid.  
*Garth.*

3. Flourishing; fresh; undecayed: from trees in Spring.—If I have any where said a *green* old age, I have Virgil's authority; *Sed cruda deo viridisque senectus*. *Dryden.* 4. New; fresh: as, a *green* wound.—

The door is open, fir; there lies your way:  
You may be jogging while your boots are *green*.  
*Shakespeare.*

Griefs are *green*;  
And all thy friends, which thou must make thy friends,  
Have but their stings and teeth newly ta'en out.  
*Shak. Henry IV.*

In a vault,  
Where bloody Tybalt, yet but *green* in earth,  
Lies festering in his blood. *Shak. Rom. and Jul.*  
—A man that studieth revenge keepeth his own wounds *green*, which otherwise would heal and do well. *Bacon.*—I might dilate on the temper of the people, the power, arts, and interest of the contrary party, but those are invidious topics, too *green* in our remembrance. *Dryden.* 5. Not dry.—If a spark of error have thus far prevailed falling even where the wood was *green*, and farthest off from any inclination unto furious attempts; must not the peril thereof be greater in men, whose minds are of themselves as dry fuel, apt beforehand unto tumults? *Hooker.*—

Being an olive tree  
Which late he fell'd; and being *green*, must be  
Made lighter for his manage. *Chapman.*

—Of fragility the cause is an impotency intended, and therefore stone is more brittle than metal, and so dry wood is more fragile than *Bacon's N. H.*—If you but consider a piece of wood burning in a chimney, you will discern, in the disbanded parts of it, the elements. *Boyle.*—The *green* do often heat and the ripe, so heated, give fire to the *Mort. Husb.* 6. Not roasted; half raw: this head we may rank those words which have different ideas, by a sort of an unaccounted fetched analogy, or distant resemblance, that has introduced between one thing and another, as when we say the meat is *green*, when roasted. *Watt's Log.* 7. Unripe; immature because fruits are *green* before they are ripe.

My salad days,  
When I was *green* in judgment, cold in blood.

O charming youth, in the first op'ning  
So many graces in so *green* an age.

You'll find a difference  
Between the promise of his *greener* day  
And these he masters now. *Shak. King's Lear.*

—If you would fat *green* geese, shut them up  
they are about a month old. *Mort. Husb.*

Stubble geese at Michaelmas are seen  
Upon the spit, next May produces *green*.  
*King's Lear.*

(ii.) \* GREEN. *n. f.* 1. The green colour of different shades.—

Her mother bath intended,  
That, quaint in *green*, she shall be looked

But with your presence cheer'd, they  
mourn;  
And walks wear fresher *green* at your return.

—Cinnabar, illuminated by this beam, appears the same red colour as in day light; and it is  
'lens you intercept the *green* making as making rays, its redness will become more and lively. *Newton's Optics.*—Let us but mix the two colours of yellow and blue: if they mingled together in any considerable proportion they make a *green*. *Watt's Logick.* 2. A plain.—

For this down-trodden equity, we tread  
In warlike march these *greens* before you

O'er the smooth enamell'd *green*,  
Where no print of step hath been,  
Follow me as I sing.

The young *Æmilia*, fairer to be seen  
Than the fair lilly on the flow'ry *green*.

3. Leaves; branches; wreaths.—  
With *greens* and flow'rs recruit their  
hives,

And seek fresh forage to sustain their lives  
Ev'ry brow with cheerful *green* is cropp'd  
The feasts are doubled, and the bowls go round.

The fragrant *greens* I seek, my brows to crown

(iii.) GREEN is one of the original primary colours, exhibited by the refraction of the white light. See CHROMATICS, § 7; and COLOURS (iv.) G

n, among painters and dyers. See KING, *Index*; and DYING, *Part III*.

ROOM. *n. f.* [*cytifo genista*, Latin.] A

IGH, a township of New York, in y; containing 164 electors, 1278 ci- 22 slaves, in 1795.

IV, a small town in Hertfordshire.

SH, a township of New York, in Ren-

TLE, a flourishing town of Pennsylv- akin county. It has a Presbyterian man Lutheran churches. It is 12 f. of Chamberburg and 156 W. by phia. Lon 2. 33. W. of that city.

NCLOTH. *n. f.* A board or court of the counting-house of the king's the taking cognizance of all matters t and justice within the king's court- correcting all the servants that shall —For the *greencloth* law, take it in se, I have no opinion of it. *Bacon.*

ICLOTH, BOARD OF, is composed toward and officers under him, who is court has power to maintain the verge, or jurisdiction of the court- is every way about 200 yards from

the last gate of the palace where his majesty re- sides. It takes its name from a green cloth spread over the board where they sit. Without a warrant first obtained from this court, none of the king's servants can be arrested for debt.

(3.) GREEN-CLOTH, CLERKS OF THE, were two officers of the board of green cloth, who appoint- ed the diet of the king and his household; and kept all records, ledgers, and papers relating there- to; made up bills, parcels, and debentures for salaries, and provisions and necessaries for the of- ficers of the buttery, pantry, cellar, &c. They also waited upon foreign princes when entertained by his majesty. But this was abolished in 1782.

(1.) GREENE, Edward Burnaby, an English poet of considerable merit, who published trans- lations of Anacreon and Pindar, with several origi- nal poems and plays. He died in 1788.

(2.) GREENE, a county of Georgia, bounded on the E. by Wilkes and S. by Washington counties; and on the W. and N. by the Oconee. It con- tained 4028 citizens, and 1377 slaves, in 1795. Greenborough is the capital.

(3.) GREENE, a county of Kentucky, bounded by Hardin and Jefferson counties on the E. the state of Tennessee on the S. the Mississippi on the W. and the Ohio on the N.

(4.) GREENE, a township of New York, in Tioga county, on the E. side of the Chenengo.

(5.) GREENE, a county of Tennessee, in Wash- ington district, containing, in 1795, 7287 citizens, and 454 slaves.

\* GREENEYED. *adj.* [*green* and *eye*.] Having eyes coloured with green.—

Doubtful thoughts, and rash embrac'd despair,  
And shudd'ring fear, and *greeney'd* jealousy.

*Shak.*

(1.) GREENFIELD, a township of Massachu- setts, in Hampshire county, on the W. coast of the Connecticut, containing 1498 citizens in 1790.

(2.) GREENFIELD, a flourishing town in the a- bove township, 4 miles N. of Deerfield, and 114 W. by N. of Boston.

(3.) GREENFIELD, a town of New York, in Sa- ratoga county. It had 380 electors in 1795.

(4, 5.) GREENFIELD, two villages of England, in Lincolnshire and Oxfordshire.

(1.) \* GREENFINCH. *n. f.* [*chloris*.] A kind of bird.—The chaffinch, *greenfinch*, dormouse, and other small birds, are injurious to some fruits. *Mortimer.*

(2.) GREEN-FINCH, in ornithology, the English name of the greenish *Tringilla*, with the wings and tail variegated with yellow. See FRINGILLA, N° 12.

(1.) \* GREENFISH. *n. f.* [*qfellus*, Lat.] A kind of fish. *Ainsworth.*

(2.) GREEN-FISH. See ONISCUS.

\* GREENGAGE. *n. f.* A species of plum.

(1.) GREENHOLM, one of the Orkney isles, 1½ miles SW. of Eda.

(2.) GREENHOLM, one of the Shetland islands, 10 miles NNW. of Lerwick.

(1.) \* GREENHOUSE. *n. f.* [*green* and *house*.] A house in which tender plants are sheltered from the weather.—If the season prove exceeding pier- cing, which you may know by the freezing of a moistened cloth set in your *greenhouse*, kindle some charcoal.

charcoal.  *Evelyn's Kalendar.*—Sometimes our road led us into several hollow apartments among the rocks and mountains, that look like so many natural *greenhouses*, as being always shaded with a great variety of trees and shrubs that never lose their verdure.  *Addison.*—A kitchen garden is a more pleasing sight than the finest orangery or artificial *greenhouse*.  *Spectator.*

(2.) A GREEN-HOUSE, or CONSERVATORY, is a house in a garden, contrived for sheltering and preserving the most curious and tender exotic plants, which in our climate will not bear to be exposed to the open air, especially during the winter season. These are generally large and beautiful structures, equally ornamental and useful. Their length must be proportioned to the number of plants intended to be preserved in them, and cannot therefore be reduced to rule; but their depth should never be greater than their height in the clear; which, in small or middling houses, may be 16 or 18 feet, but in large ones from 20 to 24 feet; and the length of the windows should reach from about one foot and a half above the pavement, and within the same distance of the ceiling, which will admit of a cornice round the building over the heads of the windows. Their breadth cannot be in proportion to their length; for if in the largest buildings they are more than 7 or 7½ feet broad, they will be extremely inconvenient. The piers between the windows must be as narrow as may be to support the building; for which reason they should either be of stone or of hard burnt bricks. If the piers are made of stone, they should be 30 inches wide in front, and sloped off behind to about 18 inches, by which means there will be no corners to take off the rays of the sun. If they are of brick, they will require to be at least 3 feet in front, but they should be in the same manner sloped off behind. Over the greenhouse may be rooms for drying and preserving seeds, roots, &c. and behind it a place for tools and other purposes; and both those behind, and the rooms above, will be of great use in keeping off the frosts, so that the wall between them need not be of more than two bricks and a half in thickness. The floor of the greenhouse, which should be laid either with Bremen squares, Purbeck stone, or flat tiles, must be raised two feet above the surface of the adjoining ground, or if the situation be damp, at least 3 feet; and if the whole is arched with low brick arches under the floor, they will be of great service in preventing damp; and under the floor, about two feet from the front, it will be advisable to make a flue of ten inches wide and two feet deep; this should be carried the whole length of the house, and then returned back along the hinder part, and there be carried up into funnels adjoining to the tool-house, by which the smoke may be carried off. The fire-place may be contrived at one end of the house, and the door at which the fuel is put in, as also the ash-grate, may be contrived to open into the tool house, and the fuel being laid in the same place, the whole will be out of sight. Bradley advises, that the front of green houses, in the colder parts of England, be built in a sweep or semicircle, so that one part or other of it may receive the sun's rays all day. The use of fires must,

however, be very sparing in this place one winter in 3 or 4 will require them if only when the weather is very severe frost cannot well be kept out any other is an expedient that is good to have in as it may save a whole house of plants side of the windows, in front of the glass there should be good strong shutters, hinges, to fold back close to the piers, may not obstruct the rays of the sun. part of the house should be either laid stucco or plastered with mortar, and white in order to prevent the frosty air from passing through the walls. When the green wainscotted, the walls should be plastered with lime and hair behind the wainscot, to keep out the cold; and the wainscot, as well as the ceiling and every part within the house, should be painted white, to reflect the sun's rays. There should be a number of tressels with forms of wood, to support the pots of plants; these should be placed hindmost, the lowest within of the windows; and the rows of plants should rise gradually, so that the heads of the plants should be entirely above the sills; and between them there should be a space of at least 12 inches for the convenience of watering the plants, and for the free circulation of the air. The place should be filled with phorbiums, cereuses, and other succulent plants among orange trees, and other common house plants, is always destructive of making them receive an improper sort of light, which plants of that kind imbibe very freely. These should therefore be placed in two wings at each end of the green-house; which, if well managed, will be a great beauty, as well as of use to the main house. These wings may be made capable of containing a hot-bed of tanner's bark, or other warmth also by more flues, and may be made to contain a hot-bed of tanner's bark, many of the tender plants, natives of warm climates. Whilst the front of the greenhouse is facing the SE. and the other the SW. By this the heat of the sun is reflected from one wing to the other all day, and the main green-house is guarded from cold winds. These two wings may be so contrived as to maintain plants of different degrees of heat, which may be easily effected by the situation of the fire-place, and the manner of conducting the flues: the wing facing the SE. is the most proper for the warmest plants, and may be divided in the middle by a wall of glass, with glass doors opening from one wing to the other. In each of these there should be a fire-place, with flues carried up against the wall, through which the smoke should be carried to pass as many times the length of the wing as the height will admit of the number of flues; the longer that the smoke is in passing the more heat will be given to the house with a less quantity of fuel. The other wing, facing the SW. should be divided and furnished with flues in the same manner; and thus different degrees of heat may be obtained, according to the seasons. Particular sorts of plants that are to be preserved in these there are no shades behind these wings should not be less than three bricks thick.

k part, having sloping roofs, which are covered with tiles or slates, should be lined with reeds, under the covering. The sloping glasses of the houses should be made to slide and take off, that they may be drawn down more or less warm weather to admit air to the plants; and upright glasses in front may be so contrived as every other may open as doors upon hinges, the alternate glasses may be divided into two: the upper part of each should be so contrived as to be drawn down like sashes, so that either of them may be used to admit air, in a greater or less quantity as there may be occasion. As to the management of the plants, Mortimer recommends watering the mould about them from time to time, sprinkling a little fresh mould in them, and a little warm dung on that; as also to water them when the leaves begin to wither and curl, and to water them, which would make them fade and dry; and to take off such leaves as wither and dry.

**GREENISH.** *adj.* [from *green*.] Somewhat tending to green.—

With goodly *greenish* locks, all loose, unty'd,  
Which had been a bride. *Spenser.*

In this order the green of all vegetables seems to be, partly by reason of the intenueness of their cells, and partly because, when they wither, some of them turn to a *greenish* yellow. *Newton.*

1.) **GREEN ISLAND**, an island of England, on the coast of Dorsetshire, near Poole.

2.) **GREEN ISLAND**, the name of two isles in Ireland; 1. in Carlingford Bay: 2. on the coast of Donaghadee: both included in Down county.

3.) **GREEN ISLAND**, an isle on the coast of Holland, 12 miles ENE. of Cape Graiton.

4.) **GREEN ISLAND**, an island on the W. end of Jamaica. It has a harbour with good anchorage.

5.) **GREEN ISLAND**, one of the VIRGIN ISLES.

6.) **GREENLAND**, a general name given to the most easterly parts of America, stretching towards the north pole, and comprehending some islands to the N. of Europe, lying in very high latitudes. This country is divided into West and East Greenland.

**GREENLAND, EAST**, was long considered as a part of the continent of West Greenland, but is now discovered to be an assemblage of islands lying between  $76^{\circ} 46'$  and  $80^{\circ} 30'$  lat. N. and between  $9^{\circ}$  and  $20^{\circ}$  lon. E. It was discovered by Hugh Willoughby in 1553, who called it **GREENLAND**; supposing it to be a part of the **EUROPEAN** continent. In 1595, it was again visited by William Barentz and John Cornelius, two Dutchmen, who pretended to be the original discoverers, and called the country **SPITZBERGEN**, from the sharp mountains, from the many sharp-pointed and rocky mountains with which it abounds. They alleged that the coast discovered by Sir Hugh Willoughby was some other country; which accordingly the Hollanders delineated on their maps and charts by the name of *Willoughby Land*; whereas in fact no such land ever existed; and it was before the voyage of these Dutchmen, Stephen Barrows, an English shipmaster, had coasted along a desolate country from Lat.  $78^{\circ}$  to  $80^{\circ} 11'$ , which was undoubtedly Spitzbergen. The

sea in the neighbourhood of the islands of Spitzbergen abounds very much with whales. It is the common resort of the whale-fishing ships from different countries, and the country itself is frequently visited by these ships; but till the late voyage of Capt. Phipps, by order of his Majesty, the situation of it was erroneously laid down. It was imagined that the land stretched to the northward as far as  $82^{\circ}$  N. lat. but Capt. Phipps found the most northerly point of land, called *Seven Islands*, not to exceed  $8^{\circ} 30'$ . Towards the E. he saw other lands at a distance, so that Spitzbergen plainly appeared to be surrounded by water on that side, and not joined to the continent of Asia, as former navigators had supposed. He also explored the N. and W. coasts, but was prevented by the ice from sailing so far N. as he wished. The coast appeared neither habitable nor accessible. It is formed of high, barren, black rocks, without the least marks of vegetation; in many places bare and pointed; in others covered with snow, appearing even above the clouds. The valleys between the high cliffs were filled with snow and ice. "This prospect," says Capt. Phipps, "would have suggested the idea of perpetual winter, had not the mildness of the weather, the smooth water, bright sun shine, and constant day-light, given a cheerfulness and novelty to the whole of this romantic scene." The current ran along this coast half a knot an hour north. The height of one mountain seen here was found by geometrical mensuration to be  $1503\frac{1}{2}$ , or  $15037\frac{1}{2}$  feet. By a barometer constructed after De Luc's method, the height was found to be  $1588\frac{1}{2}$  feet. On this occasion Capt. Phipps remarks, "I cannot account for the great difference between the geometrical measure and the barometrical according to M. de Luc's calculation, which amounts to  $84\frac{1}{2}$  feet. I have no reason to doubt the accuracy of Dr Irving's observations, which were made with great care. As to the geometrical measure, the agreement of so many triangles, each of which must have discovered even the smallest error, is the most satisfactory proof of its correctness. Since my return I have tried both the theodolite and barometer, to discover whether there was any fault in either; and find them, upon trial, as I had always done before, very accurate." There is good anchorage in Schmeerenburgh harbour, lying in Lat.  $74^{\circ} 44'$  N. Lon.  $9^{\circ} 50' 45''$  E. in 13 fathom, sandy bottom, near the shore, and well sheltered from all winds. Close to this harbour is an island called *Amsterdam Island*, where the Dutch used formerly to boil their whale-oil; and the remains of some conveniency erected by them for that purpose are still visible. The Dutch ships still resort to this place for the latter season of the whale-fishery. The stone about this place is chiefly a kind of marble, which dissolves easily in the marine acid. There were no appearances of minerals of any kind, nor any signs of ancient or modern volcanoes. No insects, or any species of reptiles, were seen, not even the common earth worm. There were no springs or rivers; but plenty of water was produced from the snow which melted on the mountains. The most remarkable views which these dreary regions present are those called ICEBERGS. They are large

bodies of ice filling the valleys between the high mountains. Their face towards the sea is nearly perpendicular, and of a very lively light green colour. One was about 300 feet high, with a cascade of water issuing from it. The black mountains on each side, the white snow, and greenish coloured ice, composed a very beautiful and romantic picture. Large pieces frequently broke off from the icebergs, and fell with great noise into the water. One piece was observed to have floated out into the bay, and grounded in 24 fathoms; it was 50 feet high above the surface of the water, and of the same beautiful colour with the iceberg from which it had separated. These islands are totally uninhabited, though it doth not appear but that human creatures could subsist on them, notwithstanding their vicinity to the pole. Eight English sailors, who were accidentally left here by a whale-fishing ship, survived the winter, and were brought home next season. The Dutch then attempted to settle a colony on Amsterdam island above mentioned; but all the people perished, not through the severity of the climate, but of the scurvy, owing to the want of those remedies which are now happily discovered, and which are found to be so effectual in preventing and curing that dreadful disease.—The late account also of six Russian sailors who staid four years in this inhospitable country, affords a decisive proof, that a colony might be settled on East Greenland, provided the doing so could answer any good purpose.

II. GREENLAND, WEST, is now determined by our latest maps to be a part of the continent of America. That part of it, which the Europeans have any knowledge of, is bounded on the W. by Baffin's Bay, on the S. by Davis's Straits, and on the E. by the northern part of the Atlantic Ocean. It is very mountainous, and some parts of it are so high, that they can be discerned 30 leagues off at sea. The inland mountains, hills, and rocks, are covered with perpetual snow; but the low lands on the sea side are clothed with verdure in summer. The coast abounds with inlets, bays, and large rivers; and is surrounded with a vast number of islands of different dimensions. In many places, however, on the E. coast especially, the shore is inaccessible by reason of the floating mountains of ice. The principal river, called *Baal*, falls into the sea in Lat. 64° where the first Danish lodge was built in 1721; and has been navigated above 40 miles up the country.

(2.) GREENLAND, ACCOUNT OF THE FIRST SETTLEMENT AT. West Greenland was first peopled by Europeans in the 8th century, when a company of Icelanders, headed by one Eric Raude, or Roux, a Norwegian, were by accident driven on the coast. On his return he represented the country in such a favourable light, that some families followed him thither, where they soon became a thriving colony, and bestowed on their new habitation the name of GROENLAND, or *Greenland*, on account of its verdant appearance. This colony was converted to Christianity by Bp. Arnald, a missionary from Norway, sent thither by the celebrated OLAF, or OLAVUS, the first Norwegian monarch who embraced the true religion, about A. D. 1203. The Greenland settle-

ment continued to increase and thrive in protection; and in a short time the coast was provided with many towns, churches, bishops, &c. under the jurisdiction of Drontheim. A considerable commerce was carried on between Greenland and Norway, a regular intercourse maintained till 1492, when Andreas the last bishop was sent over. In the time all correspondence was cut off, and the knowledge of Greenland has been buried in obscurity. This strange and abrupt cessation of all intercourse has been attributed to various causes, but the most probable is the following:—The first colony, from its first settlement, had been peopled by the natives, a barbarous and savage people, agreeing in customs, garb, and appearance to the ESQUIMAUX. The nation, called the *LINGS*, exterminated the Iceland settlers, who had inhabited the western district, in the 14th century, so that when their brethren of the eastern colony came to their assistance, they found nothing but some cattle and flocks of sheep remaining about the country. They themselves afterwards experienced the same fate, and were destroyed by these Schrellings, whose descendants still inhabit the western parts of Greenland. From tradition say, that the houses and whose ruins still appear, were inhabited by a colony of strangers, whom their ancestors drove out. There may be still however, some descendants of the ancient Iceland colony remaining in the eastern district, though they cannot be visited on account of the stupendous mountains which are usually covered with snow, which divide the western parts of Greenland; while they have been rendered inaccessible by sea, by the vast quantities of ice driven from East Greenland. Mr. Cruttwell says, "the colony was found to be still existing in 1540." One would imagine that there must have been some considerable alteration in the coast of Greenland since the 15th century, so that the coast of Greenland is now become almost totally inaccessible, though formerly visited with very little. It is also natural to ask, by what means the people of the eastern colony surmounted the above-mentioned obstacles when they were in need of the assistance of their western friends; how they returned to their own country; and in what manner the historians learned the success of their expedition? Concerning all this we have very little satisfactory information. All that can be learned from the most authentic records is, that Greenland was divided into two districts, called *West Bygd* and *East Bygd*: that the western division consisted of 4 parishes and 100 villages: that the eastern district was still more flourishing, as being peopled by Iceland, sooner settled, and more frequented by shipping from Norway. There are also several accounts, though most of them romantically attested, which render it probable that the eastern colony still subsists, who, at present, or other, may have given the imperfect information above mentioned. This colony comprehended extensive parishes, 190 villages, a bishopric, and two monasteries. The present inhabitants of the western district are entirely ignorant of the eastern part, from which they are divided by high mountains and deserts, and still more

apprehensions: for they believe the eastern  
 ders to be a cruel, barbarous people,  
 try and eat all strangers who fall into  
 ds.

REENLAND, ACCOUNTS OF OTHER AT-  
 TO COLONIZE. About 1570, several  
 e sent successively by the kings of Den-  
 discover the eastern district; but they  
 died. Among these adventurers, Mag-  
 isen, or Helmion, after having surmounted  
 gers, got sight of the land; which, how-  
 could not approach. At his return, he  
 l that the ship was wrecked in the middle  
 use by rocks of loadstone at the bottom of  
 n 1576, Capt. Martin Frobisher was sent  
 same errand by Q. Elizabeth. He like-  
 iced the land; but could not reach it, and  
 returned to England; yet not before he  
 l sixty leagues in the strait which still  
 name, and landed on several islands,  
 had some communication with the na-  
 e had likewise taken possession of the  
 the name of Q. Elizabeth; and brought  
 e pieces of heavy black stone, from which  
 rs of London extracted a proportion of  
 the ensuing spring, he undertook a ad-  
 : the head of a small squadron, equipped  
 blic expence; entered the straits a ad-  
 covered upon an island a gold and silver  
 lowed names upon different bays, islands,  
 lands; and brought away a lading of  
 her with two natives, a male and a female,  
 e English kidnapped. Encouraged by  
 fs, another armament was fitted out un-  
 al Frobisher, consisting of 15 sail, with  
 able number of soldiers, miners, smel-  
 enters, and bakers, to remain all the  
 ir the mines in a wooden fort, the dif-  
 ces of which they carried out in the  
 . They met with boisterous weather,  
 ble fogs, and violent currents upon the  
 Greenland, which retarded their op-  
 until the season was far advanced. Part  
 rooden fort was lost at sea; and they  
 r provisions nor fuel sufficient for the  
 The admiral therefore determined to re-  
 ned large quantities out of a new mine,  
 s much ore as he could procure; of this  
 hey gave the name of *the Countess of Sus-*  
 likewise built a house of stone and lime,  
 ; and here, to conciliate the affection  
 ves, they left a quantity of small mor-  
 knives, beads, looking-glasses, leaden  
 and other toys, together with several  
 read. They buried the timber of the  
 it could be easily found next year; and  
 , pease, and other grain, by way of ex-  
 to know what the country would pro-  
 ving taken these precautions, they fail-  
 beginning of September; and after a  
 rmy passage, arrived in England: but  
 lefiga was never prosecuted. Christian  
 Denmark, being desirous of discovering  
 reenland settlement, sent three ships  
 der Capt. Godske Lindenow; who is  
 : reached the E. coast of Greenland,  
 traded with the savage inhabitants,  
 y are still found in the western district,

but saw no signs of a civilized people. Had he  
 actually landed in the eastern division, he must  
 have perceived some remains of the ancient col-  
 ony, even in the ruins of their convents and villa-  
 ges. Lindenow kidnaped two of the natives,  
 who were conveyed to Copenhagen; and the same  
 cruel fraud was practised by other two ships which  
 sailed into Davis's Straits, where they discovered  
 divers fine harbours and delightful meadows co-  
 vered with verdure. In some places they are said  
 to have found a considerable quantity of ore, eve-  
 ry hundred pounds of which yielded 26 oz. of sil-  
 ver. Admiral Lindenow made another voyage to  
 the coast of Greenland in 1606, directing his course  
 to the W. of Cape Farewell. He coasted along  
 Davis's Straits; and having made some observations  
 on the face of the country, the harbours and islands,  
 returned to Denmark. Carsten Richards, being  
 detached with two ships on the same observation,  
 descried the high land on the E. side of Greenland;  
 but was hindered by the ice from approaching the  
 shore. Other expeditions have been planned and  
 executed with the same bad success, by a Danish  
 company of merchants. Two ships returned from  
 W. Greenland, loaded with yellow sand, supposed  
 to contain a large proportion of gold. This being  
 assayed by the goldsmiths of Copenhagen, was con-  
 demned as useless, and thrown overboard: but  
 from a small quantity of this sand, which was re-  
 served as a curiosity, an expert chemist afterwards  
 extracted a quantity of pure gold. The captain,  
 who brought home this adventure, was so chagri-  
 ned at his disappointment, that he died of grief,  
 without having left any directions concerning the  
 place where the sand had been discovered. In  
 1654, Henry Moller, a rich Dane, equipped a  
 vessel under the command of David de Nelles,  
 who sailed to the W. coast of Greenland, from  
 which he carried off three women of the country.  
 Other efforts have been made, by order of the  
 Danish king for the discovery of the old Iceland  
 colony in Greenland; but all of them miscarried,  
 and people began to look upon such expeditions  
 as chimerical. At length the Greenland com-  
 pany at Bergen in Norway, transported a colony  
 to the W. coast, about Lat. 64°, which sailed  
 in 1712, accompanied by the Rev. Hans Egede,  
 to whose ability and accuracy, we are indebted  
 for the best and most authentic account of mo-  
 dern Greenland. He endeavoured to reach the  
 eastern district, by coasting southwards, and ad-  
 vanced as far as the States Promontory; but the  
 season of the year and the continual storms, obli-  
 ged him to return. In 1724, a ship equipped by  
 the company, failed on this discovery, with a view  
 to land on the East side opposite to Iceland; but  
 the vast shoals of ice, which barricaded that part  
 of the coast, rendered this scheme impracticable.  
 In 1728, Christian VI. caused horses to be trans-  
 ported to Greenland, in hopes that the settlers  
 might travel over land to the eastern district; but  
 the icy mountains were impassable. Lieutenant  
 Richards, in a ship, which had wintered near the  
 new Danish colony, attempted, in his return to  
 Denmark, to land on the eastern shore; but all  
 his endeavours proved abortive. Mr Egede says,  
 that the only practicable method of reaching that  
 part of the country, will be to coast north-about

in small vessels, between the great flakes of ice and the shore; as the Greenlanders have declared, that the currents continually rushing from the bays and inlets, and running SW. along the shore, hinder the ice from adhering to the land; so that there is always a channel open, through which vessels of small burden might pass, especially if lodges were built at convenient distances on the shore, for the direction of the adventurers.

(4.) GREENLAND, CLIMATE AND GENERAL APPEARANCE OF. That part of the country which is now visited and settled by the Danes and Norwegians, lies between 64° and 68° lat. N.; and thus far it is said the climate is temperate. In summer, which continues from the end of May to the middle of Sept. the weather is warm and comfortable, while the wind blows easterly; though even at this time storms often rage with incredible violence; and in calm weather, the coasts are infested with fogs that are equally disagreeable and unhealthy. Near the shore, and in the bays and inlets, the low land is clothed with the most charming verdure; but the inland mountains are perpetually covered with ice and snow. To the N. of Lat. 68°, the cold is prodigiously intense; and towards the end of August, all the coast is covered with ice, which never thaws till April or May, and sometimes not till the end of June. Nothing can exhibit a more grand and dazzling appearance, than those prodigious masses of ice that surround the coast in various forms, reflecting a multitude of colours from the sun-beams, in calm weather; but when the wind blows, and the waves rise in vast billows, the violent shocks of these pieces of ice, dashing against one another fill the mind with horror. Greenland is seldom visited with thunder and lightning, but the *Aurora Borealis* is very frequent and bright. At the time of new and full moon, the tide rises and falls upon this coast about three fathoms; and it is remarkable, that the springs and fountains on shore rise and fall with the flux and reflux of the ocean.

(5.) GREENLAND, INHABITANTS AND DISEASES OF. This country is but thinly inhabited. The people who now inhabit the western coast of Greenland, and who, without doubt, are the descendants of the ancient *Schrellings*, who exterminated the first Iceland colony, (see § ii.) bear a near resemblance to the Samoiedes and Laplanders in their persons, complexions and way of life. They are stout, brawny, and inclined to corpulency; with broad faces, flat noses, and thick lips, black hair and eyes, and a yellowish tawny complexion. They are for the most part vigorous and healthy, but short-lived; few of them reaching the grand climacteric; and many dying in infancy, and youth. They are subject to a weakness in the eyes, occasioned by the piercing winds and the glare of the snow. The leprosy is known among them, but is not contagious. Those that dwell in the northern parts are tormented with dysenteries, rheums, pulmonary disorders, boils, and epilepsies. The small-pox being imported from Copenhagen, in 1734, made terrible havock among these poor people, who are utterly destitute of any knowledge of the medical art, and depend entirely for assistance upon their *angskuts* or conjurers.

(6.) GREENLAND, LANGUAGE AND RELIGION OF THE NATIVES OF. All the Greenlanders hitherto discovered speak the same language, different dialects prevail in different parts of the country. It abounds with double consonants, and is so guttural, that the pronunciation of words is not to be learned except by those who have been accustomed to it from their infancy. The letters C, D, F, Q, and X, are not in their alphabet. Like the North American inhabitants of Kamtschatka, they have a great number of long polysyllables. Their words, as well as verbs, are inflected at the end by the terminations, without the help of prepositions; but their language being defective, they have adopted many words from the Norwegian, notwithstanding the endeavours of the Danish missionaries, they have no great reason to be given for their profelytes among the natives. They pay great respect to the Danes, whom they regard as their masters, and hear the truths of the Christian religion expounded without doubt or scruple; but they are not without a great incredulity of their teachers, but at the same time they are not without understanding them. They believe in the immortality of the soul; as well as in the existence of a spirit whom they call *Torngarfik*, but which they have formed the most ridiculous notion of. The *Angskuts*, who are supposed to be his ministers, differ concerning the principles of his existence; some affirming that he is without shape; others, that he has the shape of a man; others, that he has a large human body, and one arm; while others affirm that he is no larger than a man's finger, with many other notions. They have also a peculiar kind of magic, by which they believe all the elements to be composed of spirits, from among which each of the elements is supplied with a familiar, named *Angskut*, who is always ready when summoned for assistance.

(7.) GREENLAND, MANNERS, CHARACTER AND CUSTOMS OF THE NATIVES OF. In the country the people dwell in huts built of stone or turf, on one side are the windows, covered with the skins of seals or rein-deer. These huts are seldom more than two feet above the surface of the ground, the rest of them being sunk in the earth to defend them against wind and cold. Several families dwell in one of these houses, possessing each a separate apartment, before which is a hearth with a lamp placed on a trevise, over which hangs a kettle: above is a rack or shelf on which the clothes are dried. They burn train oil lamps; and instead of wick, they use moss, which fully answers the purpose. These fires are not only sufficient to heat the house, but likewise produce such a heat, that the house is like a bagnio. The door is never open, as little cold air as possible may be admitted. The house within is lined with old skins, and round with benches for the convenience of the natives. In summer they dwell in tents made of poles fixed in a conical form, covered with deer's skins, and on the outside of the tent, dressed so that the rain cannot penetrate. In their dispositions the Greenlanders are phlegmatic, indolent, and slow of app

ry quiet, orderly, and good-natured. In affection, they seem to equal the natives warmest climates. Two of them were carried and brought to Denmark; but though d by the king and court, to the utmost, quite unhappy; and one of them always upon seeing an infant in its mother's arms, it was concluded, that he had left a wife young child in Greenland. They live peaceably together, and having every thing in common, without strife, envy, or animosity. They are bold, but slovenly to a degree almost beyond tentots. They never wash themselves with water; but lick their paws like the cat, and then rub their faces with them. They eat after their custom without washing their dishes; devour the rich devour them; and even lick the sweat, they scrape off from their faces with their hands. The women wash themselves with their urine, which they imagine makes their hair black; and in winter, go out immediately after the liquor freeze upon their skin. They strip their victuals off the ground, and devour the flesh with avidity. In times of scarcity they subsist on pieces of old skin, reeds, sea weeds, root called *tugloronet*, dressed with train oil. The intestines of rein deer, the entrails of tridges, and all sorts of offals, are counted as among these savages; and of the scrapings of skins they make pan-cakes. At first, they not taste the Danish provisions without abhorrence; but now they are become extremely fond of bread and butter, though they still retain a passion for tobacco and spirituous liquors; in particular they differ from almost all savages of the earth. The Greenlanders content themselves with one wife; who is valued, as among other savage nations, to do the drudgery, and may be corrected, or even sold, by the husband at pleasure. Heroes, warriors, and extraordinary personages, are indulged with a plurality of wives. Their young were generally chaste and bashful; but at some of their feasts, in the midst of their jollity, a man with his neighbour's wife behind a curtain of skins; and all the guests, thus coupled, in their turns. The women think themselves happy if an angekut or prophet will thus reward them with his caresses. These people marry within the prohibited degrees of consanguinity, nor is it counted decent in a couple to who have been educated in the same family. They have a number of ridiculous superstitious customs. While a woman is in labour, they hold a chamber-pot over her head, as a charm to hasten the delivery. When the child is born, the mother licks and slappers it all over to render it, as she imagines, more strong and

**GREENLAND, METHODS OF HUNTING AND FISHING.** The Greenlanders are constantly employed either in fishing or hunting. At sea they hunt the whales, morseas, seals, fish for eating, and sea fowls. On shore they hunt the rein-deer and great parts of the country. They drive these rein-deer, which feed in large herds, into a narrow strait, where they kill them with arrows. Their bows are made of fir tree, wound about with the

twisted sinews of animals: the string is of the same stuff, or of seal skin: the arrow is a full fathom in length, pointed with a bearded iron, or a sharp bone; but those with which they kill birds are blunt, that they may not tear the flesh. Sea fowls they kill with lances, which they throw to a great distance with surprising dexterity. Their manner of catching whales is quite different from that practised by the Europeans. About 50 persons, men and women, set out in one long boat, which is called a *kone boat*, from *kone* a woman, because it is rowed by females only. When they find a whale, they strike him with harpoons, to which are fastened long lines some seals skins blown up like bladders. These, by floating on the surface, not only discover the back of the whale, but hinder him from diving under water for any length of time. They continue to pursue him until he loses strength, when they pierce him with spears and lances till he expires. On this occasion they are clad in their spring coats consisting of one piece, with gloves, boots, and caps of seal-skin so closely laced and sewed that they keep out water. Thus accoutred, they leap into the sea; and begin to slice off the fat, even under water, before the whale is dead.—They have many different ways of killing seals; namely, by striking them with a small harpoon equipped also with an air-bag; by watching them when they come to breathe at the air-holes in the ice, and striking them with spears; by approaching them in the disguise of their own species, that is, covered with a seal-skin, creeping upon the ice, and moving the head from side to side as the seals are accustomed to do. By this stratagem the Greenlander moves towards the unsuspecting seal, and kills him with a spear. The Greenlanders angle with lines made of whale bone cut very small, by means of which they succeed wonderfully. The Greenland canoe, like that used in Nova Zembla and Hudson's bay, is about three fathoms in length, pointed at both ends, and three quarters of a yard in breadth. It is composed of thin rafts fastened together with the sinews of animals. It is covered with dressed seal-skins both below and above, in such a manner that only a circular hole is left in the middle, large enough to admit the body of one man. Into this the Greenlander thrusts himself up to the waist, and fastens the skin so tight about him that no water can enter. Thus secured, and armed with a paddle broad at both ends, he will venture out to sea in the most stormy weather to catch seals and sea fowl; and if he is overset, he can easily raise himself by means of his paddle. A Greenlander in one of these canoes, which was brought with him to Copenhagen, outfitted a pinnace of 16 oars, manned with choice mariners.—The *kone-boat* is made of the same materials, but more durable; and so large, that it will contain 50 persons with all their tackle, baggage, and provisions. She is fitted with a mast, which carries a triangular sail made of the membranes and entrails of seals, and is managed without the help of braces and bowlings. These *kones* are flat bottomed, and sometimes 60 feet in length. The men think it beneath them to take notice of them; and therefore they are left to the conduct of the women, who indeed are obliged to do all the

drudgery.

drudgery, including even the building and repairing their houses, while the men employ themselves wholly in preparing their hunting implements and fishing tackle.

(9.) GREENLAND, MINERALS OF. Greenland is thought to contain many mines of metal, though none of them are wrought. To the southward of the Danish colony are some appearances of a mine of copper. Mr Egede received a lump of ore from one of the natives; and here he found calamine of a yellow colour. He sent a considerable quantity of sand of a yellow colour, intermixed with streaks of vermilion, to the Bergen company. They probably found their account in this present; for they desired him by a letter to procure as much of that sand as possible; but he was never able to find the place where he saw the first specimen. It was one of the smallest among a great number of small islands; and the mark he had set up was blown down by a violent storm. Possibly this might be the same mineral of which Captain Frobisher brought so much to England. This country produces rock crystals both red and white, and whole mountains of the ASBESTOS or *incombustible flax*. Around the colony, which is called *Good Hope*, they find a kind of bastard marble of various colours, which the natives form into bowls, lamps, pots, &c.

(10.) GREENLAND, QUADRUPEDS, BIRDS, FISH, &c. OF. The animals which abound most in Greenland are, rein-deer, foxes, hares, dogs, and white bears. The hares are white, and very fat; the foxes are white, greyish, and bluish; and smaller than those of Denmark and Norway. The natives keep a great number of dogs, which are large, white, or speckled, and rough, with upright ears. They are timorous and stupid; and neither bay, nor bark, but sometimes howl dimly. The natives yoke them in sledges; which, though heavy laden, they will draw on the ice at the rate of 70 miles in a short winter's day. These poor animals are very ill rewarded for their service: being left to provide for themselves, except when their masters happen to catch a great number of seals, when they are regaled with the blood and entrails. Greenland is frequented by great numbers of ravens, eagles of a prodigious size, falcons, and other birds of prey; besides a kind of linnets, which warble very melodiously. Whales, sword fish, porpoises, sea cows, sea wolves, &c. abound on the coasts; also holybuts, turbot, cod, haddocks, &c. The dubious animals also, called *mermaids*, *sea serpents*, and *krakens*, said to be found on the coast of Norway, are said likewise to dwell in these seas. Mr Egede assures us, that, in 1734, the sea serpent was seen off the new Danish colony, and raised its head-mast high above the surface of the water. See KRAKEN, MERMAID, and SERPENT.

(11.) GREENLAND, SOIL AND PRODUCE OF. The soil varies like that of all other mountainous countries. The hills are barren, being frozen throughout the whole year; but the valleys and low grounds, especially near the sea, are rich and fruitful. The ancient Norwegian chronicles inform us, that Greenland formerly produced a great number of cattle; that considerable quantities of butter and cheese were exported to Nor-

way, and, on account of their peculiarity, set apart for the king's use; that of the country yielded excellent wheat; large oaks were found here, which came as big as apples. Some of these oaks in the southern parts, and in many marks of ploughed land are easily perceived; but, however, the country is destitute of sheep and cattle, though in many places it is excellent pasture; and, if properly cultivated perhaps yield grain also. Mr Egede found barley near a bay adjoining to the Danes. It sprang up so fast, that by the end of the summer it was in full ear; but being nipped by a frost, never arrived at maturity. Turnips and cabbages of an excellent taste and flavour are also here. The sides of the mountains near the coast are clothed with wild thyme, which diffuses a fragrance to a great distance. The best wheat is very common in this country, and others not described by botanists. The fruits of Greenland are juniper berries, raspberries, bil-berries, and bramble-berries. It has been said of the fertility of Greenland, that it never must be understood of that part between lat. 60° and 65°. The most parts are totally destitute of herbs and grass, even of grass.

(12.) GREENLAND, TRADE TO, AND RESPECTING IT. A joint stock of 40,000 £ statute to be raised by subscribers, who incorporated for 14 years from the first of 1693, under the name of the GREENLAND COMPANY. They were empowered to take care of catching whales, &c. into and from Greenland and the Greenland seas; and to make regulations for the government of the persons employed in their ships, &c. Stat. 4 and 5 Will. III. The Company was farther encouraged by an Act in 1696; but partly by unskillful management, and partly by real losses, it was necessary to break up, before the expiration of the term assigned to it, ending in 1707. A person who will adventure to Greenland fishing, shall have all the privileges granted to the Greenland company, by 1 Anne, cap. 10. thus the trade was again laid open. Act for the regulation of the Greenland fishery, 1713. Any person who may import whale-fins, oil, &c. of fish taken in the Greenland seas, without paying any duty, &c. stat. 10 Geo. I. cap. 16. And shiped in the Greenland fishery are to be laden, provided with boats, so many fishing lines, harping irons, &c. and be allowed to proceed; and on their return shall be allowed a bounty, for whale-fins, &c. 16 Geo. II, cap. 33. The bounty was increased, but has been lately diminished since this diminution the trade has increased. See WHALE-FISHERY.

(11.) GREENLAND, a town of England, in Hampshire, and parish of Hambledon.

(11.) GREENLAND, a town of New Hampshire, in Rockingham county, near the coast, and 10 miles from Portsmouth, containing 634 citizens.

GREENLANDERS, the natives of Greenland. See GREENLAND, N° I, § 5—7; also GREENLAND, § 11.

(1.) GREENLAW, [from Green and

cal hill.] a parish of Scotland, in Berwickshire, it 7½ miles long from N. to S. and 2 broad average. The surface on the N. is mountainous, on the W. mossy. The climate and soil very various. One half of the parish is inclosed; two thirds of it are arable. The air is healthy and except on the hills, mild. Agriculture, fowls, and the breed of cattle are much improved. Wheat, barley, oats, pease, turnips, peas, clover and rye-grass are produced in it. The population in 1785, stated by the W. Simson, in his report to Sir J. Sinclair, was 1210, and had increased 315, within 30 years following. The number of horses, in 1792, was 145 sheep 2,500, and of black cattle 850. Mr Simson proposes to add to the improvement of the land, by inclosing and cultivating the lower parts of hills and planting trees on the higher.

**GREENLAW**, a town in the above parish, 2½ miles WSW. of Berwick, 20 W. of Edinburgh, 36 SE. of Edinburgh, and 80 from Glasgow. The population in 1785, was about 1,200. Greenlaw has fairs on the 22d May and last day in Oct.

**GREENLEIGHTON**, a village of Northumberland, 10 W. of Morpeth.

**GREENLY**. *adv.* [from *green*.] 1. With a green colour. 2. Newly; freshly. 3. Immature. 4. Wanly; timidly. Not in use.—Kate, do not look *greenly*, nor gasp out my eloquence; I have I cunning in protestation. *Shak.*

**GREEN MOUNTAINS**, a range of mountains, in the United States chiefly in that of Vermont, extending NNE. and SSW. and dividing the waters which run eastward into the Connecticut from which flow W. into Lake Champlain, Lake Erie, and Hudson's River.

**GREENNESS**. *n. f.* [from *green*.] 1. The quality of being green; viridity; viridness.—A man grew such a sort of trees, as either excellent for fruit, stateliness of growth, continual freshness, or poetical fancies have made at any time famous. *Sidney*.—In a meadow, though the grass and greenness delights, yet the variety of flowers doth heighten and beautify. *Ben Jonson*.—Reason, which discourses on what it finds by phantasy, can consider greenness by itself, or in coldness, singly and alone by itself. 2. Immaturity; unripeness.—This prince, though yet the errors in his nature were excused by the greenness of his youth, which took all the life upon itself, loved a private man's wife. 3. Freshness; vigour.—Take the picture of a man in the greenness and vivacity of his youth, and in the latter date and declension of his drooping years, and you will scarce know it to belong to the same person. *South*. 4. Newness.

**GREENOCK**, [from *Grianeg*, Gael. *i. e.* sunny bay.] a parish of Scotland, in the NW. of Renfrewshire, extending 4½ miles along the side of the Frith of Clyde, in the form of the letter D, but with the curvature more protracted; its surface is mostly hilly, rising in a gradual ascent from a level strip along the shore, to 800 feet above the sea level, 2 miles SE. of Greenock, and appearing like a sweep of a large circle.

The coast is shelvy, rough and stony; and the lands with sea ware. The soil near the coast

is light and gravelly, of the ascent various; earth, clay, till, mofs, &c. The hills afford beautiful and extensive prospects, which might be still farther embellished by plantations. The population, in 1755, was only 1886, but it has since increased greatly. See § 4.

(2.) **GREENOCK**, a sea-port town of Scotland, in Renfrewshire, and one of the ports of Glasgow, 22 miles W. of that city. It is the best built town on all the coast; the chief resort of the herring fishery, and otherwise a place of great trade. The harbour was made by Sir John Shaw of Greenock, whose ancestors built the church; and the family had here a castle. This town is a borough of barony, erected in 1757, and is governed by a council of 9 feuars, 2 of whom are bailies. Its trade increased rapidly between 1784 and 1791. In 1784, the tonnage of shipping, British and foreign, amounted only to 2,626 tons inwards, and 15,389 outwards. But in 1791, it had increased to 58,838 tons inwards, and 50,381 outwards. From 5th Jan. 1791, to 5th Jan. 1792, there were entered at this port, 45,054 barrels of herrings; besides large quantities sold for home consumption. The chief imports are rum, sugar, cotton, mahogany, grain, naval stores, pot-ash, oil, timber, fruits, wines, &c. The exports are all kinds of British goods, coals and herrings. The chief manufactures are corlage, sail-cloth, soap, candles, shoes, saddlery, and fugar. Ship-building is also carried on. One vessel of 1100 tons was launched in 1791. Greenock has fairs in July and Nov. Lon. 4. 29. W. Lat. 55. 54. N.

(3.) **GREENOCK, BAY OF**, a bay of Scotland, on the coast of Renfrewshire, formerly called the Bay of St Lawrence. The Frith of Clyde here expands into a fine basin 4 miles wide, and landlocked on all sides.

(4.) **GREENOCK, NEW PARISH OF**, a parish of Scotland, disjoined from the old parish (Nº 1) about 1740, and comprehending the town (Nº 2.) with its suburbs, and the village of *Crawfurd-dike* adjoining on the E.; altogether above a mile along the Frith of Clyde in length, but hardly ½ of a mile in breadth. The population in 1755 stated by Dr Webster, was 1972, and that of both old and new parishes only 3858. But in Jan. 1792, by the rev. Arch. Reid's report to Sir J. Sinclair, it amounted to 14,499, besides above 700 persons on board coasting vessels; whence the increase in both parishes, within 37 years, was not less than 11,142.

**GREENOGH**, a town of Ireland, in Cork.  
**GREENORE POINT**, a cape of Ireland, on the coast of Wickford. Lon. 6. 13. W. Lat. 52. 16. N.

(1.) **GREENSBOROUGH**, a post town of Georgia, capital of Greene county, 30 miles from Lexington, and 78 W. by S. of Augusta.

(2.) **GREENSBOROUGH**, a town of Maryland, in Caroline county, 7 miles N. of Danton, and 22 SE. by E. of Chester.

(3.) **GREENSBOROUGH**, a township of Vermont, in Orleans county, adjoining to Maiden on the NW. and to Wheelock on the SE.

**GREENSBURG**, a post town of Pennsylvania, capital of Westmoreland county, containing about

about 600 citizens in 1795. It is 31 miles SE. by E. of Pittsburg, and 270 W. by N. of Philadelphia. Lon. 4. 23. E. of that city. Lat. 40. 18. N.

(1.) \* GREENSICKNESS. *n. f.* [*green* and *sickness*.] The disease of maids, so called from the paleness which it produces.—Sour eructations, and a craving appetite, especially of terrestrial and absorbent substances, are the case of girls in the *greensickness*. *Arbutnot.*

(2.) GREEN-SICKNESS. See MEDICINE, *Index*. GREEN-SILVER, the name of an ancient custom within the manor of Writtel in the county of Essex in England, which is, that every tenant whose fore door opens to Greenbury, shall pay an halfpenny yearly to the lord, by the name of GREEN-SILVER.

(1.) GREENSTED, a village of England, in Essex, near Chipping-Ongar, remarkable for its ancient church, built before the Norman conquest; the walls of which are formed of the solid trunks of trees placed in rows, which seem capable of still lasting for ages.

(2.) GREENSTED, a town in Northumberland. (1.) GREENSVILLE, a county of Virginia, bounded on the W., N. and E. by Brunswick, Southampton, and Suffex counties, and on the S. by N. Carolina. It is 24 miles long and 20 broad; and contained 2742 citizens and 3620 slaves, in 1795.

(2.) GREENSVILLE. See GREENVILLE. \* GREENSWARD. } *n. f.* [*green* and *ward*: \* GREENSWORD. } of the same original with *swath*] The turf on which grass grows.—

This the prettiest low-born lads that ever Ran on the *greensward*. *Shak.*

After break their fast On *greensward* ground, a cool and grateful taste. *Dryden.*

—In shallow soils all is gravel within a few inches; and sometimes in low ground a thin *greensward*, and sloughy underneath; which last turns all into a bog. *Swift.*

(1.) GREENVILLE, a county of S. Carolina, in Washington district, bounded on the E. by Spartanburg, and S. by Pendleton counties; W. by Georgia and N. by Carolina; and containing 5,897 citizens in 1795, and 606 slaves.

(2.) GREENVILLE, or GREENSVILLE, a town of S. Carolina, in Darlington county, and capital of Cheraws district, 135 miles N. by E. of Charlestown, and 776 SW. by S. of Philadelphia. Lon. 4. 29. W. of that city. Lat. 34. 34. N.

(3.) GREENVILLE, a post town of N. Carolina, the capital of Pitt county; 23 miles from Washington, 53 SW. of Edenton, 444 of Philadelphia. Lon. 2. 19. W. of that city. Lat. 35. 35. N.

(4.) GREENVILLE, a post town of Tennessee, in Greene county, 653 miles SW. of Philadelphia.

(5.) GREENVILLE, a fort and settlement of the United States, in the north western territory; 6 miles NW. of Fort Jefferson.

(6.) GREENVILLE BAY, a town and port of entry on the E. side of the island of Grenada.

GREEN WAX is used where estates are delivered to the sheriffs out of the exchequer, under the seal of that court, made in green wax, to be levied in the several counties. It is mentioned in the 43d stat. Ed. III. c. 9. and 7 Hen. IV. c. 4.

(1.) \* GREENWEED. *n. f.* [*green* and *weed*.] Dyers weed.

(2.) GREENWEED. See GENISTA, N.

(1.) GREENWICH, a town of England pleasantly situated on the bank of the river, 5 miles E. of London. It had former palace, built by Humphry duke of Gloucester, enlarged by Henry VII. and completed by Henry VIII. The latter often chose this town for his place of residence; as did also Q. Mary II. who were born in it. D. Hussey built a tower on the top of the steep hill, which was finished by Henry VII. afterwards demolished, and a royal observatory erected in its place by Charles II. furnished with mathematical instruments for astronomical observations, and a deep dry well for observing the stars in the day-time. The palace afterwards neglected, king Charles II. (who had bought the park, walled it about and planted it down, and began another, of which he saw the first wing magnificently finished by king William III. in 1694, granted it, 1000 acres of ground to be converted into a hospital for old and disabled seamen, the children of those who lost their lives in the sea, and for the encouragement of navigation, which cost king Charles 36,000 £. the first wing of the hospital towards the river. The front to the Thames consists of 100 of stone buildings, with the ranger's house in the centre of the area, but detached from the hospital. These buildings connect each other, and have their tops crowned with ballustrades. The buildings which face the river are in a more elegant style; and have domes at the top, which are 120 feet high, supported by 10 columns. Under one of these is the hall, which is finely painted by Sir James Thornhill, contains many royal portraits; and under the chapel, which was destroyed by fire, is the fire broke out in the hospital on the 2d of July, and totally consumed the dome at the top of the building, with the chapel, and the most elegant in the world, the great hall, and 8 wards containing the lodgings of 600 pensioners. The dome was rebuilt in 1785; but the reparation of the whole was not yet completed. On the sides of the hospital which opens to these buildings from the river, is placed a large terrestrial and celestial globe, in which the stars are gilt; and in the centre of the area is a statue of George II. About 200 disabled seamen are maintained in this hospital. Besides private benefactions, to the value of near L. 60,000, the British parliament settled upon it the earl of Derwent's estate, to the value of L. 6000 per ann. for the support of the school for the sons of sailors; for the support of which, every seaman in the royal navy, and in the merchant service, also pays 6d. which is stopped out of their pay, and in at the six penny receiver's office in London. On this account, a seaman, who can produce an authentic certificate of his being dis-

fit for service, by defending any ship, his Majesty's British subjects, or in ship from the enemy, may be admitted into hospital, and receive the same benefit as if he had been in his Majesty's service. Besides the seamen and widows orphans, about 100 boys, the sons of the royal navy, are bred up for the service of the royal navy here are no out-pensioners as at Chelmsford; the mariners have a weekly allowance weighing 16 oz. each; 3 lb. of beef, 1 pint of pease, 1½ lb. of cheese, and 14 quarts of beer, and 1s. a-week money: the tobacco money of the boatmen, 6d. a week each, that of their mates and that of the other officers in proportion to their rank: besides which, each common sailor receives once in two years, a suit of blue cloth, 3 pair of stockings, 2 pair of shoes, 10 shirts, and 2 night caps. Outfit is given for showing the hall, only 3d. is allowed to the person that shows rest makes an excellent fund for the maintenance of not less than 20 poor boys, orphans that have been either slain or disabled in service of their country. The park is enclosed with deer, and affords as much vapour to its size, as any in the kingdom; the views from the Observatory and the hill are beautiful beyond imagination, and the former. The projection of these hills, that one does not look down upon a falling slope or flat inclosures, but at the tops of branching trees, which are in clumps out of deep hollows and wooded dells. The cattle which feed on which appear in breaks among them, are in a region of fairy land. A thousand openings among the branches of the trees upon little picturesque views of the forest, which, when illumined by the sun, is most pleasing beyond the power of fancy. This is the foreground of the landscape: here, the eye falls on that noble structure, the eye falls on that noble structure, in the midst of an amphitheatre when the two reaches of the river make a full serpentine which forms the Isle of Thanet present the floating millions of the sea. To the left appears a fine tract of land leading to the capital, which there is a prospect. The parish church of Greenwich, by the commissioners for erecting new churches, is a very handsome structure dedicated to St Alphage, Abp. of Canterbury, and is thought to have been slain by the Danes in the spot where the church now stands. A college at the end of the town, fronted by the sea, for the maintenance of 20 decayed seamen, 12 out of Greenwich, and 8 chosen from Spottisburgh and Castle-Norfolk. This is called *the duke of Norfolk's*, though it was founded and endowed by Henry earl of Northampton the duke of Norfolk's brother, and by him committed to the service of the Mercers company. To this belongs a chapel, in which the earl's tomb, which, as well as his monument, had hither several years ago from the

PART II.

chapel of Dover castle. The pensioners, besides meat, drink, and lodging, are allowed 18d. a-week, with a gown every year, linen once in two years, and hats once in 4. In 1560, Mr Lambard, author of *The Preambulation of Kent*, also built an hospital, called *Queen Elizabeth's College*, said to be the first erected by an English Protestant. There are likewise two charity schools in this parish. The Thames is here very broad, and the channel deep; and at very high tides the water is salt. This is the chief harbour for the king's yachts. The town contains about 1500 houses; and a market on Wed. and Sat. was instituted in 1737; the direction of which is in the governors of the royal hospital, to which the profits arising from it were to be appropriated. The English astronomers reckon their longitude from Greenwich.

(2.) GREENWICH, a township of Connecticut, in Fairfield county, 40 miles E. of New York, and 50 W. of Newhaven.

(3.) GREENWICH, a township of Massachusetts, in Hampshire county, containing 1045 citizens in 1790; 20 miles E. of Northampton, and 75 W. of Boston.

(4-6.) GREENWICH, 3 towns of New Jersey: viz. 1. in Cumberland county, on the Cohanzy, 15 miles SE. of Salem, and 66 S. by W. of Philadelphia: 2. in Gloucester county, on the E. bank of the Delaware; 3 miles N. by E. of Woodbury, and 6 SE. of Philadelphia; and, 3. in Sussex county, on the Delaware, 31 miles SW. of Newton, containing 1971 citizens and 64 slaves.

(1.) \* GREENWOOD. *n. f.* [*green* and *wood*.] A wood considered as it appears in the Spring or Summer. It is sometimes used as one word.—Among wild herbs under the *greenwood* shade. *Fairfax*.—

It happened on a Summer's holiday,  
That to the *greenwood* shade he took his way;  
For Cymon humn'd the church. *Dryden*.

(2, 3.) GREENWOOD, two townships of Pennsylvania: 1. in Cumberland, and 2. in Mifflin counties.

(4.) GREENWOOD, an extensive forest of Connecticut, in Litchfield county.

(1.) \* To GREET. *v. a.* [*grator*, Lat. *gretari*, Saxon.] 1. To address at meeting.—

I think if men, which in these places live,  
Durst look in themselves, and themselves retrieve,  
They would like strangers greet themselves.

*Donne*.

I would gladly go,  
To greet my Patras with such news below. *Dryden*.

2. To address in whatever manner.—

My noble partner  
You greet with present grace, and great prediction;

To me you speak not. *Shak. Macbeth*.  
Now, Thomas Mowbray, do I turn to thee,  
And mark my greeting well; for what I speak,  
My body shall make good. *Shak. Richard II*.

3. To salute in kindness or respect.—

My lord, the Mayor of London comes to greet you.

—God bless your grace with health and happy days. *Shak*.

Now the herald lark  
Left his ground nest, high tow'ring to descry

The morn's approach, and greet her with his song. *Milton.*

Once had the early matrons run

To greet her of a lovely son. *Milton.*

The sea's our own; and now all nations greet,

With bending sails, each vessel of our fleet. *Waller.*

Thus pale they meet, their eyes with fury burn;

None greets; for none the greeting will return;

But in dumb furlinets, each arm'd with care,

His foe profess, as brother of the war. *Dryd.*

4. To congratulate.—

His lady, seeing all that channel from far,

Approach in haste to greet his victorie. *Spenser.*

5. To pay compliments at a distance.—

The king's a-bed,

And sent great larges to your officers;

This diamond he greets your wife withal,

By the name of most kind hostels. *Shak. Macb.*

6. To meet, as those who go to pay congratulations. Not much in use.—

Your haste

Is now urg'd on you.

—We will greet the time. *Shak. K. Lear.*

(2.) \* To GREET. *v. n.* To meet and salute.—

There greet in silence, as the dead are wont,

And sleep in peace. *Shak.*

Such was that face on which I dwelt with joy,

Ere Greece assembled stem'd the tides to Troy;

But parting then for that detested shore,

Our eyes, unhappy! never greeted more. *Pope's Odyssey.*

\* GREETER. *n. f.* [from the verb.] He who greets.

\* GREETING. *n. f.* [from *greet*.] Salutation

at meeting, or compliments at a distance.—

I from him

Give you all greetings, that a king, as friend,

Can send his brother. *Shak. Winter's Tale.*

\* GREEZE. *n. f.* [Otherwise written *greece*.

See GREECE, or GRIEZE, or GRICE; from *de-grees*.] A flight of steps; a step.

GREFFENSTAIN, a town of Austria, on the

Danube, 6 miles NW. of Closter-Newburg.

\* GREGAL. *adj.* [*greg, gregis, Lat.*] Belonging to a flock. *Dict.*

\* GREGARIOUS. *adj.* [*gregarius, Lat.*] Going

in flocks or herds, like sheep or partridges.—

No birds of prey are gregarious. *Ray on the Great.*

GREGOIE, an island of Africa, in the Ja-

quin, on the Gold Coast, where the Europeans

have factories; 3 miles from the sea.

GREGORIA, a town of New Mexico.

(1.) GREGORIAN CALENDAR, that which

shows the new and full moon, with the time of

Easter, and the moveable feasts depending there-

on, by means of epacts disposed through the fev-

eral months of the Gregorian year. See CHRO-

NOLOGY, *Sett. V.* and KALENDAR.

(2.) GREGORIAN STYLE, the New Style, now

used, which succeeded the Julian Syle, in Britain

in 1752.

(3.) GREGORIAN TELESCOPE. See OPTICS,

*Index.*

(4.) GREGORIAN YEAR. See CHRONOLOGY,

§ 49.

(1.) GREGORIO, St, an island of Maritima

Austria, in the prov. of Quarara, 3 miles less

half a mile broad. The natives deal chief-

ly in sheep, of which there are 2,500 on the island.

(2.) GREGORIO, St, a village of Maritima

tria, in the Paduano, near Padua.

GREGORIUS, Georgius Florentinus, or

GORY of Tours. See GREGORY, N° 19.

(1—15.) GREGORY, the name of 15

of Rome. See ITALY. Of these we have

only mention of the most eminent in letter

GREGORY I, furnished the GREAT, P

Rome, was born at Rome, of a patrician

A. D. 544. He discovered such abilities in

exercise of the senatorial employments, that

peror Justin the younger appointed him pre

Rome. Pope Pelagius II. sent him nuncio to

Constantinople, to demand succours against the

barbarians. When he thought of enjoying a

life, he was elected Pope by the clergy, the

and the people of Rome, A. D. 590. Being

learning and diligence in instructing the

both by writing and preaching, he had a ver-

py talent in winning over princes in favour

temporal as well as spiritual interest of the

He undertook the conversion of the English

sent over some monks of his order, under

rection of Augustin their abbot. With respect

to the chastity of churchmen, he was very

asserting that a man who had ever known

man ought not to be admitted to the

and he always caused the candidates for it

examined on that point. He likewise exerted

himself against such as were found guilty of crime.

However, he flattered the emperor Phocas,

his hands were yet reeking with the blood of

ritius, and of his three children, who had

been butchered in his sight. He likewise flattered

nehaud, a very wicked queen of France,

accused of destroying the noble monuments of

ancient Roman magnificence, that those who

visited the city might not attend more to the

trifling arches than to holy things; and burnt a

multitude of heathen books, Livy in particular. He

died A. D. 604. His *Dialogues*, a work stuffed with

incredible stories under the name of *miracles*,

three of his *Letters to Phocas*, are extant.

GREGORY XIII, was a native of Bologna

and succeeded Pius V, in 1572. He was

deeply versed in the canon and civil law of

his time. He ornamented Rome with many

buildings and several fountains. He con-

firm'd Gratian's Decretals, and wrote learned

works on them. But his chief merit lies in bringing

about the reform of the Kalendar, which was

effected under his orders by Lewis Lilio, a Roman

canon. See CHRONOLOGY, *Index*. A short

time before he died he received ambassadors from

Spain, acknowledging the authority of the

See CHRONOLOGY, *Index*. He died in 1585, aged 83.

GREGORY XV. was also a native of Bologna

and descended of an ancient family. His

name was Alexander Ludovisio. He was elected

Pope in 1621, and was author of several works of

particularity one intitled, *Epistola ad Romanum*,

SCHAH ABBAS; published *cum notis*

*sonis*, in 1627, 8vo.

(16.) GREGORY, K. of Scots. See SCOT-

(17.)

**GREGORY, Theodore**, surnamed *Thauron* account of his miracles, was the scholar; and was elected bishop of Neocaesarea; about A. D. 240, during the reign of Diocletian. He assisted at the council of Antioch, with Paulus Samosatenus; and died in his diocese, where there were but 17 churches when he was ordained. Of his works till extant, A. gratulatory oration to Origen; an epistle; and some other pieces.

**GREGORY, Basil**, of Nyssa, one of the fathers of the church, and author of the Nicene Creed, born in Cappadocia about A. D. 331. He was bishop of Nyssa in 372, and banished by the emperor Valens for adhering to the Nicene Creed. He was afterwards, however, by the bishops in several important affairs. He wrote, Commentaries on the scriptures; Sermons on the mysteries; Dogmatical treatises; Paenegyrics; Letters on church discipline; works. His style is very allegorical and

**GREGORY, George Florentius**, bishop of Tours, one of the most illustrious bishops and centers of the 6th century, was descended from a noble family in Auvergne. He was the nephew of Gallus, Bp. of Clermont; and wished himself so much by his learning that in 573 he was chosen Bp. of Tours. He went to Rome to visit the tombs of St. Peter and St. Paul, where he contracted a friendship with Pope Gregory the Great, and died in 595. He was zealous with regard to miracles. He wrote the history of France. 2. The lives of the saints and other works. The best edition is by F. Rumart, in 1699.

**GREGORY, Nazianzen**, surnamed *Nazianzen*; from a town of Cappadocia, of which his bishop, was born, A. D. 324, at Arianze near it, and was one of the most illustrious of the Greek church in the 4th century. He was made bishop of Constantinople; finding his election contested by Theophrastus of Alexandria, he voluntarily resigned about 382, in the general council of Constantinople. His works are extant, printed at Paris in 1609. His style is said to be that of the most celebrated orators of Greece.

**GREGORY, David**, Esq. of Kinardie, in Perthshire, was the son of the rev. John Gregory of Drumoak, and elder brother (N<sup>o</sup> 23.) the celebrated inventor of the reflecting telescope. He was born in 1627, and went to the university of Edinburgh, where, in his apprenticeship to a mercantile house in London, succeeding to the estate of Kinardie, he preferred science to commerce, and even studied medicine for some time. In this branch of science he acquired proficiency, that he not only indulged in it, but came to be consulted by the nobility and gentry, though even from a distance. He was the first person in Scotland who had a barometer; and having attention to the changes in it, he was

frequently able to prognosticate the changes in the weather. Hence he came to be suspected by the superstitious as a conjurer; and a deputation was actually sent him by the presbytery upon the subject; but he soon removed their suspicions, so that no trial for witchcraft took place. About 1700, he removed to Aberdeen, and during the war with France, in the reign of Q. Anne, invented an improvement in artillery, by which the shot of great guns could be rendered much more destructive to the enemy. By the assistance of a watchmaker, he made a model of this engine, which was submitted to the inspection of Sir Isaac Newton; but the philanthropic baronet disapproved of all inventions for the destruction of the human race, and the model was never more heard of. He was twice married, and had 32 children; of whom 3 sons became eminent in science; being all professors in universities; viz. David at Oxford, (N<sup>o</sup> 22.) James at Edinburgh, and Charles at St. Andrews. He died at Aberdeen, in 1720, aged 93.

(22.) **GREGORY, David**, F. R. S. Savilian professor of astronomy at Oxford, whom Dr Smith has termed *subtilissimi ingenii mathematicus*, was the eldest son of the above Mr Gregory. (N<sup>o</sup> 21.) He was born at Aberdeen in 1661, and received the earlier parts of his education in that city. He completed his studies at Edinburgh; and, being possessed of the mathematical papers of his uncle, soon distinguished himself likewise as the heir of his genius. In the 23d year of his age, he was elected professor of mathematics in the university of Edinburgh; and published, in the same year, *Exercitatio Geometrica de dimensione figurarum, sive specimen methodi generalis dixerunt quatuor figuras*, Edinburgh; 1684; 4to. He saw very early the excellence of the Newtonian philosophy; and had the merit of being the first who introduced it into the schools by his public lectures at Edinburgh. "He had (says Mr Whiston) already caused several of his scholars to keep acts, as we call them, upon several branches of the Newtonian philosophy; whilst we at Cambridge, poor wretches, were ignominiously studying the fictitious hypothesis of the Cartesians." In 1691, on the report of Dr Bernard's intention of resigning the Savilian professorship of astronomy at Oxford, David Gregory went to London; and being patronized by Sir Isaac Newton, and warmly befriended by Mr Flamsteed, he obtained the vacant professorship, for which Dr Halley was a competitor. This rivalry, however, instead of animosity, laid the foundation of friendship between these eminent men; and Halley soon after became the colleague of Gregory, by obtaining the professorship of geometry in the same university. Soon after his arrival in London, Mr Gregory had been elected F. R. S. and, previously to his election into the Savilian professorship, had the degree of M. D. conferred on him by the university of Oxford. In 1693, he published in the *Philos. Trans.* a resolution of the Florentine problem *de Tessidine velisemi quadrilateri*; and he continued to communicate to the public, from time to time, many ingenious mathematical papers by the same channel. In 1695, he printed at Oxford *Cateptrae et Dioptricae Sphaericae Elementa*; a work which contains

the substance of some of his public lectures at Edinburgh. This valuable treatise was republished first with additions by Dr William Brown, with the recommendation of Mr Jones and Dr Desaguliers; and afterwards by the latter, with an appendix containing an account of the Gregorian and Newtonian telescopes, together with Mr Hadley's tables for the construction of both those instruments. In the end of this treatise, there is an observation which shows, that what is generally believed to be a discovery of a much later date, the construction of achromatic telescopes, which has been carried to great perfection by Mr Dollond and Mr Ramsden, had occurred to the mind of David Gregory, from the reflection on the admirable contrivance of nature in combining the different humours of the eye. See *Catopt. et Dioptr. Sphaer. Elem.* Oxon. 1695, p. 98. In 1702, our author published at Oxford, *Astronomiæ Physicæ et Geometricæ Elementa*; a work which is accounted his master-piece. It is founded on the Newtonian doctrines, and was esteemed by Sir Isaac Newton himself as a most excellent explanation and defence of his philosophy. In 1703, he published a folio edition of Euclid in Greek and Latin. In this work, although it contains all the treatises attributed to Euclid, Dr Gregory has been careful to point out such as he found reason, from internal evidence, to be the productions of some inferior geometrician. Dr Gregory engaged, soon after, with his colleague Halley, in the publication of Apollonius's Conics, but he had not proceeded far in this undertaking when he died, in the 49th year of his age, at Maidenhead in Berkshire, A. D. 1710. To the genius and abilities of David Gregory, the most celebrated mathematicians of the age, Sir Isaac Newton, Dr Halley, and Dr Keill, have given ample testimonies. Besides those works published in his lifetime, he left in MS. *A Short Treatise of the Nature and Arithmetic of Logarithms*, which is printed at the end of Dr Keill's translation of Commandine's Euclid; and a *Treatise of Practical Geometry*, which was afterwards translated, and published in 1745, by Mr Maclaurin. He married, in 1605, Elizabeth, the daughter of Mr Oliphant of Langtown. By this lady he had four sons, of whom, the eldest, David, was appointed regius professor of modern history at Oxford by king George I. and died in 1767, in an advanced age, after enjoying for many years the dignity of dean of Christ church in that university.

(23.) GREGORY, James, F. R. S. one of the most eminent mathematicians of the 17th century, was the 2d son of the rev. Mr Gregory, and brother to David (N<sup>o</sup> 21.) and was born at Aberdeen in 1638. His mother was a daughter of Mr David Anderson of Finzaugh, a gentleman who possessed a singular turn for mathematics. This mathematical genius would seem to have been hereditary in the family. Alexander Anderson, cousin german of David, was professor of mathematics at Paris, and published there in 1612, *Supplementum Apollonii redintegrati, &c.* The mother of James Gregory inherited the genius of her family; and observing in her son, while yet a child, a strong propensity to mathematics, she instructed him herself in the elements of that science. He received his e-

ducation in the languages at Aberdeen, and through the usual course of academical study the Marischal college. At the age of 14 he finished his treatise, entitled, *Optica Promissa abditæ radiorum reflexorum et refractorum geometrice enucleatâ; cui subnectitur appendix utilissimorum astronomiæ problematum resolutionum bibens*; London, 1663; a work of great merit in which he gave the world an invention of his own, and one of the most valuable of the modern discoveries, the construction of the reflecting telescope. This discovery attracted the attention of the mathematicians, who were soon convinced of its great importance to the sciences of optics and astronomy. The manner of placing the specula upon the same axis appearing to Sir Isaac Newton to be attended with the disadvantage of losing the central rays of the larger speculum, proposed an improvement on the instrument, giving an oblique position to the smaller speculum, and placing the eye-glass in the side of the tube. But the Newtonian construction of the instrument has been long abandoned for the Galilean or Gregorian, which is now universally employed where the instrument is of a moderate size, though Mr Herschel has preferred the Newtonian form for the construction of those immense telescopes, which of late years he has so successfully employed in observing the heavens. The university of Padua being then in high reputation for mathematical studies, James Gregory went thither soon after the publication of his first work, and fixing his residence there for some years, published in 1667, *Vera Circulæ et Hyperbolæ constructio*; in which he propounded another discovery of his own, the invention of an infinitely verging series for the areas of the circle and hyperbole. To this treatise, when republished in 1668, he added a new work, intitled, *Genera pars universalis, inserviens quantitatione curvarum transmutationi et mensuræ*; in which he is supposed to have shown, for the first time, a method of the transmutation of curves. These works attracted the notice, and the correspondence, of the greatest mathematicians of the age. Not Huygens, Halley, and Wallis; and this being soon after chosen F. R. S. of London, contributed to enrich the Philosophical Transactions by many valuable papers. Through this connection he carried on a dispute with Mr Huygens, mentioned by his treatise on the quadrature of the circle and hyperbole, to which that able mathematician had started some objections. Of this controversy, it is sufficient to say, that, in the opinion of Leibnitz, (who however allows Mr Gregory the highest merit,) Mr Huygens has pointed out, though not errors, some considerable defects in the treatise above mentioned, and that much simpler method of attaining the end in view. In 1668, Mr Gregory published at London *Exercitationes Geometricæ*, which contributed to extend his reputation. About this time he was elected professor of mathematics in the university of St Andrew's; an office which he held five years. During his residence there, he married in 1669, Mary, the daughter of George James, a celebrated painter, whom Mr Walpole has set out the Vandyke of Scotland. In 1674, he was

thematical chair in the university of  
This place he had held for little more  
when, in October 1675, being em-  
owing the satellites of Jupiter through  
b some of his pupils, he was sudden-  
h total blindness, and died a few days  
early age of 37. He was a man of  
id penetrating genius. His temper  
e been warm, as appears from his dis-  
fr Huygens; and, conscious perhaps  
merits as a discoverer, he seems to  
alous of losing any portion of his re-  
the improvements of others upon his

GOAY, John, M. D. professor of me-  
: university of Edinburgh, was the son  
: Gregory, professor of medicine in  
ge Aberdeen, and grandson of the a-  
N<sup>o</sup> 23. His father was first married  
: Forbes, daughter of Sir John Forbes  
usk; by whom he had six children,  
and died in infancy. He married after-  
Chalmers, only daughter of the rev.  
ilmers, principal of King's college, by  
had two sons and a daughter. John,  
t of the three, was born at Aberdeen,  
4. Losing his father in the 7th year  
the care of his education devolved on  
ther, Principal Chalmers, and on his  
er, Dr James Gregory, who, upon the  
of their father, a short time before his  
been appointed to succeed him in the  
p of Medicine in King's college. He  
eght much in his infant years, and du-  
ble course of his studies, to the atten-  
ousin, the celebrated Dr Reid, of the  
f Glasgow. The rudiments of his clas-  
ion he received at the grammar school  
n; and, under the eye of his grandfa-  
mpleted, in King's college, his studies  
1 and Greek languages, and in the sci-  
ics, mathematics, and natural philo-  
sics master in philosophy and in mathe-  
Mr Thomas Gordon, professor of phi-  
King's college. In 1742, Mr Gregory  
inburgh, where the school of medicine  
sing to that celebrity which has since  
bly distinguished it. Here he attended  
ical lectures of the elder Dr Monro, of  
on the theory of medicine, and of Dr  
on the practice. He heard likewise  
ons of Dr Alston on the materia medica  
y, and of Dr Plummer on chemistry.  
al Society of Edinburgh, instituted for  
cussion of all questions relative to me-  
philosophy, had begun to meet in 1737.  
iety Mr Gregory was a member in 1748,  
e when Dr Mark Akenfide, his fellow  
id intimate companion, was a member  
: institution. In 1745, our author went  
and attended the lectures of those ce-  
roessors Gaubius, Albinus, and Van  
hile at this place he had the honour of  
om the King's college of Aberdeen, an  
degree of M. D. and soon after, on his  
a Holland, was elected professor of phi-  
that university. In this capacity he  
es in 1747, 1748, and 1749, on mathe-

matics, and on experimental and moral philoso-  
phy. In the end of 1749, however, he resigned  
his professorship of philosophy, his views being  
turned chiefly to the practice of physic. Previ-  
ously, however, to his settling as a physician at  
Aberdeen, he went for a few months to the Con-  
tinent. Some time after his return to Scotland,  
Dr Gregory married, in 1752, Elisabeth, daughter  
of William Lord Forbes; a young lady who, to  
the exterior endowments of great beauty and en-  
gaging manners, joined a very superior under-  
standing. With her he received a handsome addi-  
tion to his fortune; and during their union, which  
was only 9 years, enjoyed the highest portion of  
domestic happiness. Of her character it is enough  
to say, that her husband, in that admired work,  
*A Father's Legacy to his daughters*, the last proof  
of his affection for them, declares, that, "while  
he endeavours to point out what they should be,  
he draws but a very faint and imperfect picture of  
what their mother was." The field of medical  
practice at Aberdeen being at that time in a great  
measure pre-occupied by his elder brother, Dr  
James Gregory, and others, our author went to  
London in 1754; and being already known as a  
man of genius, he found an easy introduction to  
many persons of distinction, both in the literary  
and polite world. The late George Lord Lyttle-  
ton was his friend and patron. An attachment,  
founded on a striking similarity of manners, taste,  
and disposition, grew up into a firm and perma-  
nent friendship; and to that nobleman, to whom  
Dr Gregory was wont to communicate all his li-  
terary productions, the world is indebted for the  
publication of the *Comparative View of the State  
and Faculties of Man*, which made him first known  
as an author. He likewise enjoyed the friendship  
of the late Edward Montague, Esq. and of his  
lady, the celebrated champion of the Fame of  
Shakespeare against the cavils and calumnies of  
Voltaire. In 1754, Dr Gregory was chosen F. R. S.  
of London. In that city his professional talents  
would doubtless have procured him a very exten-  
sive practice; but the death of his brother, Dr  
James Gregory, in November, 1755, occasioning  
a vacancy in King's college, Aberdeen, which he  
was solicited to fill, he returned to his native  
country in 1756. Here our author remained till  
the end of 1764, when he changed his place of re-  
sidence for Edinburgh, where, in 1766, on the re-  
signation of Dr Rutherford, he succeeded as pro-  
fessor of the practice of physic; and was appoint-  
ed first physician to his majesty for Scotland, on  
the death of Dr Whytt. On his first establish-  
ment in the university of Edinburgh, Dr Gregory  
gave lectures on the practice of physic, in 1767,  
1768, and 1769. Afterwards, by agreement with  
Dr Cullen, professor of the theory of physic, these  
two eminent men gave alternate courses of the  
theory and the practice. As a public speaker, Dr  
Gregory's manner was simple, natural, and ani-  
mated. As his subject in a great degree precluded  
the graces of oratory, he expressed his ideas with  
uncommon perspicuity, and in a style happily at-  
tempered between the formality of studied com-  
position and the ease of conversation. The only  
lectures which he committed fully to writing,  
were those introductory discourses which he read  
at

at the beginning of his annual course, and which are published under the title of *Lectures on the Duties and Qualifications of a Physician*. Of these, which were written with no view to publication, many copies were taken by his pupils, and some from the original M. S., which he freely lent for their perusal. These lectures were first published in 1770, and afterwards in an enlarged and more perfect form in 1772; when he also published, *Elements of the Practice of Physic, for the use of Students*; a work intended solely for his own pupils, and to be used by himself as a text-book to be commented upon in his course of lectures. In his lectures, Dr Gregory never attempted to mislead the student by flattering views of the perfection of the science, but was rather anxious to point out its defects; wisely judging, that a sense of the imperfections of a science is the first step towards its improvement. With this view he exposed the fallaciousness of the several theories and hypotheses, which have had the most extensive currency, and perpetually inculcated the danger of systematizing with limited experience, or an imperfect knowledge of facts. Yet in the work last mentioned, he did not entirely neglect the systematic arrangements of other authors. These, however, he warned his pupils, that he had not adopted from any conviction of the rectitude of those theories to which they referred, but only as affording that degree of method, and regularity of plan, which is the best help to the study of any science. Considering a rational theory of physic to be as yet a desideratum, it was his object to communicate to his pupils the greatest portion of practical knowledge, as the only basis on which such a theory could ever be reared. Thus desirous of establishing the science of medicine upon the solid foundation of practice and experience; and knowing that many things asserted as facts by medical writers have been assumed on a very careless observation, while confirming a favourite theory; and that, on the other hand, many real and important facts have, from the same spirit of system, been explained away and discredited; he constantly endeavoured, both by his precept and example, to inculcate to his pupils the necessity of extreme caution either in admitting or in denying medical facts, or what are commonly given as such. To the desire of enforcing this necessary caution is owing that multitude of queries respecting matters of fact, as well as matters of opinion, which occurs in the *Elements of the Practice of Physic*. Dr Gregory, soon after the death of his wife, and, as he himself says, "for the amusement of his solitary hours," employed himself in the composition of that admirable tract, intitled, *A Father's Legacy to his Daughters*; a work which, though never intended by its author for the public eye, it would have been an unwarrantable diminution of his fame, and a capricious refusal of a general benefit to mankind, to have limited to the sole purpose for which it was originally designed. It was, therefore, with great propriety, published after the author's death by his eldest son. This work gives a most amiable display of the piety and goodness of his heart, and his consummate knowledge of human nature. It manifests such solicitude for their welfare, as strongly recommends the advice

which he gives. He speaks of the fem the most honourable terms, and labours in its estimation, whilst he plainly, yet gently, points out the errors into which ladies are apt to fall. It is particularly in what high and honourable terms he the Holy Scriptures, of Christian war faithful ministers; how warmly he rec to his daughters the serious and devo of God in public and private. He dw on that temper and behaviour, which a cularly suited to their education, rank cumstances; and recommends that gent nevolence, and modesty, which adorn t ter of the ladies, and do particular baso sex. His advices, with regard to love, and marriage, are peculiarly wise and They show what careful observation hel on female domestic conduct, and on the effects of possessing or wanting the in qualities which he recommends. Then thing peculiarly curious, animated, and his directions to them, how to judge of nifest an honourable passion in, and to other sex; and in the very accurate and tinction which he makes between true delicacy. Nothing can be more strik fecting, nothing more likely to give hi advices their desired effect, than the resp affectionate manner in which he mentio their mother, and the irreparable los and they sustained by her early death. in this tract, the professor shines with lustre as a husband and father, and it is adapted to promote domestic happine letters were evidently written under the of an early death, which Dr Gregory h to apprehend from a constitution subje gout, which had begun to appear at int ervals even from his 18th year. His mot whom he inherited that disease, died in 1770, while sitting at table. Dr Gre prognosticated for himself a similar dea vent of which, among his friends, he oft but had no apprehension of the nearness proach. In the beginning of 1772, in tion with his son, Dr James Gregory, remarking, that having for the 3 prece had no return of a fit, he might make hi with a pretty severe attack at that scak ceived the observation with some degree as he felt himself then in his usual state. The prediction, however, was too tru ying gone to bed on the 9th Feb. 1773 apparent disorder, he was found dead in ing. His death had been instantaneous, bably in his sleep; for there was not th discomposure of limb or of feature,—a p thanassa. Dr Gregory, in his person, d erably above the middle size. His fram was compacted with symmetry, but not gance. His limbs were not active; b somewhat in his gait; and his countena a fullness of feature and a heaviness of no external indication of superior abilitie otherwife when he engaged in conversal features then became animated, and hi expressive. He had a warmth of tone

ve a pleasing interest to every thing  
 cred: But, united with this anima-  
 as a gentleness and simplicity of man-  
 with little attention to the exterior  
 l forms of politeness, was more en-  
 the most finished address. His con-  
 ved with ease; and, when in com-  
 erary men, without affecting a dis-  
 edre, he was liberal of the stores of  
 e possessed a large share of the social  
 nt affections, which, in the exercise  
 on, appeared in many nameless, but  
 tentions to those under his care;  
 eding from an extended principle of  
 ere not spared to the circumstances  
 e patient. To many of his pupils,  
 rom all who had an interest in their  
 ras of importance to enjoy the coun-  
 e so universally esteemed. Through-  
 nd an easy introduction to an enlar-  
 ent society; and they experienced in  
 who was ever ready to assist them  
 sel and patronage. The same spirit  
 py endeared him to his intimate  
 g whom may be ranked most of the  
 iti of his time.—Some time after his  
 storship of the Theory of Medicine  
 l upon his eldest son, Dr James Gre-  
 as since succeeded to the practical

amuel Carlowitz, a late eminent na-  
 the Russian service, born at Inver-  
 ishire. The rev. Mr Andrew Ro-  
 ster of that parish, gives the following  
 of this Scoto-Russian admiral. "The  
 1. Greig was a native of this town,  
 d under the present School-master,  
 m early period of life into the British

service. While in the navy of Great Britain, he  
 distinguished himself at the defeat of Conflans by  
 Adm. Hawke, the taking of the Havannah, and  
 several other engagements in that successful war.  
 After the peace of 1763, he entered into the Rus-  
 sian service; and there at the battle of Chio, con-  
 tributed principally, by his advice and exertions  
 to the destruction of the whole Turkish fleet.  
 Sensible of his great professional merit, her imper-  
 rial majesty promoted him, (though a foreigner)  
 to the chief command of the Russian navy, which  
 he raised to a degree of respectability and import-  
 ance it never before had attained. In reward of  
 his great services, the empress bestowed on him  
 many honourable marks of distinction, and an  
 estate in Livonia, which his family now enjoy.  
 In the last war between the Russians and Turks,  
 which last were joined by the Swedes, he, in the  
 Baltic, defeated the Swedish fleet; and had not a  
 part of his squadron, through cowardice, refused  
 to come into action, he probably had captured or  
 sunk the whole of them. Soon after this, he was  
 seized with a fever, and died at Revel, on the  
 26th Oct. 1788. He was no less illustrious for  
 courage and naval skill, than for piety, benevo-  
 lence and every private virtue." *Sir J. Sinclair's*  
*Stat. Acc. IX. 510.*

GREILLENSTAIN, a town of Germany in  
 Austria, a mile W. of Horn.

GREIN, a town of Austria, on the N. side of  
 the Danube, 24 m. W. of Ips, and 62 of Vienna.

GREITZ, or GREWITZ, a town of Upper  
 Saxony, in the Vogtland, 12 m. SW. of Zwickau.

GREKSAKER, a town of Sweden in West-  
 manland, 48 miles W. of Stroemsholm.

 taining to the lap. *Dist.*

GREMSA. See GRAMESAY.

(1.) GRENADA, one of the Caribbee islands.  
 It is the last of the Windward Caribbees; and lies  
 30 leagues N. of New Andalusia, on the continent.  
 According to some, it is 24 leagues in compass;  
 according to others, only 22. It is 28 m. long,  
 and in some places 15 broad. The chief port,  
 formerly called *Louis*, now *St George's*, stands on  
 the W. side of the island, in the middle of a large  
 bay, with a sandy bottom. It is said that 1000  
 barks, from 300 to 400 tons, may ride secure from  
 storms; and that 100 ships, of 1000 tons each,  
 may be moored in the harbour. A large round  
 basin, which is parted from it by a bank of sand,  
 would contain a considerable number of ships, if  
 the bank was cut through: but by reason of it  
 the large ships are obliged to pass within 80 paces  
 of one of the mountains lying at the mouth of the  
 harbour; the other lying about half a mile distant.  
 The island abounds with game, fish, and very  
 fine timber. A lake on a high mountain, about  
 the middle of the island, supplies it with streams  
 of fresh water. Several bays and harbours lie  
 round the island, some of which might be fortified  
 to great advantage; so that it is very convenient  
 for shipping, not being subject to hurricanes. The  
 soil is capable of producing tobacco, sugar, indigo,  
 pease, and millet. In 1638, M. Poincy, a  
 Frenchman, attempted to make a settlement in  
 Grenada; but was driven off by the Caribbeans,  
 who resorted to this island in greater numbers  
 than

than to the neighbouring ones. In 1650, M. Parquet, governor of Martinico, carried over from that island 200 men, furnished with presents to reconcile the savages, and with arms to subdue them, in case they should prove intractable. The savages are said to have been frightened into submission by the number of the Frenchmen: but, according to some French writers, the chief not only welcomed the new-comers, but, in consideration of some knives, hatchets, scissars, and other toys, yielded to Parquet the sovereignty of the island, reserving to themselves their own habitations. The Abbe Raynal informs us, that these first French colonists, *imagining* they had purchased the island by these trifles, assumed the sovereignty, and soon acted as tyrants. The Caribs, unable to contend with them by force, took their usual method of murdering all those whom they found in a defenceless state. This produced a war; and the French settlers having received a reinforcement of 300 men from Martinico, forced the savages to retire to a mountain; from whence, after exhausting all their arrows, they rolled down great logs of wood on their enemies. Here they were joined by other savages from the neighbouring islands, and again attacked the French, but were defeated anew; and were at last driven to such desperation, that 40 of them, who had escaped from the slaughter, jumped from a precipice into the sea, where they all perished, rather than fall into the hands of their enemies. From thence the rock was called *le Morne des Sautours*, or "the hill of the leapers;" which name it still retains. The French then destroyed the habitations and all the provisions of the savages; but fresh supplies of Caribbeans arriving, the war was renewed with great vigour, and great numbers of the French were killed. Upon this they resolved totally to exterminate the natives; and having accordingly attacked the savages unawares, they inhumanly put to death the women and children, as well as the men; burning all their boats and canoes, to cut off all communication between the few survivors and the neighbouring islands. Notwithstanding all these barbarous precautions, however, the Caribbees proved the irreconcilable enemies of the French; and their frequent insurrections at last obliged Parquet to sell all his property in the island to the Count de Cerillac in 1657. The new proprietor, who purchased Parquet's property for 30,000 crowns, sent thither a person of brutal manners to govern the island. He behaved with such insupportable tyranny, that most of the colonists retired to Martinico; and the few who remained condemned him to death after a formal trial. In the whole court of justice that tried this miscreant, there was only one man (called *Archangel*) who could write. A farrier was the person who impeached: and he, instead of the signatures, sealed with a horse-shoe; and Archangel, who performed the office of clerk, wrote round it these words in French, "Mark of M. de la Brie, counsei for the court." It was apprehended that the court of France would not ratify a sentence passed with such unusual formalities; and therefore most of the judges of the governor's crimes, and witnesses of his execution, disappeared. Only those remained whose obscurity

screened them from the pursuit of the an estimate, taken in 1700, there were no more than 251 white people, 53 or mulattoes, and 525 slaves. The slaves were reduced to 64 horses and 569 hogs. The whole culture consisted of 3750 sugar and 52 of indigo.—The island had in 1664 to the French West India 100,000 livres. This unfavourable state was changed in 1714, owing to the condition of Martinico. The richest that island were sent to the Spanish on their way touched at Grenada to take ments. The privateering traders, took this navigation, taught the people the value of their soil, which was cultivated. Some traders furnished planters with slaves and utensils to erect plantations. An open account was kept between the two colonies. Grenada paid its debts gradually by its rich produce. The balance was on the point of being cleared by the war in 1744 interrupted the commerce between the two islands, and stopp'd the progress of the sugar plantations. They were supplied by the culture of coffee, which succeeded during the hostilities with activity. The peace of 1748 revived all the former sources of wealth, and opened all the former sources of commerce. In 1753, the population of Grenada consisted of 175 white people, 175 free negroes, and 175 slaves. The cattle amounted to 2968 horses, 2456 horned cattle, 3278 sheep, 803 hogs, 331 hogs. The cultivation rose to 8000 plantations, 2,725,600 coffee trees, 150 banana trees, and 800 cotton plants. The colony consisted of 5,740,450 trenches of cassava, 143 squares of yams. The colony made a rapid progress in the excellence of its produce. In 1762 the island was taken by the British. One of the mountains at the George's harbour was strongly fortified, but the British have made a good defence, but were obliged to give up firing a gun; and by the treaty of 1763 the island was ceded to Britain. The management of the island, from that event, the Abbe Raynal has the following marks.—"This long train of evils, arising from the on and mismanagement of his country, has thrown Grenada into the hands of those who are in possession of this conquest of 1763.—England has not made a good use of it. In the first enthusiasm of conquest, of which the highest opinion was formed, every one was eager to purchase estates there. They sold for more than their real value. This caprice, of the old colonists who were induced to the island, sent about L. 1,553,000 out of the country. This imprudence has been followed by the new proprietors, misled, by national pride, have substituted new tenants those of their predecessors. They have altered the mode of living among the negroes, who from their being more attached to their customs, have revolted. It hath been so

and out troops, and to shed blood. The colony was filled with suspicions. The men who had laid themselves under a necessity of using violent methods, were afraid of being massacred in their own plantations. They have declined, or been totally interrupted. Amity has at length been restored. The number of slaves has been increased as far as possible, and the produce has been raised to the level of what it was under the French government. The plantations will still be improved by the neighbourhood of a dozen of islands, called the **PRENADILLOES**, that are dependant on the island. (See that article.) In 1779, the conquest of this island was accomplished by D'Estaing, French admiral. Immediately after his conquest of St Lucia, he set sail for Grenada with M. de la Motte, he set sail for Grenada with a fleet of 26 sail of the line and 12 frigates, on board 10,000 land forces. Here he arrived on the 2d of July; and landed 3000 troops, Irish, being part of the brigade composed of 6000 men of Ireland in the service of France. They were conducted by Count Dillon, who distributed them in such a manner as to surround the island and harbour. To oppose these, Lord M'Cartney, the governor, had only about 1500 men, and 300 or 400 armed inhabitants; but his all resistance was evidently vain, he determined nevertheless to make an honourable and stout defence. The preparations he made were so judicious, that D'Estaing himself to be present at the first attack on the entrenchments was unsuccessful. The 2d continued two days when the garrison were obliged to yield to the immense disparity of numbers who assaulted them, after having killed or wounded 300 of the enemy. Having thus made themselves masters of the intrenchments on the hill, they turned the cannon of them towards the town which lay under it; on which the governor offered a capitulation. The terms, however, so extraordinary and unprecedented, that the governor and inhabitants agreed in rejecting them; and determined rather to surrender upon any conditions, than upon those which D'Estaing offered so extravagant. On this occasion D'Estaing is said to have behaved in a very haughty and imperious manner; indulging his soldiers also in the most unwarrantable liberties, and in which they had proceeded much farther, had they not been restrained by the Irish troops in the French fleet. In the mean time admiral Byron, who had been conveying the homeward bound West India fleet, hastened to St Vincent, in hopes of being able to intercept it; but being informed, by the way, of a descent had been made at Grenada, he changed his course, hoping that Lord M'Cartney would be able to hold out till his arrival. On the 6th of July he came in sight of the French fleet; without regarding D'Estaing's superiority of ships of the line and as many frigates, determined if possible to force him to a close engagement. The French commander, however, was not confident of his own prowess as to run the risk of an encounter of this kind; and having already

achieved his conquest, had no other view than to preserve it. His designs were facilitated by the good condition of his fleet; which, being more lately come out of port than that of the British, sailed faster, so that he was thus enabled to keep at what distance he pleased. The engagement began about eight in the morning, when admiral Barrington with his own and two other ships got up to the van of the enemy, which they attacked with the greatest spirit. As the other ships of his division, however, were not able to get up to his assistance, these three ships were necessarily obliged to encounter a vast superiority, and of consequence suffered exceedingly. The battle was carried on from beginning to end in the same unequal manner; nor were the British commanders, with their utmost efforts, able to bring the French to a close engagement. Thus captains Collingwood, Edwards, and Cornwallis, stood the fire of the whole French fleet for some time. Captain Fanshawe of the *Monmouth*, a 64 gun ship, threw himself singly in the way of the enemy's van; and admiral Rowley and captain Butchart fought at the same disadvantage: so that finding it impossible to continue the engagement with any probability of success, a general cessation of firing took place about noon. It recommenced in the same manner about 3 P. M. and lasted, with different interruptions, till evening. During this action some of the British ships had forced their way into St George's harbour, not imagining that the enemy were already in possession of the island. They were soon undeceived, however, by perceiving the French colours flying ashore, and the guns and batter's firing at them. This discovery put an end to the design which had brought on the engagement; and as it was now high time to think of providing for the safety of the British transports, which were in danger from the number of the enemy's frigates, the engagement was finally discontinued. During this action some of admiral Byron's ships had suffered extremely. The *Lion* of 64 guns, captain Cornwallis, was found incapable of rejoining the fleet which were plying to windward; and was therefore obliged to bear away alone before the wind. Two other ships lay far astern in a very distressed situation; but no attempt was made to take them, nor did the French admiral show the least inclination to renew the engagement. Grenada was restored to Great Britain by the peace in 1763. George's town, or St George's, is the residence of the governor; and the governor, gen. Matthew, made a present to the citizens of a clock and bells in 1700. The garrison then consisted of artillery, two regiments of Europeans, and one of blacks. As there are several small islands subject to the laws enacted in Grenada, they each elect a person to represent them in the general assembly, which is always held in St George's. As none of the Grenadines have a harbour fit for large vessels, the produce of them is conveyed in small vessels to St George's, from whence it is exported to the different parts of Europe, Africa, America, &c. From the number of vessels that arrive there yearly from different places, and from its being the seat of the Legislature, it has become so populous, that two news papers are published in it. Although it

the peace of 1763, all the French inhabitants who inclined to remain in the island, became invested with the privileges of British subjects; and although these privileges were confirmed in 1768, yet the treatment which they experienced from the British settlers, proved so extremely oppressive, that they at last broke out into a formidable insurrection. On the 2d March 1795, the old French inhabitants, being joined by the mulattoes under Fedon, seized the towns of Grenville and Gonyave, plundered the former, murdered 11 of the English inhabitants, and took the rest prisoners. On the 5th, 130 troops were sent against the rebels, but were obliged to retreat. The most barbarous massacres now took place on both sides; and gen. Lindsey, finding himself unable to quell the insurrection, put an end to his own life. On the 16th April, gen. Nichols, arriving from Martinico, assumed the command, and various engagements took place, wherein sometimes the insurgents and sometimes the British had the advantage. In this distracted state the island continued till Dec. 1795, when the French landed a body of troops, who joined the rebels, and reduced great part of the island; but on the 10th June 1796, the French commandant, Josley, surrendered all the French posts by capitulation to the British under gen. Abercrombie; and Fedon and his associates escaped into the woods, after having murdered all their prisoners. The British obtained complete possession on the 19th June; since which tranquillity has been restored. Lon. 61 40. W. Lat. 12. 0. N.

(2.—3.) GRENADA. See GRANADA.

(1.) GRENADÉ, a town of France, in the dept. of Landes, 7 miles E. of St Sever.

(2.) GRENADÉ, a town of France, in the dept. of Upper Garonne, 12 miles NNE. of Toulouse.

(3.) \* GRENADÉ, *n. f.* [from *pomum granatum*, Lat.] A little hollow globe or ball of iron, or other metal, about two inches and a half in diameter, which, being filled with fine powder, is set on fire by means of a small fuse fastened to the touch hole: as soon as it is kindled, the case flies into many shatters, much to the damage of all that stand near. *Harris.*

(4.) GRENADES, or GRENADES, are thrown by the grenadiers into those places where the men stand thick, particularly into trenches and other lodgements made by the enemy. They were invented about 1594. The author of *the Military Dictionary* has the following remark on the use of grenades: "Grenades have unaccountably sunk into disuse, but I am persuaded there is nothing more proper than to have grenades to throw among the enemy who have jumped into the ditch. During the siege of Cassel, under Count de La Lippe, in the campaign of 1762, a young engineer undertook to carry one of the outworks with a much smaller detachment than one which had been repulsed, and succeeded with ease from the use of grenades; which is a proof that they should not be neglected, either in the attack or defence of posts." The word GRANADO takes its rise from hence, that the shell is filled with grains of powder as a pomegranate is with kernels.

(1.) \* GRENADIER, *n. f.* [*grenadier*, French, from *grenade*.] A tall foot soldier, of whom there

is one company in every regiment: such being employed to throw grenades.—

Peace allays the shepherd's fear

Of wearing cap of *grenadier*.

(2.) GRENADIERS are armed with a firelock, a bayonet, and a pouch full of grenades. They wear high caps, are generally tall and brisk fellows, and are always upon all attacks. Every battalion of foot generally a company of them; or else 2 or 3 grenadiers belong to each company of the line, which, on division, are drawn out as a company of themselves. They always have the right of the battalion.

GRENADILLA. See EBONY, § II.

GRENADILLOES, or } See GRANADA.

GRENADINES. } These islands

3 to 8 leagues each in circumference, but to be all destitute of water, except the *riacou*, wherein one spring has been discovered by digging, which is kept locked up by the governor. The capital of that island is *HELEN*, which has a church. See GRANADA, N.

\* GRENADO, *n. f.* See GRENADE.

Yet to express a Scot, to play that

Not all those mouth *grenados* can suff

—You may as well try to quench a fire with *nado* with a shell of fair water as hope to *Watts.*

GRENAILLE, a name given by the writers to a preparation of copper, of Chinese use as a red colour in some of the china, particularly for that colour which is called *oil-red* or *red in oil*. The china ware with this is very dear. The manner in which to procure the preparation is thus: The China no such thing as silver coined, but they use in commerce bars or masses of these they pay and receive in large barges among a nation so full of fraud as the Chinese is no wonder that these are often adulterated with too great an alloy of copper. They use, however, in this state in common payments. On some occasions, however, such as the payment of taxes and contributions, on which they require their silver pure and fine: on such occasions they have recourse to people, whose business it is to refine the silver, and separate it from the lead it contains. This they do in furnaces for the purpose, and with very convenient apparatus. While the copper is in fusion, they take a brush, and dip the end of it in water; then, by the handle of the brush, they sprinkle the water by degrees upon the melted copper; a scale of lead forms itself by this means on the surface of the matter, which they take off while the copper is in fusion, and immediately throw it into a large vessel of cold water, it forms a powder which is called the *grenaille*; then they repeat the operation every time they in this manner separate the copper; and this furnishes them with as much *grenaille* as they have occasion for.

GRENAN, Benignus, professor of poetry at Harcourt, was born at Noyers, in Burgundy, 1681. He was the intimate friend of prior Boileau, but his rival in poetry and eloquence.

oems in a pure stile, and his sentiments are  
it. He died at Paris in 1723.

**NANT**, a town of France, in the dept.  
er Marne, 10 miles SSE. of Langres.

**NCHEN**, a town of the Helvetic republic,  
Valais, 25 miles E. of Sion.

**NOBLE**, a large, populous, and ancient  
France, in the dept. of Here, and ci-de-  
v. of Dauphiny, anciently called **Accu-  
COLONIA**. See that article. It contains  
number of handsome structures, particu-  
rches and ci-devant convents. The leather  
ges made here are highly esteemed. It is  
in the Here, over which there are 2 bridges  
into a large street on the other side of the  
Lon. 5. 49. E. Lat 45. 12. N.

**NVILLE**, the capital of the island of Gre-  
It was plundered, and partly burnt by the  
rgents, on the 2d March 1795. See **GRE-  
N° 1**.

**PPIN**, a town of Germany, in the electo-  
Saxony, 2 miles NNW of Bitterfeld.

**S, CAPE AU**, a promontory of N. Ame-  
the E. side of the Mississippi, in the North  
1 Territory.

**SHAM**, Sir Thomas, an opulent mer-  
1 London, descended from an ancient fa-  
Norfolk. He was born in 1519. His fa-  
s king's agent at Antwerp, for taking up  
of the merchants. Being appointed to the  
fice, he, in 1551, removed to that city  
family. This employment was suspended  
cession of Q. Mary, but, on proper re-  
tion, was restored to him again. Q. E-  
knighted him, and made him her agent  
n parts. About this time, he built a large  
house on the W. side of Bishopsgate Street,  
med **GRESHAM COLLEGE**. His father had  
d building a house or exchange for the mer-  
o meet in, instead of walking in the open  
but Sir Thomas went beyond his father:  
rd, if the citizens would provide a proper  
f ground, to build a house at his own ex-  
which being accepted, he fulfilled his pro-  
per the plan of the exchange at Antwerp.  
29th of Jan. 1570, when the new edifice  
ned, the queen came and dined with the  
; and caused a herald with a trumpet to  
it by the name of the *Royal Exchange*.  
ance also of a promise to endow a college  
rofession of the seven liberal sciences, he  
testamentary disposition of his house in  
for that purpose. See **COLLEGE**, § II.  
He left several other benefactions, and  
1579. He had a mind every way suited  
ortune, generous and benign: ready to  
good actions, and encourage them in o-  
le was a great friend and patron of the  
d martyrologist, John Fox. He was well  
ed with the ancient and several modern  
s; he had a very comprehensive know-  
all affairs relating to commerce, foreign  
estic; and his success was equal to it,  
emed the highest commoner in England,  
c. He transacted queen Elizabeth's mer-  
fairs so constantly, that he was called  
*merchant*; and his house was sometimes

appointed for the reception of foreign princes u-  
pon their first arrival in London.

**GRESHAM COLLEGE**. See **COLLEGE**, § II N° 1.

**GRESHOLM**, an isle of Denmark, in the Scag-  
gerack, 4 miles NNE. of Lefloe isle.

**GRESSEN**, a town of Poland, in Samogitia,  
20 miles NNE. of Mednik.

**GRESSET**, John Baptist Lewis, one of the  
most lively of the French poets, born at Amiens,  
in 1709. His *Poésies* is reckoned the best of his  
productions. He died in 1777.

**GRESTEN**, a town of Austria, 9 miles NE.  
of Bavaria Wadhofer.

**GRETA**, a river of Yorkshire, which runs in-  
to the Tees, near Morton.

**GRETE**, a river of Westmoreland, which runs  
into the Lune, 2 miles S. of Kirby Lonsdale.

**GRETNA GREEN**. See **GRAFTNEY**, N° 2.

**GRETSVIL**, or **GROBE**, a town of West-  
phalia, on the borders of L. Frisland, 10 miles  
NNW. of Emden.

**GRETTELSBERG**. See **GREVELSBERG**.

**GREVE AU LANCHAN**, a bay on the NW.  
coast of the island of Jersey.

**GREVEN**, a town of Westphalia, in the bi-  
shopric of Munster, 8 miles N. of Munster.

**GREVENBROICH**, a town of the French re-  
public, in the dept. of Roer, and ci-devant duchy  
of Juliers, 10 miles NNE. of Juliers.

**GREVENSTEIN**, a town of Germany, in the  
circle of the Lower Rhine, and duchy of West-  
phalia, 16 miles W. of Brünn.

**GREVERAD**, a town of Germany, in the cir-  
cle of Westphalia, and duchy of Berg, 1 mile N.  
W. of Solingen.

**GREVILLE**, Fulke, lord Brook, a poet and  
miscellaneous writer, born in 1554, and descend-  
ed from the noble families of Beauchamps of Po-  
wick and Willoughby de Brook. In company  
with his cousin Sir Phillip Sidney, he began his e-  
ducation at a school in Shrewsbury: thence he went  
to Oxford, and afterwards to Cambridge. He  
next visited foreign courts, and thus added to his  
knowledge of the ancient languages a perfect know-  
ledge of the modern. On his return to England,  
he was introduced to Q. Elizabeth by his uncle  
Robert Greville; and by means of Sir Henry Sid-  
ney, lord pretident of Wales, was nominated to  
some lucrative employments in that principality.  
In 1581, when the French commissioners, who  
came to treat about the queen's marriage with  
the duke of Anjou, were entertained with tilts  
and tournaments, Mr Greville, who was one of  
the challengers, so signalized himself, as to "win  
the reputation of a most valiant knight." He con-  
tinued a constant attendant at court, and a fa-  
vourite with the queen to the end of her reign;  
during which he obtained the office of treasurer  
of marine causes, a grant of the manor of Wedg-  
nock, and the honour of knight-hood. In her reign  
he was several times elected M. P. for Warwick-  
shire, and from the journals seems to have been a  
man of business, as his name often appears in  
committees. On the accession of K. James I. he  
was installed knight of the Bath; and soon after  
obtained a grant of the ruinous castles of Warwick,  
which he repaired at a considerable expence. In

1614, he was made under-treasurer, chancellor of the exchequer, one of the privy council, and gentleman of the bed-chamber; and in 1620, he was raised to the dignity of baron. He was also privy-counsellor to K. Charles I. in the beginning of whose reign, he founded a history lecture in Cambridge. Having thus attained the age of 74, thro' a life of continued prosperity, universally admired as a gentleman and a scholar, he fell by the hands of an assassin, one of his own domestics, who immediately stabbed himself with the same weapon with which he had murdered his master. This fellow's name was Haywood; and the cause is said to have been a severe reprimand, for his presumption in upbraiding his master for not providing for him after his death. He had been witness to lord Brook's will, and knew the contents. Some say he stabbed him with a knife in the back, others with a sword. This affair happened at Brook-house, in Holborne. Lord Brook was buried with great pomp in St Mary's church at Warwick, in his own vault, over which he had erected a monument of black and white marble, ordering at his death the following inscription to be engraved upon the tomb: "Fulke Greville, servant to Q. Elizabeth, counsellor to K. James, and friend to Sir Philip Sidney. *Trophæum Peccati*." He wrote several works in verse and prose, among which are, 1. Two tragedies, Alabam and Mithras. 2. A Treatise of Human Learning, &c. in verse, folio. 3. The Life of Sir Philip Sidney. 4. An Inquisition upon Fame and Honour, in 86 stanzas. 5. *Gaellia*, a collection of 109 songs. 6. His Remains, consisting of political and philosophical poems.

GREVILLERS, a town of France, in the dept. of the Straits of Calais, near 2 miles W. of Baupaume.

GREVIUS. See GRÆVIUS.

GREUSSEN, a town of Upper Saxony, in Schwartzburg, 16 miles N. of Eriurt.

\* GREUT. *n. f.* A kind of fossil body.—A sort of tin ore with its *grewt*; that is, a congeries of crystals, or sparks of spar, of the bigness of hay salt, and of a brown shining colour immersed therein. *Grew's Museum.*

(1.) GREW, Nehemiah, a learned English writer, of the 17th century, who had a considerable practice as a physician in London, and succeeded Mr Oldenburgh in the office of secretary to the Royal Society. In this capacity, pursuant to an order of council, he drew up a catalogue of the natural and artificial rarities belonging to the society, under the title of *Museum Regalis Societatis*, &c. 1681. He also wrote, besides several pieces in the Philosophical Transactions, 1. The Comparative Anatomy of the Stomach and Guts, fol. 2. The Anatomy of Plants, fol. 3. *Tractatus de salis Cathartici natura et usu.* 4. *Cosmologia Sacra*, or a Discourse of the Universe as it is the Creature and Kingdom of God, folio. He died suddenly in 1721.

(2.) \* GREW. The preterite of *grew*.—

The pleasant talk he fails not to renew;

Soft and more soft at ev'ry touch it *grew*. *Drvd.*

GREWESMUEHLEN, or } a town of Meck-  
GREWESMUHLEN, } lenburgh, 14 miles  
W. of Wismar.

GREWIA, in botany, a genus of the gynandria order, belonging to the gynandria plants; and in the natural method ranking the 37th order, *Columnifera*. The calyx taphyllous; there are 5 petals, each with a riferous scale at the base; the berry is quadrangular. There are two species, viz.

1. GREWIA AFRICANA, with oval spear-ferrated leaves, is a native of Senegal in from whence its seeds were brought by Mission. In this country it rises with a shrub 5 or 6 feet high, sending out many lateral with a brown hairy bark, and garnish spear-shaped ferrated leaves; but the plant flower in Britain. This species is tender must be kept constantly in a warm bed. In summer, they require a large share of air, and should have water three or four week in warm weather; but in winter they be sparingly watered. The negroes of highly value a decoction of the bark, and a never-failing remedy against venereal cost.

2. GREWIA OCCIDENTALIS, with oval leaves. It is a native of the Cape of Good and grows to the height of 10 or 12 feet stem and branches greatly resemble those small leaved elm, the bark being smooth the same colour with that when young leaves are also very like those of the elm, off in autumn. The flowers are produced along the young branches from the wing leaves, and are of a bright purple colour species, though a native of a warm climate bear the open air in this country; only to be sheltered in a green-house during winter may be propagated by cuttings or layers in pots filled with soft loamy earth.

(1.) \* GREY. *adj.* [*gris*, French. Properly written *gray*.] See GRAY.—The ruffian, Sir, whose life I spared at suit of beard. *Shak. King Lear*.—

Our green youth copies what grey is  
When venerable age commands the sin

(2.) GREY, Lady Jane, a most illustrious unfortunate lady, descended of the blood England by both parents, was the eldest of Henry Grey marquis of Dorset, and the daughter of Charles Brandon lord St Mary the dowager of Lewis XII. king of who was the youngest daughter of Henry king of England. She was born in 1537, gate, her father's seat in Leicester-shire. covered an early propensity to all kinds ture; and having a fine genius, impropr the tuition of Mr Elmer, she made a w sing progress in the languages, arts, and She understood perfectly both kinds of pl and could express herself very properly and Greek; and Sir Thomas Chaloner (in Memorials, Vol. III. p. 93.) says, that well versed in Hebrew, Chaldee, Arabic and Italian. He adds, that "she played instrumental music, writ a curious hand, excellent at the needle;" and that she nised her musical instruments with a vofitely sweet, assisted by all the graces could bestow. In 1553, the dukes of St

Northumberland, who were now, after the fall of the Northumberland, arrived at the height of power, began on the decline of king Edward's health, to think how to prevent that reverse of fortune which, as things then stood, they foresaw must happen upon his death. To obtain this end, no other remedy was judged sufficient but a change in the succession of the crown, and transferring it into their own families, by rendering Lady Jane Grey. Those most excellent and amiable qualities, which had rendered her dear to all who had the happiness to know her, joined to her near affinity to the king, subjected her to become the chief tool of an ambition not her own. With this view she was married to lord Guildford Dudley, 4th son of the duke of Northumberland, without discovering to her the real design of the match; which was celebrated with great pomp in the end of May; and was so much to the king's satisfaction, that he contributed bounteously to the expense of it from the royal wardrobe. Edward VI. died in July following; and Lady Jane, with infinite reluctance, overpowered by the solicitations of her ambitious friends, allowed herself to be proclaimed queen of England, on the strength of a deed extorted from that prince by her father in law the duke of Northumberland, which set aside the succession of queen Mary, queen Elizabeth, and Mary queen of Scots. Her regal pageantry continued but a few days. Queen Mary's hereditary right prevailed; and the unfortunate Lady Jane Grey and her husband were committed to the Tower, and on the 13th Nov. arraigned and found guilty of high treason. On the 12th February following they were both beheaded on Tower hill. Her magnanimity in this dreadful scene was astonishing. Immediately before her execution, she addressed herself to the weeping multitude with amazing composure and coherence; and died in charity with that wretched world which she had so much reason to execrate. Thus did the pious Mary begin her reign with the murder of an innocent young creature of 18; who for simplicity of manners, purity of heart, and extensive learning, was hardly ever equalled in any age or country. But, alas! Jane was an obstinate heretic! Fleckenham, Mary's chaplain, visited her in the tower and tried to convert her to the catholic faith, but found her by far his superior in argument. Her writings are, 1. Four Latin Epistles; three to Bullinger, and one to her sister lady Catharine. The last was written the night before her execution, in a blank leaf of a Greek Testament: a circumstance which seems to have led Dr Watkins, in his *Biog. Diſt.* to say, it was written "in the Greek language." These letters are printed in a work entitled *Epistole Helveticæ Reformatōribus, vel ad eos scriptæ*, &c. Tiguri, 1742, 8vo. 2. Her Conference with Fleckenham. *Ballard.* 3. A letter to Dr Harding, her father's chaplain. Printed in the *Phoenix*, vol. ii. p. 28. 4. A Prayer for her own use during her confinement. In Fox's *Acts and Monuments.* 5. Four Latin verses; written in prison with a pin. They are as follows:

*Non aliena putes, homini quæ obtingere possunt:  
Sors hodierna mihi, tunc erit illa tibi.*

Jane Dudley.

*Deo juvante, nil nocet labor malus:*

*Et non juvante, nil juvat labor gravis.*

*Post tenebras spero lucem.*

6. Her Speech on the Scaffold. *Ballard.* It began thus: "My Lords, and you good Christian people who come to see me die; I am under law, and by that law, as a never erring judge, am condemned to die: not for any thing I have offended the queen's majesty; for I will wash my hands guiltless thereof, and deliver to my God my soul as pure from such trespass as innocence from injustice; but only for that I consented to that thing I was enforced unto, constraint making it law believe I did that which I never understood. &c.—Hollinghed, Sir Richard Baker, Bale, an Fox, tell us that she wrote several other things but do not mention where they are to be found.

(3.) GREY, Richard, D. D. a learned English divine, born in 1693, and educated at Oxford where he took the degree of M. A. in 1719. He obtained the rectories of Kilcote in Leicestershire and Hindon in Northamptonshire with other benefices. He published many sermons and religious tracts; besides the following: 1. *Memoria Technica*, or a New Method of Artificial Memory; which the first edition was printed in 1730. and 4th in 1756: 2. *A System of English Ecclesiastical Law*, 8vo, 1741: 3. *The miserable and distracted State of Religion in England, upon the Downfall of the Church established*; 8vo, 1736: 4. *A new and easy Method of Learning Hebrew without points*; 1738: 5. *Historia Josephi*, and 6. *Paradigmata Verborum*, 1739: 7. *Liber Jobi*, 174: 8. *Answer to Warburton's Remarks*, 1744: *Novus Methodus Hebraicæ Disſendi*, &c. 1751: and 10. *A Translation of Mr H. Browne's poem, I Animi immortalitate*. He was married; and died Feb. 28, 1771, aged 78, leaving several daughters.

(4.) GREY, Zachary, LL. D. an English divine born in 1687. He studied and graduated at Cambridge. He was vicar of St Giles's and St Peter in Cambridge, and was author of about 30 different works; particularly *An Answer to Neale's History of the Puritans*; 3 vols 8vo. His edition of *Hudibras*, 1744, was satirized by Warburton and Henry Fielding. He died in 1766, aged 79.

GREY FRIARS. See FRANCISCANS.

(1.) \* GREY-HOUND. *n. f.* [*grigbound*, Saxon] A tall fleet dog that chafes in fight.—First may trusty greyhound transform himself into a tyger. *Sidney.*—

So, on the downs we see, near Wilton fair  
A haſt'ned hare from greedy greyhounds go.

*Sidney*

Th' impatient greyhound, ſlapt from his  
Bounds o'er the glebe to catch the fearful hare.

*Dryden*

(2.) GREY-HOUND. See CANIS, § I, vi. N<sup>o</sup> 7; and (2.) 11, 23. Among a litter of grey-hound puppies, the best are always those which are lightest. These will make the nimblest dogs as they grow up. The grey-hound is best for open countries where there is little covert. In these places there will sometimes be a course after a hare two or three miles or more, and both the dog and the game in fight all the while. It is generally supposed that the grey-hound bitch will be

the dog in running: but this seems to be an error; for the dog is both longer made, and considerably stronger, than the bitch of the same kind. In breeding these dogs, the bitch is principally to be regarded; for it is found by experience, that the best dog and a bad bitch will not get so good puppies, as an indifferent dog with a good bitch. The dog and bitch should be as nearly as possible of the same age; and for breeding perfect dogs, they should not be more than 4 years old. An old bitch may be used with a young dog, but the puppies of a young bitch and an old dog will never be good for any thing. The general food for a grey-hound is chippings or raspings of bread, with soft bones and gristles; and those chippings ought always to be soaked in beef or mutton broth. The proper exercise is courting him 3 times a-week, and rewarding him with blood; which will animate him in the highest degree, and encourage him to prosecute his game. But the hare also should always have fair play. She should have *the laze*, as it is called; that is, have leave to run about 12 score yards before the dog is slipped at her, that he may have some difficulty in the course, and not pick up the game too easily. If he kills the hare, he must never be suffered to tear her; but she must be taken from him, his mouth cleaned of the wool, and the liver and lights given him by way of encouragement. Then he is to be led home, and his feet washed with butter and beer, and about an hour after he is to be fed. When the dog is to be taken out to course, he should have nothing in the morning but a toast and butter, and then he is to be kennelled till taken out to the field. The kennelling these dogs is of great use, always giving them spirit and nimbleness when they are let loose. The best way of managing a fine grey-hound is, never to let him stir out of the kennel, except when feeding, walking, or courting.

GREYLÄCH, a town of Germany in Carniola, 8 miles N. of Rudolfswert.

GREY LEAGUE. See GRISONS.

GREYSAU, a town of Silesia; in Nieffe.

GREZ, or GREZ EN BOUERE, a town of France, in the department of Maine,  $7\frac{1}{2}$  miles ENE. of Chateau Gontier.

GREZELS, a town of France in the dep. of Lot, 8 miles N. of Moncuq.

GREZZANA, or ) a town of the Veronese, in

GREZZANO, { Maritime Austria, according to the division of that province between the emperor and the Cisalpine republic, made by the treaty of Campo Formio, in 1797: but by the late conquest of the Veronese, by the French and Cisalpines under Gen. Brune in Dec. 1800, and subsequent annexation of the whole province, it is now in the Cisalpine republic. This town is 12 miles N. of Verona, and 2 of Breonio; and is seated near the *Bridge of Beja*, a remarkable bridge formed by Nature, which connects two hills together. Its arch is 50 Veronese feet broad, and no less than 114 feet high.

GRIAS, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking with those of which the order is doubtful. The corolla is tetrapetalous; the calyx quadrifid; the stigma sessile and cruciform; the fruit is a plum with an eight-furrowed kernel. There is but one species, viz.

GRIAS CAULIFLORA, the anchovy-pea, a native of Jamaica. The leaves are nearly oval, and about three feet long. It has a straight stem, upon the upper part of which come forth the branches. The fruit is large, and contains a stone with 8 furrows. These fruits are eaten by the inhabitants.

GRIAZNUCHA, a town of Russia in the gov. of Saratov, 40 miles SSW. of Saratov.

GRIAZOVETZ, a town of Russia in the gov. of Vologda. Lon. 53. 30. E. of Ferro. Lat. 58. 16. N.

GRIBALDUS, Matthew, a learned civilian of Padua, who left Italy in the 16th century, in order to make a public profession of the Protestant religion. After having been for some time professor of the civil law at Tubingen, he was obliged to leave it, having imbibed some doubts respecting the doctrine of the Trinity: but he was seized at Bonn, where he would have met with very severe treatment, had he not pretended to renounce his opinions; but as he relapsed again, he would certainly have been put to death, had he not died of the plague in 1664. He wrote *De methodo et ratione studendi in juri civili*; and several other works, which are esteemed.

GRIBNER, Michael Henry, a learned civilian of Germany, born at Leipzig in 1682. After writing some time in the Journal of Leipzig, he was made professor of law at Wittemberg; whence he passed to Dresden, and was at last recalled to Leipzig to succeed M. Mencke. He died in 1726. Besides several academical dissertations, he wrote, 1. *Principia processus judicarii*; 2. *Principia juris prudentiae naturalis*, a small work much esteemed; 3. *Opuscula juris publici et privati*.

GRICANE, a town of European Turkey, in Moldavia, 20 miles N. of Jassi.

\* GRICE, *n. s.* 1. A little pig. *Gouldman*— 2. A step or greese.—

No, not a grice:

This is a step to love. *Shak. Twelfth Night*.

\* To GRIDE, *v. n.* [*gridare*, Ital.] To cut; to make way by cutting. A word elegant, but not in use.—

His poignant spear he thrust with puissant fury,  
That through his thigh the mortal steel did gride. *Spenser*.

So fore

The griding sword, with discontinuous wound,  
Pass'd through him! *Milton's Paradise Lost*.

\* GRIDELIN, *adj.* A colour mixed of white and red.—

The ladies dress'd in rich lymars were seen,  
Of Florence fatten, flower'd with white and green,  
And for a shade betwixt the bloomy gridelin.

*Dryden's Fables*.

\* GRIDIRON, *n. s.* [*grind*, Islandick, a grate, and *iron*.] A portable grate on which meat is laid to be broiled upon the fire.—He had added two bars to the gridiron. *Spektator*.

(1.) \* GRIEF, *n. s.* [from *grieve*; *griff*, Wel. probably from the English.] 1. Sorrow; trouble for something past.—

I will instruct my sorrows to be proud;  
For grief is proud, and makes his owner stout.

*Shak.*

—Wringing of the hands, knocking the breast, and but

emonies of sorrow, the pomp and of-  
f an effeminate *grief*, which speak not  
ic greatness of the misery as the small-  
mind. *South.*—The mother was so af-  
ic loss of a fine boy, who was her only  
ic died for *grief* of it. *Addison.* 2. *Grie-*  
ic rm. [*Grief*, Fr.] Not in use.—  
icious for redress of all these *griefs*,  
ill set this foot of mine as far  
goes farthest. *Shak.*

The king hath sent to know  
ure of your *griefs*, and whereupon  
ijure from the breast of civil peace  
ld hostility? *Shak. Henry IV.*  
:iseafe. Obsolete.

IEF. The influence of this passion on  
s very great. Its effects resemble in se-  
nces those of fear, with, however, some  
owing perhaps to its being in general  
uration. *Grief* diminishes the bodily  
; general, and particularly the force of  
and circulation; as appears by the fre-  
s and deep respirations which attend it,  
n to be necessary exertions, in order to  
the passage of the blood through the  
diminishes perspiration, obstructs the  
discharge, produces paleness of the skin,  
ratous complaints, and scirrhous of the  
parts. It aggravates the scurvy, and  
nity of putrid and contagious distempers;  
as people more apt to receive the infec-  
em. When it comes on suddenly, and  
degree, it causes a palpitation of the  
l renders the pulse irregular. Blindness,  
and sudden death, have followed the  
this sensation. Its effects of changing  
r of the hair are well known. Opiates,  
oses, are good cordials in this case.

UM, in botany; a genus of the penta-  
ler, belonging to the decandria class of  
The calyx is quinquefid; there are 5 pe-  
filaments persisting; and 5 monopel-  
l-cases.

JAW, a town of Germany, in Austria,  
NE. of Steyregg.

JBACH, a town of Austria, 2 miles N.  
id.

JBURG, a town of Germany in Stiria.

JPACH, a town of Germany, in Auf-  
iles NE. of Waidhofen.

PIHEL, a fort of Germany, in Stiria.

ISON, Constantia, a native of the coun-  
keny in Ireland, was one of the most  
omen on record, though she was born  
parents, and died at the age of 27, in  
he was an excellent Greek and Latin  
and understood history, divinity, philo-  
id mathematics. She proved her skill in  
her dedication of the Dublin edition of  
o lord Carteret, and by that of Terence  
; to whom she also addressed a Greek

She wrote many elegant English poems,  
which were inserted by Mrs Barber a-  
r own. When lord Carteret was lord  
t of Ireland, he obtained a patent for Mr  
to be the king's printer; and to reward  
nmon merit of his wife, caused her life  
luced in it.

GRIESBACH, a town of Germany, in Lower  
Bavaria, 14 miles W. of Passau.

GRIESKIRCHEN, a town of Austria, 6 miles  
SW. of Efferding, and 104 W. of Vienna.

GRIET, a town of the French republic, in the  
dep. of the Roer, and ci-devant duchy of Cleves,  
4 miles E. of Cleves.

\* GRIEVANCE. *n. f.* [from *grief*.] 1. A state  
of uneasiness. Out of use. 2. The cause of un-  
easiness. Used of such causes as are the effects of  
human conduct.—What remedy can be found a-  
gainst *grievances*, but to bring religion into coun-  
tenance, and encourage those who, from the hope  
of future reward, and dread of future punishment,  
will be moved to justice and integrity? *Swift.*

(1.) \* To GRIEVE. *v. a.* [*grever*, French;  
*griever*, Flemish; *gravis*, Latin.] 1. To afflict;  
to hurt.—For he doth not afflict willingly, nor  
*grieve* the children of men. *Luke* iii. 33.—Forty  
years long was I *grieved* with this generation.  
*Psalms.*—It repented the Lord that he had made  
man on the earth, and it *grieved* him at his heart.  
*Gen.* vi. 6.—

*Griev'd* at the thought, he vow'd his whole  
endeavour

Should be to close those breaches. *Roaue.*  
2. To make sorrowful.—When one man kills a-  
nother, thinking that he killeth a wild beast;  
if the same man remembreth afterwards what he  
hath done, and is not *grieved* for the fact, in this  
case he hath sinned; because his not grieving is of-  
fensive unto God, though the fact were merely  
besides his will. *Perkins.*

(2.) \* To GRIEVE. *v. n.* To be in pain for  
something past; to mourn; to sorrow, as for the  
death of friends. It has sometimes *at* and some-  
times *for* before the cause of grief: perhaps *at* is  
proper before our misfortunes, and *for* before our  
faults.—Do not you *grieve at* this. *Shak.*—

How didst thou *grieve* then, Adam, to behold  
The end of all thy offspring, end so sad? *Milton.*

With equal mind what happens let us bear;  
Nor joy nor *grieve* too much for things beyond  
our care. *Dryden.*

\* GRIEVINGLY. *adv.* [from *grieve*.] In sor-  
row; sorrowfully.—

*Grievingly*, I think,

The peace between the French and us not values  
The cost that did conclude it. *Shak.*

\* GRIEVOUS. *adj.* [*gravis*, Latin; or from  
*To grieve*.] 1. Afflictive; painful; hard to be  
born.—To the flesh, as the apostle himself grant-  
eth, all affliction is naturally *grievous*. *Hooker*—  
Correction is *grievous* unto him that forsaketh the  
way, and he that hateth reproof shall die. *Prov.*  
xv. 10. 2. Such as causes sorrow.—To own a  
great but *grievous* truth, though they quicken and  
sharpen the invention, they corrupt the temper.  
*Watts.* 3. Expressing a great degree of uneasi-  
ness.—He durst not disobey, but sent *grievous*  
complaints to the parliament of the usage he was  
forced to submit to. *Clarendon.* 4. Atrocious;  
heavy.—

It was a *grievous* fault,

And grievously hath Cæsar answer'd it. *Shak.*  
—Crying sins I call those, which are so heinous,  
and in their kind so *grievous*, that they hasten  
God's judgments and call down for speedy ven-  
geance

geance upon the sinner. *Perkins.* 5. Sometimes used adverbially in low language.—

He cannot come, my lord; he's *grievous* sick. *Shak.*

\* **GRIEVOUSLY.** *adv.* [from *grievous.*] 1. Painfully; with pain.—

Wide was the wound, and a large lukewarm flood,

Red as the rose, thence gushed *grievously.* *Spens.* 2. With discontent; with ill-will.—Gritus perceiving how *grievously* the matter was taken, with the danger he was in, began to doubt. *Knolles.* 3. Calamitously; miserably.—I see how a number of souls are, for want of right information, oftentimes grievously vexed. *Hooker.* 4. Vexatiously; to a great degree of uneasiness.—Houses built in plains are apt to be *grievously* annoyed with mire and dirt. *Ray.*

\* **GRIEVOUSNESS.** *n. f.* [from *grievous.*] Sorrow; pain; calamity.—They fled from the swords, from the drawn sword, and from the bent bow, and from the *grievousness* of war. *Isaiab* xxi. 15.

GRIFALCO, 2 towns of Naples; viz. 1. in Calabria Ultra, 4 miles N. of Squillace; 2. in Otranto, 17 miles SE. of Otranto.

GRIFFE, a fort of Maritime Austria, in Dalmatia, near Spalatro.

GRIFFEN, a town of Germany, in Carinthia, 4 miles N. of Wolckenmark.

GRIFFENHAKEN, a town of Prussian Pomerania, in the duchy of Stettin, on the Oder. Lon. 54. 42. E. Lat. 53. 25. N.

(1.) \* **GRIFFIN.** } *n. f.* [This should rather  
(1.) \* **GRIFFON.** } be written *gryphon*, or *gryphon*; *gryps*, *γρυψ*; but it is generally written *griffon*.] A fabled animal said to be generated between the lion and eagle, and to have the head and paws of the lion, and the wings of the eagle.—Of all bearings among these winged creatures, the *griffin* is the most ancient. *Peacbam*—Aristeus, a poet of Proconesus, affirmed, that near the encircled nations *griffins* defended the mines of gold. *Brown.*

(2.) *The* **GRIFFON**, **GRYPHUS**, by the ancients, was supposed to have 4 legs, wings, and a beak; the upper part representing an eagle, and the lower a lion: and to watch over gold mines, hidden treasures, &c. This imaginary animal was consecrated to the sun; and the ancient painters represented the chariot of the sun as drawn by griffons. *M. Spanheim* observes the same of those of Jupiter and Nemesis. The griffon is commonly seen on ancient arms; and is born in coat-armour. Guillim blazons it rampant; alleging, that any very fierce animal may be blazoned as well as the lion. *Sylvester*, *Morgan*, and others, use the terms *segrillant* instead of rampant. The griffon is also an ornament of architecture in constant use among the Greeks, and was copied from them, with the other elegancies of architectural enrichments, by the Romans. See **SPHYNX**.

(3.) *The* **GRIFFON** in Scripture is that species of the eagle called in Latin *offisraga*, the *olprey*; and פֶּרַס, of the verb פָּרַס, *paras* to break. See **FALCO**, N° 9, 13.

\* **GRIG.** *n. f.* [*kricke*, Bavarian, a little duck.] 1. It seems originally to have signified any thing below the natural size. 2. A small eel. 3. A

merry creature. [Supposed from the *Graculus festivus*, Latin.]

Hard is her heart as flint or stone,  
She laughs to see me pale;

And merry as a *grig* is grown,  
And brisk as bottled ale.

GRIGNAN, a town of France, in the ment of Drome, 18 miles SSE. of Mout

GRIGNOL, a town of France, in the ment of Dordogne; 10 miles SSW. of B

GRIGNOLS, a town of France, in the ment of Gironde, 9 miles SE. of Bazas.

\* **To GRILL.** *v. n.* [*grille*, a grate, broil on a grate or gridiron.

\* **GRILLADE.** *n. f.* [from *grill.*] A broiled on the gridiron.

\* **To GRILLY.** *v. a.* [from *grill.*] To signifies, as it seems, to harass; to hurt now say, to roast a man, for to tease him.

For while we wrangle here and jar,  
W<sup>3</sup> are grilled all at Temple-bar.

\* **GRIM.** *adj.* [*grimma*, Saxon.] 1. countenance of terour; horrible; hideousful.—

The innocent prey in haste he does  
Which quit from death, yet quakes in ev  
With change of fear to see the lion look

*Grim* Saturn yet remains  
Bound in those gloomy caves with a  
chains.

Thou hast a *grim* appearance, and  
Bears a command in't.

Their dear causes  
Would to the bleeding and the *grim* ab  
Excite the mortified man.

What if the breath that kindled the  
fires,  
Awak'd should blow them into seven

Expert to turn the sway  
Of battle, open when and where to ch  
The ridges of *grim* war.

He that dares to die,  
May laugh at the *grim* face of law, and  
The cruel wrinkle of a tyrant brow.

Their swarthy hosts would darken  
plains,  
Doubling the native horrou of the war  
And making death more *grim*.

2. Ugly; ill-looking.—

Strait stood up to him  
Divine Ulysses; who with lookes exceed  
and *grim*,

This better check gave. *C*  
*Grim* visage'd war hath smooth'd his  
front.

—Venus was like her mother; for her  
but *grim*. *Shak.*

\* **GRIMACE.** *n. f.* [French; from *grim* distortion of the countenance from habit, tion, or insolence.—

He had not spar'd to shew his piques  
Against th' haranguer's politicks,  
With smart remarks of lecting faces,  
And annotations of *grimaces*!

—The favourable opinion and good word  
comes oftentimes at a very easy rate; and

re looks and affected whims, set off with devotional postures and grimaces, and a little arts of dissimulation, cunning to wonders. *South.*—The buffoon ape, *aces* and gambols, carried it from the d. *L'Espr.*—The French nation is addicted to *grinaces*. *Speffator.* 2. Air of affectation. in a vizzard, to avoid *grimace*, all freedom, but to see the face. *Granv.* II. DI. Francis, an eminent painter, called *Bolognese*, was born at Bologna in 1588, he became a disciple of Annibal Caracci, which proved an honour to that illustrious master. From the school of Annibal he went to his studies at Rome, and improved himself until his superior talents recommended him to Innocent X. who afforded him immediate promotion. He exerted his genius in his palace of Cavallo, and in the Vatican. His merit attracted the attention of the public, and increased the number of his friends; among whom were Pamphilio, and the principal nobility of Rome. His reputation reached cardinal Mazarin, who sent for him, settled a large pension on him, and employed him for three years in painting his palace and the Louvre, by the order of Louis XIII. The troubles of the state, and the calumnies raised against the cardinal, whose warmly espoused, put him so much in debt, that his friends advised him to retire to Jesuits. He did so, and painted a design for the exposition of the sacrament during the jubilee, according to the custom of Rome. He was highly relished at Paris, and the king ordered him to paint such another for the Louvre. Grimaldi after that returned to Rome, and found his patron Innocent XII. but his successors Alexander VII. and Alexander VIII. honoured him equally with their patronage, and found him variety of employment. He was amiable in his manners, generous of soul, respectful to the great without affectation, and charitable to the poor. The solace of his benevolence may serve to comfort the man. A Sicilian gentleman, who came from Messina with his daughter during the dearth of that country, was reduced to the want of that bread. As he lived over against Grimaldi, he was soon informed of it; and in the evening, knocking at the Sicilian's door, he made himself known, tossed in a bag of gold. The thing happening more raised the Sicilian's curiosity to know the donor. Discovering him at last, by hiding behind the door, he fell down on his knees, and the hand that had relieved him. Grimaldi refused, offered him his house, and continued to assist him till his death. He died of a dropy in 1680, and left a considerable fortune to his children. The genius of Grimaldi directed to landscape. His colouring is strong; his drawing plain and delicate; his situations are unpleasant; and the leafing of his trees is sometimes, indeed, his colouring appears too green; but those landscapes, painted in the manner of the Caracci, are models for all those who admire the school: and he designed his figures in

PART II.

an elegant taste. The pictures of this master are very rare, especially those of his best time; and when they are to be purchased, they afford large prices. Of his children, the youngest, named Alexander, proved a good painter, in the same style and taste with his father, though very far inferior to him: some of the pictures of Alexander, however, are either artfully, or injudiciously, ascribed to Francis.

\* GRIMALKIN. *n. f.* [*gris*, French, grey, and *malin*, or little *Moll.*] Grey little woman; the name of an old cat.—

*Grimalkin*, to domestick vermin sworn

An everlasting foe, with watchful eye  
Lies nightly brooding o'er a chinky gap,  
Protending her fell claws, to thoughtless mice  
Sure ruin. *Philips.*

GRIMAUD, a town of France, in the dep. of Var, 12 miles S. of Frejus.

(1.) GRIMBERG, GRIMBURG, or GRIMPERG, a town of the French republic, in the dep. of Sarre and Moselle, and ci-devant electorate of Treves, 16 miles SE. of Treves

(2.) GRIMBERG, a town of Westphalia, in the county of Marck, 12 miles W. of Dortmund.

GRIMBERGEN, a town of the French republic, in the dep. of Dyle, and ci-devant province of Austrian Brabant, with a castle and abbey; one mile from the canal between Brussels and Antwerp, and 6 miles N. of Brussels. Lon. 4. 27. E. Lat. 50. 57. N.

GRIMBURG. See GRIMBERG, N° 1.

GRIMBUSTERHOLM, one of the ORKNEY islands, near the coast of Pomona.

\* GRIME. *n. f.* [from *grim*.] Dirt deeply insinuated; sullying blackness not easily cleansed.—Swart, like my face, but her face nothing to clean kept; for why? she sweats: a man may go over shoes in the *grime* of it. *Shaks. Comedy of Errors.*—Collow is the word by which they denote black *grime* of burnt coals or wood. *Woodward on Foss.*

\* To GRIME. *v. a.* [from the noun.] To dirt; to sully deeply.—

My face I'll *grime* with filth,

Blanket my locks, elf all my hair in knots. *Shaks.*

\* GRIMLY. *adv.* [from *grim*.] 1. Horribly; hideously; terribly.—

We've landed in ill time: the skies look *grimly*,

And threaten present blusters. *Shaks. Winter's T.*

So Pluto, seiz'd of Proserpine, convey'd

To hell's tremendous gloom th' affrighted maid;

There *grimly* smil'd, pleas'd with the beauteous prize,

Nor envy'd Jove his sunshine and his skies.

*Addison's Cato.*

2. Sourly; sullenly.—

The augurs

Say they know not; they cannot tell; look *grimly*,  
And dare not speak their knowledge. *Shaks.*

GRIMM, or } a town of Upper Saxony, in  
GRIMMA, } Leipzick. It has a castle, three churches and a college. Its chief trade is in linnen, flannels, thread, beer, and wood. It is 15 miles ESE. of Leipzick, and 42 WNW. of Dresden.

GRIMMEN, or GRIMM, a town of Pomerania, 14 miles S. of Stralsund. Lon. 13. 27. E. Lat. 54. 12. N.

GRIMMING, a mountain of Germany, situated

N a n u

posed

posed to be the highest in Stiria, 16 miles W. of Rottenmann.

\* GRIMNESS, *n. f.* [from *grim*.] Horror; frightfulness of visage.

GRIMNITZ, a town of Brandenburg, 1 mile NW. of Joachimsthal.

GRIMCLOW, a town of Poland, in the palatinate of Podolia, 46 miles NNW. of Kaminiac.

GRIMPERG. See GRIMBERG, N° 1.

GRIMSAY. See GRÆMSAY.

GRIMSBY, a large sea port town of England, in Lincolnshire, 169 miles from London; said to be the second, if not the first, corporation in England. It had anciently 3 convents and a castle. It is governed by a mayor, high steward, recorder, 12 aldermen, 12 common council men, 2 bailiffs, 2 coroners, and a town clerk. It has several streets of good houses, and a church that looks like a cathedral. It was a place of great trade before its harbour was choaked up; yet the road before it is a good station for ships that wait for a wind to get out to sea. Its chief trade is in coals and salt brought by the Humber.

GRIMSEL, one of the Helvetic Alps.

GRIMSTA, a town of Sweden, in W. Gothland, 28 miles NE. of Uddevalla.

(1.) \* GRIN, *n. f.* [from the verb.] The act of closing the teeth and shewing them.—

He laughs at him: in's face too.

—O you mistake him; 'twas more a humble grin,  
The fawning joy of courtiers and of dogs.

*Dryden.*

—The muscles were so drawn together on each side of his face, that he shewed twenty teeth at a grin. *Addison.*—Deists are effectually beaten in all their combats at the weapons of men, that is, reason and arguments; and they would now attack our religion with the talents of a vile animal, that is, grin and grimace. *Watts on the Mind.*—

What lords are those saluting with a grin?

One is just out, and one is lately in. *Young.*

(2.) \* GRIN, *n. f.* [*gryn, grene, Sax.*] A snare; a trap.—

Like a bird that hasteth to his gryn,

Not knowing the perile. *Cibaucer.*

—The grin shall take him by the heel, and the robber shall prevail against him. *Job xviii. 9.*

\* To GRIN, *v. n.* [*grennias, Sax. grinnen, grinden*, Dutch, undoubtedly of the same origin with *To grind*, as we now say *to grind the teeth*; *grincer*, Fr.] 1. To set the teeth together and withdraw the lips either in anger or in mirth.—

Death, death! oh, amiable, lovely death!

Come grin on me, and I will think thou smil'st.

*Shakefp.*

What valour were it, when a cur doth grin,

For one to trust his hand between his teeth,

When he might spurn him with his foot away?

*Shakefp.*

—It was no unpleasant entertainment to me to see the various methods with which they have attacked me; some with piteous moans and outcries, others grinning, and only shewing their teeth. *Stillingfleet.*—

A lion's hide he wears;

About his shoulders hangs the shaggy skin;

The teeth and gaping jaws severely grin.

*Dryden's Æneid.*

They neither could defend, nor can  
But grin'd their teeth, and cast a help

Madness, we fancy, gave an ill turn'd  
To grinning laughter, and to frantick

Fools grin on fools, and Stoicks sup  
Without one sigh, the pleasures of a

2. To fix the teeth as in anguish.—I like grinning honour as Sir Walter hath: give which if I can save, so; if not, honour look'd for, and there's an end. *Shakefp. H.*

GRINADIL, one of the HERBARDIS.

(1.) GRIND, a town of the French rep the department of Eifel, and late duchy of 20 miles NNE. of Coblenz.

(2.) GRIND, an island near the coast of Ferro, 19 miles NNW. of Harlingen. Lon. 21. Ferro. Lat. 13. 18. N.

(1.) \* To GRIND, *v. a. preter. I ground* pass. *ground*. [*grindan, gegrunden, ground*]

1. To reduce any thing to powder by fine comminute by attrition.—And whatsoever on this stone, shall be broken; but on who it shall fall, it will grind him to powder.

He that will have a cake out of the wheel needs tarry the grinding. *Shak. Troilus and*

What relation or affinity is there between body and cogitation, any more than greatest? Is a small drop of rain any wiser ocean? Or do we grind inanimate corn into

and rational meal? *Bentley's Serm. 1. T*

en or smooth by rubbing on something hard

Meeting with time, slack thing, said

Thy fithe is dull; what it, for shame!

No marvel, sir, he did reply,

If it at length deserve some blame;

But where one man would have me grin

Twenty to one too sharp do find it.

Against a stump his task the monster

And in the sharpen'd edge new vigour

*Dryden.*

3. To rub one against another.—

So up he let him rise; who with grin

And count'nance stern, upstanding, gas

His grated teeth for great disdain.

—Harsh sounds, as of a saw when it is set

and the grinding of one stone against another

a shivering or horror in the body, and set

on edge. *Bacon's Nat. Hist.*—That the

animals grinds the substances which it rec

evident from the dissection of animals, wh

swallowed metals, which have been found

ed on the side next the stomach. *Arbut.*

4. To harass; to oppress.—Some merch

tradesmen, under colour of furnishing th

with necessaries, may not grind them

always keep them in poverty. *Baron's*

*Villiers.*—Another way the Spaniards ha

to grind the Neapolitans, and yet to tak

odium from themselves. *Addison. 5. In*

lowing lines, I know not whether it be

raptly uted for grinding, cutting.—

Not knowing 'twas my labour, I see

Of sudden shootings and of grinding p

My throws came thicker, and my cries

GRIND. *v. n.* 1. To perform the act  
; to move a mill.—

Fetter'd they send thee  
common prison, there to grind  
he slaves and asses. *Milton's Agonistes.*  
loved as in the act of grinding.—

Shrinking frowns star,  
ary foam works o'er my grinding jaws.

AL, a town near Burlington, Yorksh.  
ELVALD, a town of the Helvetic re-  
e canton of Bern, 3 miles SSE. of Thun.

DER. *n. f.* [from *grind.*] 1. One that  
; that works in a mill. 2. The instru-  
ding —

art a solid rock, to fear unknown,  
ler than the grinder's nether stone.

Now exhort  
Is to exercise the pointed steel  
ard rock, and give a wheely form  
xpected grinder.

Philips.  
ubas, Sax.] The back teeth; the dou-  
The teeth are in men of three kinds:  
e fore teeth; broad, as the back-teeth,  
all the molar-teeth, or grinders; and  
th, or canine, which are between both.

ural History.—  
the raging lions confounds,  
ing lion with his javelin wounds;  
their whelps, their grinders breaks; so

old hunter starve for want of prey.

Sandys.  
teeth or grinders, in Latin *molares*, are  
nd broad a-top, and withal somewhat  
ugged, that, by their knobs and little  
ey may the better retain, grind, and  
e aliments. *Ray on the Creation.*—Na-  
great deal of labour to transmute ve-  
o animal substances; therefore herbi-  
als, which don't ruminant, have strong  
d chew much. *Arbut.* 4. The teeth,  
contempt.—

who at sight of supper, open'd wide  
before, and whetted grinders try'd.

Dryden's *Juv.*  
Both he brought;  
h'd them, and betwix't his grinders  
ght.

Dryden.  
NDING, *n. f.* or TRITURATION, the  
ing or comminuting a solid body, and  
into powder. See LEVIGATION, and  
ITION. The painters colours are grind-  
ible or porphyry, either with oil or

INDING is also used for rubbing or wear-  
regular parts of the surface of a body,  
ing it to the destined figure, whether  
, concave, or the like. The grinding  
ng of glass is a considerable art; for  
GLASS-MAKING, *See* XIII.; and, for  
optical glasses, see OPTICS.

INDING, in cutlery, the operation of  
edge-tools. This operation, as usually  
attended with no small inconvenience,  
reduction of heat by friction. The  
ced is so great, that hard tools are of-

ten softened and spoiled by the steel becoming ig-  
nited, during the grinding. To prevent this ef-  
fect, the grind-stone is partly immersed in a trough  
of water; but in this case the rotation of the stone  
must be moderate, and the work of course, flow,  
else the water will be thrown off by the centrifugal  
force. When the water is applied from above  
by a cock, the quantity is too small to counteract  
the heat and preserve the necessary low tempera-  
ture. It has even been found, that the edge or  
point of a hard tool ground under water will be  
softened, if it be not held so as to meet the stream,  
sparks being often produced even under water.  
To remedy this inconvenience, Mr Nicholson  
made the following experiments. He procured a  
Newcastle grind-stone of a fine grit, 10 inches in  
diameter, and a mahogany block, to be used with  
emery on it; both mounted on an axis, to be ap-  
plied between the centres of a strong lathe. Both  
were of the same diameter, and turned truly cy-  
lindrical. The face of the mahogany block was  
grooved obliquely in opposite directions, to afford  
a lodgement for the emery: The face of the stone  
was smooth, and a trough with water was placed  
below it. The wooden cylinder was faced with  
oil and emery. The tool to be ground was a file,  
from which it was intended to grind off all the  
teeth. The velocity of the rotation produced  
by the lathe was so great as to turn the ap-  
paratus about five revolutions in a second. Yet  
the stone operated but slowly, and the trough was  
quickly exhausted; so that the workman was ob-  
liged to slacken the velocity on account of the  
heat. The emery cylinder cut rather faster. But  
although the friction was made to operate succes-  
sively and by frequent changes on the whole sur-  
face of the file, it soon became too hot to be held;  
and when a cloth was used to defend the work-  
man's hand, the work not only went on awkward-  
ly, but the heat increased to such a degree, that  
the oil was decomposed and emitted an empyreu-  
matic smell. The stone was then allowed to dry,  
and the file tried upon its face. It almost instan-  
tly became blue, and very soon after, red-hot.

Both the cylinders were then covered with tallow,  
by holding the end of a candle to each while turn-  
ing round, and emery was sprinkled on the wooden  
one. The file was then applied to the grind-stone  
while in rapid motion. At first the friction was  
hardly observable, but very soon afterwards, the  
zone of tallow pressed by the file became melted,  
and the stone cut very rapidly. Yet the file was  
for a long time hardly heated at all; and when at  
last it began to feel warm, its temperature was in-  
stantly lowered by removing it to another zone of  
the cylinder. The same effects were produced on  
the wooden cylinder. This is easily explained up-  
on the modern theory of heat. When oil was  
used on the wooden cylinder, the heat produced  
by the friction was employed in raising the tempe-  
rature of the file and the oil; but when tallow  
was used instead of the oil, the greatest part of the  
heat was exhausted in melting this substance. From  
the increased capacity of the tallow when fused,  
the heat was absorbed and became latent, instead  
of raising the temperature: and when the melted  
tallow began to grow hot, together with the file,  
the temperature was easily reduced by employing

the heat on another zone of tallow. Mr Nicholson used these two cylinders in a considerable quantity of work with great satisfaction. This discovery bids fair to be of great utility.

\* GRINDLESTONE. GRINDSTONE. *n. f.* [from *grind* and *stone*.] The stone on which edged instruments are sharpened.—

Such a light and mettal'd dance  
Saw you never yet in France;  
—And by the lead men, for the nonce,  
That turn round like *grindstones*. *Ben Jonson*.  
—Literature is the *grindstone* to sharpen the counters, and to whet their natural faculties. *Hamm*.  
—Smiths that make hinges brighten them, yet seldom file them; but grind them on a *grindstone* till bright. *Moxon*.

(1.) GRINDON, a river of Northumberland, which runs into the sea near Berwick.

(2.) GRINDON, a town in Staffordshire.

(3.) GRINDON, a village in Durham.

(4.) GRINDON RIGG, a village in Northumberland, 9 miles N. of Wooller, memorable for a battle fought near it in 1558, in which the Scots were defeated by the English under the earl of Northumberland and his brother.

\* GRINDSTONE. See GRINDLESTONE.

\* GRINNER. *n. f.* [from *grin*.] He that grins. The frightful *grinner*.

Be the winner. *Addison's Speech*.

\* GRINNINGLY. *adv.* [from *grin*.] With a grinning laugh.

(1.) GRINSTED, EAST, a town in Wiltshire near Salisbury, 29 miles from London, seated on a hill, near the borders of Surry, and Ashdown forest. It has a handsome church, which was rebuilt after having been burnt down in 1683. On the 12th Nov. 1785, the beautiful tower having fallen to decay, fell down, and part lighting on the church very considerably damaged it. An hospital in the reign of king James I. for 31 poor people of this town was built and endowed with 30*l.* a year. It is a borough by prescription, governed by a bailiff and his brethren; has sent burgesses to parliament ever since the first of Edward II, who are elected by about 35 burgage holders: had a charter for a monthly market from Henry VII and is generally the place for the assizes. The returning officer here is the bailiff, who is chosen by a jury of burgage-holders. Its market is on Thursday, and its fairs, which are well frequented, are on July 13 and Dec. 11; which last is a great market for Welsh runts, that are bought up here by the Kentish and Sussex farmers, and for fat hogs and other cattle.

(2.) GRINSTED, WEST, a borough in Sussex, above 10 miles SW. of EAST GRINSTED, (N<sup>o</sup> 1.) 18 N. of Lewes, and 29 S. of London. The county assizes are sometimes held in it. Lon. o. 2. E. Lat. 51. 12. N.

\* GRIP. *n. f.* A small ditch. *Ainsworth*.

(1.) \* GRIPPE. *n. f.* [from the verb.] 1. Grasp; hold: seizure of the hand or paw.—

Therefore still on high  
He over him did hold his cruel claws,  
Threat'ning with greedy *grippe* to do him deadly *Spens*.

They put a barren sceptre in my *grippe*,  
Thence to be wrench'd with an unlineal hand.  
*Shakespeare's Macbeth*.

Should I

Slaver with lips, as common as the skin  
That mount the Capitol; join *gripes* with  
Made hardy with hourly falsehood as with

*Shak*

He gave me his hand,

And, with a feeble *gripe*, says, dear, my  
Command my service. *Shakespeare's Hamlet*  
I fell; and with my weight the helmet  
Was drawn along, which yet my *gripes*

*Dry*

2. Squeeze; pressure.—

Fir'd with this thought, at once he  
The breast;

'Tis true, the harden'd breast resists the  
And the cold lips return a kiss unripe.

3. Oppression; crushing power.—

I take my cause

Out of the *gripes* of cruel men, and give  
To a most noble judge the king my matter

4. Affliction; pinching distress.—

Adam, at the news

Heart struck with chilling *gripes* of sorrow  
That all his senses bound!

Can't thou bear cold and hunger? *Milton's Paradise Lost*

limbs,  
Fram'd for the tender offices of love,  
Endure the bitter *gripes* of smarting poverty

5. [In the plural.] Belly-ach; colick.—In this  
dice the choler is wanting; and the intense  
a great sourness and *gripes*, with windiness.

(2.) GRIPES, (*gripes*, *def. 5.*) in medicine, a  
cholic or painful disorder of the lower bowels,  
occasioned by some sharp pungent matter  
ting the parts, or by wind pent up in the  
tines. See MEDICINE. Index.

(1.) \* To GRIPPE. *v. a.* [*gripan*, Goth.  
Saxon; *gripan*, Dutch; *gripp*, Scottish.]  
hold with the fingers closed; to grasp; to  
with the fingers.—

He that speaks doth *gripe* the hearer's  
Whilst he that hears makes fearful ado  
With wrinkl'd brows. *Shaksp. King Lear*

2. To hold hard.—

He seized the shining bough with *grippe*  
And rent away with ease the ling'ring gold

3. [*Griper*, Fr.] To catch eagerly; to seize

You took occasion to be quickly woe  
To *gripe* the general (way into) your hands

4. To close; to clutch.—

Unlucky Welfed! thy unfeeling mate  
The more thou ticklest, *gripes* his hand

5. To pinch, to press; to squeeze.—

A wond'rous way is for this lady woe  
From lion's claws to pluck the *griped* prey

And first the dame came rushing thro  
wood;

And next the famish'd bounds that foug  
food,

And *grip'd* her flanks, and oft essay'd th  
in blood. *Dryden's*

6. To give a pain in the bowels.—

Thus full of counsel to the den the w  
*Grip'd* all the way, and longing for a vent

(2.) \* To GRIPPE. *v. n.* 1. To feel the  
to have the belly-ach.—Many people would  
reason, prefer the *griping* of an hungry

which are a feast to others. *Locke*.—The bulk, figure, texture, and motion as a power to produce the sensations and sometimes of acute pains or *grip-ocete*. 2. To pinch; to catch at motion.—It is mean revenue, by being seat-worth of times growing upon him, that had great ones, by *gripping*, made it grew stark beggars. *Fell*.

† *n. f.* [from *gripe*.] Oppressor; usurper.—Others pretend zeal, and yet usurers, *grippers*, monsters of men, *Burton on Melanchols*.

LABEN, a town of Germany, in the lower Rhine, 3 miles N. of Erfurt. *NGLY. adv.* [from *gripping*.] With ut.—Clysters help, lest the medicine ut, and work *grippingly*. *Bacon's Na-*

3. *n. f.* A greedy snatcher; a gripping r.

ALM, a town of Sweden, in the Su-25 miles N. of Stockholm.

ALD. See GRIFFWALD.

AMBER. *n. f.* Used by *Milton* for am-

sts of chase, or fowl of game, quill, or from the spit, or boil'd, steam'd. *Milton's Paradise Reg.*

*n. f.* [See GRIFF, as it should be step, or scale of steps.—

speak like ourself; and lay a sentence, a *griff* or step, may help their lovers favour. *Shakespeare's Otello*.

3, a superstition greatly in vogue a- goes in the interior parts of Africa.

According to Le Mire, are certain eters mixed with magical figures re Marabuts or priests upon paper.

is, that they are nothing else than alcoran in Arabic; but this is denied

who brought over one of these *grifgris* and showed it to a number of per-

skilled in oriental learning. None d find the least trace of any character

oud. Yet, after all, this might be e badness of the hand writing; and

provably of the Man'ingo language, characters are an attempt to imitate

The poorest negro never goes to war *grifgris*, as a char against wounds;

es inefficual, the priest transfers the e immorality of his conduct. These

*grifgris* against all kinds of dangers, r of all desires and appetites; by vir-

the possessors may obtain or avoid y like or dislike. They defend them

enemies, diseases, pains, and misfor- preserve health, long life, wealth, hon-

orit, according to the Marabuts. No world are more honoured and reve-

ople than these impostors are by the r are any people in the world more

l by their priests than these negroes is being frequently sold at 3 slaves

men. The *grifgris* intended for the : in the form of a cross, reaching from

to the neck behind, and from ear to

ear; nor are the arms and shoulders neglected. Sometimes they are planted in their bonnets in the form of horns; at other times, they are made cut like serpents, lizards, or some other animals, out of a kind of pasteboard, &c. There are not wanting Europeans, and otherwise intelligent seamen and merchants, who are in some degree infected with this weakness of the country, and believe that the negro forcerers have an actual communication with the devil; and that they are filled with the malignant influence of that evil spirit, when they see them distort their features and muscles, make horrid grimaces, and at last imitate all the appearance of epileptics.

GRISIGNANO, or } a populous town and dis-  
GRISIGNONA, } trict of Maritime Aus-  
tria, in Istria, on the N. side of the Quieto, 9 m. E. of Capo.

\* GRISKIN. *n. f.* [*grifgin*, roast meat, Irish.] The vertebrae of a hog broiled.

GRISLEA, in botany: A genus of the monogynia order, belonging to the octandria class of plants: and in the natural method ranking under the 17th order, *Calycantbeme*. The calyx is quadrid; and there are four petals, one from each incisure of it. The filaments are very long, ascending or running upwards; the capsule is globose, superior, unilocular, and polyspermous.

GRISLEHAMN, or } New, a sea port of  
(1.) GRISLEHAVEN, } Sweden, in the prov. of Upland 50 miles NNE. of Stockholm.

(2.) GRISLEHAVEN, \* Old, a seaport of Sweden in Upland 45 miles NNE of Stockholm.

\* GRISLY. *adj.* [*griflu*, Sax.] Dreadful; horrible; hideous; frightful; terrible.—

His *grifly* locks, long grown and unbound,  
Disordered hung about his shoulders round. *Spens.*

Where I was wont to seek the honey bee,  
The *grifly* toadstool grown there might I see. *Spens.*

My *grifly* countenance made others fly;  
None durst come near, for fear of sudden death.

*Shaksp. Henry VI.*  
Back step'd those two fair angels, half amaz'd  
So sudden to behold the *grifly* king;  
Yet thus, unmov'd with fear, accost him soon.

*Milton.*

For that damn'd magician, let him be girt  
With all the *grifly* legions that troop  
Under the footy flag of Acheron. *Milton.*

The beauteous form of fight  
Is chang'd, and war appears a *grifly* fight. *Dryd.*

In vision thou shalt see his *grifly* face,  
The king of terrors, raging in thy race. *Dryd.*

Thus the *grifly* spectre spoke again. *Dryden.*  
Close by each other laid, they press'd the  
ground,

Their manly bosoms pierc'd, with many a *grif-*  
*ly* wound. *Dryden.*

So rushes on his foe the *grifly* bear. *Addison.*  
GRISON, one of the GRENADILLOPS.

(1.) GRISONS, a people situated among the Alps, and long allies of the Swiss, but now united with the Helvetic republic. Their country is bounded on the N. by the ci-devant counties of Sargans and Bludenz, the canton of Glaris, and the principality of Lichtenstein; on the S. by that part of the Cisalpine republic, which comprehends the ci-devant Italian bailiwicks, Chiavenna, and the

Valetline;

Valtelline; on the E. by the late territories of Venice and Milan, now included in the Cisalpine departments; and on the W. by some of the Italian bailiwics, and the canton of Uri. It was divided into three leagues, viz. the *Grison* or GREY LEAGUE, the LEAGUE OF THE HOUSE OF GOD, and that of the TEN JURISDICTIONS; which united formed one republic. The two first lie toward the S. and the third towards the N. The length of the whole is about 70 miles, and the breadth about 60. The inhabitants are said to have been named *Grisons*, from the grey coats they wore in former times. This country, lying among the Alps, is very mountainous; but the mountains yield good pasture for the cattle, sheep, and goats, with some rye and barley: in the vallies there is plenty of grain, pulse, fruits, and wine. It abounds also with hogs and wild fowl; but there is a scarcity of fish and salt, and their horses are mostly purchased of foreigners. The principal rivers are the Rhine, the Inn, and the Adda. It has also several lakes, most of which lie on the tops of the hills. The language of the Grisons is either a corrupt Italian or the German.

(2.) GRISONS, CONSTITUTION OF THE. The present constitution of the Grisons is the same with that of the HELVETIC REPUBLIC, to which it is joined. But its late constitution was very democratic. Each of the leagues was subdivided into several lesser communities, which were so many democracies; every male above 16 having a share in the government of the community, and a vote in the election of magistrates. Deputies from the several communities constituted the general diet of the Grison leagues, which met annually, and alternately at the capital of each league; but they could conclude nothing without the consent of their constituents. Each of the Leagues was subdivided into a certain number of communities, which were a sort of republics, exercising every branch of sovereignty, except that of making peace or war, sending embassies, concluding alliances, and enacting laws relating to the whole country, which belonged to the provincial diets of the several leagues. The particular diets were composed of a deputy from each community; and both in them and the communities every thing was, and we suppose still is determined by a majority of votes. In the communities, every male above 14 had a vote. Besides the annual provincial diets for choosing the chiefs and other officers, and deliberating on the affairs of the respective leagues, there were general diets for what concerned all the three leagues or the whole body. In both these, the representatives could do nothing of themselves, but were tied down to the instructions of their principals. There was a general seal for all the three leagues; and each particular league had a separate seal. Besides the stated times of meeting, extraordinary diets were sometimes summoned, when either the domestic affairs of the state or any foreign minister required it. In the general diets, the Grey League had 28 votes; that of the House of God, 23; and that of the Ten Jurisdictions, 15. These leagues, at different times, have entered into close alliances with the neighbouring cantons and their associates. The bailiwics belonging in common to the three leagues were those

of the Valteline, Chiavenna, and Bormio united to the Cisalpine republic, Meyenlans, and Jennis; the officers of which nominated successively by the several communities every two years. The yearly revenue of the Grisons from their bailiwics amount about 13,500 florins. The public revenues there are but small, though there are many persons in the country that are rich. In extraordinary emergency, they tax them in proportion to the necessity of the service people's abilities. They have no regular but a well-disciplined militia; and upon can bring a body of 30,000 fighting men; but their chief security arises from narrow passes and high mountains by which surrounded.

(3.) GRISONS, GENERAL HISTORY. This country was anciently a part of Rhaetia; after the extinction of the Roman empire in the west, it was some time subject to its own or those of Swabia. Then the bishop and other petty princes, dependent on the emperors of Germany, became masters of it; at last, by the extinction of some, by voluntary grants, and force, it got rid of its lords, and was erected into three distinct republics. This country, as well as the whole Switzerland, has suffered much during the war, having been repeatedly and successively run by the French and Austrians. As the country will be resumed under the articles REVENUE and WAR, it is only necessary here to mention that the Austrians were driven out of it in 1799, by the French under Gen. Massena; in 5 days took 10,000 prisoners, 40 pieces of cannon, and 20 standards, with great quantities of munition and stores: that on the 10th of August following the Grison leagues were united to the HELVETIC REPUBLIC, except the Valtellina, Chiavenna, and Bormio, which had been united to the CISALPINE, at their own desire; in that in Summer 1799, this country was again over-run by the Austrians; and that in July Feldkirch and Coire were taken, and the whole country recovered by the French under Gen. Courbe.

(4.) GRISONS, LATE JURISPRUDENCE. Of the jurisprudence, &c. of the Grisons the following account is given by Mr Cox in *Travels in Switzerland*. "Throughout the leagues the Roman law prevails, modified by municipal customs. The courts of justice in each community are composed of the chief magistrate who presides, and a certain number of judges chosen by the people: they have no regular salaries, but receive for their attendance a fee arising in some communities from the expenses of the process, which are defrayed by the convicted in others from a share of the fines. The power of pardoning or diminishing the penalty, and of receiving a composition in this mode of proceeding supposes what is absurd in theory as it is contrary to experience; judges will incline to mercy when it is the most rest to convict; or will impartially inflict punishment, even when injurious to their own advantage.—The prisoners are examined

ently tortured for the purpose of forcing, when the judges either divide the nit the punishment for a composition. ricks a criminal trial is a kind of festivity, for whom a good repast is pro- experience of the prisoner if convicted; e' following allusion, in Garth's Dis- plied with more wit than truth to our vice, is literally fulfilled:—

wretches die, that jurymen may *dine*." rillments, however, are extremely umstance arising not from a want of e penal statutes, or from a propensity the judges; but because the latter advantages from fining than executing

In a word, to use the expression of ick is as true at present as it was in Many crimes go unpunished, if the commit them have either great cre- money." It is remarkable, that tor- frequently applied, and for smaller de- in these independant republics, than t provinces. The infliction of it de- ly upon the arbitrary will of the judges: whom may order it for an offence capital, nor even punishable by cor- ties. Thus it is not uncommon, in unities where fines are divided among, to torture women of loose conduct, ose of compelling them to confess with have been connected; for as such punishable by fines, the more per- victed, the larger share of money is among the judges for the trouble of ince. Even in the districts where the d to the community, torture is often only inflicted, because, when the pri- found guilty, the expences of the pro- on the public, and the judges receive nent. Even in the civil courts most ecided by bribing the judges; and ap- ple communities, wherein they are ad- cely serve any other end than to en- ere of corruption; Coire, and a few , are excepted from this general re- is fortunate for the Grisons, that this l iniquitous system has been abolished evolution.

ONS, RELIGION AND CHURCH GO- OF THE. "The religion of the Gri- sr Coxe) is divided into catholic and The doctrines of the reformation were d about 1524, and received at Fläsch ige in the Ten Jurisdictions upon the Sargans; from thence they were ex- layensfeld and Malantz, and soon after- gh the whole valley of Pretigau. The is spread with such celerity, that be- e the 16th century they were embraced e league of the Ten Jurisdictions (ex- of the community of Alvenew), the of the House of God, and a few com- the Grey League. The difference of ly excited a civil war between the two ll at the first introduction of the re- as at the beginning of the troubles in e. In the latter instance, the two in arms; but the Catholics being over-

powered by the Protestants, matters were ami- cably adjusted. Since that period all religious concerns have been regulated with perfect cordia- lity. According to the general consent of the three leagues, each community being absolute within its little territory, has the power of ap- pointing its own particular worship, and the inha- bitants are free to follow either the Catholic or Reformed persuasion. In the administration of civil affairs religion has no interference: the deputies of the general diet may be members of either com- munion, as chosen by the communities which they represent. By this moderate and tolerating prin- ciple, all religious dissensions have been suppressed, and the most perfect amity subsists between the two sects. In spiritual concerns, the Catholics for the most part are under the jurisdiction of the bishop of Coire. For the affairs of the Reformed churches, each league is divided into a certain number of districts, the ministers whereof assemble twice every year: these assemblies are called *collo- quia*. Each colloquium has its president, and each league a superintendant called a *dean*. The supreme authority in spiritual concerns is vested in the synod, which is composed of three deans, and the clergy of each league; the synod assembles every year alternately in each of the three leagues. Candidates for holy orders are examined before the synod. The necessary qualifications for ad- mission into the church ought to be the know- ledge of Hebrew, Greek, and Latin; but this rule is not strictly adhered to; many being ordain- ed without the least acquaintance with either of those languages. Formerly Latin was solely used, as well in the debates of the synod as for the pur- pose of examining the candidates; but at present that tongue grows more and more into disuse, and German is employed in its stead. The number of reformed parishes in the whole three leagues amounts to 135, in the following proportion:— In the Grey League 46, in that of God's House 53, and in the League of Ten Jurisdictions 36. The ministers of these churches enjoy but very small salaries. The richest benefices do not per- haps yield more than L. 20, or at most L. 25 *per annum*, and the poorest sometimes scarcely L. 6. This scanty income is attended with many incon- veniences. It obliges the clergy who have fami- lies to follow some branch of traffic, to the neglect of their ecclesiastical studies, and to the degrada- tion of their professional character. Another incon- venience is superadded to the narrowness of their in- come. In most communities the ministers, though confirmed by the synod, are chosen by the people of the parish, and are solely dependent on their bounty. For these reasons, the candidates for holy orders are generally extremely ignorant. They cannot support that expence which is re- quisite to pursue their studies; they are not ani- mated with the expectation of a decent compe- tence; and, from the dependent mode of their election, are not encouraged to deserve their pro- motion by a consistent dignity of character.

GRISSAUNT, William, an eminent English Physician, Astronomer, and Mathematician of the 14th century. Being, from the ignorance and superstition of the times, suspected of magic, he retired to France, gave up mathematics, and ap- plied

plied solely to medicine. His son was elected pope, and took the name of Urban V.

\* GRIST. *n. f.* [*griff*, Saxon.] 1. Corn to be ground.—

Get *griff* to the mill to have plenty in store,  
Left miller lack water. *Tusser's Husb.*

A mighty trade this lusty miller drove;

Much *griff* from Cambridge to his lot did fall,  
And all the corn they us'd at scholar's hall.

*Miller of Tromp.*

2. Supply; provision.—

Matter, as wise logicians say,

Cannot without a form subsist;

And form, say I, as well as they,

Must fail, if matter brings no *griff*. *Swift.*

3. GRIST to Mill, is profit; gain.—The computation of degrees, in all matrimonial causes, is wont to be made according to the rules of that law, because it brings *griff* to the mill. *Ayliffe's Parergon.*

\* GRISTLE. *n. f.* [*gristle*, Saxon.] A cartilage; a part of the body next in hardness to a bone.—No living creatures, that have shells very hard, as oysters, crabs, lobsters, and especially the tortoise, have bones within them, but only little *gristles*. *Bacon's Nat. Hist.*—Left the asperity or hardness of cartilages should hurt the œsophagus or gullet, which is tender and of a skinny substance, or hinder the swallowing of our meat, therefore the annular *gristles* of the windpipe are not made round, or intire circles; but where the gullet touches the windpipe, there, to fill up the circle, is only a soft membrane, which may easily give way to the dilatation of the gullet. *Ray on the Creation.*

\* GRISTLY. *adj.* [from *gristle*.] Cartilaginous; made of gristle.—At last they spit out pieces of their lungs; it may be small *gristly* bits, that are eaten off from the lung pipes. *Harvey.*—She has made the back-bone of several vertebræ, as being more fit to bend, more tough, and less in danger of breaking, than if they were all one intire bone without these *gristly* junctures. *More against Atheism.*—Fins are made of *gristly* spokes, or rays connected by membranes; so that they may be contracted or extended like women's fans. *Ray on the Creation.*—They have a louder and stronger note than other birds of the same bigness, which have only a *gristly* windpipe. *Grew.*

Each pipe, distinguish'd by its *gristly* rings,

To cherish life aerial pasture brings. *Blackmore.*

GRISTO, a town of Pomerania, one mile SSW. of Cammin.

GRISTOW, an island of Saxony, in the Drenow, between Cammen and the isle of Wollin.

GRISWOLD, PORT. See GROTON, N° 1.

(1.) \* GRIT. *n. f.* [*gritta*, *grout*, Saxon.] 1. The coarse part of meal. 2. Oats husked, or coarsely ground. 3. Sand; rough hard particles, —Silexian bole, crackling a little betwixt the teeth, yet without the least particle of *grit*, feels as smooth as soap. *Grew.*

The sturdy pear tree here

Will rise luxuriant, and with toughest root

Pierce the obstructing *grit* and resistive marle.

*Phillips.*

4. *Grits* are fossils found in minute masses, forming together a kind of powder; the several

particles of which are of no determin'd but seem the rudely broken fragments masses; not to be dissolved or disintegrated but retaining their figure, and not coherent masses. One sort is a fine, dull looking, which, if whetted with saltwater, into a paste, dries almost immediately, and con- to a hard stony mass, such as is not ex- wards disintegrated by water. This is the *peteolanus* of the ancients, mixed among ments used in buildings sunk into the sea France and Italy an ingredient in the plasters, under the name of *pozzolana* common on the sides of hills in Italy. species, which is a coarse, beautifully *grit*, is the *chrysocolla* of the ancients, w used in soldering gold, long supposed a It serves the purpose of soldering met than borax. The ferruginous black *grit*, is the black shining sand employed over writing, found on the shores of *on Fossils.*

(2.) GRIT, ARGILLACEOUS, a genus laceous earths. Its texture is more or less equable, and rough to the touch. It does fire with steel, nor effervesce with acids fresh broken and breathed upon, it is earthy smell. Mr Kirwan mentions two one from Hollington near Uttoxeter, of a or whitish grey, and about the specific g 2288. Another, from Kneperly in 2000 is of the specific gravity of 2568; and is as to be used for fire stones. According from the *grit* stone is of greater or less mostly of a grey, and sometimes of a colour, composed of a siliceous and m sand, but rarely of a sparry kind; with smaller particles closely compacted by a ceous cement. It gives some sparks with indissoluble for the most part in acids, as able in a strong fire. It is used for and whetstones; and sometimes for filters and for building.

\* GRITINESS. *n. f.* [from *grit*.] Gritiness; the quality of abounding in *grit*.— earth he could find no sand by the me nor any *gritiness*. *Mort. Husb.*

\* GRITTY. *adj.* [from *grit*.] Full of h ticles; consisting of *grit*.—I could not dit unevenness of the surface of the powder, little shadows let fall from the *gritty* thereof. *Newton's Opt.*

GRITZGALLEN, a town of Courlan SSW. of Scelburg.

GRIVE, John De LA, an eminent Fre grapher, born at Sedan, in 1689. He among other works, *The Topography* which is reckoned very accurate. He died

\* GRIZELIN. *adj.* more properly See GRIDELIN.—The Burgundy, wh *grizelin* or pale red, of all others, is su pen in our climate. *Temple.*

GRIZOLLES, a town of France i Car-nue, 15 miles SSE. of Sarrazen, a of Toulouze.

GRIZY, a town of France in the dep and Oise, 5 miles NW. of Pont Oise.

**GRIZZLE.** *n. f.* [from *gris*, gray; *grisaille*, a mixture of white and black; gray.—] A dissembling cub! what wilt thou be, me has fow'd a *grizzle* on thy face?

*Shak.*

**GRIZZLED.** *adj.* [from *grizzle*.] Interth gray.—To the boy Cæsar send this ad. *Shak.*

his beard was *grizzled*: no.

as I have seen it in his life. *Shak.*

His hair just *grizzled*,  
green old age.

*Dryden.*

*grizzled* locks, which nature did provide  
ous growth, their asses ears to hide.

*Dryden's Juv.*

**GRIZLY.** *adj.* [from *gris*, gray, French.] gray.—Living creatures generally do  
ir hair with age, turned to be gray and  
is seen in men, though some earlier,  
; in horses that are dappled, and turn  
d in old squirrels, that turn *grizly*.

X, an isle in the Atlantic, on the W.  
ance, and in the dep. of Morbihan, 4

and 1½ broad; 18 miles NNW. of  
Lon. 14. 9. E. Ferro. Lat. 74. 37. N.

AN. *n. f.* [from the verb.] 1. Breath  
h noise and difficulty, from pain, faint-  
ariness.—

las, poor country,

ghs and *groans*, and shrieks that rend  
air,

e, not mark'd!

*Shak Macbeth.*

o slaughter, and to slaughter leave;  
from hence their dying *groans* receive.

*Dryden.*

aching bosoms wear a visage gay,  
ed *groans* frequent the ball and play.

*Young.*

rse dead sound.—

hects of fire, such bursts of horrid  
der,

ms of roaring wind and rain, I never  
er to have heard. *Shak. King Lear.*

LOAN. *v. n.* [*granan*, Saxon; *gronen*,  
To breathe with a hoarse noise, as in  
ny.—

Many an heir

fair edifices, for my wars,

ard *groan* and drop. *Shak. Coriol.*

n from out of the city, and the foul  
ded crieth out. *Job xxiv. 12.*—Repent-

ning for anguish of spirit. *Wisd. v. 3.*  
shall the world go on,

malignant, to bad men benign,  
own weight *groaning*. *Milt. Par. Lost.*

can so peculiarly gratify the noble dis-  
humanity, as for one man to see ano-

ch himself as to sigh his griefs and  
ins. *South.*

he blazing pile his parent lay,  
l brother *groan'd* his life away. *Pope.*

NFUL. *adj.* [*groan* and *full*.] Sad;  
Not used.—

he kept it with so puissant wrest,  
e again it did aloft rebound,

against his mother earth a *groansful*  
l. *Spenser.*

PART II.

(1.) \* **GROAT.** *n. f.* [*groat*, Dutch; *grosso*,  
Italian.] 1. A piece valued at four pence. 2.  
A proverbial name for a small sum.—

My mother was wont

To call them woollen vassals, things created

To buy and sell with *groats*. *Shak.*

I dare lay a *groat*,

A tertian ague is at least your lot. *Dryden.*

—Imagine a person of quality to marry a woman  
much his inferior, and without a *groat* to her  
fortune. *Swift.* 3. **GROATS.** Oats that have the  
hulls taken off. *Ainsworth.*

(2.) **GROAT.** (§ 1. *def.* 1.) Other nations, as  
the Dutch, Polanders, Saxons, Bohemians, French,  
&c. have likewise their *groats*, *groote*, *groches*,  
*gros*, &c. In the Saxon times, no silver coin  
bigger than a penny was struck in England, nor  
after the conquest, till Edward III. who, about  
the year 1351, coined *grosses*, i. e. *groats*, or great  
pieces, which went for 4d. a piece: and so the  
matter stood till the reign of Henry VIII. who, in  
1504, first coined shillings.

**GROAT'S HOUSE.** See JOHN O' GROAT'S HOUSE.

**GROBBENDONCK**, a town of the French  
republic, in the dept. of Deux Nattes, and late  
prov. of Austrian Brabant; 10 miles E. of Ant-  
werp.

**GROBINEN**, a town in the duchy of Cour-  
land, 28 miles SSW. of Goldingen.

**GROBOVCPOLE**, a town of Russia, in the  
prov. of Ekaterinenburg; 40 miles W. of Ekateri-  
nenburg.

(1.) \* **GROCER.** *n. f.* [This should be written  
*groffer*, from *grofs*, a large quantity; a *grocer*  
originally being one who dealt by wholesale; or  
from *grossus*, a fig, which their present state seems  
to favour.]—A *grocer* is a man who buys and sells  
tea, sugar, and plumbs and spices for gain. *Harris's*  
*Logick.*—

Bnt still the offspring of your brain shall prove  
The *grocer's* care, and brave the rage of Jove.

*Garth.*

(2.) **GROCERS** anciently were such persons as  
*engrossed* all merchandize that was vendible; but  
now they are incorporated, and make one of the  
companies of the city of London.

\* **GROCERY.** *n. f.* [from *grocer*.] Grocers ware,  
such as tea; sugar; raisins; spice.—His troops be-  
ing now in a country where they were not expect-  
ed, met with many cart loads of wine, *grocery*,  
and tobacco. *Clarendon.*

**GROCYN**, William, a learned English divine,  
of the 15th century, born at Bristol, in 1442. He  
held a disputation at Oxford before K. Richard III,  
who rewarded him liberally. In 1485, he was  
made a prebendary of Lincoln. In 1488, he tra-  
velled into Italy, and studied Greek under Politian  
and Demetrius Chalcondylas, though he had ac-  
quired that language before. Upon his return he  
taught it, and introduced the true pronunciation  
of it into England. He was the friend and patron  
of Erasmus. He died at Maidstone, in 1522, of the  
palsy, aged 80. His works are mentioned by Bayle.  
His Latin Epistle to Aldus Manutius is prefixed  
to Linacre's translation of Proclus de Sphæra.  
Ven. 1494.

**GRODECK**, a town of Poland, in the palati-  
nate of Bielsk; 40 miles SW. of Bielsk.

GROEMS, a town of Holstein, 10 miles S. of Cismar.

GROENDALE, a town of the French republic, in the department of Dyle, and ci-devant province of Austrian Brabant, on the Iliche, 6 miles SE. of Brussels.

GROENLAND. See GREENLAND, N° 1, 1; § 1.  
\* GROGERAM. } n. f. [*gros grain*, Fr. *grosso-*  
\* GROGRAM. } *granus*, low Lat. *Answorth.*]  
\* GROGRAN. } Stuff woven with large wool and a rough pile.—

Certes they're neatly cloth'd: I of this mind am,

Your only wearing is your *grogeram*. *Donne*.—Natalia affords great store of chanelots and *grograms*. *Sandys*.—Some men will say this habit of John's was neither of camel's skin nor any coarse texture of its hair, but rather some finer weave of camelot, *rogram*, or the like. *Brown*.—The natural sweetness and innocence of her behaviour shot me through and through, and did more execution upon me in *rogram*, than the greatest beauty in town had ever done in brocade. *Addis. Spect.*

Plain goody would no longer down;

'Twas madam in her *rogram* gown. *Swift*.

GROHNDE, a town of Germany, in Calenberg, on the Weser; near which a bloody battle was fought in 1421. A monument is erected in memory of it. It lies 9 miles S. of Hameln.

(1.) \* GROIN. n. f. [Of uncertain derivation.] The part next the thigh.—

Antiplexus, a sonne of Priam, threw  
His lance at Ajax thro' the preafic, which went  
by him, and flew

On Leucus, wife Ulyffes' friend: His *groine* it  
smote. *Chapman*.

The fatal dart arrives,  
And thro' the border of his buckler drives;  
Pafs'd thro' and pierc'd his *groin*; the deadly  
wound

Cast from his chariot, roll'd him on the ground.  
*Dryden*.

(2.) GROIN. In the *Philos. Transf.* vol. lxxvii. p. 459. we have an account of a remarkable case, where a peg of wood was extracted from the groin of a young woman of 21, after it had remained 16 years in the stomach and intestines, having been accidentally swallowed when she was about five years of age.

(3.) GROIN, among builders, is the angular curve made by the intersection of two semi-cylinders or arches; and is either regular or irregular. A *regular* groin is when the intersecting arches, whether semicircular or semielliptical, are of the same diameters and heights. An *irregular* groin is where

one of the arches is semicircular, and the semielliptical.

GROINARD, an isle of Scotland, on coast of Ross-shire; 6 miles SE. of Udrigh.

GROLL, a town of the Batavian republic, in the dep. of the Rhine, late county of Zutphen, and ci-devant prov. of Dutch Guelderland, seated on the Slinghe, and is strongly fortified. The French took it in 1672, and destroyed the edifications. It lies 19 miles E. of Zutphen, 19 SSW. of Oldenzeel. Lou. 24. 10. E. 0. Lat. 52. 8. N.

GROMI, a town of Russia, in the govt. of Irkutsch, 112 miles N. of Balagauskoi.

GROMING, a town of Germany, in the (1.) \* GROMWELL. n. f. [*litbasperman* Gromill or graymill. A plant. *Miller*.  
(2.) GROMWELL. See LITHOSPERMUM.

GRONAW, a town of Germany, in the govt. of Munster, 25 miles NW. of Munster.

GRONENBACH, or GRUNENBACH, a town of Germany in Suabia, belonging to the abbot of Kempten; 13 miles NNW. of Kempten.

GRONES, a cape on the NW. coast of the island of St. Helier.

GRONESSE, a fort in the island of Jersey, 10 miles NW. of St. Helier.

GRONEY, a river of Wales, which runs into the Uik, in Brecknockshire.

(1.) GRONINGEN, the most northerly of the ci-devant Seven United Provinces, was bounded on the N. by the German ocean; on the S. by the late county of Drenthe; on the E. by the principality of Munster, and the principality of East Frisia; and on the W. by the province of Groningen, from which it was separated by the Ems. Its greatest length from SE. to NW. was 47 miles; its breadth was very unequal, the east being about 35 miles. It has rich pastures, large herds of cattle, plenty of sea and fresh fish, and of turf, with some forests and corn. There are several rivers in it; the principal are the Hunse, the Eems, and the Fivel; and a great number of canals and dykes. The city consisted of the deputies of the town of Groningen, and the Ommeland, or circumjacent parishes; and held their assemblies always in the city. The province had anciently governors, who bore the title of *burg-graves*; but their power being limited, the people enjoyed great privileges. After the death of Charles V. it became subject to the Bp. of Utrecht; but Charles V. took it off his yoke at last, and recovered its liberty in 1536, it submitted to Charles V. and in 1648 it was ceded to the union of Utrecht. The colleges were much the same here as in the other provinces, consisting of the provincial states, council of state, provincial tribunal, and chamber of accounts. Six deputies were sent to the states-general. Of the clergy there were 160 ministers, who formed three classes, whose annual synod was held, by the Bp. of Groningen and Appingedam. It is now in the Batavian republic, and department of Eems. See EEMS, N° 1.

(2.) GRONINGEN, a strong city of the Batavian republic, in the dep. of Eems, and late county of the above province, (N° 1.) is situated 10 miles from the German ocean, at the confluence of several rivulets, which form the Hunse and Fivel. Ships of considerable burden can get up to the city.

(3.) GRONINGEN, a strong city of the Batavian republic, in the dep. of Eems, and late county of the above province, (N° 1.) is situated 10 miles from the German ocean, at the confluence of several rivulets, which form the Hunse and Fivel. Ships of considerable burden can get up to the city.

ence of which it enjoys a good trade in  
 ice. Its university was founded in 1615,  
 endowed out of the revenues of the  
 manasteries. The city, which was for-  
 of the Hanse towns, is large and popu-  
 the seat of the high colleges, and con-  
 spacious market-places, and 27 streets;  
 are many fine houses, besides churches  
 public structures. By the Fivel and the  
 is a communication with Westphalia.  
 made such a gallant resistance against  
 of Munster, that he is said to have lost  
 n before it. Rodolphus Agricola and  
 wo of the most learned men of their  
 born here. Under the jurisdiction of  
 a considerable district, called the *Gorecht*.

NOVIUS, John Frederic, a very learn-  
 was born at Hamburg in 1613; and  
 velled through Germany, Italy, and  
 is made professor of polite learning at  
 and afterwards at Leyden, where he  
 1. He published, 1. *Diatribe in Statii,*  
*e Sestertis*. 3. Correct editions of Se-  
 us, Livy, Pliny's Natural History, Ta-  
 is Gellius, Phædrus, &c. with notes;  
 works.

NOVIUS, James, son of the preceding,  
 learned man, was educated first at Ley-  
 vent over to England, where he visited  
 ities, consulted the curious MSS. and  
 acquaintance with several learned men.  
 sen by the grand duke to be professor  
 a considerable salary. He returned  
 id, after he had resided two years in  
 nd consulted the MSS. in the Medicæan  
 1679, he was invited by the curators  
 ersity to a professorship; and his in-  
 ation was so highly approved of, that  
 s added 400 florins to his stipend, and  
 it to his death in 1716. His principal  
*The treasure of Greek antiquities*, in 13  
 and a great number of dissertations,  
 s of ancient authors. He was compa-  
 ioppos for the virulence of his style;  
 rity, with which he treated other great  
 iffered from him, exposed him to just

FELD, a town and ci-devant county  
 s, in the circle of Westphalia, now an-  
 e French republic, and included in the  
 of the Lower Meuse. The town is 4  
 f Mæstricht.

OOM. *n. f.* [*gram*, Dutch.] 1. A boy;  
 servant.—

alled she a *groom*, that forth him led  
 odly lodge. *Spenser.*

From Egypt's kings ambassadours they come;  
 Them many a squire attends, and many a *groom*.

Think then, my soul! that death is but a *groom*  
 Which brings a taper to the outward room.

—In the time of Edward VI. lived Sternhold, whom  
 king Henry his father had made *groom* of his cham-  
 ber, for turning of certain of David's psalms into  
 verse. *Peacbam.*—

Would'st thou be touch'd  
 By the presuming hands of saucy *grooms*? *Dryd.*  
 Am! the fold he rages, nor the sheep  
 Their shepherds, nor the *grooms* their bulls can  
 keep. *Dryden.*

2. A young man.—  
 I presume for to intreat this *groom*,  
 And silly maid, from danger to redeem. *Fairf.*

3. A man newly married.—  
 By this the brides are wak'd, their *grooms* are  
 dress'd;

All Rhodensis summon'd to the nuptial feast. *Dryd.*  
 (2.) *GROOM* is also applied to several superior  
 officers belonging to the king's household, as  
 groom of the chamber, groom of the stole. See  
 STOLE, and WARDROBE.

(3.) *GROOM* is more particularly used for a ser-  
 vant appointed to attend on horses in the stable.

GROOMSPORT BAY, a bay of Ireland, on  
 the coast of the county of Down.

GROOSENROT, a town of Germany, in  
 Hulslein, 32 miles NNE. of Oldenburg.

(1.) \* *GROOVE. n. f.* [from *grave*.] 1. A deep  
 cavern, or hollow in mines.—He might, to avoid  
 idleness, work in a *groove* or mine-pit thereabouts,  
 which at that time was little esteemed. *Boyle.* 2.  
 A channel or hollow cut with a tool.—The screw-  
 plate is a kind of steel well temper'd, with several  
 holes in it, each less than the other; and in those  
 holes are threads grooved inwards, which *grooves*  
 fit the respective taps that belong to them. *Moxon.*

(2.) *GROOVE*, among miners, is the shaft or pit  
 sunk into the earth, sometimes in the vein, and  
 sometimes not.

(3.) *GROOVE*, among joiners, the channel made  
 by their plough in the edge of a moulding, style,  
 or rail, to put their pannels in, in wainscoting.

\* *To GROOVE. v. a.* [from the noun.] To cut  
 hollow.—Of the box every joint was well *grooved*.  
*Swift.*

(1.) \* *To GROPE. v. n.* [*grapan*, Sax.] To feel  
 where one cannot see.—

My sea-gown scarf about me, in the dark  
*Grop'd* I, to find out them. *Shak. Hamlet.*  
 —We *grobe* for the wall like the blind, and we  
*grobe* as if we had no eyes. *Jf. lix. 10.*—

They meet with darkness in the clearest light;  
 And *grobe* at noon, as if involv'd with night.

—A boy was *groping* for cels, and laid his hand  
 upon a snake. *L'Est.*—This, no doubt, is better  
 for men than that they should in the dark *grobe*  
 after knowledge; as St Paul tells us all nations  
 did after God. *Locke.*—

He heard us in our course,  
 And with his out-stretch'd arms around him  
*grop'd*. *Addison.*

O' truth divine! enlighten'd by thy ray,  
I grope and guess no more, but see my way.

*Arbutnot.*

(1.) \* *To GROPE*, *v. n.* To search by feeling in the dark; to feel without being able to see.—How vigilant to grope mens thoughts, and to pick out somewhat whereof they might complain. *Hayward*.—They have left our endeavours to grope them out by twilight, and by darkness almost to discover that, whose existence is evidenced by light. *Brown's Vulgar Errors*.—

But Strephon, cautious, never meant

The bottom of the pan to grope. *Sauist.*

GROPENSTEIN, a town of Germany, in Carinthia, one mile N. of Welach.

\* GROPER, *n. f.* [from *grope*.] One that searches in the dark.

GROPPER, John, an able polemical writer, born in Westphalia. He published *Enchiridion Christianæ Religionis*, and several other works. He died in 1559.

(1.) GROS, a liquid measure, used by the French Chemists, equal to 59.0703 grains.

(2.) GROS. See GROSS, N<sup>o</sup> 3.

GROSCA, an island in the Baltic Sea. Lon. 47. 0. E. of Ferro. Lat. 44. 39. N.

GROSE, Francis, Esq. F. A. S. an eminent English antiquary, the son of Francis Grose, Esq. jeweller, of Richmond, who fitted up the coronation crown of king George II. He was born in 1731, and was left an independent fortune; but had not a disposition to preserve it. He wrote, 1. *The Antiquities of England and Wales*, in 8 vols. 4to. and 8vo, which he began in 1773, and completed in 1787; containing 589 views, besides 40 plans, &c. 2. *The Antiquities of Scotland*, 2 vols. 4to. and 8vo, containing 190 views with a map: 3. *The Antiquities of Ireland*, 2 vols. 4to. and 8vo: 4. *A Treatise on Ancient Armour and Weapons*, 4to. 1785; with a supplement in 1789: 5. *A Classical Dictionary of the Vulgar Tongue*; 8vo. 1785: 6. *Military Antiquities*; 2 vols. 4to. 1786—88: 7. *The History of Dover Castle*; 4to. 1786: 8. *A Provincial Glossary, with a collection of Local Proverbs and Popular Superstitions*; 8vo. 1788: 9. *A Guide to Health, Beauty, Honour, and Riches*; 8vo. 10. *Rules for Drawing Caricatures*; 8vo. 1788: 11. *The Ohio; a collection of Essays*; 8vo. In summer, 1789, he set out on a tour in Scotland, and began to communicate his observations in folio numbers, with 4 plates each, in 1790. Before he had completed this work, he went to Dublin, with the intention of executing a similar work, with views and descriptions of the antiquities of Ireland, executed in the same elegant manner with those of Great Britain: but being seized with an apoplectic fit, at the house of Mr Hone in Dublin, he died on the 12th May, 1791, aged about 60. He had a great talent for drawing, which peculiarly qualified him for executing the works in which he engaged; and, being of an agreeable, humorous, and communicative disposition, he was much esteemed in the extensive circle of his friends. He visited almost every part of the three kingdoms, and was every where well received. His humour was of that genuine kind, which exhilarates without offending either against virtue or good manners.

Yet a case of distress never failed to draw sympathy from his heart, and, where it was needed, from his purse. He married a lady at Canterbury by whom he had several children; of whom Daniel Grose, after serving several campaigns in America, was appointed Deputy Governor of settlement at Botany Bay, in 1790.

GROSEN, a town of Courland, 28 miles Goldingen.

GROSLEY, Peter John, a French author, compiler, born at Troyes in 1718. He finished the French *Encyclopedie*, and in the *Dictionnaire Historique*. He died at Troyes in 1785.

GROSON, a town of France, in the d. Jura, 3 miles SW. of Arbois, and 3 N. of P.

GROSONE, a town of Corsica, 3 miles Bastia.

(1.) \* GROSS, *adj.* [*grat*, French; *gross* Lian; *crassus*, Latin.] 1. Thick; bulky.—

The crows and choughs that wing the way air,

Shew scarce so gross as beetles. *Shak. K.*

—There are two gross volumes concerning power of popes. *Baker on Learning*, 2. 8 fol; unseemly; enormous.—He ripely considered how gross a thing it were for men of his wife and grave men, to live with such a multitude and to be tenants at will under them. *Hooker*.—They can say that in doctrine, in discipline, prayers, and in sacraments, the church of Rome hath very foul and gross corruptions. *Hooker* hath the natural understanding, even so dry whole nations, been darkened, that they not discerned, no, not gross iniquity to be *Hooker*.—There is a vain and imprudent, their estates, which, though it does not do like gross sins, yet disorders the heart, supports it with sensuality and dulness. *Lowell*.—Intellectually coarse; palpable; impure; un-

To all sense 'tis gross,

You love my son; invention is aim'd,

Against the proclamation of thy passions,

To say thou do'st not. *Shak.*

Examples gross as earth exhort me.

Belial came last, than whom a spirit

lewd

Fell not from heaven, or more gross to k

Vice for itself. *Milt. Pa.*

—Is not religion so perfectly good in itself, all, in its Authour, that, without the grossness, we cannot but admire it? *Spruit* a gross mistake of some men, to think that wants only and imperfections do naturally us to be beneficent. *Smairidge*.—

But she dares never boast the present

So gross the cheat, it is beyond her power

4. Inelegant; disproportionate in bulk.—

The sun's oppressive ray the role at h

Of beauty blating, gives the gloomy hu

And feature gross. *Thom.*

5. Dense; not refined; not attenuated; n

—It is manifested, that when the eye fix

the finer medium, and the object is in the

things shew greater; but contrariwise, w

eye is placed in the grosser medium, and

ject in the finer. *Bacon's Nat. Hist.*—

Of elements,  
 er feeds the purer; earth the sea,  
 l the sea feed air. *Milt. Par. Lost.*  
 umes are merry, *grosser* fumes are sad;  
 the reasonable soul run mad. *Dryden.*  
 k the mists in *grosser* air below,  
 eir pinions in the painted bow. *Pope.*  
 dull.—  
 loth then the subtle sense excel,  
 are they that drown her in the blood?

*Davies.*  
 clear dream and solemn vision,  
 of things that no *gross* ear can hear.

*Milton.*  
 n give more delight and knowledge by  
 ting of the question with perspicuity  
 than others by talking of it in *gross*  
 or whole hours together. *Watts.* 7.  
 ough; opposite to delicate.—Fine and  
 lptures are helped with nearness, and  
 stance. *Wotton's Architect.* 8. Thick;  
 —His stature was of just height and all  
 ate dimensions, avoiding the extremes  
 l meager. *Fell.*

*Gross.* *n. f.* [from the adjective.] 1. The  
 ; the main force.—

elgians hop'd, that with disorder'd haste  
 p cut keels upon the sands might run;  
 with caution leisurely were past,  
 umerous *gross* might charge us one by

*Dryd.*  
 asults are of opinion, that, in a battle,  
 discharge upon the *gross* of the enemy,  
 eiling your piece at any particular per-

*Freob.*—The *gross* of the people can  
 ther prospect in the changes and revo-

of publick blessings. *Addis.* 2. The  
 whole not divided into its several parts.  
 general inducements are used to make  
 our cause in *gross*. *Hooker.*—There was

in *gross*, that the soul was immortal.  
*escrip. of the World.*—There is confess-

is, the acknowledging our sins to God;  
 ay be either general or particular: The  
 when we only confess in *gross* that we

the particular, when we mention the  
 s and acts of our sins. *Duty of Man.*—  
 Remember, son,

a general: other wars require you;  
 he Saxon *gross* begins to move. *Dryd.*

standing the decay and loss of sundry  
 manufactures, yet, in the *gross*, we ship

e third part more of the manufactures,  
 l and tin, than we did twenty years past.

*rade.* 3. Not individual; but a body  
 —He hath ribbons of all the colours i' th'  
 they come to him by the *gross*. *Shak.*—

not instantly raise up the *gross*  
 hree thousand ducats. *Shak.*  
 the united design of many persons to

one figure: after they have separated  
 in many petty divisions, they rejoin

into a *gross*. *Dryd.* 4. The chief part;  
 mass.—Comets, out of question, have  
 nder and effect over the *gross* and mass  
*Bacon's Essay.*—The articulate sounds  
 onfused, though the *gross* of the found

. *Bacon's Nat. Hist.* 5. The number of

twelve dozen. [*Grosse*, French.]—It is made up  
 only of that simple idea of an unite repeated; and  
 repetitions of this kind, joined together, make  
 those distinct simple modes of a dozen, a *gross*,  
 and a million. *Locke.*

(3.) *GROSS*, a foreign money, in divers coun-  
 tries, answering to our groat.

(4.) *GROSS*, [*GROSSUS*,] in our ancient law writ-  
 ters, denotes a thing absolute, and not depending  
 on another. Thus, *villain in gross*, *villanus in*  
*grosso*, was a servant, who did not belong to the  
 land, but immediately to the person of the lord;  
 or a servile person not appendant or annexed to  
 the land or manor, and to go along with the te-  
 nures as appurtenant to it; but like other personal  
 goods and chattels of his lord, at his lord's plea-  
 sure and disposal.

(5.) *GROSS*, *ADVOWSON* IN. See *ADVOWSON*.

(6.) *GROSS WEIGHT*, the weight of merchan-  
 dizes and goods, with their dust and dross, as also  
 of the bag, cask, chest, &c. wherein they are con-  
 tained; out of which *gross* weight, allowance is  
 to be made of tare and tret.

(1.) *GROSSA*, a town of Germany, in Austria,  
 3 miles S. of Baden.

(2.) *GROSSA*, an island of Maritime Austria, in  
 the Adriatic, near the coast of Dalmatia, 6 miles  
 long and 1 broad, according to Mr Cruttwell;  
 but Dr Oppenheim says, it is no less than 30 miles  
 in length, 4 in breadth, and 60 in circumference,  
 and comprehends 13 villages.

*GROSS-BEAK*. See *LOXIA*.

*GROSSBOROUGH*, a town of Ireland, in the coun-  
 ty of Monaghan, and province of Ulster.

*GROSSBOTWAR*, a town of Suabia, in the  
 duchy of Wurtemberg, 10 miles SSE. Heilbronn,  
 and 13 NNE. of Stuttgart.

*GROSSEL-FINGEN*, a town of Suabia, in  
 the county of Hohen-zollern, 7 miles E. of Hohen-  
 zollern.

*GROSSETA*, or *GROSSETO*, a town of Tus-  
 cany, 14 miles ESE. of Piombino.

*GROSSETESTE*, Robert, Bp. of Lincoln, a  
 learned English divine of the 13th century, born  
 about A. A. 1175. He was the author of many  
 works, was a good Greek scholar, and esteemed a  
 man of a clear intellect.

*GROSSEUVRE*, a town of France, in the dept.  
 of Eure. 6 miles S. of Evreux.

\* *GROSSLY*. *adv.* [from *gross*.] 1. Bulkily;  
 in bulky parts; coarsely: as, *this matter is grossly*  
*pulverized*. 2. Without subtilty; without art;  
 without delicacy; without refinement; coarsely;  
 palpably.—Such kind of ceremonies as have been  
 so *grossly* and shamefully abused in the church of  
 Rome, where they remain, are scandalous. *Hooker.*

Treason and murder ever keep together,  
 As two yoke devils sworn to others purpose;  
 Working so *grossly* in a natural cause,  
 That admiration did not whoop at them. *Shak.*

And thine eyes  
 See it so *grossly* shown in thy behaviour,  
 That in their kind they speak it. *Shak.*

What! are we cuckolds ere we have deserv'd  
 it?

—Speak not *grossly*. *Shak. Merch. of Venice.*

—What I have said has been forced from me, by  
 seeing a noble sort of poetry so happily restored  
 by

by one man, and so *grossly* copied by almost all the rest. *Dryden*.—If I speak of light and rays as endued with colours, I would be understood to speak not philosophically and properly, but *grossly*, and according to such conceptions as vulgar people would be apt to frame. *Newton's Opticks*.—While it is so difficult to learn the springs and motives of some facts, it is no wonder they should be so *grossly* misrepresented to the public by curious inquisitive heads. *Swift*.

\* GROSSNESS. *n. f.* [from *gross*.] 1. Coarseness; not subtilty; thicknes; spissitude; density; greatnes of parts.—

The purpose is perspicuous even as substance, Whose *grossness* little characters sum up. *Shak.*

And I will purge that mortal *grossness* so,

That thou shalt like an airy spirit go. *Shak.*

—The cause of the epilepsy from the stomach is the *grossness* of the vapours which rise and enter into the cells of the brain. *Bacon's Nat. Hist.*

Then all this earthy *grossness* quit;

Attir'd with stars we shall for ever sit,

Triumphing over death. *Milton.*

—This being the first colour which vapours begin to reflect, it ought to be the colour of the finest and most transparent skies, in which vapours are not arrived at that *grossness* requisite to reflect other colours. *Newton's Opt.*—

For envy'd wit, like Sol eclips'd, was known  
Th' opposing body's *grossness*, not its own.

*Pope.*

2. Inelegant fatness; unwieldy corpulence.—Wife men, that be over fat and fleshy, go to sojourn abroad at the temperate diet of some sober man; and so, by little and little, eat away the *grossness* that is in them. *Afcham*. 3. Want of refinement; want of delicacy; intellectual coarseness.—I was three or four times in the thought they were not fairies; and yet the guiltiness of my mind drove the *grossness* of the foppery into a received belief that they were fairies. *Shak.*—Whatever beauties it may want, 'tis free at least from the *grossness* of those faults I mention'd. *Dryd.*—What a *grossness* is there in the mind of that man, who thinks to reach a lady's heart by wounding her ears! *Clarissa*.

GROSS-SALZE, a town of Germany, in the duchy of Magdeburg, famous for its salt works, 12 miles S. of Magdeburg.

GROSSTESTE, Claude, a French protestant divine, who came to London, on the revocation of the edict of Nantes. He was minister of the Savoy. He wrote a treatise on the Inspiration of the Sacred Books, and several sermons. He died in 1713.

GROSSULLARIA. See RIBES.

GROSSWIG, a town of Saxony, 4 miles SW. of Schmiedelburg. Amber is found near it.

GROSSZIG, a town of Upper Saxony, in Anhalt-Deffau, 19 miles SW. of Deffau.

\* GROT. *n. f.* [*grotte*, French; *grotta*, Ital.] A cave; a cavern for coolness and pleasure.—

In the remotest wood and lonely *grot*,  
Certain to meet that worst of evils, thought.

*Prior.*

Awful see the Egerian *grot*.

*Pope.*

(1.) \* GROTESQUE. *adj.* [*grotesque*, French;

*grottesco*, Italian.] Distorted of figure; unwildly formed.—

The champaign head

Of a steep wilderness, whose hairy side  
With thicket overgrown, *grotesque* and  
Access deny'd. *Milton's*

—There is yet a lower sort of poetry and which is out of nature; for a farce is the try which *grotesque* is in a picture: the and actions of a farce are all unnatural manners false, that is, not confiding with raacters of mankind: *grotesque* is the blance of this. *Dryden's Duressnoy*.

An hideous figure of their foes they  
Nor lines, nor looks, nor shades, nor  
true,

And this *grotesque* design expos'd to  
view.

Palladian walls, Venetian doors,  
*Grottesco* roofs, and stucco floors.

(2.) GROTESQUE, or GROTESK, in sculpture painting, something whimsical, extravagant, monstrous; consisting either of things that ly imaginary or so distorted, as to raise in ridicule. The word owes its derivati gures of this kind, being anciently used adorn the *grotto* wherein the tombs of persons were inclosed. Such was that whose grotto was discovered near Rome years ago.

(1.) GROTIUS, Hugo, or more properly DE GROOT, one of the greatest men was born at Delft in 1583. He made progress in his studies, that at 15 he had attain knowledge in philosophy, divinity, and and a yet greater proficiency in polite l as appeared by the commentary he had that age on Martianus Capella. In 1591 accompanied the Dutch ambassador in and was honoured with several marks by Henry IV. He took his degree of L that kingdom; and at his return to his country, pleaded at the bar before he was of age. He was not 24 when he was attorney general. In 1613 he settled at dam, and was nominated syndic of that did not accept of the office, till a protest made him that he should not be removed This prudent precaution he took from his ing, that the quarrels of the divines on the of grace, which had already given rise factions in the state, would occasion re in the chief cities. The same year he was England, on account of the divisions that between the traders of the two nations right of fishing in the northern seas; but obtain no satisfaction. He was afterward England, to persuade the king and the divines to favour the Arminians; and he veral conferences with K. James I. on t ject. On his return to Holland, his at to Barneveldt involved him in great trouble was seized, and sentenced to perpetual i ment in 1619, and to forfeit all his goods. But after having been treated with gour for above a year and a half in his com he was delivered by the advice and art

having observed that his keepers had sed themselves with searching and exact trunk full of foul linen, which used at Gorkum, but now let it pass with it, she advised him to bore holes in it his being stifled, and then to get into mplied with this advice, and was cardend's house in Gorkum; where dreslike a mason, and taking a rule and passed through the market-place, and o a boat went to Valvet in Brabant. He himself known to some Arminians, carriage to Antwerp. At first there n of prosecuting his wife, who staid in and some judges were of opinion that o be kept there in her husband's stead: ie was released by a plurality of voices, ally applauded for her behaviour. He l into France, where he met with a ception from that court, and Lewis d a pension upon him. Having resided ears, he returned to Holland, on his very kind letter from Frederic Henry range; but his enemies renewing their , he went to Hamburgh; where, in hristina of Sweden made him her counent him ambassador into France. Afischarged the duties of this office ars, he returned to give an account to a of his embassy; when he took Holway, and received many honours at . He was introduced to her at Stockthere begged that she would grant his that he might return to Holland. This l with difficulty; and the queen gave marks of her esteem, though he had ies at her court too. As he was reeship in which he embarked was cast e coast of Pomerania; and being sick, d his journey by land; but he was forat Rostock, where he died on the 28th

His body was carried to Delft, to be the sepulchre of his ancestors. Notg the embassies in which he was emcomposed a great number of excellent principal of which are, 1. *De jure bel-* which is esteemed a master-piece: 2. in the truth of the Christian religion: staries on the holy scriptures; 4. The annals of Holland: and 5. A great letters: All written in Latin.

TIUS, Peter, the 2d son of Hugh, (N<sup>o</sup> able lawyer and an acute philologist. 1678.

TIUS, William, brother to Hugh, was lawyer, and wrote several books on ce. He died in 1662.

TON, a township of Connecticut in on county, bounded on the W. by the d on the S. by Fisher's Island. It conarishes, and had 3,946 citizens in 1795. ends FORT GRISWOLD, which defends : of New London.

TON, a town in the above township New London city. It was burnt by l, on the 6th Sept. 1781, and suffered amount of 23,217 l.

ROTON, a town and township of Mas-

sachusetts in Middlesex county, containing 1840 citizens, in 1795. The town is 35 miles NW. by W. of Boston, and 341 from Philadelphia. Lon. 3. 31. E. of that city. Lat. 42. 38. N.

(5.) GROTON, a small town of England, in Suffolk, between Sudbury and Hadley.

GROTSCAW, or } a town of European Tur-  
(1.) GROTSKAW, } key in the province of Serbia, where a battle was fought between the Germans and Turks, in 1739, in which the Germans were forced to retreat with loss. Lon. 21. 0. E. Lat. 45. 0. N.

(2.) GROTSKAW, a province of Silesia.

(3.) GROTSKAW, a strong town, capital of the above province, seated in a fruitful plain. Lon. 17. 35. E. Lat. 50. 42. N.

(1.) GROTTA, a trading town of the Cisalpine republic, on the Adda, in the dep. of the Upper Po, abounding in honey and flax.

(2.) GROTTA. See GROTTO, § 2, 6.

(4.) GROTTA MENARDA, a town of Naples in Principato Ultra, 12 miles ESE. of Benevento.

(5.) GROTTA ST LORIA, a town of Naples in the prov. of Capitanata, 12 miles W. of Manfredonia.

GROTTAGLI, a town of Naples, in the prov. of Otranto, 9 miles of Tarento.

GROTTGAU, or } a town and territory of Si-  
GROTTKAU, } lesia, in the principality of Neisse, seated on the river Neisse, 14 miles N. of Neisse. Lon. 35. 19. E. of Ferro. Lat. 53. 41. N.

(1.) \* GROTTO. *n. f.* [*grotte*, French; *grotta*, Italian.] A cavern or cave made for coolness. It is not used properly of a dark horrid cavern.—

Their careleis chiefs to the cool *grottos* run,  
The bow'rs of kings, to shade them from the sun.  
*Dryden.*

—This was found at the entry of the *grotto* in the Peak. *Woodward.*

(2.) GROTTO, or GROTTA, in natural history, a large deep cavern or den in a mountain or rock. The word is formed, according to Menage, &c. from the Latin *crypta*. Du Cange observes, that *grotta* was used in the same sense in the corrupt Latin. The ancient anchorites retired into dens and grottos, to apply themselves the more attentively to meditation. ELDEN HOLE, OKEY-HOLE, PEAKE'S HOLE, and POOL'S HOLE, are famous among the natural caverns or grottos of England. See these articles. In grottos are frequently found crystals of the rock, stalactites, and other natural conglaciations, and those of an amazing beauty. M. Homberg conjectures, from several circumstances, that the marble pillars in the grotto of Antiparos vegetate or grow. That author looks on this grotto as a garden, whereof the pieces of marble are the plants; and endeavours to show, that they could only be produced by some vegetative principle. See ANTIPAROS. At Foligno in Italy is another grotto, consisting of pillars and orders of architecture of marble, with their ornaments, &c. scarcely inferior to those of art; but they all grow downwards: so that if this too be a garden, the plants are turned upside down.

(3.) GROTTO, (§ 1.) is also used for a little artificial edifice in a garden, in imitation of a natural grotto. The outides of these grottos are usually

and, dissolve it in a drampan, to every ounce of which add two drams of the finest vermilion: when you have stirred them well together, and have chosen your twigs and branches, peeled and dried, take a pencil and paint the branches all over whilst the composition is warm; afterwards shape them in imitation of natural coral. This done, hold the branches over a gentle coal fire, till all is smooth and even as if polished. In the same manner white coral may be prepared with white lead, and black coral with lamp black. A grotto may be built with little expence, of glass, cinders, pebbles, pieces of large flint, shells, moss, stones, counterfeit coral, pieces of chalk, &c. all bound or cemented together with the above described cement.

(4.) GROTTO, in geography, a district of Maritime Austria, in Friuli, in the territory of Carnia, on the Julian Alps.

(5.) GROTTO DEL CANI, a little cavern near Pozzuoli, 12 miles from Naples, the steams whereof are of a mephitical or noxious quality; whence also it is called *bocca venenosa*, the poisonous mouth. See MEFHITIS. "Two miles from Naples (says Dr Mead), just by the Lago de Agnanno, is a celebrated mofeta, commonly called *la Grotta del Cani*, and equally destructive to all within the reach of its vapours. It is a small grotto about 8 feet high, 12 long, and 6 broad; from the ground arises a thin, subtle, warm fume, visible enough to a discerning eye, which does not spring up in little parcels here and there, but in one continued stream, covering the whole surface of the bottom of the cave; having this remarkable difference from common vapours, that it does not like smoke disperse into the air, but quickly after its rise falls back again, and returns to the earth; the colour of the sides of the grotto being the measure of its ascent: for so far it is of a darkish green, but higher only common earth. And as I myself found no inconvenience by standing in it, so no animal is able to stand in it, but they all die in it."

owing to the contracture of the arteries, which promotes the contraction of the vessels, and the retarded circulation; the blood, which remains in the vesicles, may be sufficient to distend the vessels, and produce a *deliquium animi*: the lake of Agnanno has a greater virtue in it than other lakes, in that it is of a poisonous nature, and that it destroyed the elasticity of the vessels of the lungs to occasioned sudden death. It is said that this steam is nothing else but the same which has been known from time immemorial hath been known in that place in very great quantities, which cannot yet be investigated by modern discoveries concerning it. It proves pernicious when taken in great quantity, by rarefying the blood, and hence the best method of remedying it is to be apparently killed by fixed air, and a great degree of cold all over the body, which condense the blood as much as possible, the reason why the dogs recede from the lake Agnanno as about 100 paces, is that they are not able to stand in the steam. See BLOOD, § 3, and DAMPS.

(6.) GROTTO, or GROTTA, a tetraeneous cavern near the city of Braccano in Italy, is thus described: "The *grotta del serpi* is a cavern which will hold two persons. It is perforated by several small apertures, somewhat in the manner of a comb, of which, at the beginning of the stream, issues a numerous brood of serpents of various colours, but all free from a poisonous quality. In this cavern there are several persons, paralytics, arthritics, rheumatics, quite naked; where they sit for several days, and are cured of their diseases by the force of the steam which issues from the cavern."

an elm growing hard by laden with them. The discovery of this cave was by the cure of a person going from Rome to some baths near this place. Losing his way, and being benighted, he entered upon this cave. Finding it very warm, he pulled off his clothes; and being weary and dry, had the good fortune not to feel the serpents about him till they had wrought his cure.

1.) GROTO, MILKY, *Crypta Lactea*, a mile distant from the ancient village of Betlehem, is so to have been thus denominated on occasion of the blessed Virgin, who let fall some drops of milk in giving suck to Jesus in this grotto. And as it has been commonly supposed, that the floor of this cavern has the virtue of restoring milk to women that are grown dry, and even of curing the same. Accordingly, they are always digging in the earth is sold at a good rate to such as have faith enough to give credit to the fable. An house has been built on the place, and a church built by it.

ROTTOLA, a town of Naples, in the province of Basilicata, 4 miles SW. of Matera.

ROVA, a town of Africa, on the Grain Coast, 100 miles NW. of Cape Palmas.

2.) GROVE, Henry, a learned and ingenious mystical divine, born at Taunton in Somersetshire, in 1683. Having obtained a sufficient knowledge of classical literature, he went through a course of academical learning, under the rev. Mr. Rowen of Taunton, who had a flourishing academy. He then removed to London, and studied under the rev. Mr. Rowe, to whom he was nearly related. Here he contracted a friendship with several persons of merit, and particularly with Dr. Johnson, which continued till his death, though they were of different opinions in several points of divinity controverted among divines. After two years spent under Mr. Rowe, he returned into the country, and began to preach with great reputation and judgment, a lively imagination, and a rational and amiable representation of Christianity, uttered in a sweet and well governed voice, rendered him generally admired; and the spirit of piety which prevailed in his sermons procured him the esteem and friendship of Mrs. Singer, afterwards Mrs. Rowe, which she expressed in a fine eulogy in death, addressed to Mr. Grove. Soon after beginning to preach, he married; and on the recommendation of Mr. Warren, succeeded him in the academy of Taunton. This obliging him to reside there, he preached for 18 years to two small congregations in the neighbourhood; and though his salary was both less than 20l. a year, and he had a large family, he went through it cheerfully. In 1708, he published a piece, intitled, *The Regulations of Directions*, drawn up for the use of his parish. About the same time, he entered into a controversy by letter with Dr. Samuel Clarke: they not being able to convince each other, the controversy was dropped with expressions of great mutual respect. He next wrote several papers printed in the *Spectator*, viz. Numbers 588. 601. 626. 635. These were republished, by the direction of Dr. Johnson, in the *Evidences of the Christian Religion*, by Joseph Addison, Esq. In 1711, Mr. James, his partner in the academy, dying, he succeeded him in his pastoral charge at Taunton.

3.) GROVE, n. s. [from *grave*.] A walk covered by trees meeting above.—

Fulwood, near Taunton, and engaged his nephew to undertake the other parts of Mr. James's work as tutor; and in this situation Mr. Grove continued till his death, which happened in 1738. His great concern with his pupils, was to inspire and cherish in them a prevailing love of truth, virtue, liberty, and genuine religion, without violent attachments or prejudices in favour of any party of Christians. He represented truth and virtue in a most engaging light; and though his income, both as a tutor and a minister, was insufficient to support his family, without breaking into his paternal estate, he knew not how to refuse the call of charity. Besides the above pieces, he wrote, 1. An Essay towards a Demonstration of the Soul's Immortality. 2. An Essay on the Terms of Christian Communion. 3. The Evidence of our Saviour's Resurrection considered. 4. Some Thoughts concerning the Proof of a Future State from Reason. 5. A Discourse concerning the Nature and Design of the Lord's Supper. 6. Wisdom the first spring of Action in the Deity. 7. A Discourse on Saving Faith. 8. Miscellanies in prose and verse. 9. Many Sermons, &c. After his decease, his posthumous works were published by subscription, in 4 vols 8vo, with the names of near 700 subscribers, among whom were some of the best judges of merit in the established church.

I look'd toward Birnam, and anon methought  
The wood began to move;  
Within this three mile may you see it coming;  
I say, a moving *grove*. *Shakespeare's Macbeth.*  
Fortunate fields, and *groves*, and flow'ry vales;  
Thrice happy isles! *Milton.*  
She left the flow'ry field, and waving *grove*.  
*Blackmore.*

Banish'd from courts and love,  
Abandon'd truth seeks shelter in the *grove*.  
*Granville.*  
Can fierce passions vex his breast,  
While every gale is peace, and every *grove*  
Is melody? *Thomson's Spring.*

(3.) GROVE, in gardening, a small wood impervious to the rays of the sun. Groves are not only great ornaments to gardens; but also afford great relief against the violent heats of the sun, affording shade to walk under in the hottest parts of the day, when the other parts of the garden are useless; so that every garden is defective which has not shade. Groves are of two sorts, viz. either open or close. Open groves are such as have large shady trees, which stand at such distances, as that their branches approach so near each other as to prevent the rays of the sun from penetrating through them. Close groves have frequently large trees standing in them; but the ground under these are filled with shrubs or underwood: so that the walks which are in them are private, and screened from winds; by which means they are rendered agreeable for walking, at those times when the air is either too hot or too cold in other parts of the garden. These are often contrived so as to bound the open groves, and frequently to hide the walls or other inclosures of the garden; and when they are properly laid out, with dry

P p p p walks

walks winding through them, and on the sides of these sweet smelling shrubs and flowers irregularly planted, they have a charming effect.

(4.) GROVES have been in all ages held in great veneration. The προσευχαι, and high-places of the Jews, whither they resorted for the purposes of devotion, were probably situated in groves: See Joshua xxiv. 26. The προσευχαι in Alexandria, mentioned by Philo, had groves about them because he complains that the Alexandrians, in a tumult against the Jews, cut down the trees of their προσευχαι. The ancient Romans had a sort of groves near several of their temples, which were consecrated to some god, and called *luci*, by Anziphrasis, a *non lucendo*, as being shady and dark. The veneration which the ancient DRUIDS had for groves is well known.

\* To GROVEL. *v. n.* [*grifile*, Islandick, flat on the face. It may perhaps come by gradual corruption from *ground fell*.] 1. To lie prone; to creep low on the ground.—

The steel head passage wrought,  
And through his shoulder pierc'd; wherewith  
to ground

He *groveling* tell, all gored in his gushing wound.

What see'st thou there? king Henry's diadem,  
Inchas'd with all the honours of the world!

If so, gaze on, and *grovel* on thy face,

Until thy head be circled with the same. *Shak.*

Oke mast and beech, and cornell fruit they eat,  
*Groveling* like twine on earth, in fowlest sort.

Now they lie

*Groveling* and prostrate on yon lake of fire.

Upon thy belly *groveling* thou shalt go. *Milt.*

—Let us conclude that all painters ought to require this part of excellence: not to do it, is to want courage, and not dare to shew themselves:

'tis to creep and *grovel* on the ground. *Dryden's*

*Dufresnoy*. 2. To be mean; to be without dignity or elevation.—

I must disclaim whate'er he can express;

His *groveling* sense will show my passion less.

—Several thoughts may be natural which are low and *groveling*. *Spektor.*

(1.) \* GROUND. *n. f.* [*grund*, Sax *grondt*,

Danish.]: 1. The earth, considered as superficially extended, and therefore related to tillage, travel, habitation, or almost any action. The main mass of terrene matter is never called the *ground*.

We never distinguish the terraqueous globe into *ground* and water, but into *earth*, or land, and water;

again, we never say under *earth*, but under *ground*.—Israel shall go on dry *ground* through the sea. *Exodus. xiv. 26.*—

Man to till the *ground*

None was, and from the earth a dewy mist

Went up, and water'd all the *ground*. *Milton.*

From the other hill

To their fix'd station, all in bright array,

The cherubim descend, on the *ground*

Gliding meteorous. *Milton.*

A black bituminous gurge

Boils up from under *ground*. *Milton.*

And yet so nimbly he would bound.

As if he scorn'd to touch the *ground*. *H*

2. The earth as distinguished from air or

—I have made man and beast upon the

*Jeremiab.*—There was a dew upon all the

*Judges vi. 40.*—

They summ'd their wings, and fix'd

air sublime,

With clang despis'd the *ground*.

Too late young Turnus the delusion

Far on the sea, still making from the *ground*

*Dryden's*

3. Land; country.—

The water breaks its bounds,

And overflows the level *grounds*. *H*

4. Region; territory.—

On heav'nly *ground* they stood, and the

shore

They view'd the vast immeasurable abode

With these came they, who from the

d'ring flood

Of old Euphrates to the brook that part

Egypt from Syrian *ground*, had general

Of Baalim and Astartoth. *Milton's Paradise Lost*

5. Estate; possession.—

Uneasy still within these narrow bounds

Thy next design is on thy neighbour's *ground*

His crop invites, to full perfection grown

Thy own seems thin, because it is thy *ground*

*Dryden's*

6. Land occupied.—

The sea o'erflow'd my *ground*.

And my best Flanders mare was drown'd

7. The floor or level of the place.—What

should I smite thee to the *ground*? *1 Sam.*

—Dagon was fallen on his face to the *ground*

*1 Sam. v. 4.*—A multitude fit on the *ground*

*xv. 35.*—Some part of the month of June, the

water of this lake descends under *ground*, there

are many great holes at the bottom. *Brown's Travels*

8. Dregs; lees; faeces; that which settles at the

bottom of liquors.—Set by them cyder, or

four drink, or *grounds*. *Mort.*—Some infirm

having had particular success in stopping gapes

from the use of the *grounds* of strong beer,

mix'd up with bread or oatmeal. *Sharp's Surgery*

The first stratum of paint upon which the figure

afterwards painted.—We see the limner to

with a rude draught, and the painter to

*grounds* with darksome colours. *Hakewill's*

solid bodies, sensible to the feeling and dis-

placed on light and transparent *grounds*.

Example, the heavens, the clouds and water

every other thing which is in motion, and

different objects; they ought to be more

and more distinguishable, than that with

they are encompassed. *Dryden's Dufresnoy*

The fundamental substance; that by which

additional or accidental parts are supported

Over his head

A well-wrought heaven of silk and gold

spread,

Azure their *ground*, the sun in gold shone

—Indeed it was but just that the finest sim-

ture should be drawn upon the most durable

*Pope.*—

is wrought into the soul, let virtues shine,  
and eternal, as the work divine. *Young*,  
plain song; the tune on which descants

Get a prayer book in your hand,  
and between two churchmen, good my  
d;  
that ground I'll build a holy descant.

*Shak. Richard III.*  
aint; first traces of an invention; that  
as occasion to the rest.—

igh jealousy of state th' invention found,  
e reciv'd upon the former ground;  
ay the tyrant had reserv'd to fly,  
g hate, now serv'd to bring two lovers  
h. *Dryden.*

rest principles of knowledge.—The con-  
easily be known, if the fore grounds be  
y heaven in. *Preface to Accidence.*—  
statefemen, or of them they which can  
d,

their occupation find the grounds. *Donne.*  
ounds are already laid whereby that is un-  
dly refused; for having granted that  
sufficient grace, yet when he co-operates  
ually, he doth it not irresistibly. *Ham-*  
fter evening repasts, 'till bed time, their  
will be best taken up in the easy grounds  
is, and the story of scripture. *Milton on*

14. The funda- ental cause; the true  
iginal principle.—He desired the stew-  
him particularly the ground and event  
cident. *Sidney.*—Making happiness the  
his unhappiness, and good news the ar-  
his sorrow. *Sidney.*—The use and be-  
od laws all that live under them may  
delight and comfort, albiet the grounds  
original causes from whence they have  
unknown. *Hooker.*—In the solution of  
izer's objection, my method shall be, to  
in the first place, the main grounds and  
upon which he buildeth. *White.*—

Thou could'st not have discern'd  
the serpent, speaking as he spake,  
nd of enmity between us known. *Milt.*  
either of them ever think fit to make  
ular relation of the grounds of their pro-  
or the causes of their misadventures.

l judgment is the ground of writing well.  
*Roscommon.*  
once giv'n from her, and plac'd in you,  
leave no ground I ever would be true.

*Dryden.*  
easy to imagine how any such tradition  
so early, and spread so universally, if  
not a real ground for it. *Wilkins.*—If it  
, ought we not to conclude that there  
und and reason for these fears, and that  
h not planted them in us to no purpose.  
-Thus it appears, that suits at law are  
in themselves, but may lawfully be used,  
no unlawfulness in the ground and way  
ment. *Kettlewell.*—Upon that prince's  
hough the grounds of our quarrel with  
d received no manner of addition, yet  
bought fit to alter his sentiments. *Swift.*  
raculous increase of the professors of

Christianity was without any visible grounds and  
causes, and contrary to all human probability and  
appearance. *Atterbury.* 15. The field or place of  
action —

Here was thy end decreed, when these men  
rose;

And ev'n with theirs this act thy death did bring,  
Or hasten'd at the least upon this ground. *Daniel.*  
16. The space occupied by an army as they fight,  
advance, or retire.—At length the left wing of the  
Arcadians began to lose ground. *Sidney.*—

Heartless they fought, and quitted soon their  
ground,

While our's with easy victory were crown'd.  
*Dryden.*

—He has lost ground at the latter end of the day,  
by pursuing his point too far, like the prince of  
Conde at the battle of Seneffe. *Dryden's Fables,*  
*Preface.* 17. The intervening space between the  
flyer and pursuer.—

Ev'ning mist,  
Ris'n from a river, o'er the marsh glides,  
And gathers ground fast at the labourer's heels,  
Homeward returning. *Milton's Paradise Lost.*

—Superiors think it a detraction from their merit  
to see another get ground upon them, and over-  
take them in the pursuits of glory. *Spectator.*—

Even whilst we speak our conqueror comes on,  
And gathers ground upon us every moment.  
*Addison.*

18. The state in which one is with respect to op-  
ponents or competitors.—

Had'st thou sway'd as kings should do,  
Giving no ground unto the house of York,  
They never then had sprung. *Shak. Henry VI.*  
If they get ground and vantage of the king,  
Then join you with them like a rib of steel,  
To make them stronger. *Shak. Henry IV.*

—He will stand his ground against all the attacks  
that can be made upon his probity. *Atterbury.*—  
Whatever ground we may have gotten upon our  
enemies, we have gotten none upon our vices, the  
worst enemies of the two: but are even subdued  
and led captive by the one, while we triumph so  
gloriously over the others. *Atterbury.* 19. State  
of progress or recession.—I have known so many  
great examples of this cure, and heard of its being  
so familiar in Austria, that I wonder it has gained  
no more ground in other places. *Temple.*—The  
squirrel is perpetually turning the wheel in her  
cage: she runs apace, and wearies herself with  
her continual motion, and gets no ground. *Dryden.*

20. The foil to set a thing off.—  
Like bright metal on a fullen ground,  
My reformation glittering o'er my fault,  
Shall shew more goodly, and attract more eyes,  
Than that which hath no foil to set it off. *Shak.*

(2.) GROUND, in etching, denotes a gummous  
composition smeared over the surface of the metal  
to be etched, to prevent the aquafortis from eat-  
ing except in such places where this ground is cut  
through with the point of a needle. See ETCHING.

(3.) GROUND, in painting, (§ 1. def. 9.) is pro-  
perly understood of such parts of the piece, as have  
nothing painted on them, but retain the original  
colour upon which the other colours are applied  
to make the representations. A building is said to  
serve as a good ground to a figure when the figure is  
painted

painted on the building. The ground behind a picture in miniature, is commonly blue or crimson imitating a curtain of satin or velvet.

(4.) \* **GROUND.** The preterite and part. pass. of *grind*.—

How dull and rugged, ere 'tis *ground*

And polish'd, looks a diamond. *Hudibras.*

(5.) \* **GROUND** is much used in composition for that which is next the ground, or near the ground.

\* **To-GROUND.** *v. n.* [from the noun.] 1. To fix on the ground. 2. To found, as upon cause, reason, or principle.—Wisdom *groundeth* her laws upon an infallible rule of comparison. *Hooker.*—The church of England, walking in the good and old way of the orthodoxal primitive fathers, *groundeth* the religious observation of the Lord's-day, and of other Christian holidays, upon the natural equity, and not upon the letter of the fourth commandment. *White.*—It may serve us to *ground* conjectures more approaching to the truth than we have hitherto met with. *Boyle.*—

If your own actions on your will you *ground*,

Mine shall hereafter know no other bound. *Dryd.*

—Some eminent spirit, having signalized his valour, becomes to have influence on the people, to grow their leader in warlike expeditions; and this is *grounded* upon the principles of nature and common reason, which, where prudence and courage are required, rather incite us to fly to a single person than a multitude. *Sapient.*—3. To settle in firm principles or rudiments of knowledge.—Being rooted and *grounded* in love. *Eph. iii. 17.*

**GROUND ANGLING**, fishing under water without a boat, only with a plumb of lead, or a bullet, placed about 9 inches from the hook; which is better, because it will roll on the ground. This method of fishing is most proper in cold weather, when the fish swim very low. The morning and evening are the chief seasons for the ground-line in fishing for trout; but if the day prove cloudy, or the water muddy, you may fish at ground all day.

\* **GROUND-ASH.** *n. f.* A saplin of ash taken from the ground; not a branch cut from a tree.—

A lance of tough *ground-ash* the Trojan threw,

Rough in the rind, and knotted as it grew. *Dryd.*

—Some cut the young ashes off about an inch above the ground, which causes them to make very large straight shoots, which they call *ground-ash*. *Mortimer's Husbandry.*

\* **GROUND-BAIT.** *n. f.* [from *ground* and *bait*.] A bait made of barley or malt boiled; which, being thrown into the place where you design to angle, sinks to the bottom, and draws the fish to it.—Take the depth of the place, where you mean after to cast your *ground-bait*, and to fish. *Walton's Angler.*

\* **GROUNDLEDLY.** *adv.* [from *grounded*.] Upon firm principles.—He hath given the first hint of speaking *groundedly*, and to the purpose, upon this subject. *Glanville.*

\* **GROUND-FLOOR.** *n. f.* [from *ground* and *floor*.] The lower story of a house.

(1.) \* **GROUND IVY.** *n. f.* *Ledera terrestris*, Lat. Alehoof, or tunhoof.—Alehoof or *ground ivy* is, in my opinion, of the most excellent use and virtue of any plants among us. *Temple.*

(2.) **GROUND-IVY**, in botany. See **GLECK**

\* **GROUNDLESS.** *adj.* [from *ground*.] of reason; wanting ground.—

But when vain doubt and *groundless* fear  
Do that dear foolish bosom tear.

—We have great reason to look upon the pretensions which the Roman church makes miracles as *groundless*, and to reject her various fabulous accounts of them. *Atterbury.*—They who distinguish themselves by their zeal against the present establishment, should be careful to pay such a reverence for religion, as may show *groundless* that reproach is which is cast upon them, of being averse to our national *Freeholder.*

\* **GROUNDLESSLY.** *adv.* [from *groundless*.] Without reason; without cause; without reason.—Divers persons have produced their words by spirit of vitriol, or juice of lemons; but *groundlessly* ascribed the effect to some quality of those two liquors. *Boyle on Colours.*

\* **GROUNDLESSNESS.** *n. f.* [from *groundless*.] Want of just reason.—He durst not utter words either of my book or sermons, lest he should have discovered the notorious *groundlessness* of his calumny. *Tillotson.*

\* **GROUNDLING.** *n. f.* [from *ground*.] which keeps at the bottom of the water; one of the low vulgar. *Hanmer.*—It offends the soul, to hear a robustious perriwig-pate low tear a passion to tatters, to very rag, to the ears of the *groundlings*. *Shakespeare's Hamlet.*

\* **GROUNDLY.** *adv.* [from *ground*.] In principles; solidity; not superficially. No use.—A man, *groundly* learned already, may much profit himself, in using by epitome to other men's works, for his own memory like to shorter room. *Ascham.*

**GROUND-NUTS.** See **ARACHIS.**

\* **GROUND-OAK.** *n. f.* [from *ground* and *oak*.] The planting of oaks were more in use for the woods, it would spoil the coopers trade in making of hoops, either of hazel or ash; but one hoop made of the young shoots of a *ground-oak*, would outlast six of the best ash. *Mortimer.*

(1.) \* **GROUND-PINE.** *n. f.* [*clavaria piperis*, L.] A plant.—The whole plant has a very strong smell, resembling that of resin; whence its name *ground-pine*. It grows on dry and barren ground, and in some places on the ditch banks by sides. *Hill's Mat. Med.*

(2.) **GROUND-PINE**, in botany. See **TRUC**

\* **GROUND-PLATE.** *n. f.* [In architecture.] The outermost pieces of timber lying on or near the ground, and framed into one another with ties and tenons. In these also are mortises to receive the tenons of the joists, the struts and girders; and sometimes the trimmers of the stair case and chimney-way, and the binding of the roof. *Harris.*—In the orthographical scheme, should be a true delineation, if it be a building, of the several sizes of the *ground-plates*, summers, and beams. *Mortimer.*

\* **GROUND-PLOT.** *n. f.* 1. The ground which any building is placed.—Wretched *ground-plot*, where can't thou find any small *ground-plot* for hope to dwell upon? *Sidney.*—

*Plot* square five hives of bees contains; of industry and virtuous gains. *Harte*.  
 graphy of a building.

**D-RENT. n. f.** Rent paid for the pri-  
 viding on another man's ground.—A  
 , and thirty-three five sevenths deep,  
 in a *ground rent* of 5 pounds. *Arbut.*  
 : was neither granted him, nor giv'n ;  
 iture's, and the *ground rent* due to  
 'n

**D-ROOM. n. f.** A room on the level  
 ound.—I beseeched him, hereafter to  
 a *ground room*; for that otherwise it  
 possible for an artifit of any other kind  
 him. *Tasler*.

**OUNDSSEL. n. f.** [*grund* and *file*, the  
 , perhaps from *sella*, Lat.] The tim-  
 d pavement next the ground.—The  
 ne hath every one of its lights rabbet-  
 tside about half an inch into the frame;  
 : rabbits, but that on the *groundsel*,  
 square; but the rabbit on the *ground-*  
 downwards; that rain or snow may  
 fall off. *Moxon's Mechanical Exercises*.

**OUNDSEL. n. f.** [*senecio*, Lat.] A plant.  
**NDSEL.** See **BACCHARIS**, & **SENECIO**.  
**TACKLE, n. f.** a ship's anchors, cables,  
 general whatever is necessary to make  
 at anchor.

**NDWORK. n. f.** [*ground* and *work*.] 1.  
 ; the first stratum; the first part of  
 that to which the rest is additional.—  
 there is in heav'n's expanded plain,  
 when the skies are clear, is seen below,  
 als by the name of milky way;

*ndwork* is of stars. *Dryden's Fables*.  
 : part of an undertaking; the funda-  
 The main skill and *groundwork* will be  
 hem such lectures and explanations,  
 opportunity, as may lead and draw  
 ling obedience. *Milton*. 3. First prin-  
 cipal reason.—The *groundwork* thereof  
 lets true and certain, however they  
 orance disguise the same, or through  
 yer's *State of Ireland*.—The morals is  
 ments of the poet, as being the *ground-*  
 instruction. *Dryden*.

**ROUP. n. f.** [*groupe*, French; *gruppo*,  
 crowd; a cluster; a hurdle; a number  
 gether.—In a picture, besides the prin-  
 s which compose it, and are placed in  
 it, there are less *groups* or knots of  
 posed at proper distances, which are  
 piece, and seem to carry on the same  
 more inferior manner. *Dryden's Dufres*.  
 doubt but the poet had here in view  
 of *Zetus*, in the famous *group* of figures  
 sents the two brothers binding *Dircę*  
 s of a mad bull. *Addison*.—  
 ould try your graving tools.

ious *group* of fools. *Swift*.  
**UP, n.** in painting and sculpture, is an  
 of two or more figures of men, beasts,  
 ie like, which have some apparent re-  
 ch other. See **PAINTING**.

**ROUP. v. a.** [*groupper*, French.] To put  
 d; to huddle together.—The difficulty  
 ing and disposing, or as the painters

term it, in *grouping* such a multitude of different  
 objects, preserving still the justice and conformity  
 of style and colouring. *Prior*.

**GROUP ISLANDS, or } a cluster of islands lately**  
**The GROUPS, } discovered in the South**  
**Sea.** They lie in about S. Lat. 18. 12. and W.  
 Long. 142. 42. They are long narrow slips of  
 land, ranging in all directions, some of them ten  
 miles or upwards in length, but not more than a  
 quarter of a mile broad. They abound in trees,  
 particularly those of the cocoa nut. They are in-  
 habited by well made people, of a brown com-  
 plexion. Most of them carried in their hands a  
 slender pole about 14 feet in length, pointed like  
 a spear; they had likewise something shaped like  
 a paddle, about four feet long: Their canoes  
 were of different sizes, carrying from three to six  
 or seven people, and some of them hoisted a sail.

(1.) **GROUSE. n. f.** A kind of fowl; a heath-  
 cock.—

The squires in scorn will fly the house  
 For better game, and look for *grouse*. *Swift*.

(2.) **GROUSE, or GROWSE.** See **TETRAO**.  
**GROUT. n. f.** [*grut*, Saxon. In Scotland  
 they call it *grouts*.] 1. Coarse meal; pollard.—  
 King Hardicnute, 'midst Danes and Saxons rout,  
 Carous'd in nut-brown ale, and din'd on *grout*:  
 Which dish its pristine honour still retains.

And when each prince is crown'd in splendour  
 reigns. *King*.

2. That which purges off.—  
 Sweet honey some condense, some purge the  
*grout*;

The rest, in cells apart, the liquid nectar shout.  
*Dryden*.

3. A kind of wild apple. [*Agriomelum*, Latin.]  
**GROUTHEAD, or GREATHEAD, Robert,** a  
 learned bishop of Lincoln, born at Stow in Lin-  
 colnshire, or Stradbrook in Suffolk, in the end  
 of the 12th century. His parents were so poor,  
 that when a boy he was obliged to do the mean-  
 est offices, and even to beg his bread; till the  
 mayor of Lincoln, struck with his appearance and  
 the quickness of his answers to certain questions,  
 took him into his family, and put him to school.  
 Here his ardent love of learning, and admirable  
 capacity for acquiring it, soon appeared, and pro-  
 cured him many patrons, who enabled him to pro-  
 secute his studies, first at Cambridge, afterwards at  
 Oxford, and at last at Paris. In these three  
 famous seats of learning, he spent many years in  
 the most indefatigable pursuit of knowledge, and  
 became one of the best and most universal scholars  
 of the age. He was master not only of the French  
 and Latin, but also of the Greek and Hebrew lan-  
 guages, which was a very rare accomplishment  
 in those times. Roger Bacon, who was intimate-  
 ly acquainted with him, says that he spent much  
 of his time for almost 40 years in the study of  
 geometry, astronomy, optics, and other branches  
 of mathematical learning, in all which he very  
 much excelled. Theology was his favourite study,  
 in which he read lectures at Oxford with great  
 applause. In the mean time, he obtained several  
 preferments in the church, and was at length elec-  
 ted and consecrated Bp. of Lincoln, A. D. 1235.  
 In this station he soon became very famous, by  
 the purity of his manners, the popularity of his  
 preaching,

preaching, the vigour of his discipline, and the boldness with which he reprov'd the vices and oppos'd the arbitrary mandates of the court of Rome; of this last we shall give one example. Pope Innocent IV. had granted to one of his own nephews, named *Frederick*, who was but a child, a provision to the first canon's place in the church of Lincoln that should become vacant; and sent a bull to the Apb. of Canterbury, and Innocent, then papal legate in England, commanding them to see the provision made effectual; which they transmitted to the Bp. of Lincoln. But that brave and virtuous prelate boldly refused to obey this unreasonable mandate, and sent an answer to the papal bull containing the following severe reproaches against his holiness for abusing his power: "If we except the sins of Lucifer and Antichrist, there neither is nor can be a greater crime, nor any thing more contrary to the doctrine of the gospel, or more odious and abominable in the sight of Jesus Christ, than to ruin and destroy the souls of men, by depriving them of the spiritual aid and ministry of their pastors. This crime is committed by those who command the benefices intended for the support of able pastors, to be bestowed on those who are incapable of performing the duties of the pastoral office. It is impossible therefore that the holy apostolic see, which received its authority from the Lord Jesus Christ, for edification, and not for destruction, can be guilty of such a crime, or any thing approaching to such a crime, so hateful to God and so hurtful to men. For this would be a most manifest corruption and abuse of its authority, which would forfeit all its glory, and plunge it into the pains of hell." Upon reading this letter, his holiness became frantic with rage, and threatened to make the bishop an object of terror and astonishment to the whole world. "How dare (said he) this old, deaf, dotting fool, disobey my commands? Is not his master the king of England my subject, or rather my slave? Cannot he cast him into prison, and crush him in a moment?" But the cardinals brought the pope to think more calmly, and to take no notice of this letter. "Let us not (said they) raise a tumult in the church without necessity, and precipitate that revolt and separation from us, which, we know, must one day take place." Remarkable words, when we reflect when and by whom they were spoken! The bishop did not long survive this noble stand against the gross corruptions and tyranny of the church of Rome. He fell sick at his castle of Bugden that same year; and sensible that his death was drawing near, he called his clergy into his apartment, and made a long discourse to them, to prove that the reigning pope Innocent IV. was *Antichrist*. With this exertion his strength was so much exhausted, that he expired soon after, Oct. 9. 1253. A contemporary historian says, "He was a free and bold reprimander of the pope and the king; an admonisher of the prelates; a corrector of the monks; an instructor of the clergy a supporter of the studious; a censurer of the incontinent; a scourge and terror to the court of Rome; a diligent searcher of the scriptures; and a frequent preacher to the people. At his table he was hospitable, polite, and cheerful. In the

church he was contrite, devout, and sole in performing all the duties of his office venerable, active, and indefatigable." *trious Roger Bacon*, who had the best opportunities of forming a true judgment of the his learning, by perusing his works, and frequently conversing with him, hath given noutable testimony in his favour. *Grouthead Bp. of Lincoln*, and his fr *Adam de Maritico*, are the two most les in the world, and excel all the rest of both in divine and human knowledge; excellent prelate was a very voluminous and composed a prodigious number of a great variety of subjects in philosophy nity, a catalogue of which is given by

**GROUVILLE**, a small town in the Jersey, 3 miles E. of St Helier.

**GROUWE**, a town of the Batavian in the department of the Meuse, and prov. of Dutch Flanders, 5 miles NE. of

(1.) \* **To GROW**. *v. n.* preter. *grop*. *past. grown*. [*growan*, Saxon; *groya*, *r.* To vegetate; to have vegetable motion create by vegetation.—It is not the grass fruit that nourisheth man; but it is the which preserveth them. *Wisd.* xvi. 25.—seth the grass to *grow* for the cattle, and the service of man. *Pf.* civ. 14. 2. To be ced by vegetation.—In this country *grow* dance of that wood, which since is brought Europe to die red colours. *Abbat*.—*It grows* in the fields, at the first is like tennis-ball, and white; and after grows mushroom colour, and full of light dust.]

But say, where *grows* the tree? how far?

In colder regions men compose  
Poison with art; but here it *grows*.

Thousetow'rs of oak o'er fertile plains  
And visit mountains where they *ooce* &

3. To shoot in any particular form.—

Children, like tender oiers, take th  
And as they first are fashion'd, always  
*Dryd*

4. To increase in stature.—

I long with all my heart to see the p  
I hope he is much *grown* since last I sa  
*Shak.*

—The poor man had nothing, save one li  
lamb, which he had bought and reared  
it *grew* up together with him and with  
ren. 2 *Sam.* xii. 3. 5. To come to  
from infancy: commonly followed by  
the prince *groweth* up fast to be a man,  
a sweet and excellent disposition. *Bacon*  
*to Villiers*.—The main thing to be consi  
every action of a child, is how it will bec  
when he is bigger, and whether it will  
when he is *grown* up. *Locke*.—We are br  
to the world children, ignorant and u  
and we *grow* up in vanity and folly. *Wal*  
issue, as plants from a soil, or as bran  
the main trunk.—They will seem not  
him, but *growing* out of him. *Dryden's*  
*cation*. 7. To increase in bulk; to beco  
er, or more numerous.—Bones, after ful

me at a stay: as for nails they *grow* con-  
sily. *Bacon's Nat. Hist.*—

Then their numbers swell,

and *grow* upon us. *Denham.*

visions *grow* upon us, by neglect of practick  
: as every age degenerated from primitive  
they advanced in nice enquiries. *Decay of*

8. To improve; to make progress.—

in grace, and in the knowledge of our Lord

aviour Jesus Christ. *2 Pet. iii. 18.*—He then

led his best of legacies, his blessings; most

ately exhorting the young *growing* hopes

family. *Fell.*—As he *grew* forward in years

trained up to learning, under one Prona-

who taught the Pelasgick letter invented

ons. *Pope's Essay on Homer. 9.* To advance

state.—

ature, as it *grows* again towards earth,

union'd for the journey dull and heavy.

*Shak.*

by doubted whereunto this would *grow*.

24.—The king, by this time, was *grown*

an height of reputation for cunning and

that every accident and event that went

laid and imputed to his foresight. *Bacon.*

but when to ripen'd manhood he shall *grow*,

greedy sailer shall the seas forgo. *Dryd.*

to come by degrees; to reach any state gra-

—After they *grew* to rest upon number,

competent than vast, they *grew* to advan-

of place, cunning diversions, and the like;

they *grew* more skilful in the ordering of

battles. *Bacon.*—Verse, or the other harmony

me, I have so long studied and practis'd, that

are *grown* into a habit, and become familiar

to. *Dryden's Fables, Preface.*—The trespassers

people are *grown* up to heaven, and their sins

of beyond all restraints of law and authority.

11. To come forward; to gather ground.

the seeing the end of their government nigh,

ambitious practice *growing* up, which may

trouble to the next governor, will not at-

redress. *Spenser on Ireland.*—It was now the

beginning of October, and Winter began to *grow*

in: great rain, with terrible thunder and

hail, and mighty tempests, then fell abund-

antly. *Knolles. 12.* To be changed from one state

to another; to become either better or worse; to

—

A good man's fortune may *grow* out at heels.

*Shak.*

ipio Natica feared lest, if the dread of that

if were taken away, the Romans would *grow*

to idleness or civil dissension. *Abbot.*—

Hence, hence, and to some barbarous climate

fly,

which only brutes in human form does yield,

and man *grows* wild in nature's common field,

*Dryden.*

The nymph *grew* pale, and in a mortal fright,

sent with the labour of so long a flight.

*Dryden.*

Patient of command

time he *grew*; and *growing* us'd to hand,

waited at his master's board for food. *Dryd.*

he may trade and be busy, and *grow* poor by

unless we regulate our expences. *Locke.*—

will *grow* a thing contemptible, unless you

supply the loss of beauty with more durable

qualities. *Swift.*—Delos, by being reckoned a  
sacred place, *grew* to be a free port, where na-  
tions warring traded, as in a neutral country,  
*Arbutnot on Coins.*—

By degrees the vain, deluded elf,

*Grew* out of humour with his former self. *Harte.*

13. To proceed as from a cause or reason.—What

will *grow* out of such errors, as masked under the

cloak of divine authority, impossible it is that ever

the wit of man should imagine, 'till time have

brought forth the fruits of them. *Hooker.*—Shall

we set light by that custom of reading, from

whence so precious a benefit hath *grown*? *Hooker.*

—Take heed now that ye fail not to do this:

why should damage *grow* to the hurt of the king.

*Ex. iv. 22.*—Hence *grows* that necessary distinc-

tion of the saints on earth and the saints in heaven;

the first belonging to the militant, the second to

the triumphant church. *Pearson.*—The want of

trade in Ireland proceeds from the want of people;

and this is not *grown* from any ill qualities of the

climate or air, but chiefly from so many wars.

*Temple. 14.* To accrue; to be forthcoming.—

Ev'n just the sum that I do owe to you,

Is *growing* to me by Antipholia. *Shak.*

15. To adhere; to stick together.—

Honour and policy, like unfever'd friends,

I, th' war do *grow* together. *Shak.*

—The frog's mouth *grows* up, and he continues

so for at least six months without eating. *Walton.*

—In burnings and scaldings the fingers would

many times *grow* to the breast, and the arms to

the sides, were they not hindered. *Wise man's Sur-*

*gery. 16.* To swell: a sea term.—Mariners are

used to the tumbling and rolling of ships from side

to side, when the sea is never so little *grown*.

*Raleigh. 17.* The general idea given by this word

is procession or passage from one state to another.

It is always change, but not always increase; for

a thing may *grow* less, as well as *grow* greater.

2. To GROW, v. a. To plant; to raise. This

verb seems not to have been in use as an *active*

verb, when Dr Johnson compiled his dictionary;

nor does such use of it appear indeed to be sanc-

tioned by any good classical authority; though

within these few years some of the best modern

writers on agriculture use it in this sense; *to grow*

*corn* or *grain* being quite the current expression,

for what former authors would have called *raising*

it. This innovation on the English language,

appears to have arisen, not from *affiliation*, like

most of our other modern corruptions of style, but

from *ignorance* of the difference between an *active*

or *transitive* verb, and a *neuter* or *intransitive* one.

\* GROWER, n. f. [from *grow*.] An increaser.

It will *grow* to a great bigness, being the quickest

*grower* of any kind of elm. *Mort. Hayb.*

\* To GROWL, v. n. [*grown*, Flemish.] 1. To

snarl or murmur like an angry cur.—

They roam amid' the fury of their heart,

And *growl* their horrid loves. *Tobinson's Spring.*

—Dogs in this country are of the size of common

mastiffs, and by nature never bark, but *growl*

when they are provoked. *Ellis's Voyage. 2.* To

murmur; to grumble.—Othello, neighbours—how

he would roar about a foolish handkerchief! and

then he would *growl* so manfully. *Gay.*

\* GROWN. The participle of *grow*. 1.

Advanced

2. Product; production; thing produced; act of producing—

Forbidding every bleak unkindly fog

To touch the prosperous *growth* of this tall wood. *Milton.*

Our little world, the image of the great,

Of her own *growth* hath all that nature craves,  
And all that's rare, as tribute from the waves. *Waller.*

—The trade of a country arises from the native *growths* of the soil or seas. *Temple*—I had thought, for the honour of our nation, that the knight's tale was of English *growth*, and Chaucer's own. *Dryd.*

3. Increase in number, bulk, or frequency.—What I have tried, or thought, or heard upon this subject, may go a great way in preventing the *growth* of this disease, where it is but new. *Temple.* 4. Increase of stature; advance to maturity.—

They say my son of York

Has almost overtaken him in his *growth*.

*Shak. Rich. III.*

The stag, now conscious of his fatal *growth*,

To some dark covert his retreat had made.

*Denham.*

—Though an animal arrives at its full *growth* at a certain age, perhaps it never comes to its full bulk 'till the last period of life. *Arbutn on Aliva.*

—If parents should be daily calling upon God in a solemn deliberate manner, altering and extending their intercessions, as the state and *growth* of their children required, such devotion would have a mighty influence upon the rest of their lives. *Laau.* 5. Improvement; advancement.—It grieved David's religious mind to consider the *growth* of his own estate and dignity, the affairs of religion continuing still in the former manner. *Hooker.*

(2.) GROWTH, the gradual increase of bulk and stature that takes place in animals or vegetables, to a certain period. The increase of bulk in human bodies, as have no life, owing to ornamentation, and the increase of stature, owing to the growth of the bones, and the increase of the soft parts, and the increase of the blood, and the increase of the fluids, and the increase of the organs, and the increase of the system, and the increase of the whole.

17; counting of the bread, water; but his limbs soon became able, and his body beginning grew up in so extraordinary age of 5 years he measured 4 months after, he was four feet at six, 5 feet, and bulky in proportion was so rapid, that every measure required to be made longer and not preceded by any sickness with any pain in the groin or age of 5 years his voice changed to appear, and at six he had 30; in short all the unquietness were visible in him. It was country but this child was, in a condition of begetting or induced the refusal of the part his mother to keep him from conversation with children of his wit was riper than is common the age of 5 or 6, yet its proportion to that of his body.

still retained something child bulk and stature, he resembled which at first sight produced contrast. His voice was strong great strength rendered him labour of the country. At 5, good distance 3 measures of when turned of six, he could shoulders and carry loads of way off; and these exercised him as often as the curious to by some liberality. Some people think that he should giant. A mountebank was parents for him, and flattered of putting him in a way of mischief. But all his hopes were suddenly broken, and he died.

maturity. In some places of the East girls have children at 9 years of age. Instances of extraordinary growth are wrought. It seems at first view astonishing that children of such early and prodigious growth do not become giants; but when we consider the signs of puberty appear so much earlier than they ought, it seems evident that they grow more than usually rapidly, as in hot climates; and accordingly, instead of becoming giants, always die apparently of old age, long before the term of human life.

WTHEAD. } *n. f.* [from *grofs* or *great*  
WTNOL. } *head: capito, Latjn.*] 1.  
fish. *Ainsw.* 2. An idle lazy fellow.

leeping one hour refresheth his song,  
not Hob *groathead* for sleeping too

*Tusser.*  
[E, a river of Spain, in Galicia, which  
ie Bay of Biscay, at Corunna.

DANSKY, a town of Croatia, 5 miles  
ovi.

NGEN, a town of Germany, in the  
urtemberg, 10 miles NE. of Tubingen,  
.. of Stuttgart.

O. See PORTO GRUARO.

RUB. *n. f.* [from *grubbing*, or mining.]  
worm that eats holes in bodies.—There  
ce between a *grub* and a butterfly, and  
utterly was a *grub*. *Shak. Coriolanus*.—  
New creatures wife,

3 mafs at first, and short of thighs;  
oting out with legs, and imp'd with  
;s,  
s proceed to bees with pointed stings.

*Dryden.*  
The *grub*,  
serv'd, invades the vital core;  
s tenant! and her secret cave  
hourly, preying on the pulp

*Philips.*  
hick man; a dwarf. In contempt.—  
ne, a short clownish *grub*, would bear  
carcase of an ox, yet never tugged  
screw.

s, in zoology, is the English name of  
le worms, produced from the eggs of  
and which at length are transformed  
insects of the same species with their  
re ERUCA, § 1.

VB. *v. a.* [*graban*, preter. *grob* to dig,  
To dig up; to destroy by digging; to  
the ground; to eradicate by throwing  
he soil.—A foolish heir caus'd all the  
hedges about his vineyard to be *grub-*  
*str.*—

Forest land,  
ence the surly ploughman *grubs* the  
l. *Dryden.*  
*bing* up of woods and trees may  
ful, upon the account of their un-  
*Mortimer*.—As for the thick woods,  
nly Virgil but Homer mentions, they  
them *grubbed* up, since the promon-  
n cultivated and inhabited. *Addison*.

PART. II.

GRUBBING, in agriculture, the digging or  
pulling up the stubs and roots of trees. When  
the roots are large, this is a very troublesome and  
laborious task; but Mr Mortimer shows how it  
may be accomplished, in such a manner as to save  
great expence, by a very simple and easy method.  
He proposes a strong iron hook to be made about  
2 feet 4 inches long, with a large iron ring fasten-  
ed to the upper part of it. This hook must be  
put into a hole in the side of the root, to which  
it must be fastened; and a lever being put into the  
ring, 3 men, by means of this lever, may wring  
out the root, and twist the sap-roots asunder.  
Stubs of trees may also be taken up with the same  
hook, in which work it will save a great deal of  
labour, though not so much as in the other; be-  
cause the stubs must be first cleft with wedges,  
before the hook can enter the sides of them, to  
wrench them out by pieces.

\* To GRUBBLE. *v. n.* [*grubelen*, German;  
from *grub*.] To feel in the dark.—

Thou hast a colour;  
Now let me rowl and *grubble* thee:  
Blind men say white feels smooth, and black  
feels rough:

Thou hast a rugged skin; I do not like thee.

*Dryden.*  
GRUBE, a town of Germany, in the duchy of  
Holstein, 12 miles NNE. of Cismar.

GRUBEN, a town of Silesia in Neisse.

(1.) GRUBENHAGEN, a principality of Brun-  
swick, belonging to his majesty as elector of Hano-  
ver. It is partly fertile, but the greater part is  
mountainous, and, besides feeding a great number  
of sheep and black cattle, abounds with mines of  
silver, copper, lead, iron, sulphur, calamine,  
and zinc; quarries of marble, slates, lime-stone,  
alabaster, and jasper of different kinds. It has al-  
so some mines of gold, but these are not rich.  
The forests abound with oak, beech, firs, elms,  
&c. The inhabitants are Lutherans, and carry  
on linen manufactures. Eimbeck is the capital.

(2.) GRUBENHAGEN, a town and castle in the  
above principality, 6 miles NW. of Nordheim, 7  
SSW. of Eimbeck, and 45 S. of Hanover. Lon-  
9. 36. E. Lat. 51. 49. N.

\* GRUBSTREET. *n. f.* Originally the name  
of a street near Moorfields in London, much in-  
habited by writers of small histories, dictionaries,  
and temporary poems; whence any mean produc-  
tion is called *grubstreet*.—

και Ιθακη μι' ειδλα, μι' αλγη σικρα  
Λοσσασις' ην υδωσ ινασσηαι.

—The first part, though calculated only for the  
meridian of *grubstreet*, was yet taken notice of by  
the better sort. *Arbutnot*.—

I'd sooner ballads write, and *grubstreet* lays.

*Gay.*  
GRUCIUS, Nicolas, a French author, of the  
16th century, born at Rouen, and nobly descend-  
ed. He is said to have been the first who lectured  
on Aristotle in Greek. He wrote several works;  
the chief of which are 1. A treatise *De Comitibus*  
*Romanorum*: 2. Tracts against Sigonius: and, 4.  
A Translation of Castanedo's History of the Indies.  
He died at Rochelle, in 1572.

GRUCKFELDT, a town of Germany, in Ca-  
riutbia,

rinthia, with a fort on the Save. Lon. 15. 45. E. Lat. 46. 7. N.

GRUDACK, a town of Poland, in the palatinate of Lemberg, 28 miles SW. of Lemberg.

GRUDECK, three towns of Poland: viz. 1. in the palatinate of Braclaw, 28 miles E. of Braclaw: 2. in that of Kiow, 50 miles WNW. of Bialaerkiow: and, 3. in that of Podolia, 32 miles W. of Kaminiac.

GRUDEIANDS. See GRAUDENTZ.

\* GRUDGE. *n. s.* [from the verb.] 1. Old quarrel; inveterate malevolence; sullen malice.—Many countries about her were full of wars, which, for old grudges to Corinth, were thought still would conclude there. *Sidney*.—

Two household's, both alike in dignity,  
From ancient grudge break to new mutiny,  
Where civil blood makes civil hands unclean.

*Shakest.*

Let me go in to see the generals:  
There is some grudge between 'em; 'tis not meet  
They be alone.

*Shak. Julius Cæsar.*

Deep fester'd hate:

A grudge in both, time out of mind, begun,  
And mutually bequeath'd from sire to son.

*Tate's Juvenal.*

2. Anger; ill-will.—

The god of wit, to shew his grudge,  
Clapt his ears upon the judge.

*Swift.*

3. Unwillingness to benefit.—

Those to whom you have

With grudge preferr'd me. *Ben Jonf. Catiline.*

4. Envy; odium; invidious censure. 5. Remorse of conscience. *Ainsworth.* 6. Some little commotion, or forerunner of a disease. *Ainsworth.*

(1.) \* To GRUDGE. *v. a.* [from *gruger*, according to *Skinner*, which in French is to grind or eat. In this sense we say of one who resents any thing secretly, *he chews it.* *Grugnach*, in Welsh, is to murmur; to grumble. *Grunigh*, in Scotland, denotes a grumbling morose countenance.] 1. To envy; to see any advantage of another with discontent.—What means this baptising me from your counsels? Do you love your sorrow so well, as to grudge me part of it? *Sidney*.—

'Tis not in thee

To grudge my pleasures, to cut off my train.

*Shak. K. Lear.*

He struggles into birth, and cries for aid;

Then helpless in his mother's lap is laid:

He creeps, he walks; and, issuing into man,

Grudges their life from whence his own began.

*Dryden.*

These clamours with disdain he heard,

Much grudg'd the praise, but more the rob'd  
reward.

*Dryden.*

—Do not, as some men, run upon the tilt, and taste of the sediments of a grudging uncommunicative disposition. *Spec.*—Let us consider the in-exhausted treasures of the ocean; and though some have grudged the great share that it takes of the surface of the earth, yet we shall propose this too, as a conspicuous mark and character of the wisdom of God. *Bentley*.—I have often heard the Presbyterians say they did not grudge us our employments. *Swift.* 2. To give or take unwillingly.

Let me at least a funeral marriage crave,  
Nor grudge my cold embraces in the grave. *Dryd.*

—They have grudged those contributions have set our country at the head of all the ments of Europe. *Addison.*

(2.) \* To GRUDGE. *v. n.* 3. To murmur; to repine.—They knew the force of that curse, whereunto idolatry maketh subject there cause why the guilty sustaining it should grudge or complain of injustice. *1 Pet.* We do not grudge or repine at our port are contented with those circumstances; providence of God hath made to be our lot 2. To be unwilling; to be reluctant.—Make they go with as great grudging to serve in jesty's ships, as if it were to be slaves in *Res. Raleigh*.—

You steer betwixt the country and the  
Nor gratify whate'er the great desire,  
Nor grudging give what publick needs

*Dryden.*

3. To be envious.—Grudge not one another, brethren, lest ye be condemned. *Ja*

4. To wish in secret. A low word.—

E'en in the most sincere advice he gave

He had a grudging still to be a knave.

5. To give or have any uneasy remnant. not whether the word in this sense be *grugeons*, or remains; *grugeons* being the corn that remains after the fine meal has the sieve.—

My Dolabella,

Hast thou not still some grudgings of the

\* GRUDGINGLY. *adv.* [from *grudge* willingly; malignantly; reluctantly.—

Like harpies they could scent a plenteous

Then to be sure they never fail'd their

The rest was form, and bare attendance

Then drank and eat, grudgingly obey'd

GRUDOCZICZE, a town of Poland Russia, 24 miles WSW. of Halitsch.

GRUDOLO, a town of Naples, in the of Abruzzo Citra, 14 miles SE. of Solina

GRUE, Thomas, a French writer, in his translations of English works into French, among these were Rofs's History of all, and Rogers's Gate opened to the knowledge of Paganism. He died about the end of the century.

(1.) GRUEB, a town of Austria, 5 miles of Horn.

(2.) GRUEB, a town of Stiria, 6 miles of Voithberg.

\* GRUEL. *n. s.* [*gruan*, *gruelle*, French made by boiling oatmeal in water; an mixture made by boiling ingredients in

Finger of birth-strangl'd babe,

Ditch-deliver'd by a drab;

Make the gruel thick and slab. *Shak.*

Was ever Tartar fierce or cruel?

Upon the strength of water gruel?

—Gruel made of grain, broths, mak much hopped, posset-drinks, and in general ever relaxeth. *Arbutnot.*

\* GRUFF. *adj.* [*gruff*, Dutch.] Sour harsh of manners.—

Around the fiend, in hideous order

Foul bawling infamy and bold debate

Gruff discontent, thro' ignorance mist

ellation of honour was such an one the  
one the stocky. *Addison.*

FLY. *adv.* [from *gruff*.] Harshly; rug-  
ghly.—

orn of Mars high on a chariot stood,  
h'd in arms, and *gruffly* look'd the god.

*Dryden.*

RUGGEDNESS. *n. f.* [from *gruff*.] Ruggedness  
ardness of look or voice.

GRUFF, a river of Scotland, in Rosa-shire,  
over a precipice in the parish of Ed-  
co yards in perpendicular height.

ALF'S, [from *grus*, a crane.] the 14th  
anus's Fragments of a Natural Method.  
y. *Luce.*

GRUB, a town of Bohemia, in the circle  
ratz, 19 miles E. of Geyersberg.

GRUBERG, a town of Upper Saxony,  
ia, 4 miles S. of Sangerhausen.

GRUB, *adj.* [contracted from *grumble*.] Sour;  
e. A low word.—Nie looked sour and  
would not open his mouth. *Arbutnot.*

GRUBACH, a river of Upper Saxony,  
into the Saal, 4 m. NE. of Weissenfels.

GRUBACH, a town of the French repub-  
dep. of the Rhine and Nahe, and late  
grave, 23 miles N. of Deux Ponts,

of Lutereck.

GRUBACH, a town of Upper Saxony, in  
viate of Meissen, 2 miles S. of Wildorf.

GRUBACH, UNDER, } two towns of Ger-  
GRUBACH, UPPER, } many, in the circle

er Rhine, and bishopric of Spire, the  
iles, and the latter 4, SW. of Bruchsal.

GRUMBLE. *v. n.* [from *grummelen*, *grommen*,  
To murmur with discontent.—

A bridegroom,  
ling groom, and that the girl shall find.

*Shakefp.*

*grumbling* thunder join thy voice.

*Motteux.*

Like a storm  
thers black upon the frowning sky,  
mbles in the wind. *Rowe's Royal Convert.*

Vapours foul  
the mountain's brow, and shake the woods

umbling wave below. *Thomson's Winter.*

\* GRUMBLER. *n. f.* [from *grumble*.] One that  
grumbles; a murmurer; a discontented man.—

The half-pence are good half-pence, and I will  
stand by it: if I made them of silver, it would be  
the same thing to the *grumbler*. *Swift.*

\* GRUMBLING. *n. f.* [from *grumble*.] A mur-  
muring through discontent; a grudge.—

I have seiv'd

Without or grudge or *grumbings*. *Shak. Temp.*

\* GRUME. *n. f.* [from *grumeau*, Fr. *grumus*, Lat.]  
A thick viscid consistence of a fluid; as the white  
of an egg; or clot like cold blood. *Quincy.*

\* GRUMLY. *adv.* [from *grum*.] Sullenly; mo-  
rosely.

(1.) \* GRUMMEL. *n. f.* [*Lithospermum*, Latin.]  
An herb.

(2.) GRUMMEL. See LITHOSPERMUM.

GRUMO, a town of Naples, in the province  
of Bari, 3½ miles SSW. of Bidetto.

(1.) \* GRUMOUS. *adj.* [from *grume*.] Thick;  
clotted.—The blood, when let, was black, *gru-*

*mous*, the red part without a due consistence, the  
serum saline, and of a yellowish green. *Arbutnot.*

(2.) GRUMOUS BLOOD, by its viscosity and stag-  
nating in the capillary vessels, produces disorders.

\* GRUMOUSNESS. *n. f.* [from *grumous*.]  
Thickness of a coagulated liquor.—The cause may  
be referred either to the coagulation of the serum,

or *grumousness* of the blood. *Wifeman.*

(1.) GRUNAU, a town of Lower Saxony, in  
the duchy of Lauenburg, 18 m. NNE. of Mollen.

(2.) GRUNAU, a town of Silesia, in Neisse.

(1.) GRUNBERG, a town of Germany, in Up-  
per Hesse, 10 miles E. of Greiffen, and 28 W. of  
Fulda. The French kings of the Merovingian  
race, and Charlemagne, held their courts in it.

(2.) GRUNBERG, a town of Silesia, in Glogau,  
surrounded with vineyards; 12 miles N. of Frey-  
stadt, and 24 NW. of Great Glogau. It has a  
manufacture of cloth.

GRUND, or } a town of Brunswick, in the  
GRUNDE, } Hartz Forest, 12 miles SW. of  
Goslar. Lon. 13. 35. E. Lat. 52. 10. N.

GRUNDEL SEE, a lake of Germany, in Stiria,

(1.) GRUNDLBACH, a river of Franconia,  
which runs into the Rednitz, 3 miles S. of Erlang.

(2.) GRUNDLBACH, a town of Franconia, in Nu-  
remberg, 4 m. S. of Erlang, and 6 N. of Nuremberg.

GRUNEBERG, a town of Brandenburg.

GRUNER, John Frederic, an eminent German  
author, born at Cobourg, in 1723. He published

1. *Miscellanea Sacra*; 2. An introduction to Ro-  
man Antiquities; 3. Critical Remarks on the Clas-  
sics; and, 4. A new edition of Cœlius Sædullius,

with commentaries. He died in 1778.

GRUNFEID. See GRUNSFELD.

GRUNHAYN, a town of Saxony, in Erzge-  
burg, 15 miles S. of Chemnitz, and 46 WSW. of  
Dresden.

GRUNHOFF, a town of Courland.

(1.) GRUNINGEN, a town of the Helvetic re-  
public, capital of a ci devant bailiwick, in Zurich;  
12 miles E. of Zurich. It has a castle on a rock,  
which has an extensive prospect. Lon. 8. 43. E.

Lat. 47. 14. N.

(2.) GRUNINGEN, a town of Germany, in Hal-  
berstadt, on the Boden, 15 miles E. of Halber-  
stadt. Lon. 11. 41. E. Lat. 52. 4. N.

GRUN-SEE, a lake of Bavaria.

\* GRUNSEL. *n. f.* [More usually *groundfil*, unless Milton intended to preserve the Sax. *grund*.] The groundfil; the lower part of the building.—

Never came one

Who mourn'd in earnest, when the captive ark  
Maim'd his brute image, head and hands lopp'd  
off

In his own temple, on the *grundel* edge.

Where he fell flat, and sham'd his worshippers.

*Milton.*

GRUNSFELD, a town in Franconia, in the bishopric of Wurzburg, 6 miles NNW. of Merгентheim.

GRUNSTADT, a town of Germany, in the late county of Leiningen, now included in the French republic, and department of Mont Tonnerre; 28 miles S. of Mentz.

(1.) \* GRUNT. *n. f.* [from the verb.] The noise of a hog.—

Swine's snouts, swine's bodies, took they,  
bristles, *grunts*. *Chapman.*

Ran cow and calf, and family of hogs,

In panick horror of pursuing dogs;

With many a deadly *grunt* and doleful squeak,

Poor swine, as if their pretty hearts would break.

*Dryden.*

From hence were heard

The *grunts* of bristled boars, and groans of bears,  
And herds of howling wolves. *Dryden's Æn.*

(2.) GRUNT, in geography, a town of Austria, near Gundersdorf.

\* To GRUNT. To GRUNTLE. *v. n.* [*grunnie*, Latin.] To murmur like a hog.—

And neigh, and bark, and *grunt*, and roar and  
burr.

Like horse, hound, hog, bear, fire at every  
turn. *Shakespeare.*

Lament, ye swine! in *gruntings* spend your  
grief;

For you, like me, have lost your sole relief. *Gay.*

Thy brinded boars may slumber undismay'd,

Or *grunt* secure beneath the chestnut shade. *Tickel.*

The scolding quean to louder notes doth rise,

To her full pipes the *grunting* hog replies;

The *grunting* hogs alarm the neighbours round.

*Swift.*

\* GRUNTER. *n. f.* [from *grunt*.] 1. He that grunts. 2. A kind of fish. [*grunus*.]

\* GRUNTLING. *n. f.* [from *grunt*.] A young hog.

GRUPPO, or TURNED SHAKE, a musical grace, defined by Playford to consist in the alternate prolation of two tones in juxtaposition to each other, with a close on the note immediately beneath the lower of them.

(1.) GRJUS, in antiquity, a dance performed yearly by the young Athenians around the temple of Apollo, on the day of the Delia. The motions and figures of this dance were very intricate, and variously interwoven; some of them being intended to express the windings of the labyrinth where-in the Minotaur was killed by Theseus.

(2.) GRUS, in astronomy, a southern constellation, not visible in our latitude. The number of stars in this constellation, according to Mr Sharp's Catalogue, is 13.

(3.) GRUS, in ornithology. See ARDEA, N° 3.

GRUSUE, a town of Norway, 6 m. N. of

\* GRUTCH. *n. f.* [from the verb.] Ill-will.—

In it he melted leaden bullets,

To shoot at foes, and sometimes pullet

To whom he bore so fell a *grutch*,

He ne'er gave quarter t' any such. *B.*

\* To GRUTCH. *v. n.* [corrupted for the rhyme from *grudge*.] To envy; to repine discontented. Not used.—

The poor at the enclosure doth *grate*  
Because of abuses that fall,

Lest some men should have but too  
And some again nothing at all. *Taylor.*

But what we're born for we must be

Our frail condition it is such,

That what to all may happen here,

If't chance to me I must not *grutch*. *B.*

GRUTEN, a town of Germany, in the Westphalia and duchy of Berg, 3 m. of Medman.

GRUTER, James, a learned philologist of the most laborious writers of his age, born at Antwerp in 1560. He was bred when his father and mother, being perished the Protestant religion by the dukes of governers of the Netherlands, carried to England. He imbibed the elements of from his mother, who was one of the most ed women of the age, and besides French and English, was a complete mistress of and well skilled in Greek. He studied bridge, afterwards at Leyden, and at last himself wholly to polite literature, although much he became professor in the university of Heidelberg; near which city he died. He wrote many works; the principal are a large collection of ancient inscriptions, *fastus criticus*, 3. *Deliciae poetarum Galliarum, & Belgarum*, &c.

GRUTLIN, a plain of the Helvetic near the Lake of the Four Cantons, in the of Uri, famous for being the scene of the liberation of the 3 first cantons, in defence of liberty. A. D. 1307.

GRUYERES, } a town, and ci-devant  
GRUYERS, } and bailiwick, of the  
GRUYIRES, } republic, in the c  
Friburg, famous for cheese; which is exported considerable amount to France, Germany, &c. A dangerous insurrection broke out in 1781, which threatened the destruction of Friburg, before it was quelled by the of troops from Bern. It lies 15 miles S. of Lon. 7. 23. E. Lat. 46. 35. N.

GRUYNINGEN, a town of the Ba public, in the dept. of the Meuse, and prov. of Zealand, and in the isle of S. B.

GRUZINO, a town of Russia, in the Novgorod, 40 miles N. of Novgorod.

(1.) \* GRY. *n. f.* [220.] Any thing of less as, the paring of the nails. *Dry.*

(2.) GRAY, a measure containing one line. A line is one-tenth of a digit, or one tenth of a foot, and a philosophical third of a pendulum, whose diadromes, in the latitude of 45 degrees, are to one second of time, or one 60th of a

LUS, the son of Xenophon, who slew  
 the Theban general EPAMINONDAS,  
 and himself at the battle of Mantinea,  
 371. Xenophon, who was sacrificing  
 at the altar of his death, instantly threw  
 out upon being farther informed, that  
 he was slain by the enemy's general, immediate-

LYUS, in entomology, a genus of insects,  
 of the order of hemiptera, comprehending  
 the locusts, and grass hoppers. The  
 characters are these: The head is inflexed,  
 furnished with palpi; the wings are  
 setaceous, and furnished with palpi; the  
 membrane of the species are setaceous; in  
 the male; The wings are directed towards  
 the sides of the body; the membrane  
 is folded up, so as to be concealed  
 under the elytra. All the feet are armed with two  
 claws, the hind ones are formed for leaping.  
 The elytra are subdivided into five different sections,  
 viz. the *Acridæ*, *Bullæ*, *Achetæ*, *Tet-*  
*Locustæ*. All the GRYLUS, except  
 the *Achetæ*, devour other insects, live u-

The *Achetæ* feed chiefly upon the  
 leaves of the *Stigonæ* and *Locustæ* upon the leaves.  
 ACHETA are distinguished by two  
 segments above the extremity of their ab-  
 domens, having 3 stemmata; and by the tarsus  
 consisting of 3 articulations. This family  
 includes the *Cricket*, on account of the  
 noise which the insect makes. There are 28 species  
 mentioned in the new edition of the *Systema*  
 which the most remarkable are the

ACHETA CAMPESTRIS, the  
 common cricket, and the DOMESTICUS (Nº 2.) are  
 of the same species, differing only  
 in their habits; the latter being paler col-  
 oured, and having more of a yellow cast, and  
 more of a brown. The antennæ are  
 nearly equal to the body, and nearly equal to the bo-

The head is large, and round, with  
 three smaller ones of a light yellow  
 colour on the edge of the depres-  
 sion of which originate the an-  
 tennæ. The thorax is broad and short. In the  
 elytra are longer than the body, vein-  
 ed, wrinkled on the upper part, crossed  
 over, and enfolding part of the ab-  
 domen, projecting at an angle on the sides: They  
 have a pale coloured band. In  
 the elytra leave one third of the ab-  
 domen, and scarcely cross each other;  
 all over of one colour, veined and  
 wrinkled; nor do they wrap round so much  
 underneath. The female, more-  
 over, at the extremity of its body a hard  
 point, as long as the abdomen, thicker at  
 the base, composed of two sheaths, which encom-  
 pass the ovipositor: This implement serves the in-  
 strument to deposit its eggs in the ground.  
 The male and female have two pointed soft

appendices at the extremity of the abdomen,  
 their hinder feet are much larger and longer than  
 the rest, and serve them for leaping. Towards  
 sunset is the time the *field gryllus*, or CRICKET,  
 likes best to appear out of his subterraneous habi-  
 tation. In White's *Natural History of Selbourne*,  
 (Letter 46.) a very pleasing account is given of the  
 manners and economy of these insects; which,  
 however, "are so shy and cautious, (he observes,)  
 that it is no easy matter to get a sight of them;  
 for, feeling a person's footsteps as he advances,  
 they stop short in the midst of their song, and re-  
 tire backward nimbly into their burrows, where  
 they lurk till all suspicion of danger is over. At  
 first it was attempted to dig them out with a spade,  
 but without any great success; for either the bot-  
 tom of the hole was inaccessible from its termina-  
 ting under a great stone; or else, in breaking up  
 the ground, the poor insect was inadvertently  
 squeezed to death. Out of one so bruised a mul-  
 titude of eggs were taken, which were long and  
 narrow, of a yellow colour, and covered with a  
 very tough skin. More gentle means were then  
 used, and proved successful: a pliant stalk of  
 grass, gently insinuated into the caverns, will probe  
 their windings to the bottom, and quickly bring  
 out the inhabitant; and thus the humane inquirer  
 may gratify his curiosity without injuring the ob-  
 ject of it. It is remarkable, that though these in-  
 sects are furnished with long legs behind, and  
 brawny thighs for leaping, like grasshoppers; yet  
 when driven from their holes they show no activi-  
 ty, but crawl along in a shiftless manner, so as  
 easily to be taken: and again, though provided  
 with a curious apparatus of wings, yet they never  
 exert them when there seems to be the greatest  
 occasion. The males only make that shrilling  
 noise, perhaps out of rivalry and emulation, as is  
 the case with many animals which exert some  
 sprightly note during their breeding time: it is rais-  
 ed by a brisk friction of one wing against the o-  
 ther. They are solitary beings, living singly male  
 or female, but there must be a time when the sexes  
 have some intercourse, and then the wings may  
 be useful perhaps during night. When the males  
 meet they fight fiercely, as our author found by  
 some which he put into the crevices of a dry stone  
 wall, where he wanted to have made them settle.  
 For though they seemed distressed by being taken  
 out of their knowledge, yet the first that got pos-  
 session of the chinks would seize on any that were  
 obtruded upon them with a vast row of serrated  
 fangs. With their strong jaws, toothed like the  
 shears of a lobster's claws, they perforate and  
 round their curious regular cells, having no fore  
 claws to dig, like the mole cricket. When taken  
 in the hand, they never offered to defend them-  
 selves, though armed with such formidable wea-  
 pons. Of such herbs as grow before the mouths  
 of their burrows they eat indiscriminately; and  
 on a little platform, which they make just by,  
 they drop their dung; and never, in the day  
 time, seem to stir more than two or three inches  
 from home. Sitting in the entrance of their cav-  
 erns, they chirp all night as well as day from the  
 middle of May to the middle of July: in hot wea-  
 ther, when they are most vigorous, they make the  
 hills echo; and in the stiller hours of darkness,  
 may

may be heard at a considerable distance. In the beginning of the season their notes are more faint and inward; but become louder as the summer advances, and so die away again by degrees. The shrilling of the *field cricket*, though sharp and stridulous, yet delights some hearers, filling their minds with ideas of every thing that is rural, and joyous. About the 10th of March, the crickets appear at the mouths of their cells, which they then open and shape very elegantly. All that ever I have seen at that season were in their pupa state, and had only the rudiments of wings, lying under a skin or coat, which must be cast before the insect can arrive at its perfect state; from whence I should suppose that the old ones of last year do not always survive the winter. In August their holes begin to be obliterated, and the insects are seen no more till spring. Not many summers ago I endeavoured to transplant a colony to the terrace in my garden, by boring deep holes in the sloping turf. The new inhabitants staid some time, and fed and sung; but wandered away by degrees, and were heard at a farther distance every morning; so that it appears that on this emergency they made use of their wings in attempting to return to the spot from which they were taken. One of these crickets, when confined in a paper cage and set in the sun, and supplied with plants moistened with water, will feed and thrive, and become so merry and loud as to be irksome in the same room where a person is sitting: if the plants are not wetted, it will die."

2. *Gryllus Acheta Domesticus*, the *Domestic*, or *Hearth cricket*, does not require to be sought after abroad for examination, nor is shy like the other sort: it resides altogether within our dwellings, intruding itself upon our notice whether we incline or not. It delights in new built houses; being, like the spider, pleased with the moisture of the walls. The softness of the mortar enables them to burrow and mine between the joints of the bricks or stones, and to open communications from one room to another. They are particularly fond of kitchens and bakers ovens, on account of their perpetual warmth. "Tender insects, (says Mr Whyte) that live abroad, either enjoy only the short period of one summer, or else doze away the cold uncomfortable months in profound slumbers; but these, residing as it were in a torrid zone, are always alert and merry: a good Christmas fire is to them like the heat of the dog-days. Though they are frequently heard by day, yet is their natural time of motion only in the night. As soon as it grows dusk, the chirping increases, and they come running forth, and are from the size of a flea to that of their full stature. As one should suppose, from the burning atmosphere which they inhabit, they are a thirsty race, and show a great propensity for liquids, being found frequently drowned in pans of water, milk, broth, or the like. Whatever is moist they affect; and therefore often gnaw holes in wet woollen stockings and aprons that are hung to the fire. These crickets are not only very thirsty, but very voracious; for they will eat the scummings of pots, yeast, salt, and crumbs of bread, and any kitchen offal and sweepings. In the summer we have observed them to fly, when it became

dusk, out of the windows, and over the bounding roofs. This feat of activity is for the sudden manner in which they leave their haunts, as it does for the method which they come to houses where they were known before. It is remarkable, that many of insects seem never to use their wings; but they have a mind to shift their quarters and new colonies. When in the air they move *latu undoso*," in waves or curves, like woodpeckers, opening and shutting their wings at a stroke, and so are always rising or sinking. When they increase to a great degree, as they once in the house where I am now writing become noisome pests, flying into the candle dashing into people's faces; but may be killed by gunpowder discharged into their crevices and crannies. In families, at such times, they are like Pharaoh's plague of frogs,—'in their chambers, and upon their beds, and in their dens, and in their kneading-troughs.' Their noise is occasioned by a brisk attrition of wings. Cats catch hearth crickets, and play with them as they do with mice, devouring them. Crickets may be destroyed, like wasps, with a glass half filled with beer, or any liquid, and their haunts; for being always eager to get out, they will crowd in till the bottles are full. A popular prejudice, however, frequently prevents their being driven away and destroyed: as people imagine that their presence brings a curse of luck to the house while they are in it, and it would be hazardous to destroy them.

ii. *Gryllus Acheta Gryllotalpa*, the *mole cricket*, is of a very unpleasing form, and head, in proportion to the size of its body, small and oblong, with a long thick palpus, and long antennæ as slender as threads. Behind the antennæ are situated the eyes, and between two eyes are seen three stemmata or lesser eyes mounting to five in all, set in one line transverse. The thorax forms a kind of cuirass, oblong, most cylindrical, which appears as it were a helmet. The elytra, which are short, reach to the middle of the abdomen, are crossed on the other, and have large black or brown fibres. The wings terminate in a point, not only than the elytra, but even than the abdomen. This latter is soft, and ends in two or three appendices of some length. But what attracts the chief singularity of this insect are its fore feet, that are very large and flat, with long legs, ending outwardly in a large serrated and inwardly in 2 only; between which are situated, and often concealed, the tarsus. The whole animal is of a brown dusky color, and haunts moist meadows, and frequents the banks and banks of streams, performing its functions in a swampy wet soil. With a fore feet curiously adapted to the purpose, it rows and works under ground like the mole, raising a ridge as it proceeds, but seldom rising up hillocks. As mole crickets often increase by the sides of canals, they are an unwelcome guest to the gardener, raising up ridges and rendering the subterraneous progress, and rendering the progress unsightly. If they take to the kitchen they occasion great damage among the

s, by destroying whole beds of cabbages, legumes and flowers. When dug out they are very slow and helpless, and make no use of their wings by day; but at night they come abroad, and make long excursions. In fine weather, about the middle of April, at the close of winter they begin to solace themselves with a low, jarring note, continued for a long time without interruption, and not unlike the chattering of the fern-owl, or goat sucker, but more inward. At the beginning of May they lay their eggs, Mr White informs us, who was once an eye-witness: "for a gardener at an house where he was on a visit, happening to be mowing on the bank of that month, by the side of a canal, his scythe struck too deep, pared off a large piece of earth, and laid open to view a curious scene of domestic economy. There were many caverns and winding passages leading to a kind of chamber, the floor of which was smoothed and rounded, and about the size of a moderate snuff-box. Within this secret nursery were deposited near 100 eggs of a dirty yellow colour, and enveloped in a tough skin, but too hard to be excluded to contain any rudiments of young, and full of a viscous substance. The eggs lay in shallow rows, and within the influence of the sun, and the soft under a little heap of fresh mowed mould, that which is raised by ants.—When mole-crickets fly, the move " *curfu undulo*," rising and falling in curves, like the other species mentioned in the text. In different parts of this kingdom people call them PEN-CRICKETS, *churr-swarms* and *evens*, all very opposite names."

**GRYLLI ACRIDÆ**, *Truxalides* of Fabricius, a CRICKET family properly so called; of which the characters are these. The head is of a conical form, and longer than the thorax; and the antennæ are ensiform, or sword shaped. Of this genus there are 8 species, none of them found in America.

**GRYLLI BULLÆ**, or *Acrydia* of Fabricius: these are distinguished by a kind of crest or elevation on the thorax; their antennæ are shorter than the thorax, and filiform; and their palpi are equal. The chief and most obvious distinction of this genus is the form of its thorax, which is prolonged, forming the whole body, and decreases to the extremity of the abdomen. This prolongation of the thorax stands instead of elytra, of which this genus is destitute. It has only wings under this section of the thorax. Linnæus mentions a species in the thorax; which, however, is often wanting. This species is every where to be met with in the fields, in woods, &c. There are 11 species, inhabitants of Europe and America. Among these the

**GRYLLUS BULLA BIPUNCTATUS** is of a dark brown colour; sometimes besprinkled with spots of a lighter hue.

**GRYLLI LOCUSTÆ**, (the *Grylli* of Fabricius) or LOCUSTS *unarmed at the tail*. This family is distinguished by having the tail purple, about the setæ of the *Acetæ*, or the tube of the *Tettigonia*; their antennæ are filiform, and shorter than the abdomen; they have 3 stemmata, and 3 joints to the tarsi. To part of this description, however, there is an exception in the

**GRYLLUS LOCUSTA GROSSUS**, the antennæ of which are of a cylindrical form. According to Mr Barbut, "few species vary so much in size and colours. Some of these insects are twice as long as others; the antennæ in most are filiform, but in this particular species cylindrical, composed of about 24 articulations, and but one fourth of the length of the body. As to colour, the small individuals are nearly quite red, spotted with black, with the under part of the body only of a greenish yellow. The larger subjects are all over of a greenish hue, the under part being of a deeper yellow; only the inside of the hinder thighs is red. But what characterises this species is, the form of the thorax, which has, above, a longitudinal elevation, attended by one on each side, the middle whereof drawing nigh to the first, forms a kind of X. Moreover, between the claws that terminate the feet, there are small sponges, but larger in this species than the rest. This species is to be met with every-where in the country. The larvæ or caterpillars very much resemble the perfect insects, and commonly dwell under ground." Of this tribe 118 other species are enumerated in the *Systema Naturæ*, natives of different parts of the globe; besides a considerable number which it is not yet ascertained, whether they are distinct species, or only synonyms or varieties of some of the others. The distinction of *Locusts* into families, (as characterised in § 17, v.) is extremely proper; and the difference of organisation, on which it is founded, has been observed to be adapted to the mode and the places in which the insects lay their eggs. But by taking the wings into consideration, there might have been formed three tribes or divisions, instead of two, upon the same natural foundation. Thus, according to the observations of the Abbé Pouchet, (in his *Journal de Physique* for 1787, p 224.) those which have their abdomen furnished with the tube or dart above mentioned, lay their eggs in a stiff sort of earth which that instrument perforates. During the operation, the dart opens; and being hollow and grooved on each side within, the egg slides down along the grooves, and is deposited in the hole. Of those which have the tail simple, *i. e.* which have *no dart*, some have long wings, and some very short. The long winged sort lay their eggs on the bare ground, and have no use for a perforating instrument; but they cover them with a glutinous substance, which fixes them to the soil, and prevents their being injured either by wind or wetness. Those, again, which have short wings, deposit their eggs in the sand; and to make the holes for this purpose, they have the power of elongating and retracting their abdominal rings, and can turn their body as on a pivot; in which operation long wings would have been a material impediment. The annals of most warm countries are filled with accounts of the devastations produced by locusts, which sometimes appear in clouds of vast extent. They seldom visit Europe in such swarms as formerly; yet in the warmer parts of it they are still formidable. Those which have at uncertain intervals visited Europe are supposed to have come from Africa; they are a large species about three inches long. The head and horns are of a brownish

coldness of our climate, and the humidity of our soil, are very unfavourable to their production; so that, as they are only animals of a year's continuance, they all perished without leaving a young generation to succeed them. When the locusts take their flight, it is said they have a leader at their head, whose flight they observe, and pay a strict regard to all his motions. They appear at a distance like a black cloud, which, as it approaches, gathers upon the horizon, and almost hides the light of day. It often happens, that the husbandman sees this imminent calamity pass away without doing him any mischief; and the whole swarm proceeds onward to settle upon some less fortunate country. In those places, however, where they alight, they destroy every green thing, stripping the trees of their leaves, as well as devouring the corn and grass. In the tropical climates they are not so pernicious, as in the more southern parts of Europe. In the first, the power of vegetation is so strong, that an interval of three or four days repairs the damage; but in Europe this cannot be done till next year. Besides, in their long flights to this part of the world, they are famished by the length of their journey, and are therefore more voracious wherever they happen to settle. But as much damage is occasioned by what they destroy, as by what they devour. Their bite is thought to contaminate the plant, and either to destroy or greatly to weaken its vegetation. To use the expression of the husbandmen, they burn wherever they touch, and leave the marks of their devastation for 3 or 4 years thereafter. When dead, they infect the air in such a manner that the stench is insupportable. Orosius tells us, that in the year of the world 3800, Africa was infested with a multitude of locusts. After having eaten up every thing that was green,

and gardens, which they filled with large quantities of heat like combustible matter, in order to put fire on the approach of the locusts to no purpose; for the trenches were dug up, and the fires put out by the swarms that succeeded each other, after one of these was in motion. The young just hatched came to glean off the young branches, and the trees. Having lived near a month, they arrived at their full growth, and their worm-like state by which they prepare themselves for this purpose, their hinder part to some degree of a stone, when immediately they begin their motion used on this occasion, and first appear, and soon after the whole transformation was completed in 8 minutes, after which they remain while in a languishing condition, till the sun and air had hardened and dried up the moisture that remained off their former sloughs, they then recover their former greediness, with an increase of strength and agility. But they continue in this state before they are fed. After laying their eggs, they march northward, and probably to the sea. In that country, however, the fertility of the soil and warmth generally render the depredation of little consequence; besides that the insects concur to diminish their numbers, naturally herbivorous, they often devour other, and the victor devours the prey, too, of serpents and carnivorous birds. They

on wild herbs, without preying upon cultivated lands, or making their way. The peasants look on them with in-while they are frisking about in the field, any measure to destroy them till the dance, and the favourable moment to evil is elapsed. Their yearly number considerable, as the males are far more than the females. If an equal proportion allowed only for ten years, their number be so great as to destroy the whole vestment. Beasts and birds would starve for subsistence, and even mankind would prey to their ravenous appetites. In increase was so great from the multitudes, that all La Mancha and Portugal red with them and totally ravaged. of famine were spread even farther, and the fruitful provinces of Andalusia, and Valencia. The amours of these are objects of surprise and astonishment. Their union is such that it is difficult to separate them. When this separation is after having lasted some hours, they are parted, that the male retires immediately for refreshment, where, losing the limbs, he soon perishes, and becomes prey to the fish; having given life to his offspring at the expence of his own. The female, indeed, though not without violent struggles, the remainder of her days in some society, busy in forming a retreat under a stone, where she can secure her eggs, of which she lays about 40, screening them by her own body from the intemperature of the air, as well as from the immediate danger of the plough, or the fatal blow of which would destroy the hopes of a rising generation. The female in building this cell is equally surprised under part of her body, nature has provided with a round smooth instrument, 8 lines in length, which at its head is as big as a writhing tooth, at its tail as a hard point, hollow at the root of a viper, but only to be seen. At the root of this vehicle there is a kind of bladder, containing a matter, of the same colour, but without viscosity or tenacity of that of the silk-worm, by an experiment, made for the purpose, infusion in vinegar, for several days, it produces the same effect. The orifice of the bladder is exactly with the instrument which is used to extract the glutinous matter. It is hid under the skin of the belly, and its interior surface is the moveable parts of the belly, and the mechanism of its motions, forming the most adroit texture for every part of its operations, the disposal of this ingredient at pleasure, the fluid, which has 3 very essential properties, being indissoluble in water, it prevents being drowned; next, it resists the heat of the sun, otherwise the structure would destroy its inhabitants; lastly, it resists the frost of winter, so as to preserve necessary warmth within. For greater security a retreat is always contrived in a soil, for though a million of locusts were in a cultivated field, not one would de-

PART II.

posit her eggs there; but wherever they meet a barren and lonesome situation, there they are sure to repair and lay their eggs. These locusts seem to devour, not so much from a ravenous appetite, as from a rage of destroying every thing that comes in their way. It is not surprising, that they should be fond of the most juicy plants and fruits, such as melons, and all manner of garden fruits and herbs, and feed also upon aromatic plants, such as lavender, thyme, rosemary, &c. which are so common in Spain, that they serve to heat ovens; but it is very singular, that they equally eat mustard seed, onions, and garlic; may even hemlock, and the most rank and poisonous plants, such as the thorn apple and deadly nightshade. They even prey upon crowfoot, whose causticity burns the very hides of beasts; and such is their universal taste, that they do not prefer the innocent mallow to the bitter furze, or rue to wormwood, consuming all alike, without predilection or favour, with this remarkable circumstance, that during the four years they committed such havoc in Estremadura, the love-apple, or *Lycopersicon solanum* of Linnæus, was the only plant that escaped their rapacious tooth, and claimed a respect to its root, leaves, flowers, and fruit. Naturalists may search for their motives, which I am at a loss to discover; the more as I saw millions of them light on a field near Almaden, and devour the woolen and linen garments of the peasants, which were lying to dry on the ground. The curate of the village, a man of veracity, at whose house I was, assured me, that a tremendous body of them entered the church, and devoured the silk garments that adorned the images of the saints, not sparing even the varnish on the altars. The better to discover the nature of such a phenomenon, I examined the stomach of the locust, but only found one thin and soft membrane, with which, and the liquor it contains, it destroys and dissolves all kinds of substances, equally with the most caustic and venomous plants; extracting from them a sufficient and salutary nourishment. Out of curiosity to know the nature of so formidable a creature, I was urged to examine all its parts with the utmost exactness: its head is of the size of a pea, though longer; its forehead pointing downwards like the handsome Andalusian horse; its mouth large and open; its eyes black and rolling, added to a timid aspect not unlike a hare. With such a dastardly countenance, who would imagine this creature to be the scourge of mankind! In its two jaws it has 4 incisive teeth, whose sharp points traverse each other like scissars, their mechanism being such as to gripe or to cut. Thus armed, what can resist a legion of such enemies? After devouring the vegetable kingdom, were they, in proportion to their strength and numbers, to become carnivorous like wasps, they would be able to destroy whole flocks of sheep, even to the dogs and shepherds; just as we are told of ants in America, that will overcome the fiercest serpents. The locust spends the months of April, May, and June, in the place of its birth; at the end of June its wings have a fine rose colour, and its body is strong. Being then in their prime, they assemble for the last time, and burn with a desire to propagate their species: this is

R R R

ubcccc

first direction of this formidable column is always against the wind, which if not too strong, the column will extend about a couple of leagues. The locusts then make a halt, when the most dreadful havoc begins; their sense of smell being so delicate, they can find at that distance a corn field or a garden, and after demolishing it, rise again in pursuit of another: this may be said to be done in an instant. Each seems to have, as it were, four arms and two feet; the males climb up the plants, as sailors do the shrouds of a ship, and nip off the tenderest buds, which fall to the females below. Many old people assured me, when so much mischief was done in 1754, it was the third time in their remembrance, and that they always are found in the pasture grounds of Extremadura, from whence they spread into the other provinces of Spain. They are certainly indigenous, being of a different shape from those of the North or the Levant, as is evident on comparing them with such in the cabinets of natural history. The locust of Spain is the only one that has rose coloured wings: besides, it is impossible they can come from any other part. From the north it is clear they do not, by the observations of so many ages; from the south they cannot, without crossing the sea, which is hardly possible by the shortness of their flight: and like birds of passage, they would be known. I once saw a cloud of them go over Malaga, and move towards the sea, and pass over it, for about a quarter of a league, to the great joy of the inhabitants, who concluded they would soon be drowned; but, to their disappointment, they suddenly veered about towards the coast, and pitched upon an uncultivated space surrounded with vineyards, which they soon after quitted. When once they appear, let the number demolished be ever so great, the proportion

stomach; and behind that, a wrinkled and furrowed within side there is still a third! so that it with some probability, that all the genus chew the cud, as they so ruminant animals in their internal

(1.) GRYNÆUS, Simon, a learned son of a peasant of Suabia, born in Hohenzollern, in 1493. He resided at Vienna and afterwards in 1523. Being a protestant he much persecution, and in 1531 England; where he received from Sir Thomas More, to whom Erasmus recommended him. He was a learned great service to the commonwealth was the first who published the *De Republica* in Greek. He also published and Plato's works, with some of Proclus. He died at Basil, in 1531.

(2.) GRYNÆUS, Thomas, nephew (N<sup>o</sup> 1.) was born at Syringen in Helvetia. He was equally learned and amiable sons also eminent in literature.

GRYNAU, a town of the Helvetia, in the canton of Glaris, seated on the Rhine, 3 miles W. of Uznach.

GRYPHITES, in natural history, an oblong fossil shell, with a pointed head, and becoming gradually wide towards the tail, where it ends in a circular or beak of this is very hooked. They are frequently found in oolite in many countries. There are several species; some extremely rounded at the back, others less so; and the thickness of the shell, in some they are composed, are in some thinner, in others thicker and larger,

ted on the river (N<sup>o</sup> 2.) 45 miles  
Lon. 3. 59. E. Lat. 39. 15. N.

(2.) GUADALOUBE, a river of Spain, in Estre-  
madura.

(3.) GUADALOUBE, one of the CARIBBEE or  
LEEWARDS islands, lying about mid-way between  
Antigua and Martinico. It is 45 miles long, 38  
broad, and, being of an irregular figure, is about  
240 miles in circumference. It is divided into  
two parts by a small arm of the sea, which is not  
above 6 miles long, and from 15 to 40 fathoms  
broad. This canal, named the *Salt River*, is na-  
vigable, but only carries vessels of 50 tons burden.  
That part of the island, which gives its name to the  
whole is, towards the centre, full of craggy rocks,  
where the cold is so intense, that nothing will  
grow upon them but fern, and some useless shrubs  
covered with mois. On the top of these rocks a  
mountain called *la Souffriere*, or the *Brimstone*  
*Mountain*, rises to an immense height. It exhales,  
through various openings, a thick black smoke,  
intermixed with sparks that are visible by night.  
From all these hills flow numberless springs, which  
fertilize the plains below, and moderate the burn-  
ing heat of the climate by a refreshing stream, so  
celebrated, that the galleons which formerly used  
to touch at the Windward Islands, had orders to  
renew their provision with this pure and salubri-  
ous water. Such is that part of the island pro-  
perly called *Guadaloupe*. That which is common-  
ly called *Grande Terre* has not been so much fa-  
voured by nature. It is indeed less rugged, but  
it wants springs and rivers. The soil is not so fer-  
tile nor the climate so wholesome. No European  
nation had taken possession of this island, when  
550 Frenchmen arrived there from Dieppe on the  
28 June 1635. Their provisions were so ill chosen,  
that they were spoiled in the passage, and were  
all exhausted, in two months. St Christopher's  
refused to spare them any; and their first attempts  
in husbandry could not as yet afford any thing.  
No resource was left but from the savages; but  
the superfluities of a people, who cultivate little,  
and never laid up stores, could not be great. The  
new comers came to a resolution to plunder them;  
and hostilities commenced on the 16th Jan. 1636.  
The Caribs, not thinking themselves in a condi-  
tion openly to resist an enemy, who had so much  
the advantage from the superiority of their arms,  
destroyed their own provisions and plantations,  
and retired to Grande Terre, and the neighbour-  
ing islands. From thence the most desperate came  
over to Guadaloupe, and concealing themselves  
in the forests, they shot with their poisoned ar-  
rows all the Frenchmen who were hunting or  
fishing. During night, they burned the houses  
and destroyed the plantations of their unjust  
spoilers. A dreadful famine was the consequence.  
The colonists were reduced to graze in the fields,  
and to dig up dead bodies for their subsistence.  
At last the government of Aubert brought about  
a peace with the savages, at the end of 1640. The  
remembrance of the hardships they had suffered  
proved a powerful incitement to cultivate all ar-  
ticles of immediate necessity; and afterwards in-  
duced an attention to those of luxury consumed  
in the mother country. Those, who had escaped  
the calamities they had drawn upon themselves,  
were soon joined by some colonists from St Chris-  
topher's, and from Europe. But still the prosper-

city of Guadalupe was impeded by obstacles arising from its situation. The facility with which the pirates from the neighbouring islands could carry off their cattle, their slaves, and their crops, distressed them greatly. Intestine broils, arising from jealousies of authority, often disturbed the quiet of the planters. And the adventurers, who went over to the windward islands, disdain a land that was fitter for agriculture than for naval expeditions, were easily drawn to Martinico by the convenient roads it abounds with. In 1700 the number of inhabitants amounted only to 3825 white people, 325 savages, free negroes, and mulattoes; and 6725 slaves, many of whom were Caribs. There were only 60 small plantations of sugar, and 66 of indigo, cocoa, and cotton. The cattle amounted to 1620 horses and mules, and 3699 head of horned cattle. This was the fruit of 60 years labour. But at the end of 1735, the colony was peopled with 9,643 whites, and 41,140 slaves. The saleable commodities were the produce of 334 sugar plantations, 15 plots of indigo, 46,840 stems of cocoa, 11,700 of tobacco, 2,257,725 of coffee, 12,748,447 of cotton. For provisions, it had 29 squares of rice or maize, 1219 of potatoes, 2,028,520 banana trees, and 33,577,950 trenches of cassava. The cattle consisted of 4946 horses, 2924 mules, 125 asses, 13,716 head of horned cattle, 11,162 sheep and goats, 2444 hogs. Such was the state of Guadalupe when it was conquered by the British in April 1759. The British, informed of the advantage the French made of their trade with the colonies, sent large quantities of goods to the conquered island, and thus overstocked the market, and sunk the prices of European commodities. The colonists bought them at low prices, and obtained long credit. To this credit, was soon added another arising from speculation: 18,721 negroes were carried thither, to hasten the growth and enhance the value of the plantations. But all hopes of advantage from the new conquest were frustrated, Guadalupe with its dependencies being restored by the treaty of peace in 1763. By the survey in 1767, this island, including those of Descada, St Bartholomew, Marigalante, and Saints, contained 11,863 white people; 752 free blacks and mulattoes, 72,761 slaves; in all 85,376 souls. The number of cattle was 5060 horses, 4854 mules, 111 asses, 17,378 horned cattle, 14,895 sheep and goats, and 2669 hogs: The number of plantations was 1983. The sugar works employed 414 mills. The annual produce of Guadalupe, and the adjacent islands, was estimated many years ago at 46 millions of pounds of sugar, 22 millions of coffee, 320,000 lb. of cotton and 8000 of cocoa: besides logwood, ginger, rum, skins, &c. This island was taken by the British in April 1764: but retaken by the French under Victor Hugues, in Feb. 1795. Lon. from 43. 24 to 44. 15. W. of Ferro. Lat. from 15. 55. to 16. 37. N.

(14.) GUADALOUPE, an island on the coast of Caribbia. Lon. 118. 0. W. Lat. 29. 5. N.

GUADALQUIVER, one of the most famous rivers of Spain, rises in Andalusia, near the confines of Granada, and running quite through Andalusia, by the towns of Baiza, Andaxar, Cordova, Seville, falls at last into the Bay of Cadiz.

(1.) GUADARAMA, a river of Spain Castile.

(2.) GUADARAMA, a town of Spain, above river, 18 miles NW. of Madrid; in cheefe. Lon. 3. 48. W. Lat. 41. 45. N.

GUADIANA, a large river of Spain rises in New Castile, and, passing across mountains, falls down to the lakes called *Guadiana*; from whence it runs to Calatrada, Merida, and Badajoz in Extrem Spain; and after having run for some distance into Portugal, it separates Algarve, daluna, and falls into the bay of Cadiz, Castro Marino and Agramonte.

GUADIX, a town of Spain, in Granada a bishop's see. It was taken from the Moors in 1253, who afterwards retook it, but the Spaniards again got possession of it in 1489. Lon. 3. 5. W. Lat. 37. 5. N.

GUADRAMIRO, a town of Spain, in Galicia, the capital of Comarqua, containing 1000 people: 4 m. N. of Little Comarqua.

(1.) \* GUAIACUM. *n. f.* *Guaiacum*. A resinous and aperient. It is excellent in many cases, and was once famous for curing the venereal disease, which it still does singly in some climates, but with us we find it useless. It has a resin of it, improperly called *guaiacum Hill*.

(II.) GUAIACUM, in botany, *LIGNUM Pockwood*; a genus of the monogynia class, belonging to the decandria class of plants, the natural method ranking under the 14th order, *Gruinales*. The calyx is quinquefid and the petals 5, and inserted into the calyx; the fruit is angulated, and trilobular or quinquelobular.

1. GUAIACUM AFRUM, with many branched leaves, is a native of the Cape of Good Hope. The plants retain their leaves all the year. This species is to be propagated by layers, and all the winter in a good green-house.

2. GUAIACUM OFFICINALE, the common vitæ used in medicine, is a native of the India Islands and the warmer parts of America. There it becomes a large tree, having a thick, brownish bark, not very thick. The wood is firm, solid, ponderous, very resinous, and of a yellow colour in the middle, and of a bitter, resinous taste. The smaller branches have a reddish bark, and are garnished with small flowers, which are produced in clusters at the ends of the branches, and are composed of oval corolla of a fine blue colour. This species may be propagated by seeds, which must be sown in the countries where it naturally grows, or in pots, and in a good hot-bed, where they will come up in 4 or 5 weeks. While young, they may be kept in a bed of tan-bark under a frame during the winter, but in autumn they must be removed to a bark stove, where they should continue until they are fit for use. The wood of this species is of great use in medicine and in the mechanical arts. It is compact and heavy as to sink in water. The bark is often of a pale yellowish colour.

It is blacker, or of a deep brown. Sometimes marbled with different colours. It is so hard to break the tools used in felling it; and is therefore seldom used as firewood, but is of great use to the sugar-planters for making wheels and staves to the mills. It is also often made into bowls, staves, and other utensils. It is brought over to Britain in large pieces of 4 or 500 weight each; and from its hardness and beauty is in great demand for various articles of turnery ware. The wood, gum, bark, fruit, and even the flowers of the tree, possess medicinal virtues; but only the resin, particularly the wood and resin, are now of general use in Europe. The wood has little or no smell, except when heated, or while rasping, when a slight aromatic one is perceived. When wet, it impresses a mild acrimony, biting the nose and fauces. Its pungency resides in its resinous matter, which it gives out in some degree to the air by boiling, but spirit extracts it wholly. Of the bark there are two kinds; one smooth, the other unequal on the surface: they are both weaker than the wood; though in a recent state, they are strongly cathartic. The gum, or resin, is obtained by wounding the bark in different parts of the tree, or by what has been called *jaggung*. It exudes copiously from the wounds, though gradually; and when a quantity is found accumulated on the several wounded trees, hardened by exposure to the sun, it is gathered and packed in all kegs for exportation. This resin is of a friable texture, of a deep greenish colour, and sometimes of a reddish hue; it has a pungent acrid taste but little or no smell, unless heated. The tree also yields a spontaneous exudation from the bark, which is called the *native gum*, and is brought to us in small irregular pieces, of a bright nipe-lucid appearance; it differs from the former in being much purer. In the choice of the wood, that which is the freshest, most ponderous, and darkest coloured, is the best; the largest pieces are to be preferred too; and the best method is to split them as wanted, for the finer parts are apt to scale when the raspings or chips are kept. In rasping the resin, prefer those pieces which have parts of the bark adhering to them, and that easily separate therefrom by a quick blow. The resin is sometimes mixed with the gum of the manchineal tree; but this is easily detected by dissolving a little in spirit of wine or rum. The true gum imparts a whitish or milky tinge, but the manchineal gives a greenish cast. Mouch advises a few drops of *spirit. nitri dulc.* to be added to the spiritous solution, and then to be diluted with water, by which the gum will be precipitated in a blue powder; and the adulteration will appear floating in white fæces, &c. Guaiacum was first introduced into Europe as a remedy for the venereal disease, in 1508. It was attended with great success in slight affections, but failed where the disease was deep seated; and was at length superseded by mercury, which it now only serves occasionally as an adjuvant in the *decottum lignorum*, of which guaiacum is the chief ingredient. It is esteemed a warm stimulating medicine; strengthening the stomach and other viscera, and remarkably promoting the urinary and cuticular discharges: hence, in cutaneous desquations, and other disorders proceeding

from obstructions of the excretory glands, and where sluggish serous humours abound, it is useful; rheumatic and other pains have often been relieved by it. It is also laxative. The resin is the most active principle in the drugs compounded with it. The resin is extracted from the wood in part by water, but much more perfectly by spirits. The watery extract, kept in the shops, proves considerably weaker than that made with spirit. This last extract is of the same quality with the native resin, and differs from that brought to us only in being purer. The gum or extracts are given from a few grains to a scruple or half a dram, which last dose proves for the most part considerably purgative. The official preparations of guaiacum are an extract of the wood, a solution of the gum in rectified spirit of wine, a solution in volatile spirit, and an empyreumatic oil distilled from the wood. The resin dissolved in rum, or combined with water, by mucilage or the yolk of an egg, or in form of the volatile tincture or elixir, is employed in gout and chronic rheumatism. The tincture or elixir has been given to the extent of half an ounce twice a-day, and is sometimes usefully combined with laudanum.

3. *GUAIACUM SANCTUM*, with many pairs of obtuse lobes, hath many small lobes placed along the mid rib by pairs of a darker green colour than those of the foregoing sort. The flowers are produced in loose bunches towards the end of the branches, and are of a fine blue colour, with petals fringed on the edges. This species is also a native of the West India islands, where it is called *bastard lignum vite*. It may be propagated like the last.

*GUAIRA*, a prov. of S. America, in Paraguay.

*GUALATA*, a kingdom of Africa.

*GUALDO*, a town of Italy, in Ancona, 8 miles NW. of Nocera. It was almost destroyed by an earthquake in 1751. Lon. 12. 43. E. Lat. 43. 6. N.

(1.) *GUALEOR*, } or *Gosualier*, a province of  
(1.) *GUALIOR*, } Asia, situated in the middle of Indostan.

(2.) *GUALIOR*, or *GUALEOR*, a large town of the above province, with a celebrated fortress of great strength. By the nearest rout, it is upwards of 800 miles from Calcutta, and 910 by the ordinary one; and about 280 from the British frontiers. In the ancient division of the empire it is classed in the Soubah of Agra, and is often mentioned in history. In the year 1008, and during the two following centuries, it was thrice reduced by famine. It must in all ages have been deemed a military post of consequence, both from its situation in respect to the capital, and from the peculiarity of its site. It stands on the principal road from Agra to Malwa, Guzerat, and the Deccan; near the place where it enters the hilly tract which advances from Bundelcund, Malwa, and Agimere, along the banks of the Jumnah. From all these circumstances, together with its natural and acquired advantages as a fortress, the possession of it was deemed of the utmost importance by the emperors of Indostan. Its palace was used as a state prison as early as 1317, and continued to be such until the downfall of the empire. On the dismemberment of the empire, Gualeor appears to have

have fallen to the lot of a rajah of the Jat tribe; who assumed the government of the district in which it is situated, under the title of Rana of Gohud. Since that period it has changed masters more than once; the Mahrattas, whose dominions extend to the neighbourhood of it, having sometimes possessed it, and at other times the Rana: but the means of transfer were always either famine or treachery, nothing like a siege having ever been attempted. Gualcor was in the possession of Madajee Scindia, a Mahratta chief, in 1779, when the council-general of Bengal concluded an alliance with the Rana; in consequence of which, 4 battalions of sepoy, of 500 men each, and some pieces of artillery, were sent to his assistance, his district being over-run by the Mahrattas, and himself almost shut up in his fort of Gohud. The grand object of his alliance was to penetrate into Scindia's country, and to draw Scindia himself from the western side of India, where he was attending the motions of gen. Godard, then employed in the reduction of Guzerat; it being Mr Hastings's idea, that when Scindia found his own dominions in danger, he would detach himself from the confederacy, of which he was the principal member, and thus leave matters open for an accommodation with the court of Poonah. Major William Popham was appointed to the command of the little army sent to the Rana's assistance; and being very successful, in clearing his country of the enemy, and driving them out of one of their own most valuable districts, was advised by Mr Hastings to attempt the reduction of the fort. Captain Jonathan Scott, then Persian interpreter to major Popham, in a letter to his brother, major John Scott, thus describes the fort and the occasion of its capture: "The fort of Gualcor stands on a vast rock of about four miles in length, but narrow, and of unequal breadth, and nearly flat at the top. The sides are so steep as to appear almost perpendicular in every part; for where it was not naturally so, it has been scraped away; and the height from the plain below is from 200 to 300 feet. The rampart conforms to the edge of the precipice all round; and the only entrance to it is by steps running up the side of the rock, defended on the side next the country by a wall and bastions, and farther guarded by 7 stone gateways, at certain distances from each other. The area within is full of noble buildings, reservoirs of water, wells, and cultivated land; so that it is really a little district in itself. At the NW. foot of the mountain is the town, pretty large, and well built; the houses all of stone. To have besieged this place would be vain, for nothing but a surprize or blockade could have carried it. A tribe of banditti from the district of the Rana had been accustomed to rob about this town, and once in the dead of night had climbed up the rock and got into the fort. This intelligence they had communicated to the Rana, who often thought of availing himself of it, but was fearful of undertaking an enterprize of such moment with his own troops. At length he informed major Popham of it, who sent a party of the robbers to conduct some of his own spies to the spot." They accordingly climbed up in the night of the 3d of August, found the guards asleep, and thus, meeting with little resist-

ance, in the space of two hours, this important and astonishing fortress was completely reduced, with the loss of only 1 man killed and 20 wounded. On the side of the enemy, Bapoge, the governor, was killed, and most of the principal officers wounded. Thus fell the strongest fortress in Indostan, garrisoned by a chosen body of 1200 men, on the 4th Aug. 1780; and which, before the capture of it by the British, was promised by the princes of Indostan, to be impregnable. In 1783, Madajee Scindia besieged this fortress, then possessed by the Rana of Gohud, with an army of 70,000 men, and effected the reduction by the treachery of one of the Rana's officers, who executed the plan of admission of a party of Scindia's troops: These were immediately supported by another party, who attacked an opposite quarter, and got admission also. Gualcor is 8 miles from Reypour, 80 S. of Agra, and 130 from the Ganges. Lon. 78. 26. E. Lat. 26. 14. N.

GUALTEIRI, or } a town of the Cisalpine re-  
GUALTERO, } public, in the dept. of Cos-  
tolo, and late duchy of Reggio, 13 miles N. of Reggio.

GUAM, or GUAHAN, the largest of the LADRONE islands. It is about 120 miles in circumference; and is the only one among the innumerable islands in the South Sea, which has a town built in the European style, with a regular fort, a church, and civilized inhabitants. The air is excellent, the water good, and the garden stuff and fruits are exquisite; the flocks of Buffins, goats, hogs, and all kinds of poultry are innumerable. There is no port in which scorbutic fevers can be more speedily restored, or find better or more plentiful refreshments, than in this, tho' it did not originally enjoy this abundance. When first discovered by Magellan in 1521, with the other eight principal islands that lie N. of it, they were all crowded with inhabitants, but afforded no refreshment to navigators, except fish, bananas, coconuts and bread-fruit; and even these could not be procured but by force, amidst the showers of arrows and lances of the natives. The Spaniards carried thither from America the first stock of cattle, swine, plants, seeds, fruits, and garden stuffs which are all now found in such abundance. The Ladron islands were covered with inhabitants when they were discovered. See LADRONE. Guam alone contained upon its coasts more than 20,000 people. These men were ferocious savages and bold thieves; but so incapable of supporting the yoke of civilization, that the Spaniards have seen them almost annihilated within two centuries. These fierce islanders, after having long defended, by cruel wars, the right of living like wild beasts, being at last obliged to yield to the Spanish arms, took the resolution of administering poisons to their women, to procure abortions, and to render them sterile, that they might not bring into the world beings that were not free, according to the ideas that they had of liberty. This desperate resolution was persisted in with so much obstinacy in the 9 Ladron islands, that their population, which at the time of the discovery consisted of more than 60,000 souls, does not now exceed 900 in the whole archipelago. About 30 or 40 years ago, the remains of the original natives were collected and established

the island of Guam. The principal settlement, which the Spaniards call *San Juan*, is situated about twelve miles NE. of the place, on the shore, at the foot of a beautiful well-watered country, smaller settlements of Indians round the shore, composed of 5 or 6 families cultivate fruits and grain, and engage in fishing. The centre of the island is uncleared. The trees are fit for canoes and boats. The forests are very thick, and the Spaniards at first cleared certain portions to turn them into savannahs for feed; they sow these spots with grass seeds, and digenous plants fit for pasturage. The woods being shaded on all sides, prevent the sun from the great heat of noon. The multiplied astonishingly, and having must be shot when wanted, or taged. The woods are also full of wild fowls. The flesh of all these animals is excellent. In the savannahs and forests, a multitude of pigeons, paroquets, and other birds, &c. Among the indigenous plants remarkable are, the cocoa-nut and sugar-cane. The woods also abound with oranges, plantanes, citrons, lemons, and other fruits. The thorny china orange with red flowers, as many of these trees are in flower, they perfume the air with a pleasant smell, and delight the eye with the most beautiful colours. The rivers of Guam, which run in rivulets or torrents, abound in fish; Turtle grow here as large as in the West Indies, but are not eaten either by the Spaniards. The crops cultivated are, indigo, cotton, cocoa, and sugar-cane; the former is of astonishing fertility; it is a plant of 12 feet high, bearing 8 or 9 to 10 inches long, well filled with the pulp of mangoes. The former is one of the finest fruits in the world; it was brought from Manilla, and is now brought to Guam from Manilla, and is from Acapulco. The land rises gradually from the shore towards the centre by a plain, but is not very mountainous. It is said, that the soil is equally rich over the whole island, except in the north, which forms a peninsula almost entirely barren. But the rest abounds with rice in the interior part of the country, Ensenada, many springs of fine water are in basins of pure water, which, beneath thick trees, preserve a most agreeable temperature, in spite of the heat of the climate. The inhabitants are such as they were discovered by Magellan; of short stature, rather dark, and in general dirty, though much improved by the Spaniards. The women are handsome, well proportioned, and of a reddish colour. Both sexes have become gentle, honest, and the men drink freely of the wine of the country. They are fond of music, dancing, and sports. Lon. 7. 50. W. Lat. 13. 0. S. **GUAM**, a district of Peru.

**GUAMANCA**, or } a province of Peru, which  
(1.) **GUAMANGA**, } begins 240 miles NE. of Lima, and extends along the centre of the Cordilleras. The air is temperate; the soil fertile; and the mines abound with gold, silver, copper, lead, iron, quicksilver, loadstone, and sulphur.

(2.) **GUAMANGA**, the capital of the above province, with a bishop's see. It is remarkable for its manufactures. The houses are all built of stone and covered with slates. Lon. 7. 50. W. Lat. 13. 0. S.

**GUAMAN-VILLAS**, a fertile district of Peru, in Lima, 21 miles from Guamanga.

**GUANAHAMI**, or *Cat Island*, one of the **Bahamas**, memorable for having been the first part of the New World, discovered by **COLUMBUS**, in 1492.

**GUANANDO**, a town of Peru, which was destroyed by an earthquake, in Feb. 1797.

**GUANA-PATINA**, a volcano of Peru, in the valley of Quilea, near Arequipa. An eruption from it, in 1600, attended with an earthquake, laid Arequipa in ruins.

**GUANCABELICA**. See **GUANZABELICA**.  
**GUANCHACO**, a sea port of Peru, 6 miles N. of Truxillo. Lat. 8. 6. S.

**GUANCHES**. See **CANARY**, § 9.  
**GUANDAGNANO**, a town of Maritime Austria, in Friuli, 29 miles NW. of Friuli.

**GUANUCO**, a rich and handsome town of S. America, capital of a district of the same name, in the audience of Lima. Lon. 72. 55. W. Lat. 9. 55. S.

**GUANZABELICA**, a town of S. America in Peru, and in the audience of Lima. It abounds in mines of quicksilver. Lon. 71. 59. W. Lat. 12. 40. S.

**GUARA**, a town of Peru, between Truxillo and Lima.

(1.) \* **GUARANTEE**. *n. f.* [*garant*, French.] A power who undertakes to see stipulations performed.—God, the great *guarantee* for the peace of mankind, where laws cannot secure it, may think it the concern of his providence. *South*.—A prince distinguished by being a patron of Protestants, and *guarantee* of the Westphalian treaty. *Addis. on the War*.—An oath is a promise made to God, and God is our superior, superior to kings. And he is also the *guarantee* and avenger of all breach of faith and injustice. *Lesley*.

(2.) **GUARANTEE**, or **WARRANTEE**, in law, a term signifying him whom the warranter undertakes to indemnify or secure from damage. See **WARRANTY**.

(3.) **GUARANTEE**, or } in matters of polity, the  
**GUARANTY**, } engagement of neutral states, whereby they plight their faith that certain treaties shall be inviolably observed, or that they will make war against the aggressor.

\* **To GUARRANTY**. *v. a.* [*garantir*, French.] To undertake to secure the performance of any articles.

**GUARCHI**, a fertile district of Peru, 18 miles E. of Lima, extending 120 miles along the Cordillera.

(1.) \* **GUARD**. *n. f.* [*garde*, French; *ward*, Teutonick.] 1. A man, or body of men, whose business is to watch by way of defence or preven-

er, had their *guards* and spies, after the practice of tyrants. *Swift*. 2. A state of caution; a state of vigilance.—The great alteration which he made in the state ecclesiastical, caused him to stand upon his *guard* at home. *Davies*.—Femery puts a man off his *guard*. *L'Est*.—It is wisdom to keep ourselves upon a *guard*. *L'Est*.—

Now he stood collected and prepar'd;

For malice and revenge had put him on his *guard*. *Dryden*.

—Others are cooped in close by the strict *guards* of those whose interest it is to keep them ignorant. *L'Est*.—Men are always upon their *guard* against an appearance of design. *Smalridge*. 3. Limitation; anticipation of objection; caution of expression.—They have expressed themselves with as few *guards* and restrictions as I. *Atterb*. 4. An ornamental hem, lace, or border. Obsolete. 5. Part of the hilt of a sword.

(2.) **GUARD**, in a general sense, signifies the defence or preservation of any thing; the act of observing what passes, to prevent surprise; or the care used to prevent any thing from happening contrary to our intentions or inclinations.

(3.) **GUARD**, in fencing, a posture proper to defend the body from the sword of the antagonist.

(4.) **GUARD**, in the military art, is a duty performed by a body of men, to secure an army or place from being surprised by an enemy. In garrison the guards are relieved every day: hence every soldier mounts guard once every day in time of peace, and much oftener in time of war. See **HONOURS**.

(5.) **GUARD, ADVANCED, OF VAN-GUARD**. See **ADVANCE-GUARD**.

(6.) **GUARD, ARTILLERY**. See **ARTILLERY**, No 2.

(7.) **GUARD, ARTILLERY QUARTER**. is fre-

in good order; where, at drawn up, the small guard respective posts: then the for their guards, who are: of the captain of the mounts in garrison at the governor pleases.

(14.) **GUARD, PIQUET**, foot, always in readiness; horses are generally saddled. The foot draw up at lion, frequently at the bear afterwards return to their themselves in readiness to to resist in case of an attack ready.

(15.) **GUARD, PROVOST** guard that attends the prisoner to prevent desertion, &c. See **PROVOST**.

(16.) **GUARD, QUARTER** commanded by a subaltern officer of each battalion, 222 feet regiment.

(17.) **GUARD, REAR**, which brings up the rear composed of all the old guards. The rear-guard of a part about 500 paces behind guard going out upon a guard in their retreat. The corporal's guard placed in the keep good order.

(18.) **GUARD, STAND** a corporal, out of each mount on foot in the front the distance of 20 feet from the main street.

gow. The first regiment is at present commanded by 1 colonel, 1 lieutenant-colonel, 3 majors, 23 captains, 1 captain lieutenant, 31 lieutenants, and 24 ensigns; and contains 3 battalions. The 2d. regiment has 1 colonel, 1 lieutenant-colonel, 3 majors, 14 captains, 1 captain lieutenant, 18 lieutenants, 16 ensigns; and contains only 2 battalions. The 3d. regiment is the same as the 2d.

**II. GUARDS, HORSE,** in Britain, are gentlemen chosen for their bravery, to be entrusted with the guard of the king's person; and were formerly divided into 4 troops named numerically. The 1st. troop was raised in 1660, and the command given to lord Gerard; the 2d. in 1661, and the command given to Sir Philip Howard; the 3d. in 1693, and the command given to earl Feverham; the 4th. in 1792, and the command given to earl Newburgh. Each troop had 1 colonel, 2 lieutenant-colonels, 1 cornet and major, 1 guidon and major, 2 exempts and captains, 4 brigadiers and lieutenants, 1 adjutant, 4 sub-brigadiers and cornets, and private men. But the 4 troops are now turned into 2 regiments of life-guards.

**I. GUARDS, HORSE GRENADIER,** are divided into 2 troops. The 1st. troop was raised in 1693, and the command given to lieutenant-general Cholmondeley; the 2d. in 1702, and the command given to lord Forbes. Each troop has 1 colonel, 1 lieutenant-colonel, 1 guidon or major, 3 exempts, 3 captains, 3 lieutenants, 1 adjutant, 3 cornets, 60 private men.

**III. GUARD, YEOMEN OF THE,** were first raised by Henry VII. in 1485. They are a kind of pompadour foot-guards to the king's person; and are generally called by a nickname the *Beef-Eaters*. They were anciently 250 men of the first rank under the king; and of larger stature than ordinary, each being required to be 6 feet high. At present there are but 100 in constant duty, and 70 more not on duty; and when any one of the 100 dies, his place is supplied out of the 70. They go dressed after the manner of king Henry VIII's time. Their first commander or captain was the earl of Oxford, and their pay is 2s. 6d. per day.

**11.) GUARDS, EXTRAORDINARY,** or detachments, are only commanded on particular occasions; either for the security of the camp, to cover foragers, or for convoys, escorts, or expeditions.

**12.) GUARDS, ORDINARY,** such as are fixed in the campaign, and relieved daily.

**13.) GUARDS, THE LATE FRENCH,** were divided into those within, and those without, the king. The first were the *gardes du corps*, or body-guards; which consisted of 4 companies, the 1st of which was anciently Scots. See § 24. The 2d. without were the *Gens d'Armes*, light horse, squeteers, and two other regiments, the one of which was French and the other Swiss.

**14.) GUARDS, THE SCOTS,** a celebrated band, which formed the 1st. company of the ancient *des du corps* of France. During the ancient intercourse between France and Scotland, the Scots often distinguished themselves in the service of the French. On this foundation the company of the guards, and that of Scots gendarmes, were instituted by Charles VII. of France; by whom the first standing-army in Europe was formed, in 1418. See GENDARMES, § 3. Valour, honour, and fidelity, must have been very conspicuous features in the national character of the Scots, when so great and civilized a people as the French could be induced to choose a body of them, foreigners as they were, to guard the persons of their sovereigns. Of the particular occasion and reasons of this predilection, we have a recital by Lewis XII. After setting forth the services which the Scots had performed for Charles VII. in expelling the English out of France, and reducing the kingdom to his obedience, he adds—"Since which reduction, and for the service of the Scots upon that occasion, and for the great loyalty and virtue which he found in them, he selected 200 of them for the guard of his person, of whom he made 100 men at arms, and 100 life-guards: And the 100 men at arms are the 100 lances of our ancient ordinances; and the life-guard men are those of our guard, who still are near and about our person." (*Seyfil's Hist. of Louis XII.*) As to their fidelity in this honourable station, Claud Seyfil says, "The French have so ancient a friendship and alliance with the Scots, that of 400 men appointed for the king's life-guard, there are 100 of the said nation who are the nearest to his person, and in the night keep the keys of the apartment where he sleeps. There are, moreover, 100 complete lances and 200 yeomen of the said nation, besides several that are dispersed through the companies: And for so long a time as they have served in France, never hath there been one of them found that hath committed or done any fault against the kings or their state; and they make use of them as of their own subjects." The ancient privileges of the Scottish life-guards were very honourable; especially of the 24 first. The author of the *Ancient Alliance*, says, "On high holidays, at the ceremony of the royal touch, the erection of knights of the king's order, the reception of extraordinary ambassadors, and the public entries of cities, there must be six of their number next to the king's person, three on each side; and the body of the king must be carried by these only, wheresoever ceremony requires. They have the keeping of the keys of the king's lodging at night, the keeping of the choir of the chapel, the keeping of the boats where the king passes the rivers; and they have the honour of bearing the white silk fringe in their arms, which in France is the *couronne couleur*. The keys of all the cities where the king makes his entry are given to their captain, in waiting or out of waiting. He has the privilege, in waiting or out of waiting, at ceremonies, such as coronations, marriages, and funerals of the kings, and at the baptism and marriage of their children, to take duty upon him. The coronation robe belongs to him; and this company, by the death or change of a captain, never changes its rank, as do the three others." This company's first commander, who is recorded as a person of great valour and military accomplishments, was Robert Patillock, a native of Dundee; and the band continued in great reputation till 1578. From that period, the Scots guards were less attended to, and their privileges came to be invaded. In 1612, they remonstrated to Louis XIII. on the injustice they had suffered, and set before him the services they had rendered to the crown of France. Attempts were made to

and fidelity, must have been very conspicuous features in the national character of the Scots, when so great and civilized a people as the French could be induced to choose a body of them, foreigners as they were, to guard the persons of their sovereigns. Of the particular occasion and reasons of this predilection, we have a recital by Lewis XII. After setting forth the services which the Scots had performed for Charles VII. in expelling the English out of France, and reducing the kingdom to his obedience, he adds—"Since which reduction, and for the service of the Scots upon that occasion, and for the great loyalty and virtue which he found in them, he selected 200 of them for the guard of his person, of whom he made 100 men at arms, and 100 life-guards: And the 100 men at arms are the 100 lances of our ancient ordinances; and the life-guard men are those of our guard, who still are near and about our person." (*Seyfil's Hist. of Louis XII.*) As to their fidelity in this honourable station, Claud Seyfil says, "The French have so ancient a friendship and alliance with the Scots, that of 400 men appointed for the king's life-guard, there are 100 of the said nation who are the nearest to his person, and in the night keep the keys of the apartment where he sleeps. There are, moreover, 100 complete lances and 200 yeomen of the said nation, besides several that are dispersed through the companies: And for so long a time as they have served in France, never hath there been one of them found that hath committed or done any fault against the kings or their state; and they make use of them as of their own subjects." The ancient privileges of the Scottish life-guards were very honourable; especially of the 24 first. The author of the *Ancient Alliance*, says, "On high holidays, at the ceremony of the royal touch, the erection of knights of the king's order, the reception of extraordinary ambassadors, and the public entries of cities, there must be six of their number next to the king's person, three on each side; and the body of the king must be carried by these only, wheresoever ceremony requires. They have the keeping of the keys of the king's lodging at night, the keeping of the choir of the chapel, the keeping of the boats where the king passes the rivers; and they have the honour of bearing the white silk fringe in their arms, which in France is the *couronne couleur*. The keys of all the cities where the king makes his entry are given to their captain, in waiting or out of waiting. He has the privilege, in waiting or out of waiting, at ceremonies, such as coronations, marriages, and funerals of the kings, and at the baptism and marriage of their children, to take duty upon him. The coronation robe belongs to him; and this company, by the death or change of a captain, never changes its rank, as do the three others." This company's first commander, who is recorded as a person of great valour and military accomplishments, was Robert Patillock, a native of Dundee; and the band continued in great reputation till 1578. From that period, the Scots guards were less attended to, and their privileges came to be invaded. In 1612, they remonstrated to Louis XIII. on the injustice they had suffered, and set before him the services they had rendered to the crown of France. Attempts were made to

re-establish them on their ancient foundation; but no negotiation for this purpose was effectual. The troops of France grew jealous of the honours paid them: the death of Francis II. and the return of Q. Mary to Scotland, at a time when they had much to hope, were unfortunate circumstances to them: the change of religion in Scotland, was an additional blow: and the accession of James VI. to the throne of England, diminished altogether the interests of France and Scotland. The Scots guards of France had therefore, latterly, no connection with Scotland but the name.

(1.) \* *To GUARD*, *v. a.* [*garder*, Fr. from our word *ward*, the *w* being changed by the French into *g*; as *Gales* for *Wales*.] 1. To watch by way of defence and security. 2. To protect; to defend.

Naked the graces *guarded* you from all Dangers abroad, and now your thunder shall.

*Miller.*

Your pow'r you never use, but for defence, *To guard* your own or other's innocence. *Dryd.* Fix'd on defence, the Trojans are not slow

*To guard* their shore from an expected foe. *Dryd.*—The port of Genoa is very ill *guarded* against the storms. *Addison on Italy.* 3. To preserve by caution.—One would take care to *guard* one's self against this particular imperfection, because it is that which our nature very strongly inclines us to. *Addison's Spectator.* 4. To provide against objections.—Homer has *guarded* every circumstance with as much caution as if he had been aware of the objection. *Broome on Odyssey.* 5. To adorn with lists, laces, or ornamental borders. Obsolete.

Give him a livery

More *guarded* than his fellows. *Shakspeare.* See a fellow

In a long motely, *guarded* with yellow. *Shakspeare.*

(2.) \* *To GUARD*, *v. n.* To be in state of caution or defence.—There are cases, in which a man must *guard*, if he intends to keep fair with the world, and turn the penny. *Colley.*—To *guard* against such mistakes, it is necessary to acquaint ourselves a little with words. *Hart's Lexicon.*

(1.) GUARDIA, a town of Spain on the W. coast of Galicia, 15 miles WSW. of Tuy.

(2.) GUARDIA, or GUARDIA, a strong city of Portugal, in the province of Beira, and bishop's see, containing 2000 inhabitants, a cathedral, and 4 churches. It is 10 miles S.W. of Almeida, and 133 E. of Lisbon. Lon. 6. 57. W. Lat. 40. 22. N.

GUARDIA, a cape of Africa, on the E. extremity of Aden, at the entrance of the Strait of Bab-el-mandeb. Lon. 52. 5. E. Lat. 11. 40. N.

\* GUARDIAN, *v. n.* [*from guard*.] State of wind up. *Newton.*

And if so tender, fair, and happy,

Run from your *guardians* to the forty below  
Of such a kind as this. *Shakspeare, Othello.*

GUARDIA-MAR, a seaport town of Spain, in Valentia, on the Segura, 17 miles SSW. of Alcala. Lon. 1. 10. E. of Terrent. Lat. 38. 7. N.

GUARDAGLIA, a town of Romagna, in Romagna.

GUARDASUOLA, a town of Parma, 12 miles S. of Parma.

GUARDAVALLE, a town of Naples, in Calabria, 12 miles S. of Squillace.

GUARDIAN, *v. n.* appointed to row the boats, or to manage the ships of war which are laid up

in any harbour, &c. to observe that they keep a good looking-out, calling to the boat as she passes, and not suffering her to come on board, without having previously communicated the watch-word of the night.

\* GUARDER *n. s.* One who guards.

(1.) GUARDIA, or GUARDA. See G N° 2.

(2, 3.) GUARDIA, two towns of Naples; the prov. of Basilicata, 15 miles SSE. of Pa. 2. in Calabria Ultra, 15 miles W. of Bagin.

(4, 5.) GUARDIA, two towns of Spain; the province of Alva, 15 miles S. of Vitor; in New Castile, 22 miles ESE. of Toledo.

(6.) GUARDIA ALFEREZ, a town of Naples the province of Molise, 21 miles NE. of N. Lon. 14. 56. E. Lat. 41. 49. N.

(7.) GUARDIA GIARDINO, a town of Naples the province of Molise, 15 miles NW. of N.

GUARDIAGHELE, a town of Naples, bruzzo Citra, 10 miles SSE. of Chieti.

GUARDIALLOBARD, a town of Naples Principato Ultra, 6 miles N. of Cozza.

(1.) \* GUARDIAN, *n. s.* Personating the of a kind protector or superintendent.—My ing patrols protects me unseen, like my angel; and thuns my gratitude like a fair is beautiful by stealth, and conceals the she bestows the gift. *Dryden's Ded. to Cato*

Thus shall mankind his *guardian* care  
The promis'd father of the future age.

Mean while Minerva, in her *guardian*  
Shoots from the stary vaults thro' fields

(2.) \* GUARDIAN, *n. s.* [*from guardian*.] 1. One that has the care of an orphan; it is to supply the want of parents.—I am her, as I have just cause, being her *guardian*. *Shakspeare, Much Ado*—

When perjur'd *guardians*, proud and out of joint,

Chok up the streets, too narrow for the

—Hocus, with two other of the *guardians*, it their duty to take care of the care of three girls. *Arbuckle.* 2. One to whom and preservation of any thing is committed.

I gave you all,  
Mute you my *guardians*, my depreat

But kept a reservation to be found  
With such a number. *Shakspeare.*

—It then becomes the common general have truth at heart, and more especially who are the appointed *guardians* of the faith, to be up on the watch against false

*to have.* 3. A repository or storehouse.  
Where is Duncan's body?

—Carried to Colmar, &c.  
The fixed reverence of his present  
And *guardian* of their bones. *Shakspeare.*

(3.) GUARDIAN, in law, 1. a person one who has the custody and care of persons as have not sufficient due to care of themselves, and their estates, and effects. The *guardian* is entitled to the profits of the minor's lands, and to account for the same, at the end of a within a reasonable time, and to convert

money, unless the minor is near of age, at such things himself; and to pay in: money in his hands, that might have ed out; in which case it will be pre- the guardian made use of it himself. ain the lands of the heir, without ma- tion of any thing thereon, and to keep in: if he commits waste on the lands, ure of the guardianship: 3 Edward I. persons, as guardians, hold over any it the consent of the person who is, they shall be adjudged trespassers, accountable: 6 Ann. c. 17. xviii.

DIAN OF THE CINQUE PORTS. See

EDIAN OF THE SPIRITUALITIES. He spiritual jurisdiction of any diocese is during the vacancy of the see. He r guardian in law, or *jure magistratus*, thop is of any diocese wthin his pro- aridian by delegation, as he whom the r vicar-general doth for the time de-

IANSHIP. *n. f.* [from *guardian*.] The iardian.—The curate stretched his pa- cure of souls, to a kind of tutelary over goods and chattels. *L'Espr.*— ue, not only in losses and indignities rself, but also in the case of trust, re offered to others who are commit- care and *guardianship*. *Kittlowell.*— ie first who established the particu- us, assigning to himself the *guardian-* laws, and chief commands in war.

ARA, a river of Spain which rises in , runs through the provinces of La Etremaadura; then enters Portugal W. of Badajoz, and after running province of Alentejo, falls into the veen Ayamonte and Castromarin.

LESS. *adj.* [from *guard*.] Without

ie *guardless* herd, their keeper slain, yger in the Lybian plain. *Waller.* nd, *guardless* and undefended, mult een a double incitement. *South.*

RDO, a town of Spain, in the pro- n, 40 miles ENE. of Leon.

ARDO. See GOVARDO, N° 1, and 2.

ARDSHIP. *n. f.* [from *guard*.] 1.

es'd am I, by such a man led! use wise and careful *guardship* site fatigue and hardship. *Swift.* d *ship*.] A king's ship to guard the

ARD-SHIP, (§ 1. *def.* 2.) is a vessel of d to superintend the marine in a har- and to see that the ships which are not d have their proper watchward kept ding her guard-boats around them e- She is also to receive seamen who are the time of war.

, in botany; a genus of the monogy- belonging to the octandria class of e calyx is quadrifid; the petals four; n cylindrical, having the antheræ in its

mouth; the capsule is quadrilocular and quadri- valvular; the seeds solitary.

GUARGALA, or GUPGUELA, a town of A- frica, and capital of a small kingdom of the same name, in Biledulgerid, S. of Mount Atlas. Lon. 9. 55. E. Lat. 28. 0. N.

GUARIBA, in natural history, a species of monkey found in the West Indies. See SIMIA.

(1.) GUARINI, Guarino, a native of Verona, descended of an illustrious family, famous for having been the first who taught Greek after the restoration of letters. He had acquired that language at Constantinople. He died in 1460.

(2.) GUARINI, John Baptist, a celebrated Ita- lian poet, grandson to the preceding (N° 1.) born at Ferrara, in 1537. He was secretary to Alphon- so D. of Ferrara, who intrusted him with several important commissions. After the death of that prince, he was successively secretary to Vincent de Gonzaga, to Ferdinand de Medicis grand D. of Tuscany, and to Francis Maria de Feltri duke of Urbino. He was well acquainted with polite literature; and acquired immortal reputation by his Italian poems, especially by his *Pastor Fido*, the most admired of all his works, and of which there have been innumerable editions and transla- tions. He died in 1611.

GUARMA, or } a sea port of Peru, with a GUARMOY, } good harbour, about 130 miles NW. of Lima. Lon. 77. 49. W. Lat. 10. 10. S.

GUASCO, a river of S. America in Chili.

GUASTALIA, or } a strong town of the Cisal- GUASTEELLA, } pine republic, in the dep- of Mincio, and ci-devant duchy of Mantua, re- markable for a battle between the French and Im- perialists in 1734; wherein the latter were defeat- ed, with the loss of 5000 men. It is seated near the Po, at the junction of the Crostolo and the Tagliata, 15 miles N. of Reggio. Lon. 10. 33. E. Lat. 44. 55. N.

GUASTO, or VASTO, a town of Naples, in Abruzzo Citia, on the coast of the Adriatic, be- tween the mouths of the Trigno and Afiello, 15 miles SE. of Lanciano. Lon. 15. 6. E. Lat. 42. 29. N.

GUATAVITA, a lake of Terra Firma.

(1.) GUATIMALA, an Audience of N. Ame- rica, in New Spain, above 750 miles in length, and 450 in breadth. It abounds in chocolate, which they use instead of money. It has 12 pro- vinces under it; and the native Americans, under the dominions of Spain, profess Christianity, but it is mixed with many of their own superstitions. There is a great chain of high mountains, which run across it from E. to W. and it is subject to earthquakes and storms. It is however, very fer- tile; and produces great quantities of cochineal, cotton, cocoa nuts, &c.

(2.) GUATIMALA, a province of New Spain, in the above Audience, bounded on the W. by Soconusco, on the N. by Verapaz and Hondu- ras, on the E. by Nicaragua, and on the S. by the South Sea.

(3.) GUATIMALA, or ST JAGO DE GUATIMA- LA, a large and rich town of New Spain; capital of the above audience and province, (N° 1, and 2.) with a bishop's see, and an univerfity. It carries

on a great trade, especially in chocolate. On the 7th June 1773, it was swallowed up by an earthquake, when 8000 families perished. It has been since rebuilt at some distance from its former site. Lon. 91. 30. W. Lat. 14. 0. N.

(4.) GUATIMALA, VOLCANO OF, a burning mountain, in the above province, N<sup>o</sup> 1. Guatemala was almost ruined by it in 1541, but was afterwards rebuilt at a good distance from this dreadful mountain. Its eruptions added much to the horror of the earthquake in 1773.

(1.) \* GUAVA. GUAIAVA. *n. f.* An American fruit. The fruit, says Sir Hans Sloane, is extremely delicious and wholesome. They have only this inconvenience, that being very astringent, they stop up the belly, if taken in great quantities. *Miller.*

(2.) GUAVA, in botany. See PSIDIUM.

(1.) GUAXACA; a province of N. America, in New Spain, which is very fertile in wheat, Indian corn, cochineal, and cassia. It is bounded by the gulph of Mexico on the N., and by the South Sea on the S. It contains mines of gold, silver, and crystal.

(2.) GUAXACA, the capital of the above province, with a bishop's see. It does not contain above 2000 inhabitants; but it is rich, and they make very fine sweet-meats and chocolate. It has several rich convents. Lon. 100. W. Lat. 17. 45. N.

GUAYÁLAS, a fertile province of Peru, commencing 150 miles NNE. of Lima, and extending along the centre of the Cordillera.

GUAYANA, a town of Terra Firma, 75 miles S. of the gulf of Paria, and 175 SE. by E. of Calabeza.

GUAYAQUIL. See GUIAQUIL.

GUAYLES, a district of S. America, in Lima, W. of Guamailés, abounding in cattle.

GUAYNAMOTA, a town of Mexico, in the province of Guadalaxara, 70 miles NW. of Guadalaxara.

GUAYRA, a town and district of S. America, in the province of La Plata, bounded by Brasil on the E. and Paraguay on the W.

GUBBIO, GUBIO, or EUGUBIO, a town of Italy, in the territory of the church, and in the duchy of Urbino, with a bishop's see, 82 miles N. of Rome. Lon. 12. 41. E. Lat. 43. 18. N.

GUBEL, a town of Bohemia.

GUBEN, a handsome town of Germany, in Lower Lusatia, seated on the Neisse, and belonging to the house of Saxe-Merlenburg, 62 miles NE. of Dresden. Lon. 14. 59. E. Lat. 51. 55. N.

GUBER, a kingdom of Africa, in Negroland, surrounded with high mountains. The villages, which are numerous, are inhabited by shepherds. There are also many artificers, and linen-weavers, who send their commodities to Tombuto. The whole country is overflowed annually by the Niger, and at that time the inhabitants sow their rice. There is one town which contains about 6000 families, among whom are many merchants.

\* GUBERNATION. *n. f.* [*gubernatio*, Lat.] Government; superintendency; superiour direction.—Perhaps there is little of nothing in the government of the kingdoms of nature and grace, but

what is transacted by the man Jesus, imbu'd with the divine power and wisdom, and employed as a medium or conscious instrument of this *gubernation*. *Watts.*

GUBIO. See GUBBIO.

GUDENSBERG, a town of Germany, Cassel, 4 miles NNE. of Fritzlar, and Cassel.

(1.) \* GUDGEON. *n. f.* [*goujon*, Fr.] A small fish found in brooks and rivers, caught, and therefore made a proverbial name for a man easily cheated.—

'Tis true, no turbets dignify my box  
But *gudgeons*, flounders, what my Turbets

2. A man easily cheated.—This he did to you in, like so many *gudgeons*, to swallow false arguments. *Swift.* 3. Something to be to a man's own disadvantage; a bait; argument: *gudgeons* being commonly used for pike.—

But fish not with this melancholy bait  
For this fool's *gudgeon*, this opinion.

(2.) GUDGEON, in ichthyology; a *cyprinus*. See CYPRINUS, N<sup>o</sup> 7. They, though small, are of a pleasant taste, and inferior to smelt. They spawn twice in a year, and their feeding is much like the barbel, in streams and on gravel, sifting all they find; but they are easily taken with a worm, fishing near the ground; and being a rather-mouthed fish, will not easily get off when struck. They may be fished for with the hook being on the ground; or by having a running line on the ground, without a float. But although the small red worm is the best bait for these fish, yet wasps, gold-cadbaits do very well. They may also be fished for with 2 or 3 hooks at once, and afford sport, where they rise any thing large. When fishing for them, stir up the sand or gravel with a long pole; this will make them gather about that place, bite faster and more eagerly.

(3.) GUDGEON, SEA. See GOAISE.

(1.) GUE, or GUE DE LONGROY, a town of France, in the dep. of Eure and Loire, NE. of Chartres, and 4 W. of Dourdan.

(2.) GUE DE VELUIRE, a town of France, in the dept. of the Vendée, 8 miles SSW. of Nantes.

GUEBERSVEIR, a town of France, in the dep. of Upper Rhine, 6 miles SSW. of Colmar.

GUEBRES, or GARRÉS. See GARRÉS.

GUEBWILLER, a town of France, in the dep. of Upper Rhine, 12 miles SSW. of Colmar.

GUEDALL, a river of N. Wales, in Mererthshire, which runs into the Dore.

GUEGON, a town of France, in the dept. of Morbihan, 1½ miles W. of Josselin.

(1.) GUELDERLAND, a ci-devant province of Europe, bounded on the N. by the Zuyder Zee; E. by the bishopric of Munster; S. by those of Brabant, and W. by the States of Holland. It was erected into a county by the emperor Henry IV, in 1079; and into a duchy by Lewis V, in 1339. It had dukes of it till 1528, when it was yielded to Charles V.

rters of Nimeguen, Zutphen, and ing: acceded to the union, formed the **GUELDERLAND**, N<sup>o</sup> 2. The towns of chentlonck, Stralen, &c. were ced- by the treaty of Utrecht, and the ritory of Ruremond, remained to ience came to the house of Austria. mentioned territories, called *Austrian Guelderland*, are now annexed to the **PUBLIC**: (See that article.) as well as Dutch towns of Venlo and Steven-

**GUELDERLAND**, one of the ci-devant **U-** es, which now forms the department n the Batavian republic. Its great- n N. to S. is about 47 miles, and . near as much; but its figure is ve- . The air here is much healthier and e the maritime provinces, the land . Excepting some part of the *Felwee*, iful. It is watered by the Rhine, ches, the Wahal, the Yffel, and the lesser streams. Under the old cons- s divided into 3 districts, each of s states and diets. Those for the e were held twice a year at the can- d sent 19 deputies to the states ge- are computed 285 Calvinist minis- in Catholic congregations, 4 Luthe- of Remonstrants and Anabaptists. ns are Nimeguen, Zutphen, Arn- wyk, Loo, &c. **GUERES**, a strong town and district of public, in the dep. of the Roer, and by of Prussian Guelderland. It is Niers, 10 miles NW. of Venlo, and nsterdam. It was taken by the Fischegru in Oct. 1794. Lon. 6. 21. . N.

**GUERES.** See **GUELDERLAND.**  
See **GUELPHS.**

**GUERES**, a town of the French republic in ys. an late prov. of Austrian Flan- W. of Courtray. the surname of the royal family of

or **GUELFS**, a celebrated faction in sts of the **GIBELINS**. The Guelfs dled Italy with blood and carnage . The Guelfs stood for the Pope, peror. Their rise is referred by ie of Conrad III. A. D. 1139; by o- Frederic I.; and by others to that of ederic II. A. D. 1240, upon his being ed by Pope Gregory IX. But the opinion is that of Maimbourg, who two factions arose from a quarrel ncient and illustrious houses on the rmany, viz. the Henries of *Gibel-* *Guelfs* of Adorf. The name o have been formed from *Welfe*, or following occasion: the emperor aving taken the duchy of Bavaria l. brother of Henry duke of Bava-

ria, Welfe, assisted by the king of Sicily, made war on Conrad, and thus gave birth to the faction of the Guelfs. Others derive the name from the German *Wolf*, on account of the grievous evils committed by that cruel faction: others deduce the denomination from that of a German called *Guelfe*, who lived at Pistoie; adding, that his brother, named *Gibel*, gave his name to the Gibelins.

**GUEMAR**, a town of France, in the dept. of the Upper Rhine, 7 miles N. of Colmar.

**GUÉMENE**, two towns of France, 1. in the dep. of Lower Loire, 9 miles N. of Blain: 2. in that of Morbihan, 9 miles W. of Pontivy.

**GUENE**, a town of France, in the dep. of Correze, 2 miles SE. of Tulle.

**GUER**, a town of France, in the dep. of Mor- bihan, 9 miles ESE. of Ploernel.

**GUERAND**, a town of France, in the dep. of Lower Loire, 46 miles W. of Nantes, and 250 WSW. of Paris. Lon. 2. 20. W. Lat. 47. 20. N.

**GUERARD**, a town of France, in the dep. of Seine and Marne; 6 miles W. of Coulomiers.

**GUERCHE**; 3 towns of France: 1. in the dep. of Cher, 7 miles N. of Sançoins: 2. in that of Indre and Loire, 24 miles NE. of Poitiers: 3. in that of Ille and Vilaine, 10½ miles S. of Vitre.

**GUERCINO.** See **BARBIERI.**

\* **GUERDON.** *n. f.* [*guerdon, gardon, Fr.*] A reward; a recompense, in a good and bad sense. A word now no longer in use.—

But to the virgin comes, who all this while  
Amazed stands herself so mock'd to see,

By him who was the *guerdon* of his guile,  
For so misfeigning her true knight to be. *Spens.*  
—He shall, by thy revenging hand, at once re-  
ceive the just *guerdon* of all his former villainies.  
*Knolles.*—

Faire is the spur that the clear spirit doth raise  
To scorn delights, and live laborious days;  
But the lair *guerdon* when we hope to find,  
And think to burst out into sudden blaze,  
Comes the blind fury with th' abhorred sheers,  
And sits the thin-spun life. *Milton.*

**GUEREI**, a town of France, capital of the dep. of Creuse, containing 3000 citizens; seated on the Gartempe, 35 miles NE. of Limoges and 170 S. of Paris. Lon. 1. 46. E. Lat. 46. 10. N.

**GUERGUELA.** See **GUARGALA.**

**GUERICHE**, or } Otho, a native of Prussia,  
**GUERICKE**, } the most celebrated mathe-  
matician of his time, was born in 1602. He was the inventor of the air pump; and author of several works in natural philosophy, the chief of which is his *Experimenta Magdeburgica*. He died in 1686.

**GUERIGNY**, a town of France, in the dept. of Nievre, 8 miles N. of Nevers.

**GUERLESQUIN**, a town of France, in the dep. of Finisterre, 10 miles SE. of Morlaix.

**GUERMANGE**, a town of France, in the dep. of Meurte, 4 miles E. of Dieuze.

**GUERNADUAS**, a town of Cuba.

**GUERNSEY**, an island in the British channel, on the coast of the French dept. of the Channel, (ci-devant Normandy,) subject to Britain; but, as well as the adjacent islands, governed by its own laws. See **JESSAY**. It extends from E. to W. in the form of a harp, and is 13½ miles from SW. to NE.

NE. and 12½ where broadest, from E. to W. The air is very healthy, and the soil naturally more rich and fertile than that of Jersey; but the inhabitants neglect the cultivation of the land for the sake of commerce. They are, however, sufficiently supplied with corn and cattle, both for their own use and that of their ships. The island is well fortified by nature with a ridge of rocks, one of which abounds with emery, used by lapidaries in the polishing of stones, and by various other artificers. Here is a better harbour than any in Jersey, which occasions its being more resorted to by merchants; and on the S. side the shore bends in the form of a crescent, enclosing a bay capable of receiving very large ships. The island is full of gardens and orchards; whence cyder is so plentiful, that the common people use it instead of small beer, but the more wealthy drink French wine.

**GUERRICAIZ**, a town of Spain in Biscay.

**GUESCHART**, a town of France, in the dep. of Somme; 12 miles NE. of Abbeville.

\* **GUESS**. *n. s.* [from the verb.] Conjecture; judgment without any positive or certain grounds.

The enemy's in view, draw up your pow'rs:  
Hard is the *guess* of their true strength and forces.

*Shak.*

—His *guess* was usually as near to prophecy as any man's. *Fell.*—

A poet must confess

His art's like phytick, but a happy *guess*. *Dryd.*  
—It is a wrong way of proceeding to venture a greater good for a less, upon uncertain *guesses*, before a due examination. *Locke.*—We may make some *guess* at the distinction of things, into those that are according to, above, and contrary to reason. *Locke.*—

This problem yet, this offspring of a *guess*,

Let us for once a child of truth confess. *Prior.*

No man is best by accident, or *guess*,

True wisdom is the price of happiness. *Young.*

(1.) \* **GUESS**. *v. v.* [*gissen*, Dutch.] 1. To conjecture; to judge without any certain principles of judgment.—

Incapable and shallow innocents!

You cannot *guess* who caus'd your father's death.

*Shak.*

Let not your ears despise my tongue for ever,  
Which shall possess them with the heaviest sound,  
That ever yet they heard.

—Hum! I *guess* at it. *Shak. Macbeth.*

—He that, by reason of his swift motions, can inform himself of all places and preparations, should he not very often *guess* rightly of things to come, where God pleaseth not to give impediment? *Raleigh's Hist.*—

There issue swarming bands

Of ambush'd men, whom, by their arms and drefs,

To be Taxellan enemies I *guess*. *Dryden.*

—The same author ventures to *guess* at the particular fate which would attend the Roman government. *Swift.*—

Nor can imagination *guess*,

How that ungrateful charming maid

My purest passion has betray'd. *Swift.*

2. To conjecture rightly, or upon some just reason.—One may *guess* by Plato's writings, that his

meaning, as to the inferiour deities, was they who would have them might, and they would not, might let them alone; but that self had a right opinion concerning the true *Stillingfleet.*

(2.) \* **TO GUESS**. *v. a.* To hit upon by accident; to determine rightly of any thing a certain direction of the judgment.—If Xerxes able to call every common soldier by his name, his army, it may be *guessed* he got not the dreadful ability by learning his lessons by heart.

\* **GUESSER**. *n. s.* [from *guess*.] Conjector; one who judges without certain knowledge; is the opinion of divers good *guessers*, that it will not be more violent than advantage. *Pope.*—

If fortune should please but to take croquet;

To thee I apply, great Smedley's success

To give thee lawn sleeves, a mitre and

Whom would'st thou resemble? I leave *guess*.

\* **GUESSINGLY**. *adv.* [from *guess*.] Conjecturally; uncertainly. Not in use.—

I have a letter *guessingly* set down.

\* **GUEST**. *n. s.* [*gast*, *gast*, Sax. *gwest*,] 1. One entertained in the house or at the table of another.—They all murmured, saying, that gone to be *guest* with a man that is a finner.

Metbinks a father

Is, at the nuptial of his son, a *guest*

That best becomes the table. *Shak. Ham.*

Tell my royal *guest*

I add to his commands my own request.

2. A stranger; one who comes newly to a place. O desarts, desarts! how fit a *guest* art thou to me, since my heart can people you with wild beasts, which in you are wanting? *Lucy.*

Those happiest smiles

That play'd on her ripe lip, seem'd not  
What *guests* were in her eyes; when parted  
As pearls from diamonds dropt.

\* **GUESTCHAMBER**. *n. s.* [*gast* and *chamber*.] Chamber of entertainment.—Where is the *chamber*, where I shall eat the passover with my disciples? *Mark* xiv. 14.

\* **GUESTRIE**. *n. s.* [from *gast* and *rie*.] A dinner due to a *guest*.—

Ulysses so dear

A gift esteem'd it, that he would not  
In his black fletee that *guest-rie* to thee.

**GUETA**, a town of Spain, in New Castile.  
**GUETTARDA**, in botany; a genus of plants; and in the natural method under the 35th order, *Tricoc. 2.* The male cylindrical; the corolla cleft into 7 parts; the female calyx cylindrical; the corolla cleft into 7 parts; one pistil, and a dry plum.

**GUETTÄU**, a town of Austria, 9 miles of Freyburg.

**GULUGHON**, a town of France, in the dep. of Saone and Loire, 11 miles E. of Bourges.

**GUEUX**, a town of France, in the dep. of Maine, 6 miles W. of Rheims.

**GUFFIN**. See **GIFEN**.

**GUGGLE**, *v. n.* [*gorgoliarr*, Ital.] To run water running without intermission out of a row mouthed vessel.

**HLINGEN**, a town of Wurtemberg, on the river, 22 miles SSE. of Heidelberg.

**INECOURT**, a town of France, in the province of Vosges; 4½ miles NW. of Bruyeres.

**LADRON**, one of the LADRON ISLANDS.

**LAU**, a town of Silesia in Nieffe.

**LAU**, a town of Silesia, 5 m. NE. of Militsh.

**LAU**, 2 towns of Silesia; 1. in Glogau, 2. E. of Glogau; 2. in Nieffe, 6 miles W. of Glogau.

**GUAYANA**, a very extensive country of S. America, bounded on the E. and NE. by the Atlantic and the Oroonoko; on the S. by the Amazon and the W. by Grenada and New Andalusia Terra Firma, from which it is separated by the W. and N. by the Oroonoko. It extends 200 miles in length, from NE. to SW.; from the mouth of the Oroonoko to that of the Amazon, and from 300 to 600 in breadth. Geographers divide it into two parts, called the country along the coast *Carribbeano* and the interior *Guianu Proper*: the last is called EL DORADO by the Spaniards, on account of the immense quantity of gold it is supposed to contain. The Portuguese, French, and Dutch, have all formed settlements along the coast.

The coast between Cape North and Cape Orange is possessed by the natives. Along the coast, the land is low, marshy, and subject to inundations by the rivers which descend from the inland mountains. Hence the atmosphere is suffocating, moist, and unhealthy, especially where the woods have not been cleared away. The Europeans are forced to live in the most disagreeable huts, and fix their colonies at the mouths of the rivers, amidst stinking marshes, and the putrid exhalations of the salt morasses, for the conveniency of export and importation. The inhabitants are the natives, who are of a reddish brown; or the Europeans; or a mixed progeny of the natives in various combinations. The natives are divided into different tribes, more or less civilized and polished, as they are more remote from the settlements of the Europeans.

They allow polygamy, and have no divisions of lands. The men go to war, hunt, and fish; the women look after domestic concerns, spin, weave, and dress in their fashion, and plant cassava and maize, the only plants which are cultivated by the natives. Their arms are bows and arrows; sharp iron arrows, blown through a reed, which they use in hunting; and clubs made of a heavy wood called *Iron-wood*. They eat the dead bodies of those that are slain in war, and sell for those they take prisoners; their wars are chiefly undertaken to furnish the Europeans with slaves. All the different tribes go naked. On particular occasions they wear caps of feathers; cold is wholly unknown, they cover no part of their bodies that which distinguishes the sex. They are cheerful, humane, and friendly; but timid, when heated by liquor, and drunkenness is a common vice among them. Their houses are made of 4 stakes set up in a quadrangular form, the sides of the poles, bound together by slit nibbles,

and covered with the large leaves called *troelits*. Their life is ambulatory; and their houses, which are put up and taken down in a few hours, are all they have to carry with them. When they remove from place to place, which, as they inhabit the banks of rivers, they do by water in small canoes, a few vessels of clay made by the women, a flat stone on which they bake their bread, and a rough stone on which they grate the roots of the cassava, a hammock and a hatchet, are all their furniture and utensils; most of them, however, have a bit of looking-glass framed in paper, and a comb. Their poisoned arrows are made of splinters of a hard heavy wood, called *cacario*; they are about 12 inches long, and somewhat thicker than a coarse knitting needle: one end is formed into a sharp point; round the other is wound some cotton to make it fit the bore of the reed through which it is to be blown. They will blow these arrows 40 yards with absolute certainty of hitting the mark, and with force enough to draw blood, which is certain and immediate death. Against this poison no antidote is known. The Indians never use these poisoned arrows in war, but in hunting only, and chiefly against the monkeys; the flesh of an animal thus killed may be safely eaten, and even the poison itself swallowed with impunity. This country, except its sea coast, and lands adjacent to its rivers, has hitherto remained unknown to all but its original natives; and even of these, it is only the Dutch territories that foreigners have any knowledge of; for those of the Spaniards, French, and Portuguese, are inaccessible to them. This country, on account of the diversity and fertility of its soil, and of its vicinity to the equator, which passes through it, affords almost all the productions of the different American countries between the tropics, besides a variety peculiar to itself.

**1. GUIANA, DUTCH**, (as it has been hitherto called, though it may now be called **BRITISH**;) was first discovered by Columbus, in 1498. It lies between 7° of N. and 5° of S. lat. and between 53° and 60° of lon. W. It is bounded on the N. and E. by the Atlantic; on the W. by the Oroonoko and the Negroe; and on the S. by the Amazon. It was formerly the property of the English, who made settlements at Surinam, where a kind of corrupt English is still spoken by the negroes. The Dutch took it in the reign of Charles II, and it was ceded to them by treaty in 1674, in exchange for what they had possessed in the province, now the state of New York. It consists of 4 settlements, viz. **BERBICE**, **DEMERARA**, **ISSEQUEBO**, and **SURINAM**; which have all been taken by the British during the present war. (See these articles.) The land for 50 miles up the country from the sea-coast is flat; and, during the rainy seasons, covered 2 feet high with water. This renders it inconceivably fertile, the earth, for 12 inches deep, being a stratum of perfect manure: an attempt was once made to carry some of it to Barbadoes; but the wood ants so much injured the vessel, that it was never repeated. The excessive richness of the soil is a disadvantage, for the canes are too luxuriant to make good sugar; and therefore, the first and second crops are converted into rum. There are some trees on this part; but they are small and low,

low, consisting chiefly of a small species of palm, intermixed with a leaf near 30 feet long and 3 wide, which grows in clusters, called *Troachie*; and, at the edges of running water, with mangroves. Farther inward the country rises; and the soil, though still fertile, is less durable. It is covered with forests of valuable timber, that are always green; and there are some sandy hills, but no mountains. In this country the heat is seldom disagreeable; the trade winds by day, the land breezes in the evening, and the invariable length of the nights, with gentle dews, refresh the air, and render it temperate and salubrious. There are two wet seasons and two dry, of three months each, in the year, and during more than a month in each wet season, the rain is incessant. The dry seasons commence six weeks before the equinoxes, and continue six weeks after. The wet seasons are more wholesome than the dry, because the rains keep the waters that cover the low lands, next the sea fresh and in motion; but during the dry season it stagnates, and, as it wastes, becomes putrid, sending up very unwholesome exhalations. Blossoms, green and ripe fruit, are to be found upon the same tree in all seasons. There are some fine white and red agates in Guiana, which remain untouched; and mines of gold and silver, which the Dutch would not suffer to be wrought.

II. GUIANA, FRENCH, *Old Cayenne, or Equinocial France*, extends from Cape Orange, about 240 miles along the coast, to the Marani; where the Dutch territory begins, and extends to the mouth of the Oroonoko. This part of Guiana is said to be mountainous. The present French government have made it a receptacle for exiles. In Jan. 1801, 80 *Jacobins* were banished to it, without even the form of a trial!

III. GUIANA, PORTUGUESE, is that part of Guiana which lies S. of Cape North. It has been united to BRASIL and is now considered as part of that country.

(1.) GUIAQUIL, a river of Peru.

(2-4.) GUIAQUIL, a city, bay, and harbour of Peru, and capital of an audience of the same name. The city is two miles in extent, has 3 forts, and contains 20,000 inhabitants. Lon. 79. 15. W. Lat. 2. 9. S.

GUIARA, a sea port town of S. America, on the Caracca coast. The British attempted to take it in 1739 and 1743; but were repulsed both times. Lon. 66. 5. W. Lat. 10. 35. N.

GUIBARRA, a river of Ireland, in Donegal, which runs into the Atlantic, 13 miles N. of Ililly Begs.

(1.) GUICCIARDINI, Francis, a celebrated historian, born at Florence in 1482. He professed the civil law with reputation, and was employed in several embassies. Leo X. gave him the government of Modena and Reggio, and Clement VII. that of Romagna and Bologna. Guicciardini was also lieutenant general of the pope's army, and distinguished himself by his bravery on several occasions; but Paul III. having taken from him the government of Bologna, he retired to Florence, where he was made counsellor of state, and was of great service to the house of Medici. He at length retired into the country to write his history of Italy, which he composed in Italian, and

which comprehends what passed from 1532. This history is greatly esteemed; continued by John Baptist Adriani, who died in 1540.

(2.) GUICCIARDINI, Lewis, nephew preceding, wrote a History of the Low Countries and Memoirs of the affairs of Europe, from 1560. He wrote with great spirit a persecution of the duke d'Alva, for which he was imprisoned. He died in 1583.

GUICHE, a town of France, in the Saone and Loire, 10 miles NNE. of Chalon.

GUICQUELLAU, a town of France, dep. of Finisterre; 3 miles NW. of Lescop.

\* GUIDAGE. *n. f.* [from *guide*.] The given to a guide. *Ainsworth*.

\* GUIDANCE. *n. f.* [from *guide*.] D government.—They charge me with neglect of wiser men. *Spenser*.—As to those who lived under the guidance of reason alone, the assistance of supernatural light, it is probable that miracles, or a message from the dead, would persuade them. *Atterbury*.—A similar application must be left to Christian prayer under the guidance of God's holy spirit, who knows our necessity before we ask, and grants us assistance in asking. *Rogers*.—

This to the young—but thy experience  
Wants not the guidance of a former life  
—A prince ought not to be under the influence of either faction, because he is from his office of presiding over the whole the head of a party. *Swift*.

(1.) \* GUIDE. *n. f.* [*guide*, French, *verb.*] 1. One who directs another in a journey.—Thou gavest them a burning pillar of fire to guide them in the unknown journey. *Wisd.* 13.

Can knowledge have no bound, but advance

So far to make us wish for ignorance?  
And rather in the dark to grope our way?

Than, led by a false guide, to err by day?  
2. One who directs another in his conduct.

While yet but young, his father dy'd  
And left him to an happy guide.

—They have all the same pastoral guidelines, authorized, sanctified, and set apart by the appointment of God by the direction of the Holy Spirit, to direct and lead the people of God in the same way of eternal salvation. *Pearson*.

—Who is the guide of nature?  
—Who is the God of nature? In him we live and are. Those things which nature is fit to be done are by divine art performed, using natural instruments: nor is there any such thing as a divine nature herself working, but in the instrument of nature's work. *Hooker*.—

Some truths are not by reason to be known  
But we have sure experience for our guide.

(2.) GUIDES, in military language, are persons who direct the country people in the neighbourhood of an encampment; who give the army intelligence concerning the country, the roads by which they are to march, and the probable route of the enemy.

\* TO GUIDE. *v. a.* [*guider*, French, *verb.*] To direct in a way.—When the spirit of truth shall come, he will guide you into all truth. *Jo. xvi.*

served to *guide* them to their neighbours  
*ecay of Piety*.—Whosoever has a faithful  
*guide* him in the dark passages of life,  
his eyes in another man's head, and  
ver the worse. *South*. 2. To influence,  
refe, or such like secular maxims, when  
at the interest of this world *guides* men,  
times conclude that the slightest wrongs  
be put up. *Kettiswell*. 3. To govern  
1; to instruct.—For thy name's sake  
nd *guide* me. *Pf. xxxi*. 3. 4. To regu-  
superintend.—Women neglect that which  
signs them as their proper business, the  
the house. *Decay of Piety*.

GUIDEL, a town of France in the dep.  
te, 5 miles SE. of Quimperle.

GUIDEL, a town of France, in the dep. of  
5 miles NW. of Orient.

GUIDLESS. *adj.* [from *guide*.] Having  
wanting a governour or superintendent.  
ambitious Swede, like restless billows tost,  
in his life he blood and ruin breath'd,  
ow *guideless* kingdom peace bequeath'd.

*Dryden*.  
: fierce winds o'er dusky valleys blow,  
every puff bears empty shades away,  
*guidel's* in those dark dominions stray.

*Dryden*.  
DER. *n. s.* [from *guide*.] Director; te-  
nide; Obsolete.—

under come! to the Roman camp con-  
tus.

tion, that being provoked by excessive  
fl his dagger into his body, and there-  
of reaching his vitals, opened an im-  
the unknown cause of all his pain, and  
bed himself into perfect health and ease,  
great reason to acknowledge chance  
urgeo, and Providence for the *guder*  
l. *South*.

Alexander, an eminent Italian poet,  
via in 1650. At Rome, he attracted  
of Q. Christina of Sweden, who retain-  
er court; he also obtained a confid-  
from pope Innocent XI. and a pen-  
he duke of Parma. For a good office  
state of Milan with prince Eugene, he  
ed among the nobles and decurions of  
and died in 1712. His exterior form  
urable; he was short and crooked, his  
rge, and he was blind of his right eye.  
were published at Verona in 1716.

ZZOLO, a town of the Cisalpine re-  
the department of Miucio, and late  
fantua.

IDO ARETIN. See ARETIN, N° 2.

DO RENI. See RENI.

UIDON. *n. s.* [Fr.] A standardbearer;  
Obsolete.

GUIDON is a flag born by the king's  
broad at one extreme, and almost  
the other, and slit or divided into two  
sign or flag of a troop of horse guards.  
), § 20, N° ii.

UIDON, ( § 1. *def.* 1.) the officer who  
uidon, is that in the horse guards which  
s in the foot; and takes place next be-  
net.

PART II.

(4.) GUIDONS, [*guidones*, or *schola guidonum*,]  
were a company of priests established by Charle-  
magne, at Rome, to conduct and guide pilgrims  
to Jerusalem, to visit the holy places: they were  
also to assist them in case they fell sick, and to  
perform the last offices to them in case they died.

GUIDCRE, a river of Ireland in Donegal.

(1.) GUIENNE, the largest ci-devant province of  
France, was bounded on the N. by Saintogne,  
Angoumois, and Limosin; on the E. by Limosin,  
Auvergne, and Languedoc; on the S. by the Py-  
renees, Lower Navarre, and Berni; and on the  
W. by the ocean. It was 225 miles long and 200  
broad; and was divided into the Upper and  
Lower. This extensive province was anciently  
called AQUITAINE, and is now divided into the  
departments of Aveyron, Dordogne, Gers, Gi-  
ronde, Landes, Lot, Lot and Garonne, Lower  
and Upper Pyrenees. The principal rivers are,  
the Garonne, the Adour, the Tarn, the Aveyron,  
and the Lot. Bourdeaux was the capital.

1. GUIENNE, LOWER, contained Bourdelois, Pe-  
rigord, Agenois, Condomois, Bazadois, Landes,  
Proper Gascony, and the district of Labour.

2. GUIENNE, UPPER, comprehended Querci,  
Rouergue, Armagnac, the territory of Com-  
minges, and the county of Bigorre.

(ii.) GUIENNE, PROPER, a ci-devant province  
of France included in the above extensive province  
(N° 1.) but extending only 90 miles in length and  
80 in breadth. It now forms the departments of  
Gironde, and Lot and Garonne.

GUIFONI, a town of the French republic in  
Cortica 13½ miles S. of Corte.

GUIGNEN, a town of France, in the dep. of  
Ille and Vilaine; 18 miles NNE. of Rhedon.

GUILANDINA, the NICKAR TREE: A genus  
of the monogynia order, belonging to the decan-  
dria class of plants; and in the natural method  
ranking under the 33d order, *Lomentaceæ*. The  
calyx is monophyllous and salver-shaped; the  
petals, inserted into the neck of the calyx, nearly  
equal; the seed-vessel a legumen. There are 3  
species:

1. GUILANDINA BONDUCA, the yellow nickar.

2. GUILANDINA BONDUCELLA, the gray nickar.  
These are climbing plants, natives of the West  
Indies, where they rise to 12 or 14 feet; the  
flowers come out at the wings of the stalks; and  
are composed of 5 concave yellow petals. They  
are succeeded by pods about 3 inches long and  
two broad, closely armed with slender spines,  
opening with two valves, each inclosing two hard  
seeds about the size of childrens marbles, of a  
yellowish colour. See N° 3.

3. GUILANDINA MORINGA, the morunga nic-  
kar, is a native of Ceylon, and some places  
on the Malabar coast. It rises to 25 or 30 feet,  
having flowers produced in loose bunches from  
the sides of the branches, and composed of an un-  
equal number of petals. These plants, being na-  
tives of warm climates, require to be kept through-  
the winter in a stove in this country. They are  
propagated by seeds; but those of the BONDUCA  
are so hard, that unless they are soaked some days  
in water before they are put into the ground, or  
placed under the pots in the tan-bed to soften  
their covers, they will remain for years without

T t t t vegetating

vegetating. The roots of the Moringa are scraped when young, and used by the inhabitants of Ceylon and Malabar as those of horse-radish are in Europe. The wood dyes a beautiful blue colour. It is the *liquor nephriticum*, or nephritic wood, of the dispensatories; and is brought over in large, compact ponderous pieces, without knots, of a whitish or pale yellow colour on the outside, and dark coloured or reddish within: the bark is usually rejected. This wood imparts to water or rectified spirit a deep tincture; appearing when placed between the eye and the light, of a golden colour; in other situations blue; pieces of another wood are sometimes mixed with it, which give only a yellow colour to water. It has scarce any smell, and very little taste. It has been recommended in difficulty of urine, nephritic complaints, and all disorders of the kidneys and urinary passages.

(1.) \* GUILD, *n. f.* [*gildseip*, Saxon, a fellowship, a corporation.] A society; a corporation; a fraternity or company, combined together by orders and laws made among themselves by their prince's licence. Hence the common word *guild* or *guildhall* proceeds, being a fraternity or commonalty of men gathered into one combination, supporting their common charge by mutual contribution. *Cozuel.*—

Towards three or four o'clock  
Look for the news that the *guild* hall affords.

*Shak. Rich. III.*  
—In woollen cloth it appears, by those ancient *guilds* that were settled in England for this manufacture, that this kingdom greatly flourished in that art. *Hale's Origin of Mankind.*—

As when the long-ear'd milky mothers wait  
At some sick miser's triple bolted gate,  
For their defrauded absent foals they make

A moan so loud, that all the *guild* awake. *Pope.*  
(2.) GUILD, (from the Saxon verb *gildan*, to pay), signifies a fraternity or company, because every one was *gildare*, *i. e.* to pay something towards the charge and support of the company. It was a law among the Saxons, that every freeman of 14 years of age should find sureties to keep the peace, or be committed: upon which certain neighbours, consisting of ten families, entered into an association, and became bound for each other, either to produce him who committed an offence, or to make satisfaction to the injured party: that they might the better do this, they raised a sum of money among themselves, which they put into a common stock; and when one of their pledges had committed an offence, and was fled, then the other nine made satisfaction out of this stock, by payment of money, according to the offence. Because this association consisted of ten families, it was called a *decennary*: and from hence came out later kinds of fraternities. But as to the precise time when these guilds had their origin in England, there is nothing of certainty to be found; since they were in use long before any formal licence was granted to them for such meetings. It seems to have been about the close of the 11th century, says Anderfon, in his *History of Commerce*, vol. 1. p. 75, that merchant guilds, or fraternities, which were afterwards styled corporations, came first into the general use in many

parts of Europe. Mr Madox, in his *Form*, chap. i. § 9. thinks, they were hardly known to the Saxons, and that they might be first brought into England by the Normans.

(3.) GUILD, *Gild*, or *Geld*, is also used by ancient writers, for a compensation or satisfaction for a fault committed.

(4.) GUILD, in the royal boroughs of Scotland is still used for a company of merchants, or freemen of the borough. See *BOURGHESE*.

(5.) GUILD, DEAN OF. See *DEAN*.  
ii. Every royal borough has a DEAN OF THE BOROUGH, who is the next magistrate below the bailiffs; judges of controverfies among men of the trade; disputes between inhabitants and landlords; calls courts, at which his brethren of the *guild* are bound to attend; manages the stock of the *guild*; and amercos and collects.

(1.) GUILDFORD, or GULDERSFORDE, a borough town of Surry, on the Wye, near the site of an old castle. In the Saxons times it was a royal villa, where many of the Anglo-Saxons used to pass their festivals. It is a corporation consisting of a mayor, recorder, aldermen, and has sent two members to parliament since the commencement. The great road from London to Chichester and Portsmouth lies through this town, which has always been famous for inns, and excellent accommodations; and assizes are often held here. Its manufactory was cloth, of which there are but few small remains. Here is a school founded by Edward VI: an almshouse endowed with the yearly worth 300*l.* a-year; and two charity schools for 30 boys and 20 girls. There were 3 churches, but one of them fell down in April 1740. It is a fine circular course for horse races, which begin when the Newmarket are ended. K. William III. founded a race of 100 guineas to be run for here every Monday to honour the race with his presence once king George I. The Wye is made use of to the town, and by it a great quantity of timber is carried to London, not only from the neighbourhood, but from Suffex and Hampshire 30 miles off. Guildford is 30 miles SW. of London. Lon. 0. 30. W. Lat. 51. 16. N.

(2.) GUILDFORD, a town of the State of Connecticut 12 miles E. of Newhaven, and 201 NE. of Philadelphia. Lon. 2. 6. E. Lat. 41. 19. N.

(3.) GUILDFORD, a county of N. Carolina, bounded on the E. by Orange county, N. by Johnston, S. by Rockingham, and W. by Guilford counties; containing 6,675 citizens in 1790, and 516 slaves. Martinville is the capital.

(4.) GUILDFORD, a town of N. Carolina in Guilford county, 137 miles WNW. of Raleigh. Lon. 79. 56. W. Lat. 36. 8. N.

(5.) GUILDFORD, a town of N. Carolina 5 miles S. of Yixonton.

GUILD-HALL, or *Gild Hall*, the great judicature for London. In it are kept the court, the sheriff's court, the court of conscience, court of common council, chamberlain's court, &c. Here also the court sits upon *nisi prius*, &c.

*n. f.* [guile, gills, old French, the  
deceitful cunning; insidious ar-  
riving words he courted her awhile,  
and oft sighing sore,  
his heart did court with divers guile;  
and looks, and sighs she did abhor.

*Spenser.*  
I have most need to employ a friend,  
wily, treacherous, and full of guile,  
To lead me to the top of heav'n,  
For I am cold in zeal to you or yours. *Shak.*  
With more successful hope, resolve  
force or guile eternal war. *Milton.*  
his malice and false guile contend;  
ends must be who could seduce

*Milton's Paradise Lost.*  
[guile and fall.] 1. Wily;  
deceitfully artful.—The way not to  
be deceived is to be *guileful* through-  
out. *Shak.*  
Without expence at all,  
Without words, peace may be obtain'd.

*Shakespeare's Henry VI.*  
I saw his *guileful* act  
Which all unwitting, seconded  
By him, did bring about the overthrow  
Of our dear prince, and vanquish'd in a cloud. *Dryd.*  
is: secretly mischievous.—  
My brethren to that *guileful* hole,  
Whence the dead corps of Bassianus lay. *Shak.*

*ULLY adv.* [from *guileful*.] Infi-  
dentially.—  
The tempter *guilefully* reply'd. *Milt.*

*ULNESS n. f.* [from *guileful*.] Se-  
cretly cunning.

*ULLESS adv.* [from *guile*.] Free from  
deceitfulness; simply honest.

*UL n. f.* [from *guile*.] See *BEGUILER*.  
leads into danger by insidious practi-

as wary wife in all his way,  
He deceived his deceitful sleight;  
He lost his safety to betray;  
He beguile the *guiler* of the prey. *Spens.*

*ULD n.* See *GUILDFORD*.

*UL n.* town of the French republic, in  
Normandy and late prov. of Auvergne  
situated on the Main 6 miles from  
Paris. E. Lat. 40. 27. N.

*UL n.* See *COLYMBUS*.

*UL n.* a town of France in the dep.  
of Aisne, 9 miles NNW. of Embrun.  
The prince Eugene in 1692. Lon. 6.  
N. 41. N.

*UL n.* John, of Welsh extraction, was  
born in North Wales, about 1565. Having com-  
menced at Brasen Nose college, Ox-  
ford a member of the college of arms  
he was made rouge croix pursuivant,  
and died in 1621. He published, in  
1614, a celebrated work, intitled *the Display of*  
*the fift*, which has gone through many  
editions, the fifth, which came out in 1679,  
is a *treatise of honour civil and military*,  
by John Loggan.

*GUILLOTIERE*, a village of France in the dep.  
of Rhone and Loire, near Lyons. It was put in  
a state of siege, along with the commune of Ly-  
ons, by decree of the Directory, on the 3d Feb.  
1793.

*GUILLOTINE. n. f.* an engine of decapitation,  
decreed by the French National Assembly, to be  
the sole punishment of persons condemned to  
death, on the 20th of March, 1792; so named  
from Dr Guillot, a member of the Assembly, who  
proposed it as an instrument of *mercy*, by giving  
the criminal a more expeditious death than any  
other means can afford. Its effect it must be al-  
lowed is instantaneous. A minute description of  
it is unnecessary, as *fig. 4.* and *5. Pl. CLXXI.* will  
convey a sufficient idea of it. This instrument is  
not a new invention. It was used in Scotland a-  
bout the time of the reformation, when it was  
called *the Maiden*; (See *MAIDEN*;) and is still  
kept in the lower part of the Parliament House  
at Edinburgh, where it is shown as a curiosity.  
Some say it was invented and first used at Halifax  
in Yorkshire.

*To GUILLOTINE, v. a.* To behead with that  
engine; a new verb, introduced by the use of it.

*GUILLOIN*, a town of France in the dept. of  
Yonne, 7 miles E. of Avallon.

*GUILT n. f.* [guilt, Saxon, originally signi-  
fied the fine or mulet paid for an offence, and af-  
terward the offence itself.] 1. The state of a man  
justly charged with a crime; the contrary to in-  
nocence.—It was neither *guilt* of crime, nor re-  
ason of state, that could quench the envy that was  
upon the king for this execution. *Bacon's Henry*  
*VII.*—When these two are taken away, the possi-  
bility of *guilt*, and the possibility of innocence,  
what restraint can the belief of the creed lay upon  
any man? *Hammond.* 2. A crime; an offence.—  
Close pent up in *guilts*

Rive your concealing contents, and alk  
These dreadful summoners grace. *Sba. K. Lear.*

*\* GUILTYLY. adv.* [from *guilty*.] Without  
innocence; without clearness of conscience.—  
Bloody and guilty; *guiltily* awake,  
And in a bloody battle end thy days:  
Think on lord Hastings, and despair and die. *Sba.*

*\* GUILTINESS. n. f.* [from *guilty*.] The state  
of being guilty; wickedness; consciousness of  
crime.—He thought his flight rather to proceed  
of a fearful *guiltiness* than of an humble faithful-  
ness. *Sidney.*—

The last was I that felt thy tyranny;  
O, in the battle think on Buckingham,  
And die in terror of thy *guiltiness*. *Shak. R. III.*

I should be guilty than my *guiltiness*. *Shak.*

*\* GUILTILESS. adj.* [from *guilt*.] innocent;  
free from crime.—

I am in this commanded to deliver  
The noble duke of Clarence to your hands:  
I will not reason what is meant hereby,  
Because I will be *guiltless* of the meaning. *Shakesp.*

Many worthy and chaste dames thus,  
All *guiltless*, meet reproach. *Shakesp. Othello.*

—Then shall the man be *guiltless* from iniquity,  
and this woman shall bear her iniquity. *Num. v. 31.*

Thou, who do'st all thou wishest at thy will,  
And never wishest ought but what is right,

T t t t 2 Preserve

ney.—I would not have had any hand in his death, of whose *guiltlessness* I was better assured than any man living could be. *King Charles.*

\* **GUILTY.** *adj.* [*guiltig*, Sax. one condemned to pay a fine for an offence.] 1. Justly chargeable with a crime; not innocent.—Is there not a ballad of the king and the beggar?—The world was *guilty* of such a ballad'some three ages since. *Shak.*

Mark'd you not

How that the *guilty* kindred of the queen  
Look'd pale, when they did hear of Clarence's  
death!

—We are verily *guilty* concerning our brother, in that we saw the anguish of his soul when he besought us, and we would not hear. *Gen. xlii. 21.*—

With mortal hatred I purfu'd his life,  
Nor he, nor you, were *guilty* of the strife;  
Nor I, but as I lov'd; yet all combin'd,  
Your beauty and my impotence of mind. *Dryd.*  
Farewel the stones

And threshold, *guilty* of my midnight moans.

—There is no man that is knowingly wicked, but is *guilty* to himself; and there is no man that carries guilt about him, but he receives a sting into his soul. *Tillotson.* 2. Wicked; corrupt.—

All the tumult of a *guilty* world,  
Tost by ungenerous passion, sinks away. *Thomf.*

**GUIMARAENS**, an ancient and elegant town of Portugal, in Entre Duero e-Minho, divided into the old and new town. The former is seated on an eminence, about 1100 paces in circumference, and defended by a barbican. The latter contains 15 squares, 57 streets, 8 gates, 6 churches, 6 convents, 4 hospitals, 4 bridges, and 6000 inhabitants. Its chief manufacture is linen. It lies 10 miles E. of Braga, and 165. NE. of Lisbon. Lon. 2 27. W. Lat. 41. 20. N.

ces spontaneously, and almost without all the necessaries of life, grain, fruit, and roots. Every thing matures to perfection is excellent in its kind." One thing surprised him, was the prodigious rapidity with the sap of trees repairs any loss they "I was never (says he) more astonished, on landing 4 days after the locusts had demolished the fruits and leaves, and even the buds, to find the trees covered with new and they did not seem to me to have suffered." Similar accounts are given of the rest of Guinea.

GUINEA, GENERAL DESCRIPTION OF. 1. Of above mentioned. (§ 1.) the 1st is situated on the west coast, which is said to be navigable more than 200 miles, and is by travellers described to be fertile and fruitful. Mr Brue, principal agent for the French African company, who spent 3 years in that country, after describing its fertility and plenty near the sea, adds, "The farther you go from the sea, the country on the coast the more fruitful and well improving with Indian corn, pulse, fruit, &c. are vast meadows, which feed large herds of great and small cattle, and poultry are plenty in the villages that lie thick on the river banks. The country is well peopled." *Abley's Travels*, ii. p. 46. The same author in the account of a voyage he made up the river Gambia, which of which lies about 300 miles S. of the coast, and is navigable about 600 miles up the river, says, "that he was surprized to see the land so well cultivated; scarce a spot lay unimproved, the low lands divided by small canals sowed with rice, &c. the higher grounds sowed with millet, Indian corn, and peas of several sorts; their beef excellent; poultry plenty and very cheap, as well as all other necessaries." Mr Moor, who was sent from England in 1725, in the service of the African company, and settled at James Fort on the Gambia, or in the territories on that river, about 5 years, can give above account of the fruitfulness of the country.

Captain Smith, who was sent in 1726, in the service of the African company to survey their settlements on the whole coast of Guinea, says, "the coast of the Gambia is pleasant and fruitful; all sorts of all kinds being plenty and exceeding good." *Voyage to Guinea*, p. 31, 34. The country between the two above mentioned rivers is large and extensive, inhabited principally by three Negro nations known by the names of FULIS, and MANDINGOS. The Jalofas, the principal settlement is on both sides of the river; great numbers of these people are also to be found in the Mandingos; which last are mostly on both sides of the Gambia. The Fulis are found on both sides of the river Senegal: their country which is very fruitful and populous, extends for 400 miles from east to west. They are of a deep tawny complexion, appearing to have some affinity to the Moors, whose country lies to the north: they are good farmers, and produce great harvests of corn, cotton, tobacco, &c. and breed great numbers of cattle of all kinds. The most particular account we have of these

people is from Moore, who says, "Some of these Fulis blacks, who dwell on both sides the river Gambia, are in subjection to the Mandingos, amongst whom they dwell, having been probably driven out of their country by war or famine. They have chiefs of their own, who rule with much moderation. Few of them will drink brandy, or any thing stronger than water and sugar, being strict Mahometans. Their form of government goes on easy, because the people are of a good quiet disposition, and so well instructed in what is right, that a man who does ill is the abomination of all, and none will support him against the chief. In these countries the natives are not covetous of land, desiring no more than what they use; and as they do not plough with horses and cattle, they can use but very little; therefore the kings are willing to give the Fulis leave to live in their country, and cultivate their lands. If any of their people are known to be made slaves, all the Fulis will join to redeem them; they also support the old, the blind, and lame, amongst themselves; and as far as their abilities go, they supply the necessities of the Mandingos, great numbers of whom they have maintained in famine." The author, from his own observations, says, "They were rarely angry, and that he never heard them abuse one another." The Mandingos are said by Mr Brue "to be the most numerous nation on the Gambia." See MANDINGOS. 2. That part of Guinea known by name of the *Grain* and *Ivory Coast* extends about 500 miles. See IVORY COAST. 3. Next adjoining to the Ivory Coast are the GOLD COAST and the SLAVE COAST. Authors are not agreed about their bounds, but their extent together along the coast may be about 500 miles. And as the policy, produce, and economy of these two kingdoms of Guinea are much the same, they will be found described together. See SLAVE COAST. 4. Next adjoining to the Slave Coast, is the kingdom of Benin, which, though it extends but about 170 miles on the sea, yet spreads so far in land as to be esteemed the most potent kingdom in Guinea. See BENIN, N° 1 and 3. Artus says, "the natives are a sincere, inoffensive people, and do no injustice either to one another or to strangers." (*Collect.* vol. iii. p. 228.) Smith confirms this account, and says, "that the inhabitants are generally very good-natured, and exceeding courteous and civil. When the Europeans make them presents, which, in their coming thither to trade, they always do, they endeavour to return them doubly." Bosman tells us, "that his countrymen the Dutch, who were often obliged to trust them till they returned the next year, were sure to be honestly paid their whole debts." There is in Benin a considerable order in the government; theft, murder, and adultery being severely punished. Smith says, "their towns are governed by officers appointed by the king, who have power to decide in civil cases, and to raise the public taxes; but in criminal cases, they must send to the king's court, which is held at the town of OEDO, or GREAT BENIN. See BENIN, N° 3. This town, which covers a large extent of ground, is about 60 miles from the sea." Barbot tells us, "that it contains 30 streets, 20 fathoms wide, and almost two miles long, commonly extending

miles on the coast. Great numbers of the natives of both these kingdoms profess the Christian religion, which was long since introduced by the Portuguese, who made early settlements in that country. See **ANGOLA** and **CONGO**. In the Collections, it is said, that both in Congo and Angola, the soil is in general fruitful, producing great plenty of grain, Indian corn, and such quantities of rice, that it hardly bears any price, with fruits, roots, and palm oil in plenty. The natives are generally a quiet people, who discover a good understanding, and behave in a friendly manner to strangers, being of a mild conversation, affable, and easily overcome with reason. In the government of Congo, the king appoints a judge in every particular division, to hear and decide disputes in civil causes; the judges imprison and release, or impose fines according to the rules of custom; but in weighty matters, every one may appeal to the king, before whom all criminal causes are brought, in which he gives sentence; but seldom condemns to death. The town of Loango stands in the midst of four lordships, which abound in corn, fruit, &c. Here they make great quantities of cloths of divers kinds, very fine and curious; the inhabitants are seldom idle; they even make needle-work caps as they walk in the streets. The slave trade is here principally managed by the Portuguese, who carry it far up into the inland countries. They are said to send off from these parts 15,000 slaves each year. At Angola, about 10° lat. S. ends the trade for slaves.

(5.) **GUINEA, HUMANITY AND CIVILITY OF THE NATIVES OF.** M. Adanson speaking of the appearance of the country about the Senegal and Gambia, and of the disposition of the people, says, "which way soever I turned mine eyes on this pleasant spot, I beheld a perfect image of pure nature;

capes are those of Cape Blanco, Leon, Cape St Ann's, Cape Pal Points, Cape Formosa, Cape Mo Cape Lopus, Cape Ledo, and C chief bays are the Cyprian or C bite of Guinea. (7.) **GUINEA, PRODUCE OF.** ry, and slaves, Guinea affords Senega, gum tragacauth, and other gums and drugs.

(8.) **GUINEA TRADE, HISTO** most ancient account we have of ticularly that part situated on a negal and Gambia, is from th ancient authors, one an Arabia Moor. The first wrote in Ar: century. His works, printed : Rome, were afterwards translat printed at Paris, under the pat mous Thuanus chancellor of title of *Geographia Nubi:pt*, count of all the nations lying c Gambia. The other was writt Moor, born at Granada in Spair were totally expelled from that sited in Africa, but being on a poli to Tunis, was taken by for who finding him possessed of sev besides his own MSS. conclude of learning, and as such prese Leo X. This pope encouragin ced the Romish religion, and Africa was published in Italian.

but supported themselves in an equal state, the natural produce of the country, which consisted of roots, game, and honey. That covetous or avarice never drove them into foreign parts to subdue or cheat their neighbours, they lived without toil or superfluities." The ancient inhabitants of Morocco, who wore iron mail, and used swords and spears headed with iron, coming amongst these harmless and simple people, soon brought them under subjection, divided that part of Guinea which lies on the coast of Gambia into 15 parts; those were the kingdoms of the negroes, over which the Moors presided, and the common people were negroes. These Moors taught the negroes the Mahometan religion, and arts of life; particularly the use of iron, before unknown to them. About the 14th century, a native negro, called *Ileli Ichia*, expelled the Moorish conquerors; but though the Moors threw off the yoke of a foreign nation, Ichia only changed a Libyan king for a negro master. Ichia himself becoming king, led the negroes to foreign wars, and established himself in power over a very large extent of country." Since that time, the Europeans have had very little knowledge of those parts of Africa, nor do they know what became of his great empire. It is probable that it fell to pieces, and that the natives retained many of their ancient customs; for in an account published by Moore, in his *Travels on the Coast of Gambia*, we find a mixture of the Moorish and Mahometan customs, joined with the original simplicity of the negroes. It appears by accounts of ancient voyages, collected by Hackluit, and others, that it was about 50 years after the discovery of America, that the Portuguese attempted to sail round Cape Bojador, which lies between their country and Guinea: this, the natives, divers repulses occasioned by the violent currents, they effected; when landing on the west coast of Africa, they soon began to make incursions into the country, and to seize and carry off the natives. Early in 1482, Alonzo Gonzales, the first who is recorded to have met with the natives, being on the coast, pursued and attacked a number of them, and some were wounded, as was also one of the Portuguese; which the author records as the first blood shed by Christians in those parts. Six years after, Gonzales again attacked the natives, and took 12 prisoners, with whom he returned to his ships: he afterwards put a woman on shore, to teach the natives to redeem the prisoners; but the next day 150 of the inhabitants appeared on the coast with camels, provoking the Portuguese to fight; which they not daring to venture, the natives discharged a volley of stones at them, and retired off. After this, the Portuguese continued to send vessels on the coast of Africa: particularly in 1482, when one of their falling on a village, whence the inhabitants fled, and, being pursued, 25 were taken. "He that ran best (says the author,) taking most. In their way home they killed some of the natives, and took 55 more prisoners. Afterwards Dinisanes Dagrama, with two other vessels, landed on the island Arguin, where they took 54 negroes; then running along the coast 80 leagues farther, they at several times took 50 slaves; but 7 of the Portuguese were killed. Then being

joined by several other vessels, Dinisanes proposed to destroy the island, to revenge the loss of the seven Portuguese; of which the Moors being apprised fled, so that no more than 12 were found, whereof only four could be taken, the rest being killed, as also one of the Portuguese." Many more captures of this kind on the coast of Barbary and Guinea are recorded to have been made in those early times by the Portuguese; who, in 1482, erected their first fort at D'Elmina on that coast, from whence they soon opened a trade for slaves with the inland parts of Guinea. From the foregoing accounts, it is undoubted, that the practice of making slaves of the negroes owes its origin to the early incursions of the Portuguese, solely from an inordinate desire of gain. This is clear from their own historians, particularly Cada Mosto, about 1455, who writes, "That before the trade was settled for purchasing slaves from the Moors at Arguin, sometimes 4, and sometimes more Portuguese vessels, were used to come to that gulph, well armed; and landing by night, would surprise some fishermen's villages: that they even entered into the country, and carried off Arabs of both sexes, whom they sold in Portugal." And also, "That the Portuguese and Spaniards, settled on 4 of the Canary islands, would go to the other island by night, and seize some of the natives of both sexes, whom they sent to be sold in Spain." After the settlement of America, those devastations, and the captivating the miserable Africans, greatly increased. Anderson, in his *History of Trade and Commerce*, p. 336, speaking of what passed in 1508, writes, "That the Spaniards had by this time found that the miserable Indian natives, whom they had made to work in their mines and fields, were not so robust and proper for those purposes as negroes brought from Africa: wherefore they, about that time, began to import negroes for that end into Hispaniola, from the Portuguese settlements on the Guinea coasts; and also afterwards for their sugar-works." About 1551, towards the end of Edward VI's reign, some London merchants sent out the first English ship on a trading voyage to the coast of Guinea. This was soon followed by several others; but the English not having then any plantations in the West Indies, and consequently no occasion for negroes, they traded only for gold, elephants teeth, and Guinea pepper. This trade was carried on at the hazard of losing their ships and cargoes, if they had fallen into the hands of the Portuguese, who claimed an exclusive right of trade there. In 1553, capt. Thos. Windham traded along the coast with 140 men, in 3 ships, and sailed as far as Benin, to take in a load of pepper. Next year John Lock traded along the coast, as far as D'Elmina, when he brought away considerable quantities of gold and ivory. He speaks well of the natives, and says, "That whoever will deal with them must behave civilly, for they will not traffic if ill used." In 1555, William Towerston traded in a peaceable manner with the natives, who complained to him of the Portuguese at D'Elmina, saying, "They were bad men; who made them slaves if they could take them, putting irons on their legs." This bad example of the Portuguese was soon followed by some Englishmen; for Capt. Towerston says, "That in the

course of his voyage, he perceived the natives near D'Elmina unwilling to come to him, and that he was at last attacked by them; which he understood was done in revenge for the wrong done them the year before by one captain Gainsh, who had taken away the negro captain's son and three others, with their gold, &c. This caused them to join the Portuguese, notwithstanding their hatred of them, against the English." (*Collection*, vol. i. p. 148.) Next year captain Towerfon brought these men back again; whereupon the negroes showed him much kindness. Soon after this, another instance occurred in the case of Capt. George Fenner, who being on the coast with 3 vessels, was attacked by the negroes, who wounded several of his people, and violently carried 3 of his men to their town. The captain sent a messenger, offering any thing they desired for the ransom of his men: but they refused to deliver them; letting him know, "That 3 weeks before, an English ship, which came in the road, had carried off 3 of their people; and that till they were brought again, they would not restore his men, even though they should give their 3 ships to release them." It was probably the bad conduct of these and some other Englishmen, which occasioned what is mentioned in *Hill's Naval History*, viz. "That when Capt. Hawkins returned from his first voyage to Africa, Q. Elizabeth sent for him, when she expressed her concern, lest any of the African negroes should be carried off without their free consent: which she declared would be detestable, and would call down the vengeance of heaven upon the undertakers." Hawkins made great promises, but did not perform them; for his next voyage to the coast seems to have been principally to procure negro slaves, and sell them to the Spaniards in the West Indies; upon which the same author has these remarkable words: "Here began the horrid practice of forcing the Africans into slavery: an injustice and barbarity, which, so sure as there is vengeance in heaven for the worst of crimes, will some time be the destruction of all who act or who encourage it." This captain Hawkins, afterwards Sir John Hawkins, seems to have been the first Englishman who gave public countenance to this wicked traffic: for Anderson, (p. 401,) says, "That in 1562, Capt. Hawkins, assisted by subscription of sundry gentlemen, now fitted out 3 ships; and having learnt that negroes were a very good commodity in Hispaniola, he sailed to the coast of Guinea, took in negroes, and sailed with them for Hispaniola, where he sold them and his English commodities, and loaded his 3 vessels with hides, sugar, ginger, &c. with which he returned home, in 1563, making a prosperous voyage." As it proved lucrative, the trade was continued, both by Hawkins and others, as appears from the *Naval Chronicle*, p. 55; where it is said, "That on the 18th Oct. 1564, Capt. John Hawkins, with two ships of 700 and 140 tons, sailed for Africa; that on the 8th Dec. they anchored S. of Cape Verd, where the captain manned the boat, and sent 80 men in armour into the country, to see if they could take some negroes; but the natives flying from them, they returned to their ships, and proceeded farther down the coast. Here they lay certain days, sending their men ashore, in order (as the author says) to burn

and spoil their towns and take the inhabitants. The land they observed to be well cultivated there being plenty of grain and fruit of several sorts, and the towns prettily laid out. On the 25th, being informed by the Portuguese of a town of negroes called *Bymba*, where there was not only a quantity of gold, but 140 inhabitants, they resolved to attack it, having the Portuguese for their guide; but by mismanagement they took but 10 negroes, having 7 of their own men killed and 27 wounded. They then went farther down the coast: when having procured a number of negroes, they proceeded to the West Indies, where they sold them to the Spaniards." It is added (p. 76.) "That in 1567, Francis Drake, before performing his voyage round the world, went with Sir John Hawkins in his expedition to the coast of Guinea, where taking in a cargo of slaves, they determined to steer for the Caribbee islands." How Q. Elizabeth suffered so grievous an infringement of the rights of mankind to be perpetrated by her subjects, and how she was persuaded, about the 30th year of her reign, to grant patents for carrying on a trade from the N. part of the Senegal to 100 leagues beyond Sierra Leona, is hard to account for, otherwise than that it arose from the misrepresentation made to her of the frictions of the negroes, and of the advantages it was promised they would reap from being made acquainted with the Christian religion. This was the talent of Louis XIII. of France; who, Labat (in his *Account of the Isles of America*) tells us, "was extremely uneasy at a law by which the negroes of his colonies were to be made slaves; but it being strongly urged to him as the readiest means of their conversion to Christianity, he acquiesced therewith." Nevertheless, some of the Christian powers did not so easily give way in this matter: for we find, "That cardinal Cibo, one of the pope's principal ministers of state, wrote a letter on behalf of the college of cardinals, to the missionaries in Congo, complaining that the pernicious and abominable abuse of selling slaves was yet continued; requiring them to remedy the same if possible; but that the missionaries saw little hopes of accomplishing, by reason that the trade of the country lay wholly in slaves and ivory." It has been urged in justification of this trade, that by purchasing the captives taken in battle, they save the lives of so many human creatures, who otherwise would be sacrificed to the implacable revenge of the victors. But this pretence has been refuted by an appeal to reason and fact. For if the negroes apprehended they should be cruelly put to death if they were not sent away; why, it is asked, do they manifest such reluctance and dread as they generally do, in being brought from their native country? Smith in his *Account*, p. 28, says, "The Gantians abhor slavery, and will attempt any thing, though ever so desperate, to avoid it." And Thomas Phillips, in his account of a voyage he performed to the coast of Guinea, writes, "They (the negroes) are so loth to leave their own country, that they have often leaped out of the canoe, being on ship, into the sea, and kept under water till they were drowned, to avoid being taken up." But had the fact even been otherwise, the above plea is urged with an extreme bad grace, when it is

notorious that the very wars said to be productive of such cruelty were fomented by the infamous arts of the Europeans. See SLAVE TRADE.

(II, i.) \* GUINEA. *n. f.* [from *Guinea*, a country in *Africa*, abounding with gold.] A gold coin valued at one and twenty shillings.—By the word gold I must be understood to design a particular piece of matter; that is, the last *guinea* that was coined. *Locke*.—

Ladies, whose love is constant as the wind :

Cits, who prefer a *guinea* to mankind. *Young*.  
(ii.) THE GUINEA anciently bore the impression of an elephant. Its value has varied; when first struck it was 20s.; from the scarcity of gold it was afterwards advanced to 21s. 6d. but it is now sunk to 21s. The pound weight troy of gold is cut into 24½ parts; each part makes a *guinea*.

(III.) GUINEA COMPANY. See COMPANY, § IV, ii, i.

(IV.) GUINEA, NEW, a long and narrow island of the East Indies, very imperfectly known. It was supposed to be connected with New Holland, until Captain Cook discovered the strait which separates them. New Guinea, including Papua, its NW. part (which Bougainville conjectures is separated from it by a strait), reaches from the equator to 12° lat. S. and from 131° to 150° lon. E. In one part it does not appear to be above 50 miles broad. It was first visited by an European ship in 1529. Saavedra, a Portuguese, who made the discovery of the NW. part of this country, called it *Terra di Papuas* or *Papoa*. Van Schouten, a Dutch discoverer, afterwards gave the name of *New Guinea* to its SW. part. Admiral Roggewain also touched here; and before him Dampier, 1st Jan. 1700. Capt. Cook made the coast of New Guinea, in lat. 6° 15' lon. 136° E. on the 3d Sept. and landed, accompanied by Mr Banks, Dr Solander, 9 sailors, and servants well armed, and advanced a little way up the country; but coming to the skirts of a thick wood, about a quarter of a mile from the boat, 3 Indians rushed out of it with a hideous shout; threw their darts, and showed such a hostile disposition, that the party returned to their boat, as they had no intention to invade the country, and it was evident nothing could be done upon friendly terms. When they got on board the boat, they rowed along the shore, and about 80 Indians assembled, resembling the New Hollanders, being stark naked, with their hair cropped short. All the while they were shouting defiance, and throwing something out of their hand which burnt exactly like gun powder, but made no report; what these fires were, or for what purpose intended, could not be guessed at. Those who discharged them had in their hands a short piece of stick, possibly a hollow cane, which they swung sidewise from them, and immediately fire and smoke issued, resembling the discharge of a musket, and of no longer duration, this was observed from the ship, and the people on board thought they had firearms. After looking at them attentively for some time, without taking any notice of their flashing and vociferation, the sailors fired some muskets over their heads. Upon hearing the balls rattle among the trees, they walked leisurely away, and the boat returned to the ship. Upon examining the weapons which the natives had thrown, they

were found to be light darts, about 4 feet long, very ill made, of a reed or bamboo cane, and pointed with hard wood, in which there were many barbs. They were discharged with great force, for at 60 yards distance they went beyond the party. The general opinion was, that they were thrown with a stick in the manner practised by the New-Hollanders. The land here is very low, as is every other part of the coast; but it is covered with a vast luxuriance of wood and herbage. Cocoa nut, plantain, and bread-fruit trees, flourish in perfection.

\* GUINEADROPPER. *n. f.* [*guinea* and *drop*.]

One who cheats by dropping guineas.—  
Who now the *guineadrop*'s bait regards,  
Trick'd by the sharper's dice, or juggler's cards. *Gay*.

(1.) GUISE, a town of France, in the dept. of Aisne, on the Oise, 20 miles N. of Laon, and 95 NE. of Paris. Lon. 3. 42. E. Lat. 49. 54. N.

(2.) GUISE, Henry, duke of. See LORRAIN.

(3.) \* GUISE. *n. f.* [The same with *wise*, *guise*, French; *wisa*, the *w* being changed, as is common into *g*.] 1. Manner; mein; habit; cast of behaviour.—

His own fire, and master of his *guise*,  
Did often tremble at his horrid view. *Spenser*.  
Thus women know, and thus they use the *guise*,

T' enchant the valiant and beguile the wife.

*Fairfax*.

—Lo you! here she comes: this is her very *guise*; and, upon my life, fast asleep: observe her, stand close. *Shak. Macbeth*.—

They stand a horrid front  
Of dreadful length, and dazzling arms, in *guise*  
Of warriors old, with order'd spear and shield,  
Awaiting what command their mighty chief  
Had to impose. *Milton's Paradise Lost*.

By their *guise*  
 Just men they seem, and all their study bent  
 To worship God aright. *Milton's Par. Lost.*  
 Back, shepherds, back;  
 Here be without duck or nod,  
 Other trippings to be trod,  
 Of lighter toes and such court *guise*,  
 As Mercury did first devise. *Milton.*  
 — Their external shapes are notoriously accommodated to that law or *guise* of life that nature has designed them. *Morc.* 2. Practice; custom; property. —  
 I have drunke wine past my usual *guise*;  
 Strong wine commands the foole, and moves the wife. *Chapman.*  
 This would not be slept;  
 Old *guise* must be kept. *Ben Jonson.*  
 The swain reply'd, it never was our *guise*  
 To slight the poor, or aught humane despise. *Pope.*

3. External appearance; dress.—When I was very young, nothing was so much talked of, as rickets among children, and consumptions among young people: after these the spleen came in play, and then the scurvy; which was the general complaint, and both were thought to appear in many various *guises*. *Temple.*—The Hugenots were engaged in a civil war, by the specious pretences of some, who, under the *guise* of religion, sacrificed so many thousands to their own ambition. *Swift.*

GUISHDEN, a river of Ireland, in Mayo.  
 GUISONI, a town of Corsica.  
 GUISONA, a town of Spain, in Catalonia.  
 (1.) \* GUITAR, *n. f.* (*guitarra*, Ital. *guitarre*, Fr.) A stringed instrument of music.—  
 Sallads and eggs, and lighter fare;  
 Tune the Italian scark's *guitar*. *Prior.*

(2.) The GUITAR has 5 double rows of strings; of which those that are brass are in the middle, except it be for the burden, an octave lower than the fourth. It was first used in Spain, where it is still greatly in vogue. There are few Spaniards who cannot play on it, to serenade their mistresses at night.

(1.) GULA, the gullet. See ANATOMY, p. 278.  
 (2.) GULA, or GUEULE. See OGEE.  
 \* GULCH, } *n. f.* (from *gulo*, Lat.) A lit.  
 \* GULCHIN, } the glutton. *Skinner.*  
 GULDE, a river of Denmark.

GULDENSTAEDT, John Anthony, M. D. was born at Riga, April 26, 1745, and in 1763 was admitted into the medical college of Berlin. He completed his studies at Frankfort upon the Oder, where, in 1767, he received his degree. Being invited to Peterburg, in 1768, he was created adjunct, and in 1770, member of the imperial academy, and professor of natural history. In June 1765, he set out upon his travels, and was absent 7 years. From Moscow, where he continued till March 1769, he passed to Voronetz, Tzaritzin, Astracan, and Kilar, near Persia. In 1770 he examined the districts watered by the Terek, Sunha, and Akkai, in the E. extremity of Caucasus; and in 1771 penetrated into Ossitia, in the highest part of the same mountain; where he collected vocabularies of the languages spoken in those regions, made enquiries into the history of the people, and discovered some traces of Chris-

tianity among them. Having visited Cabarda and the N. of Caucasus, he proceeded to Georgia, and was admitted to prince Heraclius, who was encamped ten miles from Teflis, and whom he followed in spring to Koketia, and explored the S. districts inhabited by the Turcoman Tartars in the company of a Georgian magnet, whom he had cured of a dangerous disorder. In July he passed into Imeretia; penetrated into the middle chain of mount Caucasus, visited the confines of Mingrelia, Middle Georgia, and Eastern and Lower Imeretia; and after escaping many imminent dangers, returned to Kilar on the 18th Nov. where he passed the winter, collecting various information concerning the neighbouring Tartar tribes of Caucasus, particularly the Lelgees. In the following summer he journeyed to Cabarda Major, continued his course to mount Beshton, the highest point of the first ridge of the Caucasus; inspected the mines of Masbar, and went to Tcherkash upon the Don. From thence he made expeditions to Azof and Taganrog, and thence along the new limits to the Dnieper; established this year's route at Kremenshuk, in New Russia. In the following spring, he was proceeding to Crim Tartary; but receiving an order of recall, he returned through the Ukraine to Moscow and St Peterburg, where he arrived in March 1775. Upon his return, he began to arrange his papers; but before he could finish them for the press, was seized with a violent fever, which carried him off in March 1781. A list of his writings is given in Coxe's Travels, Vol. I. p. 161.

GULDENS FEIN, two towns of Denmark: 1. in the isle of Funen; and 2. in Holstein.

GULE of AUGUST, the day of St Peter *ad vincula*, which is celebrated on the 1st of August. It is called the *gule of August*, from *gula*, a throat, because one Quinius, a tribune, having a daughter diseased in her throat, went to Pope Alexander, the sixth from St Peter, and desired of him to see the chains that St Peter was chained *under* Nero; which request being granted, he, on kissing the chains, was cured of her disease; whereupon the Pope instituted this feast in honour of St Peter. Hence the day was called either that of St Peter *ad vincula*, from what wrought the miracle; or the *gule of August*, from the part whereon it was wrought.

(1.) \* GULES, *adj.* [perhaps from *gule*, the throat.] Red: a barbarous term of heraldry.—  
 Follow thy drum;

With man's blood paint the ground: *gules, gules*;  
 Religious canons, civil laws are cruel;  
 Then what should war be? *Shak Tamer*

He whole sable arms,  
 Black as his purpose, did the knight resemble,  
 When he lay couched in the ominous horse,  
 With now his dread and black complexion near,  
 With heraldry more dismal; head to foot,  
 Now is he total *gules*. *Shak*

(2.) GULES, a corruption of the French word *gueules*, which in heraldry signifies red, is represented in engraving by perpendicular lines. It serves to denote martial prowess and hardihood for the ancients used this colour to make themselves terrible to their enemies, to stir up magnanimity, and to prevent the seeing of blood, by its

likeness

likeness of the colours: for which reason perhaps it is used by the English. This colour is by the generality of the English thought ranked before a azure. But the elegant French heralds preferred azure.

(1.) \* GULF, *n. f.* [*golfo*, Italian.] 1. A bay; an opening into land.—The Venetian admiral withdrew himself farther off from the island Corfu, into the *gulf* of the Adriatick. *Knelles*. 2. An abyss; an insupportable depth.—

Thence turning back in silence soft they stole,

And brought the heavy coils with easy pace

To yawning *gulf* of deep Avernus' hole. *Spens.*

I know thou'd'st rather

Flow thine enemy in a fiery *gulf*,

Than flatter him in a bower. *Shak. Coriolanus*.

—This is the *gulf* through which Virgil's Alecto shoots herself into hell: the tail of waters, the woods that encompass it, are all in the description. *Addition on Italy*—The sea could not be much narrower than it is, without a great loss to the world: and must we now have an ocean of mere flats and shoals, to the utter ruin of navigation, for few our heads should turn giddy at the imagination of gaping abysses and unathomable *gulfs*? *Leutley*. 3. A whirlpool; a sucking eddy.—

England his approaches makes as fierce

As waters to the sucking of a *gulf*. *Shak. H. V.*

4. Any thing insatiable, as the mouth or stomach.

Scul of dragon, tooth of wolf,

Witches mummy; raw and *gulf*

Of the ravening salt sea shark;

Root of hemlock, digg'd i' th' dark. *Shak.*

(2.) A GULF, (*g* 1, *u* 1, *f* 1) is a capacious bay between two promontories, sometimes taking the name of a *sea*, when very extensive; but particularly when it only communicates with the sea by a Strait. Such are the Euxine or Black Sea, called the *Gulf of Constantinople*; the Adriatic Sea, or the *Gulf of Venice*; the *Gulf of Lyons*, near France, and the *Gulf of Sierra* near Barbary. All these are in the Mediterranean. There are the *Gulfs of Mexico*, St Lawrence, and California, in N. America; the *Gulf of Persia*, or the *Red Sea*, between Persia and Arabia; the *Gulf of Bengal* in India; and the *gulfs of Cochinchina* and *Kamtchatka*, near these countries.

\* GULFY, *adj.* [from *gulf*.] Full of *gulfs* or whirlpools; tortuous.—

River arise; whether thou be the fon

Of utmost Tweed, or Ootie, or *gulfy* Dun. *Milt.*

At their native realms the Greeks arriv'd,

All who the war of ten long years surviv'd,

And scap'd the perils of the *gulfy* main. *Pope.*

High o'er a *gulfy* sea the Pharian isle

Fronts the deep roar of discombing Nile. *Pope.*

(1.) \* GULL, *n. f.* [from the verb.] 1. [*Mergus*.] A sea-bird. 2. A cheat; a fraud; a trick.

—I should think this a *gull*, but that the white-bearded fellow speaks it. *Shak. Much Ado*.—Either they have these excellencies they are praised for, or they have not; if they have not, 'tis an apparent cheat and *gull*. *Government of the Tongue*.

3. A stupid animal; one easily cheated.—

Being fed by us you us'd us so,

As that ungentle *gull*, the cuckow bird,

Useth the sparrow. *Shak. Henry IV.*

Why have you suffer'd me to be imprison'd  
Kept in a dark house, visited by the priest,  
And made the most notorious geck and *gull*  
That e'er invention play'd on. *Sh.*

That paltry story is untrue,

And forg'd to cheat such *gulls* as you. *Hudibr.*

(2.) GULL, in ichthyology. See LARUS.

\* To GULL, *v. n.* [*gulo*, to cheat, old F.] To trick; to cheat; to defraud; to deceive.—I do not *gull* him into a ray word, and make it a common recreation, do not think I have wit enough to be straight in my bed. *Shak.*—

Yet love their forgeries did remove, and me

Thrice to *gull* thine own mother for my love.

*Don*

He would have *gull'd* him with a trick,

But Mart was too, too politick. *Hudibr.*

—They are not to be *gull'd* twice with the same trick. *L'Esfran*.—The Roman people were *gull'd* twice or thrice over, and as often enslaved in one century, and under the same pretence reformation. *Dryden*.—

By their designing leaders taught,

The vulgar, *gull'd* into rebellion, arm'd. *Dry.*

For this advantage age from youth has we

As not to be out-riden, though out-run;

By fortune he was now to Venus trin'd,

And with stern Mars in Capricorn was join'd

Of his disposing in his own abuse,

He tooth'd the goddess, while he *gull'd* the ge

*Dryden*

\* GULLCATCHER, *n. f.* [*gull* and *catch*.]

cheat; a man of trick; one who catches silly people.—

Here comes my noble *gullcatcher*. *Shak.*

\* GULLER, *n. f.* [from *gull*.] A cheat; an impostor.

\* GULLERY, *n. f.* [from *gull*.] Cheat; its posture. *Answorth*.

(1.) \* GULLET, *n. f.* [*goulet*, Fr. *gula*, Lat.]

1. The throat; the passage through which the food passes; the meat pipe; the oesophagus.—

It might be his doom,

One day to sing

With *gullet* in string. *Denham*

—Many have the *gullet* or feeding channel which have no lungs or windpipes; as fishes which have gills, whereby the heart is refrigerated; for such thereof: as have lungs and respiration are not without whizzon, as whales and cetaceous animals. *Brown's Vulgar Errors*. 2. A small stream or lake. Not in use.—

Nature has various tender muscles plac'd,

By which the artful *gullet* is embrac'd. *Blackm*  
—The liquor in the stomach is a compound of that which is separated from its inward coat, the spittle which is swallowed, and the liquor which distils from the *gullet*. *Sirbutnot*.—The Euxine sea and the Mediterranean, small *gullets*, if compared with the ocean. *Heylyn*.

(2.) GULLET. See ANATOMY, § 278.

GULL ISLE, an isle near Cape St John.

\* To GULLY, *v. n.* [corrupted from *gurgle*.] To run with noise.

\* GULLY HOLE, *n. f.* [from *gully* and *hole*.] The hole where the gutters empty themselves in the subterraneous sewer.

\* GULOSITY, *n. f.* [*gulosus*, Latin.] Greediness;

ness; gluttony; voracity.—They are very temperate, seldom offending in ebriety, nor erring in *gulosity*, or superfluity of meats. *Brown.*

\* **GULP.** *n. s.* [from the verb.] As much as can be swallowed at once.—In deep suspirations we take more large *gulps* of air to cool our heart, overcharged with love and sorrow. *Moss.*

As out as he can catch a *gulp* of air,  
And peep above the seas, he names the fair.

*Dryden.*

\* **To GULP.** *v. a.* [*galpen*, Dutch.] To swallow eagerly; to suck down without intermission.—He loosens the fish, *gulps* it down, and so soon as ever the morsel was gone wipes his mouth. *L'Esfrange.*—

I see the double flaggon charge their hand;  
See them puff off the froth, and *gulp* amain,  
While with dry tongue I lick my lips in vain.

*Gay.*

**GULPEN**, a town of the French republic, in the dep. of Forets and late duchy of Limburg.

**GULZOU**, a town of Saxony, SE. of Cammin.

(1.) \* **GUM.** *n. s.* [*gummi*, Latin.] 1. A vegetable substance differing from a resin, in being more viscid and less friable, and generally dissolving in aqueous menstrua; whereas resins, being more sulphurous, require a spirituous solvent. *Quincy.*—

One whose eyes,  
Albeit unuse'd to the melting mood,  
Drop tears as fast as the Arabian trees  
Their medicinal *gum*. *Shak.*  
He ripens spices, fruit, and precious *gums*,  
Which from remotest regions hither come. *Wall.*  
Her maiden train,  
Who bore the vests that holy rites require,  
Inceuse, and od'rous *gums*, and cover'd fire.

*Dryden.*

2. [*Goma*, Saxon; *gumme*, Dutch.] The fleshy covering that invests and contains the teetn.—

The babe that milks me,  
Pd pluck my nipple from his boneless *gums*.

*Shak.*

Sh' untwists a wire, and from her *gums*  
A set of teeth completely comes. *Swift.*

(2.) **GUM** is of no particular smell or taste. It becomes viscous and tenacious when moistened with water; totally dissolves in water into a liquid, more or less glutinous in proportion to the quantity of the gum; not dissolving in vinous spirits or in oils; burning in the fire to a black coal, without melting or catching flame; suffering no dissipation in the heat of boiling water. The true gums are gum arabic, gum tragacanth, gum senega, the gum of cherry and plum trees, and such like. All others have more or less of resin in them.

(3.) **GUM**, in gardening, a kind of gangrene incident to fruit-trees of the stone kind, arising from a corruption of the sap, which, by its viscosity, not being able to make its way through the fibres of the tree, is, by the protrusion of other juice, made to extravasate and ooze out upon the bark. When the distemper surrounds the branch, it admits of no remedy; but when only on one part of a bough, it should be taken off to the quick, and some covering clapped on the wound, covered over with a linnen cloth, and tied down. *M.*

Quintinie directs to cut off the morbid branches or three inches below the part affected.

(4.) **GUM AMMONIAC.** See **AMMONIAC**, § 1.—

(5.) **GUM ARABIC** is the produce of a species of **MIMOSA**. See **MIMOSA**, N° 11. Its chief use in medicine is from its glutinous quality, which serves to incrassate and obtund this acid humour and thus is useful in coughs, alvine fluxes, haemorrhages, gripes, &c. In a dysuria the true gum arabic is more cooling than the other simple gums. One ounce of gum arabic renders a pint of water considerably glutinous; 4 oz. give it a thick firm consistence; but for mucilage, one part gum to two parts water is required; and for some purposes an equal proportion will be necessary.

Dr *Percival's Essays*, Vol. I. p. 319. See there a curious account, by Mr Henry, of the property which this gum has of dissolving and keeping suspended in water not only resinous but also of substances, which should seem not likely to be all affected by it. Mr Hasselquist in his Travels relates an instance of the extraordinary medicinal virtues of this gum; which happened to the Arabian caravan, in 1740, whose provisions were consumed, when they had still two months to travel. They were then obliged to search for something among their merchandise wherewith they might support nature; and found nothing more proper than gum arabic, of which they had carried a considerable quantity along with them. This served to support above 1000 persons for two months; and the caravan at last arrived at Cairo without any loss of people either by hunger or disease.

(6.) **GUM, ELASTIC.** See **RESIN, ELASTIC**.

(7.) **GUM, ELEM.** See **AMYRIS**, § 2.3.

(8.) **GUM GUAIACUM.** See **GUAIACUM**.

(9.) **GUM GUTTÆ.** See **CHEMISTRY, JU**.

(10.) **GUM KINO.** See **KINO**.

(11.) **GUM LACCA.** See **COCCUS**, and **LAC**.

(12.) **GUM SENECA** is a gum extremely resembling gum arabic. See **SENECA**.

(13.) **GUM TRAGACANTH.** See **ASTRAGA**.

\* **To GUM.** *v. a.* [from the noun.] To mix with gum; to smear with gum.—The eyelids apt to be *gummed* together with a viscous humour. *Wifeman's Surgery.*

**GUMBINNEN**, a town of Lithuania.

**GUMIEL**, a town of Spain in Old Castile.

**GUMINEN**, a town of the Helvetic republic in the canton of Bern, 5 miles W. of Bern.

**GUMMA**, a sort of venereal excrecence on the periosteum of the bones.

\* **GUMMINESS.** *n. s.* [from *gummy*.] A state of being gummy; accumulation of gum. The tendons are involved with a great quantity and collection of matter. *Wifeman's Surgery.*

\* **GUMMOSITY.** *n. s.* [from *gummosus*.] A nature of gum; gumminess.—Sugar and other particles are detained by their innate *gummosity*. *Flozer.*

\* **GUMMOUS.** *adj.* [from *gum*.] Of the nature of gum. — Observations concerning English amber and relations about the amber of Prussia, that amber is not a *gummosus* or resinous substance drawn out of trees by the sun's heat, but a natural fossil. *Woodward's Nat. Hist.*

*adj.* [from *gum.*] 1. Consisting of nature of gum.—From the utmost branches there issueth out a *gummy* angeth downward like a cord.

*gummy* stores Arabia yields. *Dryd.*  
rising alder now appears,  
Po distils her *gummy* tears. *Dryd.*  
f gum.—

the clouds  
light'ning; whose thwart flame  
own,

*gummy* bark of fir and pine. *Milton.*  
with gum.—

ng youth, scarce half awake, essays  
s and dozy head to raise;  
s *gummy* eyes, and scrubs his pate,

*Dryden.*

See GUN-POWDER. The word GUN  
most species of fire-arms; pistols and  
almost the only ones excepted from  
ation. They are divided into great  
s: the former including all that we  
on, ordnance, or artillery; the lat-  
musquets, carabines, musquetoons,  
s, fowling-pieces, &c. (See these  
is not known when these weapons  
invented. Though, comparatively  
introduction of guns into the western  
world is but of a modern date; yet it  
at in some parts of Asia they have  
ough in a very rude and imperfect  
many ages. Philostratus mentions  
he Hyphasis in the Indies, which was  
mpregnable, and that its inhabitants

were relations of the gods, because they threw  
thunder and lightning upon their enemies. Hence  
some imagine that guns were used by the eastern  
nations even in the time of Alexander the Great;  
but however this may be, many of our modern  
travellers assert, that they were used in China as  
far back as A. D. 85, and have continued in use  
ever since. The first hint of the invention of guns  
in Europe is in the works of ROGER BACON, who  
flourished in the 13th century. In a treatise writ-  
ten by him about 1286, he proposes to apply the  
violent explosive force of gun-powder for the  
destruction of armies. In 1320, Bartholomew  
Schwartz, a German monk, is said to have in-  
vented gun-powder, though it is well known, that  
this composition is described by Bacon in some of  
his treatises long before the time of Schwartz.

The following is said to have been the manner in  
which SCHWARTZ invented gun-powder. Having  
pounded the materials for it in a mortar, which  
he afterwards covered with a stone, a spark of  
fire accidentally fell into the mortar and set the  
mixture on fire; upon which the explosion blew  
the stone to a considerable distance. Hence it is  
probable that Schwartz might be taught the sim-  
plest method of applying it in war; for Bacon  
seems rather to have conceived the manner of using  
it to be by the violent effort of the flame unconfined,  
which is indeed capable of producing astonishing  
effects. See GUNPOWDER, § 4. The figure and name  
of *mortars* given to a species of old artillery, and  
their employment (which was throwing great  
stone bullets at an elevation), very much corrobo-  
rates this conjecture. Soon after the time of  
Schwartz, we find guns commonly made use of  
as instruments of war. Great guns were first  
used. They were originally made of iron bars  
folded together, and fortified with strong iron  
hoops; some of which are still to be seen, *viz.*  
one in the Tower of London, two at Woolwich,  
and one in the royal arsenal at Lisbon. Others  
were made of thin sheets of iron rolled up to-  
gether and hooped; and on emergencies they were  
made of leather, with plates of iron or copper.  
These pieces were made in a rude and imperfect  
manner, like the first essays of many new in-  
ventions. Stone balls were thrown out of them, and  
a small quantity of powder used on account of  
their weakness. These pieces had no ornaments,  
were placed on their carriages by rings, and were  
of a cylindrical form. When or by whom they  
were made is uncertain; the Venetians, however,  
used cannon at the siege of Claudia Jussia, now  
called *Chioggia*, in 1366, which were brought  
thither by two Germans, with some powder and  
leaden balls; as well as in their wars with the  
Genoese in 1379. Edward III. made use of can-  
non at the battle of Cressy in 1346, and at the  
siege of Calais in 1347. Cannon were made use  
of by the Turks at the siege of Constantinople,  
in 1394, and in 1452, that threw a weight of  
100 lb. but they generally burst at the 1st, 2d, or  
3d. shot. Lewis XII. had one cast at Tours, of  
the same size, which threw a ball from the Bastille  
to Charenton. One of those famous cannon was  
taken at the siege of Dieu in 1546, by Don John  
de Castro; and is in the castle of St Julio da Bar-  
ra, 10 miles from Lisbon: its length is 20 feet 7  
inches.

inches, diameter at the centre 6 feet 3 inches, and it discharges a ball of 100 lb. It has neither dolphins, rings, nor button; is of a curious kind of metal; and has a large Indian inscription upon it, which says it was cast in 1400.

(3.) GUNS, NAMES, SIZES AND WEIGHTS OF. Formerly the cannon were dignified with uncommon names. In 1503, Lewis XII. had 12 brass cannon cast, of an extraordinary size, called after the names of the 12 peers of France. The Spanish and Portuguese called them after their saints. The emperor Charles V. when he marched before Tunis, founded the 12 Apostles. At Milan there is a 70 pounder, called the *Pimontelle*; and one at Bois-le-duc, called the *Devil*. A 60 pounder at Dover-castle, called *Queen Elizabeth's pocket-pistol*. An 80 pounder in the Tower of London (many years in Edinburgh castle), called *Mons Meg*. An 80 pounder in the royal arsenal at Berlin, called the *Thunderer*. An 80 pounder at Malaga, called the *Terrible*. Two curious 60 pounders in the arsenal at Bremen, called the *Messengers of bad news*. And lastly, an uncommon 70 pounder in the castle of St Angelo at Rome, made of the nails that fastened the copper-plates which covered the ancient Pantheon, with this inscription upon it: *Ex clavibus trabalibus porticus Agrippæ*. In the beginning of the 15th century the following more universal names took place, viz. Cannon royal, or carthoun = 48 pounders, about 90 cwt. Bastard cannon, or  $\frac{1}{2}$  carthoun = 36 pounders, 79 cwt.  $\frac{1}{3}$  Carthoun = 24 pounders 60 cwt. Whole culverins = 18 pounders, 50 cwt. Demi culverins = 9 pounders, 30 cwt. Falcon = 6 pounders 25 cwt. Sacker = 5, 6, and 8 pounders, 13, 15 and 18 cwt. Basilisk = 48 pounders, 85 cwt. Serpentine = 4 pounders, 8 cwt. Aspice = 2 pounders, 7 cwt. Dragon = 6 pounders, 12 cwt. Syren = 60 pounders, 81 cwt. Falconet, = 3, 2, and 1 pounders, 15, 10, and 5 cwt. Moyens, which carried a ball of 10 or 12 ounces, &c. Rabinet, which carried a ball of 16 oz. At present cannon take their names from the weight of the ball they discharge. Thus a piece that discharges a ball of 24 pounds, is called a 24 pounder; one that carries a ball of 12 pounds, is called a 12 pounder; and so of the rest, divided into the following sorts, viz. Ship guns, consisting of 42, 36, 32, 24, 18, 12, 9, 6, and 3 pounders. Garrison guns, in 42, 32, 24, 18, 12, 9, and 6 pounders. Battering guns, in 24, 18, and 12 pounders. Field-pieces, in 12, 9, 6, 3, 2,  $1\frac{1}{2}$ , 1, and  $\frac{1}{2}$  pounders.

GUNAIKOG, a town of Sweden, in the province of Warmeland, 34 miles NW. of Carlstadt.

GUNDANILLA, a town in Porto Rico.

(1.) GUNDELFINGEN, a town of Bavaria in Neuburg, on the Brentz, 19 miles NE. of Ulm, and 38 W. of Neuburg. Lon. 27. 58. E. of Ferro. Lat. 48. 34. N.

(2-4.) GUNDELFINGEN, a town, fort, and barony in Suabia, 21 miles W. of Ulm.

GUNDELIA, in botany: A genus of the polygamia fegregata order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. There is scarce any calyx, but quinqueflorous, with tubu-

lar hermaphrodite florets; the receptacle with scarce any pappus.

GUNDELSHEIM, a town of Suab Neckar, 30 miles E. of Heidelberg.

GUNDERSDORF, a town of Austria NNW. of Vienna

GUNELLUS. See BLENNIUS, N°

GUNFLEET, a town in Essex, S. of

GUNHADA. See ENGLAND, § 17.

GUNNA, one of the HEBRIDES, I M

\* GUNNEL. *n. f.* [corrupted from See GUNWALE.]

(1.) \* GUNNER. *n. f.* [from *gun*.] One whose employment is to manage them in a ship,—

The nimble *gunner*

With lintock now the devilish cannon  
And down goes all before him. *Shak*

—They flew the principal *gunners*, and way their artillery. *Hayward*.

(2.) A GUNNER is an officer appointed the guns, either by sea or land. In the London, and other garrisons, as well as in this officer carries a field staff, and a large horn in a string over his left shoulder. He is by the guns; and when there is any occasion of danger, his field staff is raised. His business is to lay the gun, to pass, and to load and traverse her.

(3.) GUNNER, MASTER, a patent officer of ordnance, who is appointed to teach all to learn the art of gunnery, and to certify to the general the ability of any person thought to be one of the king's gunners. To whom he administers an oath not to serve, without any other prince or state; or teach any one of gunnery but such as have taken the Oath

GUNNERA, in botany; a genus of the didyma order, belonging to the gymnomorphous plants. The amentum consists of unisexual flowers there is neither calyx nor corolla; the flower is bidented, with two styles and one seed.

(1.) \* GUNNERY. *n. f.* [from *gun*.] The science of artillery; the art of managing cannon

(2.) GUNNERY is the art of charging, discharging, and exploding fire-arms, as cannons, muskets, &c. to the best advantage.—It depends greatly on having the guns and the proper size and figure, and well adapted to other. See ORDNANCE. As both the practice of GUNNERY are intimately connected with the subject of PROJECTILES, we refer the reader to that article: under which we treat of the practical part of Gunnery, but what relates to the action of GUN-POWDER, we communicate to bullets, the resistance the atmosphere opposes to their motion, and the curves they describe, will be found fully treated.

(1.) \* GUNPOWDER. *n. f.* [from *gun* and *powder*.] The powder put into guns. It consists of about fifteen parts of nitre, two parts of sulphur, and two of charcoal. The proportions are not exactly kept.—*Gunpowder* consists of three ingredients, saltpetre, small quantity of brimstone. *Brown's Vulgar Errors*.

(2.) GUNPOWDER is a composition of sulphur, and charcoal, mixed together, and

culated; which easily takes fire, and, when expanded with great vehemence, by its elasticity. To this powder we owe all the action of guns, ordnance, &c. so that the military art in a great measure depends on it.

**GUNPOWDER, DIFFERENT KINDS OF.** The ingredients of gunpowder are mixed in various proportions according as the powder is intended for muskets, great guns or mortars: though these proportions seem not to be perfectly adjusted or fixed by competent experience. Schiœnowitz, directs 100 lb. of saltpetre, 25 of sulphur, and 25 of charcoal: for great guns, 100 lb. saltpetre, 15 of sulphur, and 18 of charcoal; for muskets and pistols, 100 lb. of saltpetre, 8 of sulphur, and 10 of charcoal. Miethius extols a proportion of 1 lb of saltpetre to 3 oz. of charcoal and 2 or 2½ of sulphur; than which, he affirms, no gunpowder can possibly be stronger. He adds, that the usual practice of making the powder weaker for mortars than guns, is without foundation, and renders the expence needlessly greater: for whereas to load a large mortar with 4 lb. of common powder is required, and commonly, to load it 10 times, 240 lb. he shows, by calculation, that the same effect would be had with 24 lb. of the strong powder. On this subject, Benjamin Thompson, now Count Rumford, makes several judicious observations, in the *Philos.* Vol. 71. See PROJECTILES.

**1. GUNPOWDER, FORCE OF.** Though Gunpowder is commonly made use of for military purposes only in small quantities, and confined in cartridges; yet when large quantities are fired at once, even when unconfined in the open air, it is capable of producing terrible destruction. The extent of damage done by the blowing up of mines, powder mills, &c. are too numerous to well known to be here taken notice of. The following is a relation of what even a moderate quantity of powder will accomplish, when fired in the open air. "The king of Navarre took Monday. Captain Milon inclosed 500 pounds of powder in a bag, which he introduced, by a drain the town, into the ditch between two principal gates; the end of the leader was hid in the ditch. Every thing being ready to play off this mine, the king gave us leave to go and see its effect; which were surprising. For one of the powder was thrown into the middle of the town, the other into the field fifty paces from the town: all the vaults were destroyed, and a passage made in the wall for three men to enter abreast, which the town was taken."—For further accounts of the force of large quantities of powder, see LINE.

**2. GUNPOWDER, INVENTION OF.** See GUN, § 2.

**3. GUNPOWDER, MEDICAL VIRTUE OF.** Dr Boerhaave says, that the flame affords a very healing virtue in the height of the plague, because the five acid vapour of nitre and sulphur corrects it; and that the same vapour, if received in a close pent up place, kills insects.

**4. GUNPOWDER, METHOD OF MAKING.** Dr Boerhaave's receipt is as follows: Take 4 oz. of refined nitre, 1 oz. of brimstone, and 6 dr. of charcoal; reduce these to a fine powder, and continue burning them for some time in a stone mortar with

a wooden pestle, wetting the mixture between whiles with water, so as to form the whole into a uniform paste, which is reduced to grains, by passing it through a wire sieve fit for the purpose; and in this form, being carefully dried, it becomes gunpowder. For greater quantities mills are usually provided, by means of which more work may be performed in one day than a man can do in 100. The nitre is refined thus: Dissolve 4 lb. of rough nitre, by boiling it in as much water as will commodiously suffice for that purpose: then let it shoot for 2 or 3 days in a covered vessel of earth; with sticks laid across for the crystals to adhere to. These crystals being taken out, are drained and dried in the open air. To reduce this salt to powder, dissolve a large quantity of it in as small a proportion of water as possible; then keep it constantly stirring over the fire till the water exhales and a white dry powder is left behind. To purify the brimstone, dissolve it with a very gentle heat; then scum and pass it through a double strainer. If the brimstone should take fire in the melting, the iron cover is fitted on close to the melting-vessel, and damps the flame. The brimstone is judged to be sufficiently refined if it melts, without yielding any fetid odour, between two hot iron plates, into a kind of red substance. The charcoal for making gunpowder is either that of willow or hazel, well charred in the usual manner, and reduced to powder. Thus the ingredients are prepared; but as these require to be intimately mixed, and as there would be danger of their firing if beat in a dry form, they are kept continually moist, either with water, urine, or a solution of sal ammoniac: They continue thus stamping them together for 24 hours; after which the mass is fit for corning and drying in the sun, or otherwise, so as to prevent its firing.

**(8.) GUNPOWDER, METHOD OF RECOVERING DAMAGED.** The powder merchants put part of the powder on a sail cloth, to which they add an equal weight of what is really good; and with a shovel mingle it well together, dry it in the sun, and barrel it up, keeping it in a dry and proper place. Others again, if it be very bad, restore it by moistening it with vinegar, water, urine, or brandy: then they beat it fine, searce it, and to every pound of powder add 1 oz. 1½ or 2 oz. according as it is decayed, of melted salt-petre. Afterwards, these ingredients are to be moistened and mixed well, so that nothing can be discerned in the composition, which may be known by cutting the mass; and then granulate it as at first. If the powder be in a manner quite spoiled, the only way is to extract the saltpetre with water by boiling, filtrating, evaporating, and crystallizing; and then with fresh sulphur and charcoal to make it up anew.

**(9.) GUNPOWDER, METHODS OF TRYING.** There are two general methods of examining gunpowder; 1st with regard to its purity: 2d. As to its strength. 1. Its purity is known by laying 2 or 3 little heaps near each other upon white paper, and firing one of them. For if this takes fire readily, and the smoke rises upright, without leaving any dross or feculent matter behind, and without burning the paper, or firing the other heaps, it is esteemed a sign that the sulphur and nitre were well purified,

purified, that the coal was good, and that the ingredients were thoroughly incorporated together: but if the other heaps also take fire at the same time, it is presumed that either common salt was mixed with the nitre, or that the coal was not well ground, or the whole mass not well beat and mixed together; and if either the nitre or sulphur be not well purified, the paper will be black or spotted. 2. Several instruments have been invented to try the strength of gunpowder; but they have generally been complained of as inaccurate. Count Rumford in the *Philosoph. Transf.* Vol. 71. gives an account of an exact method of trying the strength of it. "As the force of the powder (says he) arises from the action of an elastic fluid that is generated from it in its inflammation, the quicker the charge takes fire, the more of this fluid will be generated in any given short space of time, and the greater of course will its effect be upon the bullet. But in the common method of proving gunpowder, the weight by which the powder is confined is so great in proportion to the quantity of the charge, that there is time quite sufficient for the charge to be all inflamed, even when the powder is of the slowest composition, before the body to be put in motion can be sensibly removed from its place. The experiment therefore may show which of the two kinds of powder is the strongest, when equal quantities of both are confined in equal spaces, and both completely inflamed; but the degree of inflammability, which is a property essential to the goodness of the powder, cannot by these means be ascertained. Hence it appears how powder may answer to the proof, such as is commonly required, and may nevertheless turn out very indifferent when it comes to be used in service. But though the common powder triers, may show powder to be better than it really is, they can never make it appear to be worse than it is; it will therefore always be the interest of those who manufacture the commodity to adhere to the old method of proof, but the purchaser will find his account in having it examined in a method by which its goodness may be ascertained with greater precision." To determine the goodness of powder by Count Rumford's method, it is necessary to have a barrel suspended by two iron rods, in such a manner, that it can easily move backward or forward by the vibration of the rods; and the space it moves thro' ascertained by marking it on a piece of ribbon. The barrel being then charged with powder, and fitted with a proper bullet, is to be fired, and the recoil marked upon the ribbon. The experiment is to be repeated 3 or 4 times, or oftener if there is any difference in the recoil; the extremes of which may be marked with black lines on the ribbon, and the word *proof* written in the middle line betwixt the two. But if the experiments are made with sufficient accuracy, there will commonly be very little difference in the length to which the ribbon is drawn out. Thus the comparative goodness of powder may easily be ascertained; for the stronger the powder is, the greater will be the recoil, and consequently the greater length to which the ribbon will be drawn out; and if care is taken in proportioning the charge to the weight of the bullet, to come as near as possible to the

medium proportion that obtains in the determination of the goodness of powder from the result of this experiment can hold good in actual service. The bullet should be made to fit the bore with very little play, and it would be better if they were cast in the same mould and in the same parcel of lead; as their weights and dimensions would be more accurately the same; and the experiment of course be more conclusive. The state of the powder might be half an ounce, and it may be put up in a cartridge; and when it is loaded, it should be primed with powder, first taking care to prick the cartridge thro' with a priming wire down the

(10.) GUNPOWDER, PHYSICAL CAUSE OF EXPLOSION OF. See PROJECTILES.

(11.) GUNPOWDER, STATUTES RELATIVE TO. It is enacted by 5 and 11 of Geo. 1. c. 20. that gunpowder be carried in a covered carriage; the barrels being bound up in casks and bags of leather, persons keeping more than 200 pounds of gunpowder at one time, within the city of London and Westminster, or the suburbs, liable to forfeitures if it be not removed by justices of peace may issue warrants to seize, and remove the same.

(12.) GUNPOWDER TREASON. See § 42.

(1.) \* GUNSHOT. *adj.* [ *gun* and *shot* ] by the shot of a gun.—The symptoms are related to *gunshot* wounds. *Wife-man.*

(2.) \* GUNSHOT. *n. f.* The reach of a gun; the space to which a shot can come.—Those who are come over to the religion are supposed to be out of *gunshot*. *D.*

(3.) GUNSHOT WOUNDS. See § 42.

\* GUNSMITH. *n. f.* [ *gun* and *smith* ] whose trade is to make guns.—It is in great esteem with the *gunsmiths* for stocks.

GUNSMITHERY, *n. f.* the business of a gunsmith, or the art of making fire arms, pistols, &c. See MUSKET, and PISTOL.

\* GUNSTICK. *n. f.* [ *gun* and *slick* ] a stick; or stick with which the charge is put into a gun.—

Even a *gunstick* flying into fame.

\* GUNSTOCK. *n. f.* [ *gun* and *stock* ] the part to which the barrel of a gun is fixed; the number is used for bows, pullies, screws, &c. *Mort Hüß.*

\* GUNSTONE. *n. f.* [ *gun* and *stone* ] a kind of stone used in the construction of cannon. They were formerly used in the construction of artillery.—

Tell the pleasant prince, this *gunstone* hath turn'd his ball to *gunstones*.

Shall stand fore charged for the offence.

That shall fly with them.

GUNTER, Edmund, M. A. and excellent mathematician, born in 1581. He studied at Westminster where he graduated in 1606, and eminent for his knowledge in the mathematics was in 1613, chosen professor of Mathematics at Gresham-college, where he distinguished himself by his lectures and writings. He in

useful instruments which bear his name; and published *Canon Triangulorum*: and a work on the Sector, Cross-staff, &c. He died at Gresham-college in 1626.

GUNTERSBERG, a town of Upper Saxony, in Anhalt Bernburg, 52 miles WSW. of Dessau.

GUNTER'S LINE. See LINE.

GUNTER'S QUADRANT. See QUADRANT.

GUNTER'S SCALE, called by navigators simply the *gunter*, is a large plain scale, generally two feet long, and about an inch and a half broad, with artificial lines delineated on it, of great use in solving questions in trigonometry, navigation, &c.

GUNFOOR, a river, town, and fort of Hindostan, N. of the Carnatic, and S. of the Kistnah, extending 40 m. along the bay of Bengal. It belongs to Britain.

GUNTZ, a river, town, and fort of Hungary, 40 miles S. of Vienna.

GUNTZELSDORF, a town of Austria.

GUNWALE, or GUNNEL of a Ship. *n. f.* That piece of timber which reaches on either side of the ship from the half deck to the fore castle, being the uppermost bend which finishes the upper works of the hull in that part, and wherein they put the stanchions which support the waite trees; and this is called the *gunwale*, whether there be guns in the ship or no; and the lower part of any port, where any ordnance are, is also termed the *gunwale*. *Harris.*

GUNZ, a river of Suabia.

GUNZBURG, a town of Suabia, seated on the Gunz, at its confux with the Danube.

GUNZENHAUSEN, a town of Franconia, in Anspach, 10 miles SSE. of Anspach.

GURGE. *n. f.* [*gurges*, Latin.] Whirlpool; gulf.—

Marching from Eden he shall find

The plain, wherein a black bituminous *gurge* Boils out from under ground. *Milton.*

GURGEON. *n. f.* The coarser part of the meal, sifted from the bran.

GURGISTAN. See GEORGIA, N<sup>o</sup> I, § 1.

GURGLE. *v. n.* [*gorgogliare*, Italian.] To fall or gush with noise; as water from a bottle.

Then when a fountain's *gurgling* waters play,  
They rush to land, and end in foalts the day. *Pope.*

Pure *gurgling* rills the lonely desert trace,  
And waite their musick on the savage race. *Young.*

GURGOVATZ, a town of Turkey, in Bulgaria.

GURIEL, a small kingdom of Asia, with its capital on the coast of the Black Sea.

GURK, a town of Carinthia, on the Gurk.

[1.] GURNARD. GURNET. *n. f.* [*gournard*, French.] A kind of sea fish.—If I be not ashamed of my soldiers I am a sow'd *gurnet*: I have misus'd the king's press damnably. *Shak.*

[2.] GURNARD. See TRIGLA.

[1.] GURRAH, a town of Hindostan, capital of Gurrah Mundella, 5 miles N. of the Nerbudda.

[2.] GURRAH MUNDELLA, a circar of Hindostan, between Allahabad and Berar; 120 miles long, and from 40 to 80 broad.

GURRAMCONDA, a town of Hindostan, in Mysore, 112 miles WNW. of Madras.

GURRY, a river of Perthshire in Athol.

GURTNAMACKIN, a river of Ireland, which

VOL. X. PART II.

rises near Loughrea, and after running below ground at different places, falls into Galway bay.

GURUNHUEL, a town of France, in the dep. of the North Coasts; 6 miles SW. of Guingamp.

\* GUSH. *n. f.* [from the verb.] An emission of liquor in a large quantity at once; the liquor so emitted.—If a lung-vein be bursted, generally at the first cough a great *gush* of blood is coughed up. *Harvey.*

\* To GUSH. *v. n.* [*goshelen*, Dutch.] 1. To flow or rush out with violence; not to spring in a small stream, but in a large body.—

A sea of blood *gush'd* from the gaping wound,  
That her gay garments stained with filthy gore. *Spenser.*

—The covering of this abyfs was broken asunder, and the water *gush'd* out that made the deluge, *Burnet.*—

Incessant streams of thin magnetick rays  
*Gush* from their fountains with impetuous force,  
In either pole, then take an adverse course. *Blackmore.*

On either hand the *gushing* waters play,  
And down the rough cascade white dashing fall. *Boonson.*

2. To emit in a copious effluxion.—

The gaping wound *gush'd* out a crimson flood. *Dryden.*

Line after line *ryg* *gushing* eyes o'erflow,  
Led through a sac variety of woe. *Pope.*

GUSSAGO, a town and district of the Cisalpine republic, in the dep. of the Mela, containing 13 communes, and 10,000 citizens in 1797.

\* GUSSET. *n. f.* [*gouffet*, French.] Any thing sewed on cloth in order to strengthen it.

GUSSOLENGO, a town of the Cisalpine republic, in the late province of Verona, on the Adige, 6 miles WNW. of Verona.

\* GUST. *n. f.* [*gouff*, Fr. *gustus*, Latin.] 1. Sense of tasting.—

Destroy all creatures for thy sport or *gust*,  
Yet cry, if man's unhappy, God's unjust. *Pope.*

2. Height of perception; height of sensual enjoyment.—

They fondly thinking to allay  
Their appetite with *gust*, instead of fruit  
Chew'd bitter ashea, which th' offended taste  
With spattering noise rejected. *Milton.*

Where love is duty on the female side,  
On theirs meer sensual *gust*, and fought with  
furlly pride. *Dryden's Fables.*

My sight and smell, and hearing were employ'd,  
And all three senses in full *gust* enjoy'd. *Dryden.*

3. Love; liking.—

To kill, I grant, is sin's extremest *gust*;  
But, in defence, by mercy 'tis made just. *Shak.*

—Old age shall do the work of taking away both the *gust* and comfort of them. *L'Estr.*—We have lost, in a great measure, the *gust* and relih of true happiness. *Tillotson.*

4. Turn of fancy; intellectual taste.—The principal part of painting is to find what nature has made most proper to this art, and a choice of it may be made according to the *gust* and manner of the ancients. *Dryden.*

5. [From *gustor*, Islandick.] A sudden violent blast of wind.—

She led calm Henry, though he were a king,  
X x x

As doth a sail, fill'd with a fretting *gust*,

Command an argosie to stem the waves. *Shak.*

You may as well forbid the mountain pines

To wag their high tops, and to make a noise,

When they are fretted with the *gust* of heav'n.

*Shak.*

—Presently come forth swarms and volleys of libels, which are the *gusts* of liberty of speech restrained. *Bacon.*—

As when fierce northern blasts from th' Alps descend,

From his firm roots with struggling *gusts* to rend  
An aged sturdy oak. *Denham.*

Part stay for passage, 'till a *gust* of wind

Ships o'er their forces in a shining short. *Dryd.*

Pardon a weak distemper'd soul that swells

With sudden *gusts*, and sinks as soon in calms,

The sport of passions. *Addison.*

6. It is written in *Spenser* vitiously for *justs*, sports.

For jolly knight he seem'd, and fair did fit,

As one for knightly *gusts* and fierce encounters fit.

*Spenser.*

\* **GUSTABLE.** *adj.* [*gusto*, Latin.] 1. To be tasted.—This position informs us of a vulgar error, terming the gall bitter; whereas there is nothing *gustable* sweeter. *Harvey.* 2. Pleasant to the taste.—A *gustable* thing, seen or smelt, excites the appetite, and affects the glands and parts of the mouth. *Derham.*

\* **GUSTATION.** *n. f.* [*gusto*, Latin.] The act of tasting.—The gullet and conveying parts partake of the nerves of *gustation*, or appertaining unto sapor. *Brown.*

(1.) **GUSTAVIA**, in botany: a genus of the polyandria order, belonging to the monadelphia class of plants. There is no calyx; the petals are very numerous; the berry multilocular; the seeds appendaged.

(2.) **GUSTAVIA**, a town of Sweden, in the island of St Bartholomew.

(1.) **GUSTAVUS I.** king of Sweden, son of Eric Vasa, duke of Gripholm. Christian II. K. of Denmark having made himself master of Sweden, confined Gustavus at Copenhagen; but he making his escape, wandered long in the forests, till the cruelties of the tyrant having occasioned a revolution, he was first declared governor of Sweden, and then, in 1523, elected king. He introduced Lutheranism into his dominions, and died in 1560. See SWEDEN.

(2.) **GUSTAVUS ADOLPHUS, THE GREAT,** K. of Sweden, was born at Stockholm in 1594, and succeeded his father Charles IX, in 1611. He espoused the cause of the Protestants in Germany, who were oppressed by Ferdinand I. He was a great warrior, and gained many victories, (See SWEDEN.) but was killed in the battle of Lutzen, where his troops got the victory, and defeated two of the emperor's armies, in Nov. 1632.

(3.) **GUSTAVUS III.** See SWEDEN.

\* **GUSTFUL.** *adj.* [*gust* and *full*.] Tasteful; well-tasted.—What he defaults from some dry insipid sin, is but to make up for some other more *gustful*. *Decay of Picty.*

\* **GUSTO.** *n. f.* [Italian.] 1. The relish of any thing; the power by which any thing excites sensations in the palate.—Pleasant *gusts* gratify the appetite of the luxurious. *Derb.* 2. Intellectual

taste; liking.—In reading what I have writ them bring no particular *gusto* along with *Dryden.*

**GUSTOW**, a town of Pomerania.

**GUSTROW**, a town of Mecklenburg.

\* **GUSTY.** *adj.* [from *gust*.] Stormy; turbulentous.—

Once upon a raw and *gusty* day

The troubled Tyber chasing with his fl

*Shak. Julius*

Or whil'd tempestuous by the *gusty*

**GUSUM**, a town of Sweden, in E. Got

\* **GUT.** *n. f.* [*kutteln*, German.] 1. The pipe reaching with many convolutions from stomach to the vent.—This lord wears his belly, and his *guts* in his head. *Shak.*—should have a lay of wire strings below, the belly, and then the strings of *guts* upon a bridge, that by this means the upper stricken should make the lower resound.

—The intestines or *guts* may be inflamed acrid or poisonous substance taken inward *but not on Diet.* 2. The stomach; the receipt of food: proverbially.—

And cram'd them 'till their *guts* did

With cawdle, custard, and plum-cake.

With false weights their servants *guts* cheat,

And pinch their own to cover the deceit

3. Gluttony; love of gormandizing.—

Apicius, thou did'st on thy *guts* bestow

Full ninety millions; yet, when this was

Ten millions still remain'd to thee; which

Fearing to suffer thirst and famishment,

In poison'd potion drank't. *Hakewill on*

\* **To GUT.** *v. a.* [from the noun.] 1. To

cerate; to draw; to exenterate.—The fish save the most part of their fish: some are splitted, powdered and dried. *Carrew's &*

2. To plunder of contents.—

In Nero's arbitrary time,

When virtue was a guilt, and wealth a

A troop of cut-throat guards were sent

The rich-men's goods, and *gut* their pa

—Tom Brown of facetious memory, having

a proper name of its vowels, used it as he pleased. *Addison.*

**GUTA**, a town of Hungary, 25 m. E. of Pr

**GUTHALUS**, or **GUTTALUS**, in ancient

graphy, is thought to be the **VIARDUS** of Pr now called the **ODER**.

(1.) **GUTHRIE**, William, a celebrated geographer, famous for his Geographical Grammar born in Aberdeenshire, in 1702, and educated at Aberdeen. He died in 1769.

(2.) **GUTHRIE**, a parish of Scotland, in Aberdeenshire, consisting of two parts, 6 miles distant each other, and containing 2681 acres; of

1072 were under oats, barley, pease, flax, potatoes, and sown grass, in 1792. The rest

under moss, moor, wood, and water. The population, stated by the rev. Mr William M

in his report to Sir J. Sinclair, was 571, and decreased 13, since 1755. There are vestiges

of a Roman camp in the parish, 15 acres in extent. The *vallum* and *fossa* are yet distinct. The

is an ancient and strong building, erected by Sir Alex. Guthrie, who was slain at Foddon. It is still entire. Its walls are 60 feet high and 10 thick. It has a prodigious massive iron door.

(1.) GUTTA, *n. f.* a Latin term for PROP.

(2.) GUTTA. See ARCHITECTURE, *Index*.

(3.) GUTTA ANGLICANA, *English Drops*, a chemical preparation esteemed of great virtue against vapours and lethargic affections, and purchased at 5000 l. by king Charles II. from the inventor, Dr Goddard. It is a spirit drawn by the retort from raw silk, and rectified with an essential oil.

(4.) GUTTA ROSACEA, in medicine, a red or pimped face; a distemper which, tho' not always owing to hard drinking, is most incident to tipplers.

(5.) GUTTA SERENA, a disease in which the patient, without any apparent fault in the eye, is deprived of sight. See MEDICINE, *Ind. x.*

\* GUTTATED. *adj.* [from *gutta*, Lat. a drop.] Besprinkled with drops; bedropped. *D. S.*

GUTEMBERG, John, one of the inventors of printing, was born at Mentz in 1408, where he died in 1468. He was descended of a noble family. See PRINTING.

\* GUTTER. *n. f.* [from *guttur*, a throat, Lat.] 1. A passage for water; a passage made by water.—These gutter tiles are in length ten inches and a half. *Moxon*.—Rocks rise one above another, and have deep gutters worn in the sides of them by torrents of rain. *Addison on Italy*. 2. A small longitudinal hollow.

\* To GUTTER. *v. a.* [from the noun.] To cut up small hollows.—

Tempests themselves, high seas, and howling winds,

The gutter'd rocks, and congregated sands,  
Traitors entsepe'd to clog the guillets keel,  
As having sense of beauty, do omit  
Their mortal natures, letting safe go by  
The divine Desdemona. *Shakesp. Othello*.

My cheeks are gutter'd with my fretting tears. *Sundys*.

First in a place, by nature close, they build  
A narrow flooring, gutter'd, wall'd, and til'd.

*Dryden*.

(1.) \* To GUTTLE. *v. a.* [from *gut*.] To swallow. A low word.—The fool spit in his porridge, to try if they'd hiss: they did not hiss, and so he guttled them up, and scalded his chops. *L'Espr*.

(2.) \* To GUTTLE. *v. n.* To feed luxuriously; to gormandize. A low word.—

His jolly brother, opposite in sense,  
Laughs at his thrift; and, lavish of expence,  
Quaffs, crams, and guttles in his own defence.

*Dryden*.

\* GUTTLER. *n. f.* [from *guttle*.] A greedy eater.

\* GUTTULOUS. *adj.* [from *guttula*, Lat.] In the form of a small drop.—Ice is plain upon the surface of the water, but round in hail, which is also a glaciation, and figured in its guttulous descent from the air. *Brown's Vulgar Errors*.

\* GUTTURAL. *adj.* [*gutturalis*, Latin.] Pronounced with the throat; belonging to the throat.—The Hebrews have assigned which letters are labial, which dental, and which guttural. *Bacon*.—In attempting to pronounce the nasals, and some of the vowels spiritaly, the throat is brought to labour, and makes that which we call a guttural pronunciation. *Holder*.

\* GUTTURALNESS. *n. f.* [from *guttural*.] The quality of being guttural. *D. S.*

GUTTY, in heraldry, a term used when at thing is charged or sprinkled with drops. In blazoning, the colour of the drops is to be named.

\* GUTWORT. *n. f.* [*gut* and *wort*.] An herb

(1.) GUY, Thomas, an eminent bookseller, son of T. Guy, coal-dealer in Southwark. He set a trade about 1668, with a stock of 200 l. The English bibles being then very badly printed, Mr Guy contracted with the university of Oxford for their privilege of printing them, and carried on great trade in them, for many years. Thus he began to accumulate money, and being a stingy man, and very penurious both in living and dressing, he daily increased his store. The bulk of his fortune, however, was acquired by purchasing sea mens tickets during Q. Anne's wars, and South Sea stock, in 1720. To show what great event spring from trivial causes, the public owe the dedication of the greatest part of his immense fortune to charitable purposes, to the indiscreet of civilities of his maid-servant, whom he had agreed to marry; but previous to his nuptials, had ordered the pavement before his door, to be mended as far as to a particular stone which he pointed out. The maid, looking on the paviers at work, remarked a broken place that they had not repaired; but they told her that Mr Guy had directed them not to go so far. "Well, says she, do you mend it; tell him I bade you, and he will not be angry." But the poor girl had presumed too much on her influence over her careful lover, with who a few extraordinary shillings expence turned the scale totally against her. The men obeyed; Guy enraged to find his orders exceeded, renounced his matrimonial scheme, and commenced a build of hospitals. He was 76 years of age when he formed the design of building the hospital which bears his name, and lived to see it roofed in dying in 1724. The charge of erecting this vast pile amounted to 18,793 l. and he left 219,499 l. to endow it; a much larger sum than had ever been dedicated to charitable uses in this kingdom by any one man. He erected an almshouse with library at Tanworth in Staffordshire, for which he was representative in parliament, for 14 poor men and women; and left 125 l. a-year for their pension.

(2.) \* GUY. *n. f.* [from *guide*.] A rope used to lift any thing into the ship. *Skinner*.

(3.) GUY is also a large slack rope, extending from the head of the main-mast to the head of the fore-mast, and having 2 or 3 large blocks fastened to the middle of it; to sustain the tackle used hoist in and out the cargo of a merchant ship.

GUYON, J. M. de la Mothe. See MOTHE.

GUY'S CLIFF, in Warwickshire, a great cliff on the W. side of the Avon and N. side of Warwick where in the time of the Britons was an oratory, as in that of the Saxons a hermitage, to which Gu earl of Warwick, retired, cohabited with the hermit, and built a chapel. This hermitage was kept up till the reign of Henry VI. when Rich. Beauchamp earl of Warwick established a chantry here, and, in memory of Guy, erected a large statue of him in the chapel 8 feet in height.

GUZ, an Indian measure, = 1 yard English.

GUZERAT, a peninsula of Indostan, 170 mi

long, and 140 broad, formed by the Arabian sea, and the gulf of Cambay. It is the richest province in the Mogul's empire.

**GUZMAN, Dominic DE**, founder of the Dominican order of monks, was born at Calaroga in Old Castile, 1170. He preached with great fury against the Albigenes, when Pope Innocent III. made a croisade against that unhappy people; and was inquisitor in Languedoc, where he founded his order, and got it confirmed by the Lateran council in 1215. He died at Bologna in 1221, and was canonized. See **DOMINICANS**.

**GUZNOORGUL**, a prov. of Asia, in Cuttore.  
(1.) \* **To GUZZLE**. *v. a.* To swallow with immoderate gust.—

The Pylian king  
Was longest liv'd of any two legg'd thing,  
Still *guzzling* must of wine. *Dryden.*

(2.) \* **To GUZZLE**. *v. n.* [from *gut*, or *gust*, to *guttle*, or *gustle*.] To gormandize; to feed immoderately; to swallow any liquor greedily.—

Well feason'd bowls the gossip's spirits raise,  
Who while she *guzzles* chats the doctor's praise.  
*Roscommon.*

—They fell to lapping and *guzzling*, till they burst themselves. *L'Esrange.*—

No more her care shall fill the hollow tray,  
To fat the *guzzling* hogs with floods of whey. *Gay.*

\* **GUZZLER**. *n. f.* [from *guzzle*.] A gormandizer: an immoderate eater or drinker.

**GWALIOR**. See **GUALIOR**.

**GWINIAD**. See **SALMO**.

**GY**, a town of France, in the dep. of Up. Saone.

**GYALGUR**, or **GAWILE**, a town of Indostan, in Berar, 20 miles NNW. of Ellichpour, and 75 W. of Deogur.

**GYARUS**, one of the Cyclades, E. of Delos, 12 miles in compass. It was a desert island, and allotted for a place of banishment by the Romans.

\* **GYBE**. *n. f.* [See **GIBE**.] A sneer; a taunt; a sarcasm.—Ready in *gybes*, quick answer'd, saucy, and as quarrelous as the weazel. *Shak. Cymbeline.*

\* **To GYBE**. *v. n.* To sneer; to taunt.—

The vulgar yield an open ear,  
And common courtiers love to *gybe* and sneer.  
*Spenser.*

**GYBING**, the act of shifting any boom sail from one side of the mast to the other. By a boom sail is meant any sail whose bottom is extended by a boom, the fore end of which is hooked to its respective mast; so as to swing occasionally on either side of the vessel, describing an arch, of which the mast will be the centre. As the wind or the course changes, it becomes necessary to change the position of the boom, with its sail, which is accordingly shifted to the other side of the vessel as a door turns upon its hinges. The boom is pushed out by the effort of the wind upon the sail, and is restrained in a proper situation by a strong tackle communicating with the vessel's stern, called the *sheet*. It is also confined on the fore part by the *Guy*.

**GYEY**, a town of France, in the department of Upper Maine.

**GYGÆUS**, or **COLOUS**; a lake of Lydia, 40 stadia, or 5 miles, from Sardis.

**GYGES**, a Lydian, to whom Candaules king of the country showed his wife naked. See **LYDIA**.

Plato says, Gyges descended into a chasm of earth, where he found a brazen horse, whose side he opened, and saw within the body the carcase of a man, from whose finger he took a brazen ring. This ring, when he put it on his finger, rendered him invisible; and by means of it he introduced himself to the queen, murdered her husband, married her, and usurped the crown of Lydia.

**GYGONIUS LAPIS**. See **ROCKING STONE**.  
**GYMNASIARCHA**, in antiquity, the office of the gymnasium. He had two deputies: the **XYSTARCHA**, and the **GYMNASIARCHA**.

**GYMNASIUM**, [from *gymnos*, naked.] In Grecian antiquity, a place fitted for performing exercises of the body, &c. so called because the athletes put off their clothes, to practise with freedom. Gymnasia were first used at Ithaca, but were afterwards common in all Greece; and imitated, augmented, and improved at Rome. There were 3 principal gymnasia: the Academy, the Lyceum, and the Stoa.

Vitruvius describes the structure of the ancient gymnasia, lib. v. c. 11. They were called **PALESTRÆ**, from wrestling, which was one of the most usual exercises; and they were also called them **THERMÆ**, because the bath was a principal part of them. They performed exercises in Homer's time in drawers; which were not laid aside before the 32d Olympiad.

Pythagoras is said to have been the first who introduced the practice: for having been worsted in a wrestling match, he threw them away, and the rest afterwards imitated him. They were a knot of buildings united, sufficient to hold many thousands of people, and having room for philosophers, rhetoricians, the professors of all other sciences, and no less for lectures; and wrestlers, dancers, and a school for those who had a mind to exercise; and who were not without the least disturbance or interruption.

They consisted of 12 parts, viz. 1. The porticos, where the philosophers, rhetoricians, mathematicians, physicians, and other virtuous men gave public lectures, and where they also dispersed and rehearsed their performances. 2. The **XYSTI**, where the youth assembled very early, to perform their exercises in private without any interruption. 3. The **CORYCEUM**, apodyterion, or gymnasium, a kind of wardrobe, where they stripped to bathe or exercise. 4. The **CLATHRARIUM**, or unclathrium, appointed for the purpose of wrestling, which either preceded or followed the bath, wrestling, pancratia, &c. 5. The **CONISTRUM**, or conistra, in which they covered themselves with sand or dust, to dry up the oil.

6. The **PALÆSTRA**, properly so called, where they practised wrestling, the pugillate, and other exercises. 7. The **SPHÆRISTERIUM**, a court, reserved for exercises wherein they used balls. 8. Large unpaved alleys, which were hended the space between the portico walls wherewith the edifice was surrounded. 9. The **XYSTI** or porticos for the wrestlers to use in bad weather. 10. Other **XYSTI** or porticos for fine weather, some of which were planted with trees. 11. The **APARTMENTS**, or **STADIA**, a large space of a semicircular

shape, where they practised the pugillate, and other exercises. 12. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 13. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 14. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 15. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 16. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 17. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 18. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 19. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 20. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 21. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 22. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 23. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 24. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 25. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 26. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 27. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 28. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 29. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 30. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 31. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 32. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 33. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 34. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 35. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 36. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 37. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 38. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 39. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 40. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 41. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 42. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 43. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 44. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 45. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 46. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 47. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 48. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 49. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 50. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 51. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 52. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 53. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 54. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 55. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 56. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 57. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 58. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 59. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 60. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 61. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 62. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 63. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 64. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 65. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 66. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 67. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 68. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 69. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 70. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 71. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 72. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 73. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 74. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 75. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 76. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 77. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 78. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 79. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 80. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 81. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 82. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 83. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 84. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 85. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 86. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 87. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 88. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 89. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 90. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 91. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 92. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 93. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 94. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 95. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 96. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 97. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 98. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 99. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises. 100. The **APARTMENTS**, or **STADIA**, a large space of a semicircular shape, where they practised the pugillate, and other exercises.

th sand, and surrounded with seats for  
ators. For the administration of the  
, there were different officers: the prin-  
s, 1. The gymnasiarcha. 2. The xystarch a.  
mnastes. And, 4. The pædotriba. See  
les. Under these 4 officers were a num-  
balterns. The gymnastic exercises may  
d to two general classes; as they depend  
the action of the body alone, or as they  
ternal agents or instruments. The lat-  
ed chiefly in mounting the horse, driving  
ot, and swimming. The former were  
two kinds; ORCHESTRICE, and PA-  
E; which see.

MASTES, a deputy under the gymnasi-  
o was master of the ceremonies.

GNASTICALLY. *adv.* [from *gymnastick*.]  
lly; fitly for strong exercise.—Such as  
ty and vigour are not *gymnastically* com-  
or actively use those parts. *Brown*.

GYMNASTICK. *adj.* [γυμναστικός; *gym-*  
French.] Pertaining to athletic exer-  
cising of leaping, wrestling, running,  
the dart, or quoit.—The Cretans wisely  
eir servants *gymnasticks* as well as arms;  
our modern footmen exercise themselves  
illst their enervated lords are softly lolling  
hariots. *Arbutb. and Pope*.

YMNASTICS, GYMNASTICÆ, or the GYM-  
art, the art of performing exercises of the  
ether for defence, health, or diversion.  
YNASIUM. Several modern writers have  
f this art. M. Burette has given the histo-  
nals in the *Mem. of the R. Acad. of*  
On the first establishment of society, men,  
rised of the necessity of military exer-  
repelling the insults of their neighbours,  
games and proposed prizes to animate  
th to combats of divers kinds. And as run-  
ning, throwing the javelin, driving a ball,  
quoit, wrestling, &c. were exercises suited  
anner of fighting in those days; so the  
d to excel in them, in the presence of the  
to sat as judges, and dispensed prizes to  
victors; till what was originally only a  
t, became at length a matter of such im-  
portance, as to interest great cities and entire na-  
tions in its practice. Hence arose an eagerness to  
win prizes, and hopes of being one day crowned con-  
querors in the public games, which was the highest  
honour mortal could arrive at: nay, they ima-  
gined that even the gods were not insensible of what  
they were so captivated with; and, in consequence,  
performed the greatest part of these exercises in-  
religious and funeral ceremonies. The  
art, as appears from Homer's *Iliad*, lib.  
2, he describes the games at the funeral of  
Patroclus, was known at the time of the Trojan  
war. From the description, it appears, that they  
were foot-races, boxing, wrestling, foot-races,  
throwing the discus, drawing the bow,  
throwing the javelin; and that even then the  
art wanted little of perfection. When  
there was no gymnastic art in Homer's  
time, it is thought that it began to appear no earlier than  
the time of Pythagoras, who is thought to have  
learned it in Sicily. See § 3.

YMNASTICS, MEDICINAL. According to

Plato, one Herodicus, a little prior to Hippocrates,  
was the first who introduced this art into phyfic;  
and his successors, convinced of its usefulness, im-  
proved it. Hippocrates has given instances of it,  
where he treats of exercise in general, and of the  
particular effects of walking, with regard to health;  
also of the different sorts of races on foot or horse-  
back; leaping, wrestling, the exercise of the sus-  
pended ball, chironomy, unctious, frictions, roll-  
ing in the sand, &c. But as physicians did not adopt  
all the gymnastic exercises in their practice, it  
came to be divided between them and the masters  
of martial and athletic exercises, who kept schools,  
the number of which was greatly increased in  
Greece. The Romans, adopting the military and  
athletic exercises of the Greeks, advanced them  
to the utmost pitch of magnificence. But the  
declension of the empire involved the arts in its  
ruin, and, among others gymnastics and medicine;  
which last unhappily then relinquished the title it  
had to the former, and has neglected to resume it  
ever since.

\* GYMNICK. *adj.* [γυμνικός; *gymnique* French.]  
Such as practise the athletic or gymnastic exer-  
cises.—

Have they not sword-players, and ev'ry fort  
Of *gymnick* artists, wrestlers, riders, runners?

*Milton*.

GYMNOPYRIS, in natural history, a name  
given by Dr Hill to pyritæ of a simple internal  
structure, not covered with a crust. See PYRITES.  
Of these there are only two species: 1. A green  
variously shaped kind. 2. A botryoide kind. The  
first is the most common of all the pyritæ, and ap-  
pears under a great diversity of shapes. It is very  
hard and heavy, readily gives fire with steel, but  
will not at all ferment with aquafortis. The 2d  
is very elegant, its usual colour is an agreeable  
pale green; but what most distinguishes it is, that  
its surface is always beautifully elevated into tu-  
bercles of various sizes, resembling a cluster of  
grapes.

GYMNOSOPHISTS, [γυμνοσophισται, Greek, *i. e.*  
a naked philosopher,] a set of Indian philosophers,  
famous in antiquity, so called from their going  
naked. They, however, did not absolutely go na-  
ked; but only clothed themselves no farther than  
modesty required. There were some of these sages  
in Africa; but the most celebrated of them were  
in India. In general, the Gymnosophists were  
wise and learned men; their maxims and discour-  
ses, recorded by historians, do not savour of a bar-  
barous education, but are the result of great sense  
and deep thought. They kept up the dignity of  
their character to so high a degree, that it was never  
their custom to wait upon any body, not even u-  
pon the princes. They believed the immortality  
and transmigration of the soul: they placed the  
chief happiness of man in a contempt of the goods  
of fortune and the pleasures of sense, and gloried  
in having given faithful and disinterested counsels  
to princes and magistrates. It is said, that when  
they became old and infirm, they threw them-  
selves into a pile of burning wood, in order to  
prevent the miseries of an advanced age. One of  
them, named *Calamus*, thus burnt himself in the  
presence of Alexander the Great. Apuleius de-  
scribes the Gymnosophists thus: "They are all  
devoted

who is raised by others among the Egyptians. He makes Buddas, the preceptor of Manes the Persian, the founder of the Gymnosophists.

1. GYMNOSOPHISTS, THE AFRICAN, dwelt upon a mountain in Ethiopia, near the Nile, without either house or ceil. They did not form themselves into societies, but each had his private recess, where he studied and performed his devotions by himself. If any person had killed another by accident, he applied to these sages for absolution, and submitted to whatever penances they enjoined. They lived solely upon the fruits of the earth. Lucan ascribes to these Gymnosophists several discoveries in astronomy.

2. GYMNOSOPHISTS, THE INDIAN, dwelt in the woods, where they lived upon the wild products of the earth, and never drank wine nor married. Some of them practised physic and travelled from one place to another; these were particularly famous for their remedies against barrenness. Some of them, likewise, pretended to practise magic, and to foretel future events.

GYMNOSPERMIA. See BOTANY, *Index*. In this order, the seeds are constantly 4 in number, except in one genus, viz. PHRYMA, which is monospermous.

\* GYMNOSPERMOUS. *adj.* [*γυμνός* and *σπέρμα*.] Having the seeds naked.

GYMNOIUS, in ichthyology, a genus of fishes belonging to the order of apodes. They have two tentacula at the upper lip: the eyes are covered with the common skin; there are five rays in the membrane of the gills; the body is compressed, and carinated on the belly with a fin. There are five species, the most remarkable of which is the

GYMNOTUS ELECTRICUS, or electric eel, called by the French *anguille tremblante*. See Plate CLXXI, *fig.* 3. This species is peculiar to Surinam: and is found in the rocky parts of the river.

into the lower part of the body distinguished by its thinness and by the reticulated skin light colour, with which it rina begins about 6 or 7 inches the head; and, gradually down as it goes along, reaches down it is thinnest. The fourth soft, and wavy fin, which tail inches at most below the down the sharp edge of the ty of the tail. The situation singular; being an inch more toral fins. Externally it secunda; but the formed excise of a quill of a common were two pectoral fins just below an inch in length, of a persistence, and orbicular shape chiefly useful in supporting of the fish when he came up he was obliged to do ever cross the body were a number lar divisions, or rather rugose of these the fish seemed to peculiar nature, had the power of tending its body like a worm backwards as well as forwards property of the vermicular then it laid itself on one side rest. For an account of this fish, see ELECTRICI:

GYNÆCEUM, in antiquity women, a separate room in house, where they employed, weaving, and needle.

GYNÆCOCRATUM, man, and *κατακρατορ*; vanquisher of Sarmatia Euronæa. i

the flower, and bears both the floral. See BOTANY, *Index*. The clafs, fays Linnæus, have a monoe, arifing from the unufal fituation of fructification.

COCRACY. *n. f.* [*γυμναζοκρατία*; *nch.*] Petticoat government; fe-

RACY, denotes alfo a ftate where the fupreme command. Such n, &c.

Subgenus of falcons. See FALCO. *adj.* Of gypfum, or plafter.

EGYPTIANS, an outlandifh tribe called *Bobemians* in France, and who; who, difguifing themfelves in fmeared their faces and bodies, anting language, wander up and etence of telling fortunes, curing ufe the people, trick them out of fteal all they can come at. They d of commonwealth of wander- id jugglers, who made their firft emany, about the beginning of

Munfter, who is followed and pelman, fixes the time of their 117; but as he owns, that the firft w were in 1529, it is probably an for 1517; efppecially as, when Sul- ered Egypt in 1517, feveral of the to fubmit to the Turkish yoke, ler one ZINGANEUS; whence the em ZINGANEES; but being at ed and banifhed, they agreed to parties all over the world, where ill in the black art gave them an on in that age of fuperftition and very few years they gained fuch profelytes, (who imitated their complexion,) that they became l even formidable to moft of the

Hence they were expelled from and from Spain in 1591. And of England took the alarm much 130, they are defcribed by Stat. . 10. "as an outlandifh people es Egyptians, uſing no craft nor dize, who have come into this from ſhire to ſhire, and place to companies, and uſed great, ſubtile, s to deceive the people; bearing at they by palmiftry could tel n's fortunes; and ſo many times ily have deceived the people of d alfo have committed many nei- l robberies." Wherefore they are the realm, and not to return u- ifonment, and forfeiture of their ls; and upon their trials for any y may have committed, they ſhall a jury *de medietate lingus*. And nacted, by ſtatutes 1ſt and 2d Ph. and 5th Eliz. c. 20. that if any l be imported into the kingdom, l forfeit 40l. And if the Egypti- main one month in the kingdom, being 14 years old, whether nat- or ſtranger, which hath been

feen or found in the fellowſhip of ſuch Egyptians, or which hath diſguifed him or herſelf like them, ſhall remain in the ſame one month at one or feveral times, it is felony without benefit of clergy. Sir M. Hale ſays, that at one Suffolk aſſizes, no leſs than 13 perſons were executed upon theſe ſtatutes a few years before the reſtoration. But, to the honour of humanity, there are no inſtances more modern than this of carrying theſe laws into practice; and the laſt ſanguinary act is itſelf now repealed by 23 Geo. III. c. 54. In Scotland they ſeem to have enjoyed ſome ſhare of indulgence; for a writ of privy ſeal, dated 1594, ſupports John Faw, lord and earl of Little Egypt, in the execution of juſtice on his company and folk, conform to the laws of Egypt, and in puniſhing certain perſons there named, who rebelled againſt him, left him, robbed him, and refuſed to return home with him. James's ſubjects are commanded to aſſiſt in apprehending them, and in aſſiſting Faw and his adherents to return home. There is a like writ in his favour from Mary Q. of Scots, in 1553; and in 1554, he obtained a pardon for the murder of Ninian Small. So that it appears he had ſtaid long in Scotland, and from him this ſtrolling people received the name of *Faw's Gang*, which they ſtill retain. A very circumſtantial account of this ſingular race of men has been lately given in an *Inquiry* concerning them, written by H. M. G. Grellman, and tranſlated by Mr Rapcr. It is incredible how this ſwarm of banditti have ſpread over the earth. They wander about in Aſia, and Africa, and moſt of the European nations. Spain is ſuppoſed by Mr Twiſs to contain 40,000, by others 60,000; and by ſome 120,000. But in Sept. and Oct. 1806, they were almoſt totally extirpated by the plague. They abound in Italy, and are ſcattered through France, Germany, Denmark, Sweden, and Ruſſia. Europe contains more than 700,000 of theſe vagabonds. For near 4 centuries they have wandered through the world; and in every region, and among every people, whether barbarous or civilized, they have continued unchanged. Their origin has been generally believed to be from Egypt. Thomalius, Salmon, and Sig. Grifclini, have endeavoured to prove it. M. Grellman, however, traces it from Indoftan, and the cauſe of their emigration from the bloody wars of Timur Beg in India, in 1408-9.

GYPHOPHILA, in botany, a genus of the digynia order, in the decandria claſs of plants; in the natural method ranking under the 22d order, *Caryophyllei*. The calyx is monophyllous, campanulated and angulated; the petals are 5, ovate, and ſeffile; the capsule globoſe and unilocular.

GYPHUM, PLASTER STONE, OR ALABASTER, a natural combination of the calcareous earth with vitriolic acid. See ALABASTER. The properties of gypfum, according to Cronſtedt, are, 1. It is looſer and more friable than calcareous earth. 2. It does not efferveſce with acids, or at moſt in a very ſlight degree. 3. It falls into powder in the fire very readily. 4. When burnt without being made red-hot, its powder readily concretes with water into a maſs which ſoon hardens; but without any ſenſible heat being excited in the operation. 5. It is nearly as difficult of fuſion as limſtone; and ſhows almoſt the ſame effects upon

other

other bodies with limestone, though the acid of vitriol seems to promote the vitrification. Magellan, however, says, that most of the gypsa, particularly the fibrous, melt in the fire pretty easily by themselves. 6. When melted with borax, it puffs and bubbles very much, and for a long time during the fusion. Magellan says, when a small quantity of any gypsum is melted with borax, the glass becomes colourless and transparent; but some sorts of sparry gypsum, melted with borax, yield a fine yellow transparent glass, resembling the topaz; but if too much of the gypsum is used in proportion to the borax, the glass becomes opaque. 7. When burnt with any inflammable matter, it emits a sulphureous smell, and may thus be decomposed, as well as by either of the fixed alkaline salts: In this last method there ought to be 5 or 6 times as much salt as gypsum. 8. The residuum shows some signs of iron. The species are, 1. *Friable gypseous earth*, white, found in Saxony. 2. *Indurated gypsum of a solid texture*, or *Alabaster*, the particles of which are not visible. This is sometimes found unsaturated with vitriolic acid. It is easily cut, and takes a dull polish. It is of several kinds. See ALABASTER, § 1—3. Fabroni tells us, that various fine alabasters are met with in Italy: 24 quarries of them, each of a different colour, being worked out at Volterra. 3. *Gypsum of a scaly texture*, or common plaster of Paris. See PLASTER. 4. *Fibrous gypsum*, or *plaster-stone*, has two varieties, viz. with coarse or with fine fibres. It is white. 5. *Selenites*, or *spar-like gypsum*, by some also called *glacies mana*, and confounded with the clear and transparent mica. It is of two kinds, clear and transparent, or yellowish and opaque, and abounds every where. 6. Crystallized gypsum, or gypseous drusen. This is found composed of wedge-shaped and sometimes of capillary crystals, sometimes white, and some yellowish. 7. Stalactitical gypsums of many different forms and colours. In large pieces it commonly varies between white and yellow, and likewise in its transparency. It is used as alabaster in several works. England abounds with gypseous substances. There are plenty in Derby, Nottingham, and Somerset shires; so fine as to take a polish, like alabaster. A very fine semipellucid alabaster is found in Derbyshire. Fine fibrous talcs are also found in many other places. Very fine gypseous drusen is found in Sheppey Isle, and some exceedingly beautiful, large, and clear as crystal, in the salt rocks at Nantwich in Cheshire. The selenites rhomboidalis abounds in England, particularly in Shotoverhill, in Oxford, though rare in other counties. Sheppey affords spar-like gypsa, of a fibrous nature, and accreting like the radiations of a star on the septaria, and thence called *Stella septarii*. See CRYSTALLIZATION, § I, vii.

\* GYRATION. *n. f.* [*gyro*, Latin.] The act of turning any thing about.—This effluvium attenuates and impelleth the neighbour air, which, returning home, in a *gyration* carrieth with it the obvious bodies into the electric. *Brown*.—If a burning coal be nimbly moved round in a circle with *gyrations*, continually repeated, the whole circle will appear like fire; the reason of which is,

that the sensation of the coal in the several of that circle remains impressed on the soul until the coal return again to the same place.

\* GYRE. *n. f.* [*gyrus*, Latin.] A circle described by any thing moving in an orb.—

Ne thenceforth his approved skill to w  
Or strike, or hurlen round in warlike gy  
Remember'd he; ne car'd for his life  
But rudely rag'd.

Does the wild haggard tow'r into the  
And to the South by thy direction fly?  
Or eagle in her gyres the clouds embrace  
He fashion'd those harmonious orbs, t  
In restless gyres about the Arctic pole.

Quick and more quick he spins the gidd  
Then falls, and in much foam his soul e

\* GYRED. *adj.* Falling in rings.—

Hamlet, with his doublet all unbrac'd  
No hat upon his head, his stockings loos  
Ungarter'd, and down gyred to his ankle  
GYRFALCO. See FALCO, N° 31.

GYRINUS, in zoology, a genus of in  
the coleoptera order. See Plate CLXXI.  
The antennæ are cylindrical, stiff, and short  
the head; the eyes are 4, two on the upp  
two on the under part of the head. Ther  
species.

GYRINUS NATATOR, the common water  
is one third of an inch long; of a bright br  
lour; the feet yellow, flat, and large. It run  
great celerity in circles on the surface of the  
and is very difficult to catch.

GYROMANCY, *n. f.* [from *gyros*, t  
round, and *manis*, magic.] a kind of div  
performed by walking round in a circle.

GYRON, in heraldry, an ordinary of  
straight lines, issuing from divers parts of the  
cheon, and meeting in the Fesse point.

GYRT, a town of Sweden, in E. Gothl

GYSHORN, a town of Lunenburg, on

ver Aller. Lon. 10. 45. E. Lat. 51. 50. N

GYSSONE, a town of Corsica.

\* To GYVE. *v. a.* [from the noun.]  
ter: to shackle; to enchain; to ensnare.  
as little a web as this, will I ensnare as gr  
as Cassio. Ay, smile upon her, do. I'd  
thee in thine own courtship. *Sbak. Otobello*

\* GYVES. *n. f.* [*gewyn*, Welch.] Fetters  
for the legs.—The villains warched wide  
the legs, as if they had gyves on. *Sbak.*—

And knowing this, should I yet stay,

Like such as blow away their lives,

And never will redeem a day,

Enamour'd of their golden gyves? *Ben*

—The poor prisoners, boldly starting up  
off their chains and gyves. *Knolles.*—

Gyves and the mill had tam'd thee.

But Telamon rush'd in, and hap'd to

A rising root, that held his fasten'd feet

So down he fell, whom sprawling on the

His brother from the wooden gyves un

GYZEI, a town of Egypt, near C  
which the French removed the national  
office from that city, in March 1800.
